The value of soy forage. Soybeans in mixtures with other crops. Green manure. The concept of Dr. Uribe Echeverri, minister in Brazil.

Page 1180 states: "Climatological conditions. The soybean is suited to the temperate zones but it can become acclimatized to warmer climates and it has succeeded at the agricultural experiment stations of Valle de Cuaca and of Tolima and in various regions of the Intendencia del Chocó. It is probable that some varieties from England and from the north of Canada can acclimatize themselves in good conditions in our cold lands.

Note 1. This is the earliest document seen (May 2009) concerning soybeans in Colombia, or the cultivation of soybeans in Colombia. Note 2. No mention is made of soya in Nicaragua.

Note 3. This is the earliest Spanish-language document seen (Dec. 2012) that uses the term *habas tostados* to refer to soynuts.

Note 4 This is the earliest Spanish-language document seen (June 2009) that uses the term *habas verdes* to refer to green vegetable soybeans. Address: Agrónomo Nacional de la Intendencia del Chocó [Colombia].

831. Haas, Louis W.; Bohn, Ralph M. Assignor to J.R. Short Milling Company. 1934. Bleaching agent for flour and process of utilizing same in making bread. *U.S. Patent* 1,957,336. May 1. 3 p. Application filed 8 Feb. 1933.
• ***Summary:*** Soy-bean milk, processed at a low temperature, is used to bleach wheat flour for making bread. The soy-bean milk is "an aqueous dispersion of carotin-decolorizing matter derived solely from vegetable origin and containing active enzymes." A formula for the dough is given. Address: 1. Chicago, Illinois; 2. Evanston, Illinois.

832. Red & White Stores. 1934. The Red & White–Leader stores: Salmon week (Ad). *Toronto Daily Star* (*Canada*). May 31. p. 38.
• ***Summary:*** In the middle left of this full-page ad: "Vi-Tone 6 oz. tin–27¢. A soya bean food. Medical men recognize its value for health." Address: Toronto.

833. Adolph, William H.; Wang, Ying-Lai. 1934. The digestibility of the protein of soybean-milk. *Chinese J. of Physiology* 8(2):171-78. May. [5 ref. Eng; chi]
• ***Summary:*** "Soybean milk (vegetable milk) is being used to an increasing extant for infant feeding, where cow milk is either unobtainable or beyond the reach of the average food budget." The protein of fresh cow's milk is more readily digested *in vitro* by trypsin or trypsin + pepsin than is that of soybean milk; the latter, however, is more readily hydrolyzed by pepsin. Cow's milk and soybean milk have approximately the same optimum pH for proteolysis. The apparent digestibility by rats is approximately the same: Digestibility of soybean milk protein is 84.9%; cow milk protein is 86.6%. Address: Dep. of Chemistry, Yenching Univ., Peiping, China.

834. *Pediatrie.* 1934. Revue des thèses: Le lait de soja dans l'alimentation des nourrissons [Review of theses: Soymilk in the feeding of infants]. 23(5):122. May. [1 ref. Fre]
• ***Summary:*** A ¼-page review of the thesis by Dr. Lucie Yeu, Edition Véga, 175, boulevard Saint-Germain, Paris. Prix: 12 francs.

835. Pierce (S.S.) Co. 1934. Spring and summer mail order catalog. *The Epicure* (*Boston and Brookline, Massachusetts*) 48(1):1-72. May. Illust. Index. 28 cm.
• ***Summary:*** This company, which delivers fine specialty foods throughout New England, was established in 1831 and incorporated in 1894. Soy related items: Chinese foods–Ingredients for making Chop Suey: La Choy Soy Sauce (6½ oz bottle, $0.23, p. 40). Flour and meal–Dietetic flour: Cellu Soy Bean Flour (5 lb tins, $1.00, p. 43). Sauces–Worcestershire sauce: Lea & Perrins (large, $0.57; small, $0.29, p. 50). Note: Under "Sauces," no soy sauces are listed. But there is Harvey Sauce from Crosse & Blackwell, and H.P. Sauce.

Vegetables–Dried vegetables, Beans: Soy ($0.12/lb, p. 53).

Battle Creek Foods Department [Michigan] (full page, with photo and illustrations, p. 72)–Crackers: Soy Bean Biscuits ($0.60/package). Soy Gluten Bread ($0.35/tin). Flour: Soy Flour ($0.35/14 oz tin). Vegetables: Soy Beans, Baked ($0.18/11 oz tin).

Battle Creek Foods also offers: Psyllium seed. Bran-Gluten Flakes. Zo (a cereal rich in food iron and vitamin B). Kaffir tea (made from a shrub native to South Africa). Malted Nuts ("a vegetable substitute for milk, containing malt sugar"). Minute Brew (cereal beverage with coffee-like flavor). Bran biscuit. Gluten bread. Gluten biscuits. Rice biscuits. Nut butters: Almond butter and peanut butter. Savita (yeast extract, bouillon cubes, sal-Savita salt). Vegetable meats: Nuttolene, Nuttose, Protose, Saucettes. Vegetable gelatin (agar, flaked).

Note: Inserted in this catalog is an undated leaflet titled: "You are invited to attend a special demonstration of Battle Creek Special Purpose Foods, conducted by Miss Minnie Duffy, Oct. 12 to Oct. 17 at Park Grocery Co., 18-20 North Diamond, Mansfield, Ohio." Small photos show: (1) Battle Creek Sanitarium. (2) Miami Battle Creek Sanitarium

[Florida]. (3) Battle Creek Food Co. Address: Importers and Grocers, Boston and Brookline, Massachusetts.

836. La Sierra Industries. 1934. La Sierra soy bean products: Perfect protein, high alkaline ash, low starch (Ad). *Health* (*Mountain View, California*) 1(3):30. June.
• ***Summary:*** "Add variety and new flavors to your menu with the following foods–soy cheese [tofu], soy milk, soy butter [like a soynut butter, non-hydrogenated], sandwich spread, canned soy beans, soy breakfast food, soy flour (raw), Mamenoka, Smoein, Soy-Co (beverage), soy oil, soy noodles, soy loaf.

"Low in price. Ask your health food store or grocer, or write to La Sierra Industries."

Note 1. This is the earliest document seen (June 2001) that advertises or markets tofu.

Note 2. This is the earliest dated publication seen (Sept. 2000) concerning La Sierra Foods and soy.

Note 3. This is the earliest English-language document seen (Dec. 2012) that uses the term "soy butter" to refer to soynut butter. Address: Arlington, California.

837. Lin, F.C. 1934. A soybean digest medium for diagnostic work. *Chinese Medical Journal* 48(6):571-76. June. [4 ref. Eng]
• ***Summary:*** These media, soybean digest broths in plain and sugar free forms, are made by coagulating soybean milk with concentrated hydrochloric acid and pepsin scales. In the sugar free broth the milk is fermented with *B. coli*, with potassium dibasic phosphate added. They can replace the more expensive meat infusion in routine work, and may also be employed for the preservation of stock cultures. The various ingredients are inexpensive and readily available locally. The disadvantage is the same as with all digest media in that its nutritive contents tend to fluctuate with various batches prepared at different times. Address: Dep. of Bacteriology and Immunology, Peiping Union Medical College, Peiping.

838. Van Gundy, Dorothea. 1934. Soy beans: The new thing in foods. *Health* (*Mountain View, California*) 1(3):13, 30. June. [3 ref]
• ***Summary:*** Just below the subtitle is written: "Soy beans are going to revolutionize humanity"–Dr. A.A. Horvath. This article discusses: Nutritional value of soybeans, soybeans as a source of "complete protein" (which, when taken alone, will furnish all the essential elements for proper nutrition in sufficient quantities so there will be no impairment in growth or maintenance), soybeans for those who are seeking wholesome vegetable proteins to substitute for animal proteins, soy-bean flour (all cereals yield an acid ash, but soy flour is high in alkaline ash), whole soy beans (baked or pressure cooked), soy milk, and soy cheese or soy curd ("The Oriental people call it *tofu*, and make great use of it in their diets").

Soy beans "may be brought into the diet in almost any of the courses from soup to nuts, even entering the dessert course, for pumpkin pie made from soy milk with a crust made from soy flour is most delicious. Soy cookies are very nutritious as well as tasty.

"This unique food of the Orient is fast becoming Westernized, for all who study foods and nutrition are recognizing the value of the soy bean. Its high percentage of complete protein, its low starch content, its high alkaline ash, its valuable mineral and vitamin content, and its great versatility predestine this food to become an important and valuable addition to the American bill of fare." Address: Dietitian, California.

839. *Times of India* (*The*) (*Bombay*). 1934. Agricultural topics: Exploring. Aug. 11. p. 12.
• ***Summary:*** Dr. David Fairchild of the USDA was recently awarded the Marcellus Hartley Gold Medal for the year 1934 for excellence in the application of science for the public welfare.

The following is a quotation from the speech he gave upon receiving the medal: "It is with a thrill that I remember, each time I drink a glass of soybean milk, that in 1898, before we knew how to grow soybeans in this country [USA], I sent to Tokyo for soil with which to inoculate the root systems of our experimental plantings of them, little thinking that I should see the day when four million acres of soybeans would be grown in America."

840. Christian Science Monitor Bureau. 1934. Chicago finds that soy bean, made up into savory dishes, rivals noted Boston article. *Chicago News*. Aug. 18.
• ***Summary:*** For the text of this article, see the *Christian Science Monitor* of 18 Aug. 1934.

841. *Christian Science Monitor.* 1934. Chicago finds that soy bean, made up into savory dishes, rivals noted Boston article. 26(223):1. Aug. 18. Central edition.
• ***Summary:*** This article was written after Henry Ford's gala soybean banquet at the Chicago World's Fair. "Chicago. Aug. 18–Please pass the soy bean salad. Oh won't you have some soy bean soup?" "This soy bean cake is delicious, but after the soy bean croquettes, soy bean apple pie and soy bean coffee you know, one isn't really hungry.

"Remarks like these were heard here last night at a dinner in which the humble soy bean made its social debut. The hosts were the Ford exposition staff who have been exhibiting growing soy beans at the World's Fair all summer and who thought it about time to prove their claims about soy beans being excellent food for people.

"As the dinner advanced some 30 guests who had arrived in a state of anxious expectation, not at all sure they were going to be able to eat their way through the five

courses, relaxed and began to enjoy themselves. The soy bean appetizers, which included celery stalks stuffed with soy-bean cheese [tofu], set the pace for an excellent dinner in which every dish and drink was made wholly or in part of the little legume.

"No meat was served and it was not missed. The dish which took the place of the usual roast was soy bean croquettes. The hosts had obligingly furnished the guests with typewritten receipts of the foods they were eating so they were able to find out just how the croquettes were made... The man who was responsible for the menu, as well as for most of the recipes, was here to face the guests. He is Dr. A. E. Ruddimer [sic, Dr. E.A. Ruddiman], now chief chemist for the Ford Motor Company, but as one time desk-mate of Mr. Henry Ford's in a little country school in Michigan...

"Soy-bean meals are really only a side line for Dr. Ruddimer [Ruddiman]. He has been greatly interested in perfecting the salted soy bean and in developing synthetic milk from the legume, but the important part of his work, in Mr. Ford's scheme of things, he says, is the discovery of industrial uses for the bean.

"The Ford Company now makes 20 automobile parts and all of its car body enamel out of soy beans. Fortunately none of the parts or enamel got mixed up in the meal last night, which Dr. Ruddimen [sic, Ruddiman] had cooked in Dearborn with the aid of the Ford cafeteria staff to whom he gave much credit. It was brought here ready to serve in automobiles."

Note 1. This exact article was also published in the *Chicago News* on the same day. Note 2. No mention is made of Jan Willemse. Address: Special to the Christian Science Monitor Bureau, Boston, Massachusetts.

842. *St. Louis Globe-Democrat* (*Missouri*). 1934. Too much beans. Aug. 21.
• ***Summary:*** "It is to be feared that Henry Ford, in developing new uses for farm products, is doing a grave injustice to the City of Boston. The Ford Company makes 20 automobile parts and all of its car-body enamel out of soy beans, and now the Ford staff at the Chicago Exposition is trying to prove that soy beans are excellent food for people...

"As a demonstration of the versatility of the soy bean, the dinner was an unqualified success. But it is a terrible blow to the Boston baked bean...

"But is Boston the only place that has reason to be alarmed? Admitting that a bean which can take the place of meat, cheese, coffee and dessert might be a great asset if the nation's supply of grain and live stock were further reduced by drouth and crop limitation, what would happen if production of these commodities were normal and soy-bean dinners were served in every household? Brazil's coffee industry would collapse. The hog and cattle market would be demoralized. To prevent disaster to the farmers, the AAA [Agricultural Adjustment Administration (USDA)] would have to concentrate on limitation of soy-bean acreage. There would be no demand for cheese. And if the automobile manufacturer succeeded in developing synthetic milk from soy beans, as he is trying to do, the dairy industry would be in even greater peril.

"Mr. Ford should hesitate before he goes on with his efforts to find new uses for farm products."

Note: This is the earliest document seen (March 2006) that mentions USDA's Agricultural Adjustment Administration–the first major piece of New Deal agricultural legislation.

843. LeClerc, J.A. 1934. A list of references on soybean milk. Washington, DC: U.S. Bureau of Chemistry and Soils. Food Research Div. Aug. 28. 2 p. Aug. 28. Unpublished manuscript. [33 ref]
• ***Summary:*** The 33 references are listed no discernible order. Address: USDA.

844. Ford Motor Co. 1934. Menu of dinner served at Ford Exhibit, Century of Progress, August 17, 1934. Dearborn, Michigan. 1 p.
• ***Summary:*** "Tomato juice seasoned with soy bean sauce. Salted soy beans. Celery stuffed with soy bean cheese. Puree of soy bean. Soy bean cracker. Soy bean croquettes with tomato sauce. Buttered green soy beans. Pineapple ring with soy bean cheese [tofu] and soy bean dressing. Soy bean bread with soy bean relish. Soy bean buscuit [sic, biscuit] with soy bean butter. Apple pie (soy bean crust). Cocoa with soy bean milk. Soy bean coffee. Assorted soy bean cookies. Soy bean cakes. Assorted soy bean candy."

Note 1. No mention is made of soy ice cream being served at this meal in Aug. 1934. Yet shortly thereafter, and definitely by Aug. 1935 soy ice cream for dessert was served at similar meals in the pine-panelled dining room in the Ford Engineering Laboratory (Strother 1961).

Note 2. A 1936 recipe book published by the Edison Institute describes how to make "Soy bean butter: Mix hydrogenated soy oil with salt, coloring matter and diacetyl to color and taste." Thus this product is similar to today's soy margarine.

Note 3. This is the earliest menu seen on which soyfoods appear prominently. Address: Dearborn, Michigan.

845. Grulee, Clifford G.; Sanford, H.N.; Herron, P.H. 1934. Breast and artificial feeding. Influence on morbidity and mortality of twenty thousand infants. *J. of the American Medical Association* 103(10):735-39. Sept. 8.
• ***Summary:*** Soy is not mentioned. Address: 1. Prof. of Pediatrics, Rush Medical College; 2. Medical Director, Infant Welfare Society, Chicago; 3. Spokane, Washington.

846. *Oil and Soap.* 1934. The world's fair and the Oil and

Soap Chemists. 11(9):194-95. Sept.
• ***Summary:*** "In the scientific exhibits of the World's Fair of 1934 the soy bean, as a source of basic materials, is occupying a prominent place because of the bean's variety of economic appeals. Three exhibits in which soy beans are shown as an oil source susceptible of great development are those of the Ford Motor Company, the University of Illinois and the Sherwin-Williams Company. In the latter soy bean oil appears as a paint base with some limitations.

"Dealing with the soy bean as an agricultural product the University of Illinois exhibit in the Food and Agricultural Building shows the possibilities of this plant as a profitable crop. In the past year, 4,350,000 bushels were produced in the state...

"The University exhibit includes samples of jars of various grades of soy oil which may be used in hard and liquid soaps. There are also exhibits of varieties of soy beans and of soy bean flours and bakery goods made from them.

"Henry Ford has been a consistent advocate of soy beans as a farm crop as part of his program for the industrialized farm, in which the farmer will have a variety of ways of turning his crop into money. In the Ford exhibit at the Fair the Ford 'Industrialized Barn' is surrounded on two sides by plots in which soy beans are growing as demonstration of the vigor and productiveness of the plants.

"The barn is the original Ford homestead barn built in 1863 near what is now the city of Dearborn, Michigan. The building was taken up and transported to the Fair, partly for its sentimental interest and partly as a demonstration of how a farmer may transpose his old home barn into an industrial unit. A soy bean processing plant is built around the interior of the barn, the engine being outside.

"Units of the oil extractor are of simple design and made chiefly of standard piping and sheet metal that any mechanic could put together. The crushing rolls and a few accessories are the only parts that need be purchased.

"Oil extraction operation in this plant is by solvent. The beans are taken from storage in dry sheds, tempered to 12 per cent moisture content, then gravity fed to a series of five rolls between which they are progressively reduced to flakes of minimum thinness. The flaked beans are then passed by conveyor through a counter current of solvent, gasoline being used in the exhibit. The gasoline is distilled out of the solvent-oil solution and re-used. Flakes come through the process reduced to 2 per cent oil. The solvent is steamed out of the flakes, they are dried and ready for further conversion into food or industrial products. A paper concerning soy bean oil extraction is scheduled for the morning of Oct. 11 of the A.O.C.S. [American Oil Chemists' Society] meeting.

"A soy food exhibit in the Ford barn shows soy flours, cheese, milk, butter, sprouts, salad dressing and various bakery goods. Dinners have been served at the Ford exhibit at which a number of guests have sat down to meals of which the entire menu was contrived from soy beans in various disguises. Plastic uses of the soy bean also are shown. Light switch assemblies are molded in a demonstration operation. Gear shift knobs and other small parts are exhibited. The entire exhibit is a forceful educational effort in which Henry Ford's campaign to urge the raising of crops that will provide the farmer winter employment as manufacturer is centered on the soy bean."

A photo at the bottom of p. 195 bears the caption: "This crude barn, originally built 71 years ago on the farm of Henry Ford's father at Dearborn demonstrates to the World's Fair visitors what has been called 'Henry Ford's solution to the Farm Problem."

847. Castagnol, E.M. 1934. Étude sur la fabrication du lait de soja [Study on the production of soymilk]. *Bulletin Economique de l'Indochine* (*Hanoi*) 37:982-94. Sept/Oct. [Fre]
• ***Summary:*** Contents: Introduction. Composition of soymilk. Technique for the preparation of soymilk: soaking, grinding, dilution with water, filtration / dewatering using a centrifuge, centrifugation. Material balance / Description of the process (start with 200 gm dry soybeans. Soak in water for about 12 hours until soybeans swell to 439 gm. Grind while adding 500 gm water. Measure the frothy result: 867 gm. Dilute by adding 500 gm water, resulting in 1,367 gm of product. Centrifuge to filter off the fiber; the filtered liquid should weigh 966 gm. Centrifuge again to give a final weight of 954 gm).

Fermentability of soymilk (fermenting soy milk). Improvement of the yield of nitrogen through extraction of nitrogenous materials: Influence of the pH on the extraction, influence on the sodium ions, influence of the length of soaking. Conclusion: Making soymilk at home, making soymilk on a larger scale for sale.

Tables show: (1) Composition of soybean seeds. (2) Soaking #1 (length of soaking, weight of the seeds, quantity of water absorbed). (3) Soaking #2 (soaking water temperature, weight of seeds, weight of water absorbed). (4) Materials balance. (5) Composition of each step of the process. (6) Fermentation temperatures for 0-9 hours. (7) Fresh milk, whey, and curd. (8) Treatments and pH. (9) Treatments and yield. (10) Soak times and yield. Address: Ingenieur Agronome, Chef de la Division de Chemie de la Section Nord, Institut des Recherches Agronomiques de l'Indochine.

848. Juday, C.B. 1934. Development of combine reduces soybean losses. *Purdue Agriculturist* (*Indiana*) 29(1):1, 9. Oct.
• ***Summary:*** "During the past decade, there has been a remarkable increase in the acreage of soybeans in Indiana and the other Corn Belt States... A recently increasing interest in soybeans has been the result of the discovery of their practical use in the manufacture of oils, soybean flour,

numerous synthetic products, and various articles of food such as salad oils, sauces, and soybean milk."

"Probably no other phase has caused the soybean grower as much concern as that of successfully harvesting the crop." "The shattering property of the variety of soybeans grown and the method of harvesting used will determine the time of cutting... Common varieties which shatter quite badly are Midwest, Peking, and Ito San. Some of the varieties which shatter least Manchu, Mansoy, Kingwa, Dunfield and Illini. Varieties which are early maturing are Ito San and Early Brown.

"There are various methods of harvesting the crop. From one third to one half of the soybeans of the state are harvested by the combine which has many advantages. Another method is to cut the crop with the grain binder and shock the beans until they are cured suitable for threshing with a stationary thresher. This means is used extensively because the machinery is available to most farmers and the first cost is lower. Other methods are cutting with a mowing machine with a side delivery or buncher attachment, cutting with a self-rake reaper, and using special devices of varying utility.

"Combining is the most economical and satisfactory way of harvesting soybeans for seed. In fact this crop was responsible for the introduction of the combine into Indiana in 1925, and approximately three fourths of the 500 combines in the state in 1931 were purchased primarily for soybeans."

Discusses the many advantages to the use of the combine.

A photo caption states: "The general purpose tractor has sufficient power to pull a ten-foot combine under average conditions." One man is driving the tractor and another is standing on the combine. The ten foot wide combine has proved most popular in Indiana. On average, 1.8 acres of soybeans can be harvested per hour. "Soybeans should be cut less than three inches from the ground to get the low beans." Address: Class of 1935.

849. Reid, Eric. 1934. The nutritive properties of soybean-egg powder, a substitute for cow's milk in the infant dietary. *Far Eastern Association of Tropical Medicine, Transactions of the Congress* 9th Congress 1:367-71. Oct. Held 2-8 Oct. 1934 at Nanking, China. [11 ref]

• ***Summary:*** The authors believe that soybean-egg powder contains sufficient vitamin D and bone-building salts to prevent the development of rickets in the young growing dog. This powder consists of about 22% protein, 25% fat, 40% carbohydrate, and 0.4 to 0.5% calcium and phosphorus. Note: Since this powder was not fed to human infants, the title of the paper seems misleading. Address: Div. of Physiological Sciences, Henry Lester Inst. of Medical Research, Shanghai, China.

850. Torres Herrera, José M. 1934. El haba soya, su cultivo y beneficio [The soybean, its culture and benefits]. *Boletin de Agricultura y Trabajo* (*Nicaragua Ministerio de Agricultura y Trabajo*) 6(54):24-26. Aug.; 6(55):6-8. Sept.; 6(56-57):6-12. Oct/Nov. 3a Epoca. [Spa]

• ***Summary:*** The article begins with the following: "In previous editions of this bulletin we inserted various articles concerning the cultivation of soya; however, given the large importance of this legume, we decided to reprint this article by José M. Torres Herrera from the *Boletín Agrícola* of Medellín, Colombia" [April 1934. 8(189):1180-92]. The soybean variety Brazilian Yellow can be obtained in Sao Paulo for 10 cents gold at the most" (i.e., it is inexpensive).

Contents: Part I. Introduction. Climatological conditions for different varieties. Soils appropriate for this crop. Inoculation with bacteria. Preparation of the soil. Soya in crop rotations.

Part II. Sowing the seeds. The work of cultivation. Calculation of the cost of production for 6,400 square meters (Data taken from the Palmira Agricultural Experiment Station, Bulletin No. 1; the cost is $0.45 per arroba = ca. 25 lb). Soybean varieties ("Agriculturists interested in planting this crop which has no equal, can obtain seeds free of charge from the Pamira [sic, Palmira] Agricultural Experiment Station or the Antioquia Agricultural Society [Sociedad Antioqueña de Agricultores, Colombia]"). Production of seeds. Yields of various varieties.

Part III. Harvesting and threshing of the grain. The uses of soya (*la soya*). Utilization of the plant and seeds of the soybean (*de las habas soyas*)*:* The plants as hay, pasture, green forage, ensilage, green manure. The seeds as whole dry soybeans (*habas secas*, for making infant foods, flour, soup, butter, diabetic foods and breads, cooked whole soybeans, confections, health foods [alimentos para sano]: soymilk, soybean roasts or steaks, soy sprouts. Breakfast foods: Vegetable curd or cheese [cuajada o queso vegetal], soy sauce, malted milk, soy coffee cakes, flour, livestock feed), green vegetable soybeans (*habas verdes*), soy flour (*harina de habas*), soy oil (*aceite de habas*). Soya as human food. The composition of various legumes. Soy flour. Soy oil. Soy milk (*leche de soya*)*:* Nutritional comparison of soy milk and cow's milk, powdered soymilk, fermented soymilk, tofu (*queso soya*), soy casein (*Caseína*). Whole dry soybeans: Roasted soybeans (*habas tostadas*), soy coffee (*café de soya*), soy chocolate (*chocolate de soya*). Green-seeded soybeans (*habas soyas verdes o legumbres*)*:* Soy sprouts, soy sauces. Edelsoya (soy flour made by Berczeller). The value of soy forage. Soybeans in mixtures with other crops. Green manure. The concept of Dr. Uribe Echeverri, minister in Brazil.

Note: No mention is made of soya in Nicaragua. Address: Agrónomo Nacional de la Intendencia del Chocó [Colombia].

851. Kellogg, John Harvey. 1934. Method of making acidophilus milk [from soybean milk]. *U.S. Patent* 1,982,994. Dec. 4. 2 p. Application filed 14 June 1933. [1 ref]
• ***Summary:*** An "acidophilus milk" or "buttermilk" type product was prepared by inoculating sterilized soybean milk with *Bacillus acidophilus* and culturing the milk at about 100ºF. About 2% lactose may be added to the milk. The "culture count in soy acidophilus milk far exceeds the count in cow acidophilus milk. Old cultures are rejuvenated immediately. The organism is thicker and grouped in longer strings. Persons who are sensitized against cow's milk may employ soy acidophilus milk without experiencing allergic symptoms. In cases of acute colitis, especially in children, when cow's milk must be avoided, soy acidophilus milk is of special service. Likewise in cases of extreme toxemia, when all animal proteins are harmful to the patient, soy acidophilus milk may be used as a source of protein." Address: Battle Creek, Michigan.

852. Carqué, Otto. 1934. Vital facts about foods: A guide to health and longevity with 200 wholesome recipes and menus and 250 complete analyses of foods. 2nd ed. Los Angeles, California: Published by the author. 208 p. Index. 24 cm. [20+* ref]
• ***Summary:*** This so-called 2nd edition is identical to the first edition (1933) except that: (1) Two lines on the 2nd page of the Preface have been moved to the first page; both pages are unnumbered. (2) Two paragraphs, titled "Preface to the second edition" have been added to the end of the Preface and dated "November, 1934." The author's signature again appears at the end of the Preface.

Note: The first 5,000 copies were exhausted in about a year. Address: Los Angeles, California.

854. **Product Name:** Loma Linda Soy Milk (Canned).
Manufacturer's Name: Loma Linda Food Co.
Manufacturer's Address: Loma Linda, California.
Date of Introduction: 1934.
Wt/Vol., Packaging, Price: Can.
New Product–Documentation: Some Products of LLF. 1934. Handwritten manuscript. "Soy milk experiments by Harry Meger." House of Better Living. 1936. Sept. p. 4. "Soy Milk with a pleasing taste, and full of nutrition, SOY MILK is one of several Loma Linda soy products." Price list. 1938. Sold in plain and chocolate flavors.

Rosenberg's Original Health Food Store. 1940. Catalog of Health Foods... p. 52. "Loma Linda Foods: Soy Milk. $0.10, $0.15, $0.25." Loma Linda. 1945. Wholesale price list; Today's Food. 1966. Spring. States that Loma Linda first began making soy milk in about 1930.

Thomas' Wholesale Grocery... Register. 1955. July. p. 1474. Soy products. California, Arlington: Loma Linda Foods Co. (Soy milk).

Interview with Charlotte Holmes. 1981; Shurtleff & Aoyagi. 1984. Soymilk Industry and Market. p. 26.

855. Adachi, Isamu; Sakurai, Shigeru. 1934. Nihon shokumotsu-shi [History of Japanese foods]. Tokyo: Yuzankaku. 480 p. [Jap]
• ***Summary:*** This is the best book seen on the history of Japanese foods. The following soyfoods are discussed: Firm tofu, soymilk and okara (p. 290-91; discusses the *Teikun Orai* by Iseno Teijo, tofu-kan, tofu-jiru = soymilk, setsurun-sai = okara), yuba (p. 336), shoyu and tofu (p. 370-71), unohana (okara, p. 377), tofu and natto (p. 382-83).

856. Battle Creek Food Co. 1934. Healthful living. Battle Creek, Michigan. 64 p.
• ***Summary:*** The top one-third of the front cover contains a photo of the Battle Creek Sanitarium, with the tall twin towers. The bottom third is a table of contents.

The section titled "Nut butters" (p. 13) contains a description of the company's products with a photo of a jar of peanut butter; in the middle of the label is written "The Original." "Peanut butter–We were the originators of peanut butter, which we first made for the Battle Creek Sanitarium in 1892. We at first roasted the nuts, but found that roasting destroyed some of the fine qualities and rendered the product hard to digest. After much experimenting, we discovered a new process whereby a far more delicious and entirely wholesome product could be made without roasting. The roasted nut butter is difficult for some people to digest.

"Our peanut butter is prepared from choicest nuts. A most excellent fattening food. Capital for use in sandwiches and salads.

"Almond butter–Prepared by our own process from the finest quality of sweet almonds. Thoroughly cooked and emulsified, it dissolves readily in water, and until opened will keep indefinitely in any climate.

"Almond butter may be prepared for table use by mixing with an equal amount of water and adding salt. This makes delightful sandwiches. Mixed with equal parts of lemon juice and salt to taste, you have a sour salad dressing. Makes delicious nut cream and nut milk."

The price list (p. 64) gives the prices for 132 foods–including various sizes. Among these are Agar (flaked), Almond butter (8 oz jar, $1.35), Bran biscuit, Bran–cooked, Bromose–Nut, Dietetic bran (starchless), Gluten bread in tin, Gluten biscuit–40%, Gluten flour (5 lb sack), Granola, Meltose, Kaffir tea, Malted nuts, Meltose sugar (malt sugar), Nuttolene, Nuttose, olive oil, Peanut butter (8 oz jar, $0.40), Protose vegetable meat, Savita, Soy beans baked (11 oz tin, $0.18), Soy bean biscuit (package, $0.60), Soy flour (14 oz tin, $0.35; 5 lb tin, $1.25), Soy gluten bread ($0.35),

Vegetable gelatin, Whole wheat flour (100%, 5 lbs, $0.55), Whole wheat wafers, Yogurt tablets, Zwieback. Address: Battle Creek, Michigan.

857. Delegación de los Servicios Hidráulicos del Guadalquivir. 1934. Campos de experimentación agrícola. Ensayos con la "Soja." Laboratorio [Agricultural experimentation fields. Trials with soybeans. And the laboratory]. Sevilla, Spain. 89 p. [Spa]
• ***Summary:*** This Directorate of Waters, Delegation of the Guadalquivir (*Jefatura de Aguas de la Delegación del Guadalquivir*), has knowledge through lectures and references of trials conducted in different regions with the legume called 'soy,' whose products have numerous applications, both agricultural and industrial. I endeavored in late August 1932, while taking charge of the Delegation of Hydrological Services of the Guadalquivir, to see that this plant was tested at the Agricultural Experiment Fields that this organization had established in Córdoba and Granada. The tests began in 1933.

More than 20 years ago in Spain, soybean trials were conducted with good results by the Count of San Bernardo at his farm "El Alamillo," located in Ecija (Sevilla). In 1910 the soybean was cultivated by the agricultural engineer Mr. Noriega in Jerez (Cádiz) and even though the seeds were not in good condition, the plant showed its excellent resistance to drought. In 1917 the Spanish Consul in Shanghai, China, made three varieties of soya available for testing. Nowadays this plant is examined with care and curiosity, and later [p. 81-82] we shall say that what has been done by us at the experiment field of Córdoba.

In 1933 the varieties Lorca and Laredo were tested, and additional plantings of Laredo were done to test its use as fodder and to gather its beans. In 1934 the soybean trials were repeated, to test for both grain use and hay. Address: Seville, Spain.

• ***Summary:*** Title and text also in Bulgarian. Address: Bulgaria.

861. Matveeff, G.N. 1934. [Varieties of soybeans in Georgia]. Tblisi, Georgia: Georgian Press. 146 p. Scientific Research Works, Series A, Issue No. 1. [51 ref. Geo]
• ***Summary:*** Table 1 (p. 8-9) shows the increase in the area planted to soybeans in Georgia from 1930 to 1933. Part 1 shows the area planted to soybeans only ("pure sowings"); this value increased from 626 ha in 1930 to 1,653 ha in 1933. Part II shows the mixed plantings converted to pure sowings; this value decreased from 49,544 ha in 1930 to 28,878 ha in 1933. Part III shows the total planted area (pure + mixed); this value decreased from 50,170 ha in 1930 to 30,531 ha in 1933. Part 4 shows soybean area as a percentage of total area; this figure decreased from 5.09% in 1930 to 3.05% in 1933. A note (p. 9) explains that this table is based on statistical data received from the Narcomzem (Agricultural Department) of Georgia.

Page 10 states that in 1932 a soymilk manufacturing plant was established in Tblisi. Page 11 states that soybeans exported from the port of Batumi (Georgia, on the Black Sea) to Germany and Denmark sold for ¼ to ½ to price of soybeans purchased from Manchuria.

Table 2 (p. 12) shows soybean production in Georgia in 1931 and 1932, and how these soybeans were utilized. Soybean production was 10,760 tons in 1931, and 3,611 tons in 1932. For the two years (respectively), 32.6% and 48.8% were exported (outside the USSR), 21.2% and 22.5% were exported to other countries inside the USSR, 27.9% and 2.6% were delivered to various organizations in Georgia for use in making edible oils and confections.

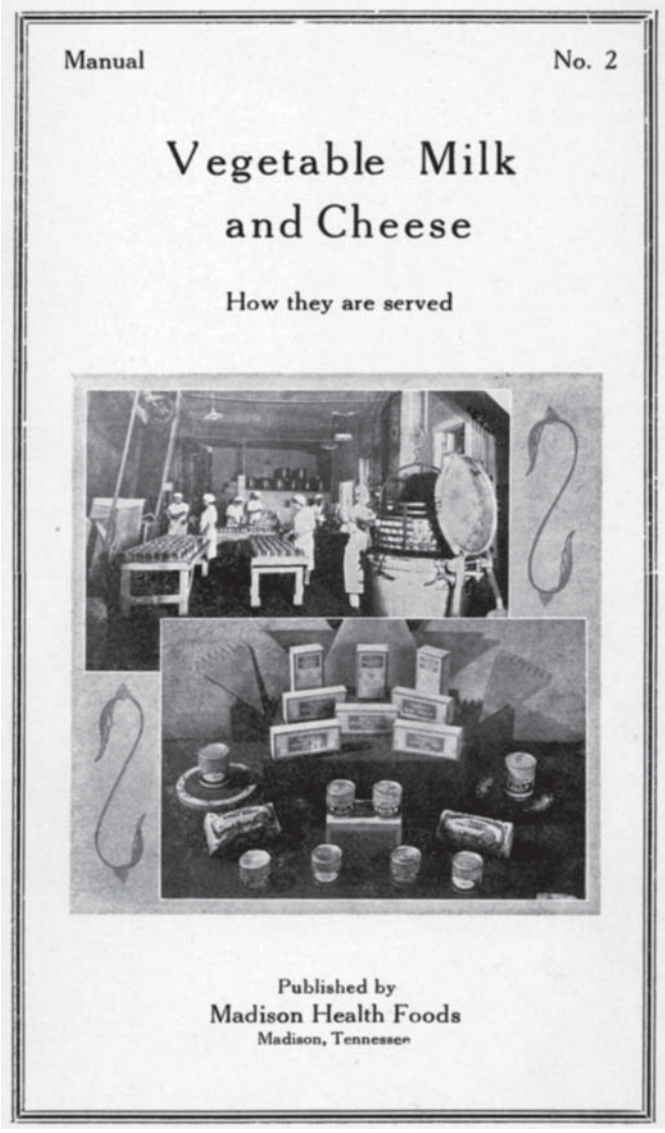
Page 10 states that G. Struev [G. Sturua] (1882) gave the names of some varieties he obtained from Japan. According to G. Japardize, S. Timofeev, and E. Wuchino, soybeans were introduced to Georgia during the 1870s.

Page 20 states: The first information about the soybean in Russia was from the year 1874 (See G. Tupikova).

Address: Georgia.

862. McGuire, Ray F. 1934. Soybean values. Cedar Rapids, Iowa: Soybean Production Advisory Board. 15 p. [24 ref]
• ***Summary:*** Contents: Values as farm crop. Commercial possibilities. Valuable human food. Modern method of producing oil and oil meal. Utilization of soybean oil. Utilization of soybean oil meal. Soybean flour. Imports, exports and the tariff. Marketing soybeans, oil and meal. Potential markets. Production last year (in the United States). Graphs show the domestic production of soybean oil, 1927-1932, and the increasing seed production in Iowa 1924-1933. A map shows the principal soybean producing counties in Iowa. Address: Iowa.

863. Madison Health Foods. 1934? Vegetable milk and cheese. How they are served. Manual No. 2. Madison, Tennessee. 21 p. Undated. 22 cm.



• ***Summary:*** Contents: Introduction. Composition of the soybean. Soybean–A food for infants. Salads: How to make a perfect salad (20 recipes, including 11 with soy cheese [tofu] and 7 with grated soy cheese): Tomato, pineapple, cheese salad (with grated soy cheese). Jellied soy salad (with grated soy cheese). Waldorf cheese salad (with grated soy cheese). Raisin and soy cheese salad (with grated soy cheese). Almond and soy salad (with grated soy cheese). Sliced fruit and cheese salad (with soy cheese). Soy peach salad (with grated soy cheese). Tomato and soy salad (with soy cheese). Baked apple with soy sauce (with grated soy cheese). Pineapple and cheese salad (with grated soy cheese). Apple, carrot and soy salad (with grated soy cheese). Soybean salad (with whole soybeans). Soybean sprout salad (with soybeans sprouted until the sprouts are about 2 inches long). Cold sliced curd (with thin-sliced soy cheese). Potato soy salad (with grated soy cheese). Stuffed egg with soy cheese. Vegetable soy salad (with grated soy cheese). Cheese, cantaloupe, and tomato salad (with grated soy cheese). Mock chicken salad (with grated soy cheese). Pea soy salad (with grated soy cheese).

Sandwiches (9 recipes, incl. 5 with soy cheese and 4 with grated soy cheese; one recipe uses Vegex). Cooked vegetable dishes with soy cheese (40 recipes, all use soy cheese except 2 which use soybean puree). Other soy dishes (3 recipes). Desserts (1 recipe for Soy cream custard, with soy milk). Diabetic foods (4 recipes, each using soy meal [flour]). Soups (5 recipes, using soybeans, grated soy cheese, and soy milk or soybean milk). Breakfast dishes (4 recipes, using canned soybeans, soy meal, or grated soy cheese).

Note 1. This is the earliest English-language document seen (April 2013) that uses the term “grated soy cheese” to refer to grated tofu.

On the last page (inside rear cover) are listed “Products for sale by Madison Health Foods Inc. (Madison, Tennessee): Soy cheese, 14 or 30 oz. Soy beans, 14 or 30 oz. Soy milk, 14 or 30 oz. Soy meal, 5 or 10 lb. Also many other health products. Write for information and prices.”

Two photos on the cover show: (1) Students at work inside the Madison food factory, with two long tables and a retort cooker. (2) Various food products made by the company.

Note 2. Although this booklet is undated, the two photos on the cover appear in the *Madison Survey* issue of 14 March 1934 (p. 31). Address: Madison, Tennessee.

864. Monnier, Emile. 1935. Les préparations à base de graines de soja dans l’alimentation des Annamites [Preparations based on soybeans in the diet of the Annamites (of Central Vietnam)]. *Bulletin Economique de l’Indochine* (*Hanoi*) 38:66-86. Jan/Feb. Also in Annales de Medecine et de Pharmacie Coloniales (1935) 33. p. 34-57. [11 ref. Fre]
• ***Summary:*** An excellent, very precise and detailed discussion of the subject. Contents: Introduction, botany of

the plant, nutritional composition, and utilization. Soymilk (used to make tofu–*le fromage de soja–dau-phu*). Tonkin soy sauce (*La sauce de soja = dau-tu'o'ng.* It is made by fermentation of a mixture of glutinous rice and roasted soybeans {*graines de soja grillées*}. It is made on a family level. It corresponds roughly to Japanese shoyu and Chinese soy sauce (*téou-yeou*). Describes exactly how it is made). Soy cream [yuba] (*La crème de soja = dau-phu-chuc;* [dried yuba sticks]). It comes in the form of sheets.

Note. This is the 2nd earliest French-language document seen (Dec. 2012) that mentions roasted soybeans, which it calls *graines de soja grillées.* Address: Chef du Laboratoire de Chimie de l'Institut Pasteur, Hanoi.

865. Reid, Eric. 1935. The nutritive properties of soybean-egg powder, a substitute for cow's milk in infant dietary. *Chinese J. of Physiology* 9(1):27-42. Feb. [14 ref. Eng; chi]
• ***Summary:*** Describes modifications in the method of preparing soybean-egg powder from that described in the Journal for March 15, 1934, and reports feeding experiments on rats. Soya-bean powder, prepared from soya-bean flour (125 gm), sucrose (40 gm), lactose (30 gm), dextrin (20 gm), liquid egg-yolk (50 gm), peanut oil (20 gm), calcium lactate (5 gm), and NaCl (2 gm), fed to young rats appears to be adequate for blood and bone formation and to produce no enlargement of thyroid or liver. In general, the growth-promoting power is greater than with whole milk powder, with or without iron citrate. The soybean flour used was Soylac, marketed by Nutro Products Co., Shanghai. Address: Div. of Physiological Sciences, Henry Lester Inst. of Medical Research, Shanghai.

866. Rittinger, Fred; Dembo, L.; Torrey, G.G. 1935. Soy bean (vegetable) milk in infant feeding. *J. of Pediatrics* 6(4):517-32. April. [16 ref]
• ***Summary:*** Gives the results of a 3½-year study on the growth and development of 205 infants. The gain in weight, general development, and resistance to infection were all satisfactory and paralleled that of breast-fed infants and those fed on carefully prepared dairy milk mixtures. The stool flora showed a high percentage of gram-positive organisms (acidophilus), resembling that of breast-fed babies.

The soy bean milk was found valuable in the treatment of infantile eczema when there was evidence of sensitization to animal protein. It was helpful in cases of constipation, owing to its bulkage and to the fact that *Lactobacillus acidophilus* thrives in soy bean milk. Address: Pediatric Services, St. Ann's Hospital and St. Luke's Hospital, Cleveland, Ohio.

867. Bowdidge, Elizabeth. 1935. The soya bean: Its history, cultivation (in England), and uses. London: Oxford University Press. xii + 83 p. Foreword by Sir John T. Davies (Director, Ford Motor Co., Ltd.). Illust. 20 cm.

• ***Summary:*** Contents: 1. Introduction. 2. The soya bean in the East: Europe, United States, Canada. 3. Description of the plant: Results of experiments in England, the 1934 experiment in Essex, yields from the four varieties, description of the four varieties, composition of English and other varieties. 4. Culture of the soya bean: Soil requirements, inoculation of the seed, preparation of soil, rates of seeding, sowing seed, cultivation, fertilizers, harvesting the crop, threshing, storage, yields in various countries, soya bean prices. 5. Soya bean hay: Feeding values, time of cutting, soya straw, soya in the mixed crop (in mixed cropping plans with sorghum, maize, etc.). 6. Soya beans for soil improvement. 7. By-products of the soya bean: Oil and its uses, notes on experiments in breeding for oil, methods of extraction, soya cake and meal, results of comparative feeding tests. 8. Food products of the soya bean.

This book describes the successful introduction and cultivation of soybeans in England. The Foreword notes (p. v): "In past years no sustained effort has been made to grow the plant on a large scale in England. The Royal Agricultural Society devoted several years to experiment at Woburn, but in 1914 they reported that the plant was quite unsuitable for growth in this country as it required more warmth than could be obtained here. The British Board of Agriculture reported in 1916 that 'the Japanese and Manchurian varieties hitherto tested cannot be relied upon to produce seed in this country."

In the Preface (p. ix) Ms. Bowdidge acknowledges: "That very able and unique work *The Soybean*, by Messrs. Piper and Morse, has been my principal source of information."

"Efforts to introduce the [soy] bean to English agriculture were begun in 1909 and given up in 1914, and except for the work of Mr. J.L. North nothing further has been done" (p. 9).

The section titled "Results of experiments in England" (p. 15-17) states: "One of the first attempts to acclimatize the soya bean in England began in 1914 at the Royal Botanic Gardens, Regents Park, when it was shown by Mr. North that certain varieties could be 'advanced' sufficiently to produce a mature crop towards the end of September. Many years devoted to careful selection of seed from the varieties in his collection had resulted in several early strains. In 1928, a hybrid was received from Canada which, on passing the experimental stage, was planted out on a number of small plots in various parts of the country. It proved to be a very reliable cropper and matured earlier than any of the sixty varieties previously under test. Planted in the first week in May it was harvested at the beginning of September, and reports of good results came from Middlesex, Essex, Berkshire, Oxfordshire, and Hampshire.

"The largest experimental test ever conducted in this country took place in 1933 at Boreham, Essex, when forty-seven different varieties of the soya bean originating from North America, Canada, Manchuria, and Japan were grown

under observation. The selection included four varieties which had been acclimatized by Mr. North. Mr. North was engaged to supervise operations, and 50 lb. of his special seeds was purchased. The results obtained were most interesting."

"There is no doubt at all that the four varieties acclimatized by Mr. North were a great success; two reached maturity on September 1st and two on September 6th. In many cases plants bearing between 300 and 400 seeds were harvested."

"It has been found by Mr. North in the course of more than twenty years' study of the subject, mainly with foreign beans grown in various parts of the country, that no variety of soya bean has any chance of success in England unless it matures in less than 100 days in America. Varieties requiring this length of time in America need nearly a month more in this country and, owing to our colder spring weather, no advantage is gained by earlier sowing. Mr. North's seeds require 124 to 127 days to reach maturity in England but, if grown in America, they would only require 85 to 90 days.

The section on "The 1934 Experiment in Essex" (p. 17-23) notes: "The result of the 1933 experiment was so encouraging that it was determined that a further attempt should be made in 1934 to ascertain whether it would be possible to grow the plant profitably as a field crop and, with this in view, a field of nearly 20 acres was specially prepared for the acclimatized seeds from the 1933 crop."

Joseph Bramah, an English engineer, invented the hydraulic press in 1796, leading to a "great advance in the oil-extraction industry." All "old methods in the western world immediately gave place to the new appliance." More recently the method of solvent extraction has been developed; it is now used throughout the world and removes nearly all the oil from the seeds (p. 69).

"There is plenty of evidence as to the efficiency of soya meal in live-stock feeding, yet it does not appear to be used in this country as widely as its feeding value merits. The prejudice formed when it was first introduced in England as dairy food seems still to exist. It was thought at that time that the use of the meal might affect the taste of milk and butter; but, although this was disproved later, England remains a small user" (p. 72).

Food products of the soya bean (p. 80-83): "It is unfortunate that the inherent conservatism of English people to anything new has been the cause of past failures to popularize soya bean food products for consumption in this country. The bean contains iron, magnesium, calcium, and other mineral salts; phosphorus in the form of lecithin makes it valuable in cases of nervous disorders...

"Soya 'sprouts,' which have been grown and used for centuries in the East, have recently been introduced as a green vegetable. The beans gathered before ripe and prepared in the same manner as green peas are a very satisfactory vegetable and the dried beans, if soaked for forty-eight hours, may be cooked like haricot or butter beans and make a most delicious and nutritious vegetable dish."

There is no doubt that soybean products are gradually becoming established in Western countries. We sometimes eat soybeans without knowing it. "The bean, when properly prepared by roasting, makes an excellent cereal beverage which looks, smells, and tastes like coffee; a sauce, appropriately seasoned with spices, is the so-called 'Worcester Sauce', and soya soups made from the bean taste like beef extract. During the late war, when Germany found herself on the verge of starvation, glutamic acid, produced from the soya bean, was used in German hospitals to form the basis of beef-tea, and it is said that the ground bean also was used at that time for the making of bread. Soya bread, made from properly prepared flour, is obtainable in England and is stated to be of high nutritive value" (p. 81).

Soya flour has long been used in foods for diabetic persons requiring a low starch diet. "The flour contains more protein and fat, and less carbohydrates than ordinary cereal flours, and a certain variety manufactured in England is stated by the proprietors to contain 42 per cent. protein and 20 per cent. fat, having good keeping qualities, 0.13 per cent lecithin phosphoric acid and the vitamins A, B, D, and E. There are many food products on the London market under the names that conceal their soya bean origin. Just before the late war [World War I] an enterprising English firm was making great strides with soya products. Vegetable butter, biscuits, cocoa, milk chocolates and other confectionery, cream, cakes, bread, &c., proved quite a success until a war-time embargo placed upon the importation of soya beans put a stop to the business; the organizers eventually went to America! (p. 82).

The author concludes (p. 83): "The soya bean is by far the most valuable of all known beans and our farmers ought to make a serious effort to grow it. It has already been shown that the acclimatized bean will grow in this country, and if crops can be raised profitably and on a commercial basis, a service will be rendered both to the farmer himself and to the country."

Excellent photos show (see p. xiii): (1) A typical example of the soya bean plant grown at Boreham, County of Essex, in 1933. (2) The soya bean plant in full maturity. (3) Bags of English acclimatized soya beans harvested on Fordson Estates, Boreham, Essex, in 1933. Left to right: Brown 'C,' yellow 'J,' black 'O,' and green 'Jap.' (4) A sturdy specimen of the 'Jap' soya bean plant grown at Boreham, Essex in 1934. (5) The 'J' variety. (6) The 'O' variety (for hay) at the seed stage. (7) Aerial view of the soya bean field as it appeared on 29 Aug. 1934. (8) Soya beans inoculated the previous day being fed into the horse-drawn drill prior to sowing. (9) A man seated on an ordinary horse-drawn grain-drill, planting soya beans in rows wide enough to enable cultivation later on. (10) Six men stooping in a field, planting small quantities of different varieties of soya

beans by hand in 30-inch rows. (11) A man walking beside a horse pulling a cylindrical roller, which helps to give the seeds a better growth and even stand. (12) Harvesting soya beans with a reaper and binder pulled by a tractor. (13) Threshing soya beans in 1934 with a mechanical 'Ruston' Thresher; many beans were split. (14) Loading sacks of soya beans onto an open-bed truck for conveyance to storage barns. (15) The first English rick of soya hay, grown in 1933. (16) Baled and trussed soya bean straw being ricked; a man is shouldering a bale atop the rick with a ladder propped against one side. (17) Heated cakes of crushed soya beans ready for hydraulic pressing at Erith Oil Mills, Ltd. (18) Soya bean cakes, after leaving the press, are passed through a paring machine where the edges are trimmed at Erith Oil Mills. Address: England.

868. Dittes, Frances Linda. 1935. Food for life: The art and science of preparing food. Madison, Tennessee: Associated Lecturers, Inc. xii + 332 p. Spring. Recipe index. 23 cm.
• ***Summary:*** This early Seventh-day Adventist vegetarian cookbook contains more soyfoods recipes that any published up to this time. The author, a soyfoods pioneer born in 1891, first attended Madison College in 1910 and joined the faculty in 1912. She did her graduate work in nutrition, specializing in soyfoods nutrition, at George Peabody College for Teachers (in Nashville, Tennessee), from which she received her MA degree in 1929. This book was printed by the "Rural School Press" (Madison College's school press) and published in the spring of 1935.

Contents: Part I: Food and nutrition. Milk. The acid-base balance. Fruit acids. Balancing the food. Measuring food values. Menu planning. The art and science of food preparation (preceded by this quotation: "Food will be the medicine of the future"–Harvey W. Wiley). Food combinations. Condiments. Suggestions for flavoring. Garnishings. Measurements. Part II: Recipes (listed by recipe type such as breads {some recipes call for Crisco shortening}, soups, salads, desserts, etc.). One chapter titled "Dishes to take the place of flesh foods" (p. 149-65) contains many interesting recipes such as: Preparation of gluten. Gluten pot pie. Gluten loaf. Glutose (with 5 cups ground cooked gluten, plus potatoes, eggs, and cream). Cold sliced Nut Meat or Vigorost (Nut Meat is sold in 2-lb cans, Vigorost in 14 oz cans). Peanut roast. Chow mein (with soy cheese or Nut Meat). Boiled peanuts. Soy-related recipes are given below. Another chapter is "Nutritive value of the soy bean. Soy bean dishes" (p. 166-86).

Appendixes: A. Classification of carbohydrates. B. Canning. C. Sample menus. D. 100 calorie portions of foods. E. Approximate servings and values of a few common foodstuffs. F. Protein, calcium, phosphorus, and iron in 100 calories of food material. G. Ash constituents of foods in percentage of edible portion.

The author uses the term "soy cheese" to refer to tofu. Soy-related recipes include: Soy bread (20% soy flour and 80% white wheat flour; p. 96). Soy gems (18-20 muffins using soy flour; p. 108). Tomato-soy sandwich (with grated soy cheese; p. 114). Soy noodle soup (with grated soy cheese browned in butter; p. 122). Jellied soy salad (with grated soy cheese; p. 138). Potato soy salad (with grated soy cheese; p. 138). Tomato and soy salad (with soy cheese). Waldorf soy cheese salad (with grated soy cheese; p. 139). Lentil-soy loaf (with soy bean puree; p. 157). Savory soy loaf (with soy cheese). Soy souffle (with grated soy cheese browned in butter; p. 159). To fu chi (deep-fried soy cheese stuffed with rice and seasoned with soy sauce). Soy gravy (with 3 parts soy flour and 2 parts white wheat flour).

The chapter titled "Nutritive Value of the Soy Bean" (p. 167-86) discusses the general nutritional composition, then gives details on protein, fats (including lecithin), minerals (including tofu made with magnesium chloride or calcium sulphate). Recipes are given for: Cooked soy beans. Soy milk (after soaking 1 lb of Mammoth variety soy beans overnight in water, "Wash several times in hot water to remove undesirable taste."). Soy milk no. 2. Soy acidophilus milk. Soy bean cheese [tofu, curded with calcium sulphate]. Soy bean cake [okara] loaf. Browned soy cheese. Green soy beans. Escalloped green soy beans. Dried soy beans. Baked soy beans. Soy beans southern style. Roasted soy beans. Soy beans in tomato sauce. Chop suey (with soy cheese). Sauce (with soy sauce). Soy bean omelet. Lentil soy bean loaf (with soy bean puree). Soy bean loaf. Soy bean pie (with soy bean pulp). Soy bean meat.

Note 1. This is the 2nd earliest English-language document seen (June 2013) that calls for okara as an ingredient in a recipe.

Note 2. This is the earliest English-language document seen (June 2013) that uses the term "Soy bean cake" to refer to okara.

* = made with soy bean flour. Soy bean muffins*. Soy muffins*. Soy biscuits*. Soy bread*. Soy nut bread*.

Escalloped onions with soy cheese. Baked rice with soy cheese. Escalloped potatoes with soy cheese. Spaghetti and soy cheese. Stuffed pepper with soy cheese. + = with soy cheese. Left-over croquettes+. Soy croquettes+. Soy cheese with rice. Stuffed baked potato with soy cheese. Soy fritters+. Soy cutlets+. Savory soy loaf+. Spanish chop suey+. Soy souffle (with grated soy cheese browned in butter). Cream of soy soup. Soy noodle soup+. Soy soup+. # = made with soy milk. Soy cream of tomato soup#. Soy cream of pea soup#. Soy cream custard#. Jellied soy salad+. Waldorf cheese salad+. Potato soy salad+. Stuffed egg with soy cheese. Soy bean salad. Soy bean sprout salad. Soy Vegex sandwich+. Tomato-soy sandwich+. Egg and soy sandwich+. Soy and cucumber sandwich+. Celery and soy sandwich+. Banana soy sandwich+. Scrambled egg and soy cheese sandwich. Diabetic crackers (with soy meal). Diabetic pie crust (with soy meal). Diabetic soy bean mush*.

Vegetables: Soy cheese sauce (with grated soy cheese and soy sauce, p. 195). Steamed cucumbers with soy cheese (grated, p. 201). Escalloped onion with soy cheese (p. 204). Spinach with soy cheese sauce (and Vegex, p. 207).

Desserts (p. 215-36), Cakes (p. 237-53), Pies (p. 255-60), Cookies (p. 261-68), and Ice creams and sherbets (p. 269-74). Some of these sweet recipes use agar-agar, gelatin, Malta (malt syrup), Health Koko, and Crisco. Some desserts call for 1-2 cups sugar per 4 servings and 1 pound of sugar is used in an icing for pound cake (p. 242). No soy is used in any sweet recipes. Note: It is surprising that Ms. Dittes and Madison had not discovered the use of tofu or soy milk in ice creams, other desserts, or dressings. Nor is peanut butter mentioned.

The chapter titled "Milk" (p. 17-21) states: "Since milk is an important food constituent, especially for children, those responsible for planning dietaries should see that each child has one quart of clean milk or its equivalent each day; adults, about one pint... *Grade A* is a raw milk from cows free from disease, having a bacteria count of not more than 100,000 per cubic centimeter at the time of delivery. *Grade B* must be pasteurized and the bacteria count must not exceed 1,000,000 per cubic centimeter. It must also come from cows free from disease." All other milk is Grade C.

The chapter titled "The acid base balance" (p. 23-24) states: "Most foods when burned in the body leave an ash in addition to the carbonic acid which is thrown off by the lungs. This ash may be either alkaline, neutral, or acid in reaction. The principal base-forming (alkaline) elements are calcium, potassium, magnesium, and sodium, while the chief acid-forming elements in foods are sulfur, phosphorus, and chlorine... A neutral or slightly alkaline condition will produce a feeling of buoyancy, health, vigor, and clear mental activity... In general, all fruits and vegetables (with a few exceptions) are potent in producing alkaline ash. Meat, eggs, breads, and cereals are acid-formers."

The chapter titled "Condiments" (p. 51-52) states: "Spices, such as mustard, ginger, pepper, horseradish, curry, and cloves, are among the most irritating of the seasonings used. It would be better if these exciting substances were not added to the food... Vinegar contains acetic acid which is burned in the body with difficulty. Citric acid as found in the lemon juice is more easily oxidized in the tissues. Lemon juice, therefore, makes a good substitute for vinegar, both as to ease of oxidation and flavor." Address: Director, Food and Nutrition, Nashville Agricultural Normal Inst., Madison Rural Sanitarium and Hospital, Madison, Tennessee.

869. Gay, H. 1935. La culture et les usages du soja [The cultivation and uses of the soybean]. *Revue de Botanique Appliquee & d'Agriculture Tropicale* 15(165):309-24. May; 15(166):447-53. June. [15 ref. Fre]
• ***Summary:*** Contents: Introduction. Geographical area and climatic requirements. The plant and its varieties: Taxonomy, anatomy, physiology. Soybean cultivation: Place in the crop rotation, preparation of the soil, manure and fertilizer, sowing (the seeds, time of sowing, details of sowing), vegetation and the points of [crop] maintenance / management, harvest (of seeds, of forage), grain storage, yields (of seeds in kg/ha {3,500 in Manchuria, 2,700 in China, 1,700 in France, 1,200 in Japan}, of forage in quintals/ha {in America they range from 163 to 168}), enemies. Note: 1 quintal = 100 kg.

Technology of soya: Soymilk (production, properties, uses), soy cheeses (*Fromages de soja*, called "tofu" in Asia), soy oil and cake, soy flour and products made from it (bread, rusks {*biscottes*}, cakes, and pancakes {*galettes*}). Soya as livestock feed: Soya forage, soya hay, soymilk for calves, soybeans seeds and cake.

Economic data: Hectares planted to soya in 1929-30: Northern China and Manchuria (11,800,000), USA (500,000), Japan and Korea (400,000), Russia (300,000), Sunda or Soenda Isles (100,000 ha);

Note: The *Iles de la Sonde* are the islands of the Malay Archipelago divided into two groups: (1) Greater Sunda Islands, comprising Java, Sumatra, Borneo, Celebes, and adjacent islands; (2) Lesser Sunda Islands, comprising the chain of islands east of Bali to and including Alor and Timor, but not Wetar.

Exports of soya from China in 1929-30 (in tons): To Japan 1,700,000, to Europe 1,500,000, to southern China 600,000, to the Netherlands Indies [Indonesia] 100,000, to other countries 100,000. Address: France.

870. *Hygeia.* 1935. Questions and Answers: Soy bean milk. 13:466. May. [2 ref]
• ***Summary:*** Dr. A.A. Horvath describes how to prepare soy bean milk, and bean curd (tofu).

871. *J. of the American Medical Association.* 1935. Soy bean milk in infant nutrition. 104(23):2098-99. June 8. [8 ref]
• ***Summary:*** This editorial review of the literature describes the work of various people who have made experiments on the use of soybean milk for infants. The pioneer in his field in America was John Ruhräh, who was able to produce improvements in infants with summer diarrheas and certain forms of intestinal disturbances. "Despite this pioneer work, soy bean milk has not until recent years received serious consideration in this country as a definite food for babies."

The editorial finishes by stating: "There appears to be considerable evidence, therefore, to warrant the conclusion that the soy bean is destined to assume a role of importance in infant nutrition."

872. Kennedy, L.W. 1935. The soybean... A new American. *Purdue Agriculturist* (*Indiana*) 29(9):83, 86. June.
• ***Summary:*** "This article was written with the aid of material taken from an undergraduate thesis submitted by E.A. Johnson, '34 [class of 1934]. Products of the soybean are

rapidly becoming more important to agriculture and various manufacturing industries of the nation." Soybean oil meal is an important livestock feed for cattle, hogs, sheep, and poultry. It is also "used extensively in the making of glue, water paints, fertilizer, celluloid substitutes, [plastic] gear shift knobs, etc. Breakfast food, diabetic food, infant food, macaroni, crackers, bean curd, soy sauce, vegetable casein, and meat substitute are popular in the list of foods made from soybean oil meal. The meal possesses a nut-like flavor and lends itself well to be used as human food."

Crude soy bean oil is dark brown in color and has a "beany" odor. It is largely refined to make special oils for use as paints, varnishes, glycerine, enamel, the waterproofing of cloth, fabrics, papers, and sandpapers, the making of oilcloth, shade cloth, rubber substitutes, printers ink, lubricants, hard and soft soaps, insecticides, foundry core oil, and lighting fuels. The food products, salads, edible oils, and lard and butter substitutes are also prepared by a commercial process from soybean oil. In 1930 about 6,000,000 pounds of soybean oil, or one-sixth of the domestic crop, were used in the preparation of edible products.

Note: This is the earliest document seen (Sept. 2001) concerning the use of soybean oil in insecticides or other crop-protecting chemicals (pesticides).

"A new auto body finish from soybean oil is the result of experiments made by the Ford Motor Company of Detroit, Michigan."

Also discusses "the vegetable soybean" which can serve as a supplement to the garden pea or lima bean. "In China vegetable soybeans have long been used as a delicacy on the table. They may be used green, or canned, or made into salads."

"Dried soybeans serve as a good substitute for coffee and peanuts when properly roasted and prepared. The dried beans are also used in preparing soy sauce, boiled beans, baked beans, breakfast food, soaps, and vegetable milk. From the vegetable milk, meat substitutes, infant food, confections, cheese, and fresh, dried, condensed [milk], and fermented bean curd is prepared. Soybean milk has not received serious consideration in this country, but it has been successfully used as a food for growing infants in China." Address: Class of 1936.

873. Lager, Mildred. 1935. Food facts. Los Angeles, California: House of Better Living. 228 + 10 p. No index. 23 cm. [34 ref]

• ***Summary:*** Contents: 1. Purpose of food. 2. Classes of food. 3. Natural foods are best. 4. Acid-alkaline balance. 5. Minerals. 6. Vitamins. 7. Proteins. 8. Carbohydrates. 9. Fats. 10. Fruits. 11. Vegetables. 12. Beverages. 13. Better cooking. 14. Food combinations. 15. The mental side of health. 16. What is the "House of Better Living."

Pages 67-68 contain a very positive section on soy beans and foods made from them, including whole soybeans, "curd cheese, resembling cottage cheese [tofu], and soy bean milk... Other soy food products are soy butter [no description is given; this is probably soynut butter from T.A. Van Gundy's La Sierra Foods, but it could be margarine made from soy oil], soy loaf (combined with gluten), soy sandwich spread, soy bologna, soy oil, soy sauce, soy ready-to-serve breakfast foods, coffee substitute, as well as soy flour. Soy flour is yellow and fluffy, and can be used in all baking... Soy macaroni, noodles, spaghetti, bread, and pancake flour are also on the market. Soy beans are also sugar coated for candy and toasted as peanuts. They are a wonderful food for animals and have been used in that way in this country for years. Today the governments of Europe and America are devoting a great deal of attention to the soy bean as human food and the next few years will see an increased consumption, as well as many new soy products."

Page 75 contains a nutritional analysis of soy beans.

In the chapter on Acid-alkaline balance (p. 22-25), foods with the most acid ash are egg yolk and oysters, followed by eggs, most fish and meats. Foods with the most alkaline ash are lima beans, string beans, dried beans, spinach, raisins, figs, dates, and dried milk, followed by soy beans, soy bean tea, and most vegetables. The author believes that one should keep an alkaline balance in the body. Sleep is a great alkalinizer.

The subsection titled "Lima beans: states: "Dr. Sansum of Santa Barbara was instrumental in having lima bean flour made, and Bill Baker of Ojai, California pioneered this field, developing the original lima bean bread and lima bean pancake flour."

This is not a vegetarian book. Meat and dairy products are discussed at length, and their consumption is not discouraged. However this is the earliest book seen that uses the term "natural foods" prominently–in this case as a chapter title.

Also discusses (see index for page numbers): Acidophilus milk, alfalfa (alfalfa tea has alkaline ash, p. 35), almonds, almond oil, aluminum, avocado, bran, carob beans, chufas, cottonseed, cottonseed oil, garbanzas, kephir, lentils, lima beans, linseed, margarine / oleomargarine, olive oil, olives, palm oil, palm kernel oil, peanuts, peanut oil, rape seed oil, sago, sesame oil.

Note 1. This is the earliest document seen (Sept. 2009) concerning Mildred Lager and soy.

Note 2. This is the 2nd earliest document seen (July 2005) that mentions a food or drink product ("alfalfa tea") made from alfalfa. This is also the earliest English-language document seen (July 2005) that contains the term "alfalfa tea." It was used for its alkaline ash. Address: House of Better Living, 1207 West 6th St., Los Angeles, California. Phone: Mutual 2085.

• ***Summary:*** "Weight building foods" include all whole-grain bread stuffs (incl. gems, muffins, biscuits, etc.), soy beans, soy bean milk, cold-pressed olive oil and peanut oil, almonds, etc. Address: N.D. [Naturopathic Doctor].

875. Morse, W.J. 1935. Soybeans: Ancient and modern uses. *Proceedings of the American Soybean Association* p. 34-35, 37. 15th annual meeting. Held 21-22 Aug. 1935 at Evansville and 23 Aug. at Lafayette, Indiana. [1 ref]
• ***Summary:*** The soybean "was sown yearly with great ceremony by the Emperors of China and poets in the ages before the Christian Era extolled the virtues of the soybean in its services to humanity.

"The soybean was included in the 2nd class of drugs and was regarded as having many medicinal virtues. We learn from a materia medica written about 452 A.D. that the soybean was not poisonous but was a specific remedy for proper functioning of the heart, liver, kidneys, stomach and bowels. It was also used as a remedy for constipation, as a stimulant for the lungs, eradication of poison from the system, improving the complexion by cleaning the skin of various impurities, and stimulating the growth and appearance of the hair. We also find that the fresh or green bean was used as a remedy for the following: Dropsical affections, gastric fever, paralysis, bladder trouble, improper circulation of the blood, catarrh or improper flowing of the fluids of the vital organs, heart, liver, kidneys, stomach and bowels, chills and poisoning from eating aconite. Further, it is learned that when the bean was cooked in a powder or meal-like form, the taste was sweet and good and was a remedy for gastritis, fevers, tumorous swellings, paralysis, inability to digest grain foods, and abdominal dropsy. The yellow soybean was used to increase lung power, make the body plump, and beautify the complexion. The beans were also cooked until they were of an oily consistency, mixed with hog's fat and taken in the form of pills in order to fatten and increase the strength of the body, and as a remedy for hoarseness. The soybean was said to have a cooling effect on the human system. If the beans were boiled into a liquid form and eaten, they eradicated all poison from the system and cured gastric fever, paralysis, pains, and bladder troubles. Bean or soy sauce was considered an antidote for poison caused by eating fish, fresh meat, vegetables, mushrooms, etc. It was also said to cure poison from bites of worms, insects, and bee stings. The yellow, green, and white varieties were regarded as valuable foods for the use of mankind. The black beans were used for food and it was also customary when taking a long journey to feed the horse black beans in order to make it strong. In addition to the use of the beans, many references are made on value of bean sauce, bean milk, bean curd, and bean sprouts for various diseases and other bodily ailments. The stems and leaves of the young bean plants were boiled and eaten by the farming people. No mention is found of the use of bean oil so it is concluded the crushing of beans for oil occurred at a much later date.

"In reviewing the old records, it is most interesting to find that many of the ways in which the ancient Chinese used the soybean as a remedy for human ills are now being found applicable to the same ailments by scientific research in America and Europe." Address: Bureau of Plant Industry, USDA, Washington, DC.

876. *Detroit News.* 1935. 'Milk' obtained from soy beans. Sept. 3. p. 20, col. 8.
• ***Summary:*** Mrs. William Bradshaw of Columbus, Ohio, has concocted a liquid resembling milk from soy beans for use in the two Presbyterian hospitals directed by her husband in the city of Lin Chow, 300 miles north of Canton. She developed the process (which is described) while doing research in dietetics. This liquid looks like milk and compares favorably with it in food values. "Although the patients look on it as medicine, they like the drink."

877. Powers, Grover F. 1935. Infant feeding: Historical background and modern practice. *J. of the American Medical Association* 105(10):753-61. Sept. 7. [22 ref]
• ***Summary:*** Contents: Introduction. Historical summary: Early history, chemical studies, pathologic studies, metabolism studies, clinical studies, vitamin studies and the concept of food deficiencies. The formulation of the infant's diet in modern practice: Energy, protein, carbohydrates, vitamins, water, salts. Rules for devising formulas. Infant mortality (breast fed babies have the lowest mortality rate). Psychological era. Conclusion. Address: Dep. of Pediatrics, Yale Univ. School of Medicine, New Haven, Connecticut.

878. Kellogg, John Harvey. 1935. Re: Growing soy beans. Making condensed soy bean milk and soy acidophilus milk. Letter to Mr. William J. Morse, Bureau of Plant Industry, USDA, Washington, DC, Sept. 16. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** "Thank you for your letter of September 5. I am expecting to have 75 or 80 bushels of soy bean seed of the 78-day variety. I shall be glad to know if there will be any demand for this seed and at what price.

"You may be interested to know that our company is making a condensed soy bean milk which may be used either as it comes from the can or with the addition of one or two equal volumes of water according to the degree of richness desired. If you care to have me do so, I will be glad to have sent you a sample for your criticism and also a sample of our soy acidophilus which we are using extensively and with great profit."

879. Gandhi, M.K. 1935. Soya beans. *Harijan* 3(33):263-64.

Sept. 28. [1 ref]
• ***Summary:*** "As soya beans are claimed to possess high nutritive value, I reproduce the following from pamphlet No. 7 published by the Bombay Presidency Baby and Health Week Association to enable the food reformer to make experiments."

Much of the pamphlet is published. It discusses: The introduction of the soybean to Europe by Kaempfer in 1712 and by Haberlandt from 1873. Soybean botany, regions of adaptation, and nutritional composition and value. Utilization of soybeans in diabetic diets and for the production of soya bean coffee, soya bean milk, and soya bean flour. For details see Bombay Presidency... 1935.

Note: The author is Mohandas Karamchand "Mahatma" Gandhi. This is the earliest publication seen in which Gandhi discussed soya beans or attempted to introduce soya beans to India. Address: Maganwadi, India.

880. Bombay Presidency Baby and Health Week Association. 1935. Pamphlet No. 7. Bombay, India. *
• ***Summary:*** Discusses the introduction of the soybean to Europe by Kaempfer in 1712 and by Haberlandt from 1873. Soybean botany, regions of adaptation, and nutritional composition and value. Utilization of soybeans in diabetic diets, as whole dry soya beans, and for the production of soya bean coffee, soya bean milk, soya bean flour, and tofu.

"The soya bean is one of the most important articles of diet. It contains far more protein than any grain or pulse seed known so far. It has as much as 40 per cent. protein, i.e. twice as much as pulses and beans, three times as much as wheat, and five times as much as rice. Its proteins are of high biological value, as they contain all the important amino-acids... In fact, the protein of soya bean is similar to that found in cow's milk and animal foods... It is a boon to vegetarians, as its protein resembles animal protein. Soya bean oil contains a large amount of Lecithin and Vitamin A & D, and in this respect it resembles butter. Lecithin of soya bean is identical with that of yolk of eggs.

"Soya bean is one of the few seeds containing three Vitamins A, B & D, which are indispensable in a staple food consumed by mankind."

Note: Mohandas K. (Mahatma) Gandhi reproduced this pamphlet in the 28 September 1935 issue of his popular periodical *Harijan.* Address: Bombay, India.

881. Dokras, M.R. 1935. Soya beans. *Allahabad Farmer* 9(5):226-30. Sept. [Eng]
• ***Summary:*** The author began to cultivate the soya-bean in 1931 in Berar. His unmanured field yielded 350 lb/acre while his manured field yielded 800 lb/acre. Address: Chandur, Berar.

882. La Sierra Industries. 1935. Soy bean products, "La Sierra Brand": Complete protein, low starch, high alkaline ash (Ad). *Health* (*Mountain View, California*) 2(9):31. Sept.
• ***Summary:*** Ad for canned soybeans (plain with tomato sauce), soy loaf, soy spread, soy bologna, soy breakfast food, soy milk, soy cheese [tofu], soy butter [like a soynut butter, non-hydrogenated], Soy-Co (beverage), Smoein (flavor), soy flour (raw), soy flour (processed).

Note: Neither Mamenoka, noodles, nor oil are mentioned. Address: Box 203, Arlington, California.

883. Marlatt, Abby L. 1935. Soybean dishes: New & old. *Wisconsin Agricultural College, Extension Service, Special Circular* 7 p. Sept. Revised Feb. 1937. [1 ref]
• ***Summary:*** Contents: Introduction. Supplies satisfactory proteins. Soybean flour useful. Soybeans good sources of vitamins. Dry soybeans: Black soybean soup, Cream soybean soup, Dry green soybeans, Yellow soybean souffle, Baked soybeans, Soybean loaf. Green soybeans [green vegetable soybeans]: Green soybean salad, Soybean perfection salad, Canned green soybeans. Soybean meal: Muffins (dry mixture), Yeast bread–soya flour, Yeast bread (2 loaves). Soybeans in place of wheat and wheat products: Soybean and buckwheat muffins, Soybean and corn meal muffins, Corn meal, rice and soybean muffins, Soybean and barley muffins, Spoon bread, Soya flour sponge cake, Muffins for diabetics (wheat free), Salmon loaf (wheat free with soybean flour), salmon croquettes, pie crust.

"Within the last two years the green soybean has been grown in Wisconsin and found to be most palatable and especially attractive in its clear emerald green color. The bean grows in long pods from which it is shelled after the whole pod is kept five minutes in boiling water. Then the bean comes out easily when the pod is pressed. These beans cook in from 10 to 15 minutes in boiling water and require only salt and butter or salt and cream–being served as you serve the small lima beans or the French haricot bean." Address: Wisconsin.

884. R.A.L. 1935. Les produits dérivés du soja [Products derived from soybeans]. *Bulletin des Matieres Grasses* (*Paris*) 19(9):232-40. Sept. (Institut Colonial de Marseille). Summarized in Bulletin Economique de l'Indochine (Hanoi) 38:830. [4 ref. Fre]
• ***Summary:*** This is a excerpt from an article said to be published in the *Revue des Produits Chimiques.* However, after a long search, we cannot find the original. So here is the contents of this excerpt:

Uses of soya. Soymilk. Soy caseine (*La Caséine de soja*), defatted soybean oil cakes (*les torteaux deshuilés*), vegetable caseine (*caséine végétale*) as made in Vietnam. Industrial, food and feed applications of the soybean and the products derived from it (*... des produits dérives*)*:* Shoyu or soy sauce, green vegetable soybeans, soy flour (free of starch, which is good for in diabetic diets), use as an incomparable forage plant, soymilk for humans

or young animals (it is free of tuberculosis bacteria), powdered soymilk, a type of cheese called tofu (which can be fermented, dried, salted, or smoked), soy oil (for food or industrial uses–such as paints, varnish, lubricants, printing inks, candles, and oilcloth), hydrogenated soy oil, soybean cakes (which make excellent animal feed). Address: Ingénieur chimiste ICMp, Licencié ès Sciences, France.

885. Desai, Mahadev. 1935. Dietetic experiments. *Harijan* 3(36):281, 283. Oct. 19. [1 ref]

• ***Summary:*** "The reader must have seen the difficulty of procuring clean, wholesome, unadulterated ghee... It was partly with a view to getting rid of this eternal problem of getting good ghee that Gandhiji has been casting about for a substitute of milk and ghee. The high protein and fat content of soya beans and their procurability on the premises, combined with the successful experiment of Sjt. Narhar Bhave, encouraged Gandhiji to start the experiment in Maganwadi last week. Oil and ghee and part of the wheat ration was cut out of the dietary of those who joined the experiment and substituted by a soya bean ration equal in dietetic value. It is difficult yet to say anything about the results of the experiments, but one might safely say that it is no longer the bugbear that it once used to be because of the unpleasant taste of soya bean milk. We soak the beans for a few hours and steam-cook them and serve them whole... Let the reader also know that we have grown soya beans on our own ground plenty enough for our experiments."

Also summarizes an article on soybeans from the *Far Eastern Survey* of Sept. 11. discussing the current rapid growth of soybeans in the USA, used for industrial products (paints, soaps, linoleum, etc.). "An impressive number of foods–flour and flour products, candy, milks, oils, meat, and margarine–in which it is used suggests a steady increase in its dietary use because of its high protein, fat, and vitamin contents."

Note: The introduction to the 1973 edition of *Harijan: The Journal of Applied Gandhiism, 1933-1955* states: "*Harijan* made more news than it reported. Its inception in 1933, the impact of its suspension in 1940, the drama of its complete suppression in 1942, and its resumption of publication in 1946 were events of historical moment."

"*Harijan* was not a party organ, yet it became the most influential journal involved in the movement for Indian independence... The journal provided the medium of moral instruction through which congressmen learned what Gandhi expected of them."

"The word *harijan* literally means God's people. It was the name coined by Gandhi to designate the so-called untouchables of India. The journal *Harijan* reflects the many social and individual concerns which were a part of Gandhi's complex and continuing analysis of the human predicament. *Harijan* is indeed a highly political journal, and that is so because Gandhi directly related the concerns expressed throughout its pages to the political fact that the India which gave rise to the founding of *Harijan* was a subject nation. Freedom as Gandhi perceived and publicly pursued it, begins with the individual."

"Mahadev Desai, whose initials, M.D., appear after so many columns in *Harijan*, has been described as more than a mere Boswell and not only a faithful chronicler of Gandhi's life and work. He was a peerless interpreter of Gandhi, gifted with a keen sense of humor and a penetrating intellect. Following his death (on August 15, 1942) Pyarelal took his place at Gandhi's side to continue the distinguished tradition which 'M.D.' had established." Address: India.

886. Gandhi, M.K. 1935. Soya beans. *Harijan* 3(36):287. Oct. 19.

• ***Summary:*** "It has been found that soya beans can be cooked whole and eaten like any other beans. Shri Narhar Bhave of Baroda, who has given his three gifted and gentle sons, Vinoba, Balkrishna and Shivaji to national service, is himself a careful observer, 61 years old. He is living almost wholly on milk and 6 ounces of soya beans and is keeping perfect health and strength. He is of the opinion that soya beans help him to avoid constipation which milk alone or milk taken in combination with cereals and vegetables could not do. Soya beans have in his opinion helped him also to avoid flatulence which other pulses or milk produced. He has come to this conclusion after an unbroken experience of over ten months. I may add that Shri Bhave used to suffer from gout and corpulence and had a trace of diabetes. He got rid of this triple disability by mere careful dieting. In imitation of Shri Bhave the inmates of Maganwadi including me have been trying soya beans for the last few days... Put these beans in boiling water and cook for fifteen minutes on a quick fire. No salt or soda to be added while cooking. Salt may be added after. At Maganwadi we steam them for two hours.

"Let those who are interested in food reform from the poor man's point of view, try the experiment. It should be remembered that soya beans are a most nutritious diet. It stands at the top of all known articles of diet because of its low percentage of carbohydrates and high percentage of salts, protein, and fat. Its energy value is 2,100 calories per lb. against 1,750 of wheat and 1,530 of gram. It contains 40 per cent of protein and 20.3 per cent of fat against 19 and 4.3 respectively of gram and 14.8 and 10.5 of eggs. Therefore no one should take soya beans in addition to the usual protein and fatty foods. The quantity, therefore, of wheat and ghee should be reduced and dal omitted altogether, soya beans being themselves a highly nutritious dal. We are just now trying the Manchurian variety. The Baroda beans we have not tried. Maganwadi has its own crop of soya beans. I hope to report the quality of Indian varieties from a layman's point of view as they come under my observation. Those who have Indian varieties are requested to send me samples with

prices." Address: Maganwadi, India.

887. Associated Press (AP). 1935. Drink soya bean milk. *Detroit News.* Nov. 3. Section 1. p. 2, col. 6.
• ***Summary:*** "Singapore. Nov. 2. Asiatic families in Malaya, too poor to buy natural or tinned milk, have invented a palatable beverage made by grinding soya beans to a fine powder and mixing it with sugar and eggs."

888. *Agriculture et Elevage au Congo Belge.* 1935. Le lait de soja [Soymilk]. 9(11):170-71. Nov. [1 ref. Fre]
• ***Summary:*** Gives the conclusions obtained in a study of soybean milk by Dr. Lucie Yeu, who set out to find if it were suitable in infant feeding. She conducted her research at the Centre d'Hygiène infantile Paul-Marquet [in Neuilly, near Paris], under the direction of Mr. Marcel Maillet.

Dr. Yeu concluded the following: Soymilk has been used for a long time as a food in the manufacture of tofu or "vegetable cheeses" (*fromages végétaux*). It has been studied in France since 1880, but its application in infant dietetics has only begun very recently. This "vegetable milk" (*lait végétal*) approaches animal milks on the whole in its physical properties and its qualitative composition. For example, in comparison with cow's milk, it has a lower content of fats, sugars, and calcium. It contains no chlorine or sodium. So when administering it to infants, some corrections must be made in its composition. Soymilk was generally well accepted and well tolerated by the 100 infants that she studied. To assure satisfactory growth as often as possible, it is sufficient to add normal nutrients or dyspeptics, but after a relatively short time, the infant has more difficulty accepting it and the weight graph becomes irregular. And in an important number of cases, the soymilk causes erythema of the buttocks to such an extent that its use must be discontinued. Erythema is abnormal redness of the skin due to capillary congestion. Soymilk, in the way it has been used by Dr. Yeu, cannot replace cow's milk in raising normal infants. In the case of dyspeptic infants, digestive problems are often improved but not in any consistent way. Soymilk works best with infants who are intolerant to cow's milk or have rank / fetid dyspepsia (with an offensive smell).

889. *Priroda i Nauka* (*Nature and Science, Bulgaria*). 1935. Izlojbata na soia [Soya exposition. Editor's note]. 6(3):46. Nov. [Bul]*
• ***Summary:*** Editor's note states: "The pioneer in popularizing soya in Bulgaria is Dr. A. Zlatarov, who has been trying for many years to publicize the importance of soya. Now he is able to see the fruits of his work."

Rosen L. Paskalev (1986) adds that this soya exposition, organized in Oct. 1935, was supported by the Bulgarian Agricultural Bank, which was very interested in supporting soybean production and utilization. It had been proved in 1933 that soybean culture would be very profitable for export but its use as food was not widespread in Bulgaria. For this reason foods such as soy flour, biscuits, bread, cheese, and soymilk, and some industrial products, were displayed at the exposition. A soyfoods kitchen was organized at the expo and soyfoods were served at a special vegetarian restaurant throughout the exposition. Soy oil was even demonstrated as a fuel for a diesel engine. Address: Bulgaria.

890. Reid, Eric. 1935. The calcium, phosphorus, and nitrogen retention of rats on soybean-egg powder and whole milk powder diets. *Chinese J. of Physiology* 9(4):307-14. Nov. [8 ref. Eng; chi]
• ***Summary:*** This soybean-egg powder helps to prevent rickets. It promotes calcium and phosphorus retention equal that of whole milk powder; nitrogen retention and digestibility are greater than that of whole milk powder. Address: Henry Lester Inst. of Medical Research, Shanghai.

891. Kellogg, John Harvey. 1935. Re: Growing and canning shell soy beans. Making condensed soy milk and soy acidophilus milk. Letter to Mr. William J. Morse, Bureau of Plant Industry, USDA, Washington, DC, Dec. 9. 3 p. Typed, without signature (carbon copy).
• ***Summary:*** "We have been doing some experimenting this year with growing and canning shell soy beans. I am having a couple of cans sent you so you can see what our product is like. We think it is very fine. The few thousand cans we put up went off like hot cakes.

"We are thinking of doing rather extensive planting this year. We shall not have any seed to sell but may need to buy some more seed.

"Here are some points on which I should like information: 1. Do you know of anyone in this country who is putting up shell soy beans? 2. Are shell soy beans canned in Japan and China, and if so can they be purchased there and brought to this country?..."

"I should also be glad to know if you have other varieties of shell beans of good quality with a growing period of about the same length.

"I am also having sent to you samples of our condensed soy milk. Diluted with two or three times its volume of water, it is, I think you will agree, a very palatable product. We supply this to people who are interested in soy acidophilus milk and willing to take the trouble to make it at home. We supply them with the culture. They simply put the condensed milk into a clean fruit jar, add hot water, let it cool to body temperature and then add the culture and wrap it up in a blanket and set it on the kitchen table and the next day the buttermilk is ready.

"Soy milk produces a much more vigorous growth of the bacillus acidophilus than does cow's milk. The organism is more than twice as large and it grows twice as fast and does not require the long training, 25 to 30 transfers, required when cow's milk is used for the culture medium. In other

words, the bacillus acidophilus seems to like vegetable products for a culture medium better than animal.

"I shall be glad to know how you like the milk. If you would like to try making it at home, I will have some more cans and cultures sent to you. The process is so simple any housewife can do it. Slight contamination occurs, of course, but by using a large inoculum this does not matter for the first culture; but a fresh pure culture has to be used every time. If an attempt is made to make a culture from a home made culture it will be likely to fail because of the contamination likely to occur.

"Thanking you in advance for any information you may be able to give me, I remain, dear Sir, Very sincerely yours,

"P.S. Soy acidophilus milk has become so popular at my institution here that dairy milk rarely appears on the table. Everybody likes the soy milk better, and of course when people have been properly informed they want the soy acidophilus milk to change their flora and to get rid of intestinal putrefaction and to encourage bowel action. The effect of the soy acidophilus milk in this particular is very remarkable. In cases of very chronic constipation I have observed complete recovery with two or three normal bowel actions daily.

"The Canadian quintuplets are taking soy acidophilus milk at every feeding and have been doing so since last September when they had an attack of bowel trouble which disappeared as soon as they began taking the soy acidophilus milk which I sent them and have supplied to them ever since.

"I am accumulating evidence to the effect that the soy bean encourages the growth of the protective organisms in the human intestine to a very pronounced degree and by producing acids not only prevents putrefaction but encourages bowel action.

"I think every effort possible ought to be made to spread information among the people respecting the value of the soy bean, which I am sure is some time destined to become one of the most important staple foods in this country as well as in China and Japan.

"Here is another question: One of the difficulties in the way of the soy shell bean business is the expense of picking from the vines and shelling the pods. Do you know of any machinery that is used for either of these purposes?"

Note 1. This is the earliest English-language document seen (June 2009) that uses the term "shell soy beans" to refer to shelled green vegetable soybeans.

Note 2. This is the earliest document seen (June 2009) that mentions machinery or equipment for picking / harvesting or shelling green soybeans in the pods. However it only asks a question about this machinery.

892. *Harijan.* 1935. More about soya beans. 3(46):366-68. Dec. 28. [1 ref]

• ***Summary:*** Mahadev Desai introduces the article by stating, "A friend who is now in America has brought together the following article information about soya beans collected by him from books and various institutions." Much of the information apparently came from the Bureau of Home Economics, Washington, DC. Under the subtitle "Soybean and soybean products for table use," it discusses the nutritional composition of soybeans, green soybeans and their varieties (including Hahto and Easy Cook [Easycook], with 3 recipes including ones for salted soya beans [soy nuts], and whole dry soya beans used in soup), soybean sprouts, soybean flour, soya bean sauce, soya bean milk, and soya bean cheese (to fu). Details of how each food is prepared are also given. Continued in Harijan on 4 Jan. 1936. Address: India.

893. Akker, W. van den. 1935. Kedeleemelk voor Kindervoeding [Soy milk for infant feeding]. *Bull. Hyg. Org. DVG* 21:1. [Dut]*

• ***Summary:*** This is the earliest Dutch-language document seen (Aug. 2013) that uses the term *kedeleemelk* to refer to soymilk.

894. Novotel'nov, N.V. 1935. [Use of soybeans in confectionery. III. Soybean enzymes and their activity]. *Trudy Nauchno-Issledovatel'skogo Instituta Pishchevoi Promyshlennosti* (*Proceedings of the Institute for Scientific Research in the Food Industry, Leningrad*) 2(2):34-40. (Chem. Abst. 30:5674). [Rus]*

• ***Summary:*** Soybean milk must be pasteurized at 80ºC for 15 minutes to inactivate its oxidase, protease and urease enzymes. Tests did not reveal the presence of any lipase. At the usual acidity, soymilk may be kept for several days, but not longer because of bacterial spoilage.

895. Voskresenskii, V.M.; Dobruinina, T.K. 1935. [Uses of soybeans in confectionery. I. Soybean milk. II. Soy cream]. *Trudy Nauchno-Issledovatel'skogo Instituta Pishchevoi Promyshlennosti* (*Proceedings of the Institute for Scientific Research in the Food Industry, Leningrad*) 2(2):23-34. (Chem. Abst. 30:5673-74). [Rus]*

• ***Summary:*** To make soybean milk, soak soybeans for 2 hours then emulsify them thoroughly. Longer soaking gives an emulsion which is less stable but which has a higher fat content. Either whole or dehulled soybeans may be used; after soaking, grind them thoroughly and homogenize them in water for at least 1 hour, then add water and emulsify for at least 30 minutes. Pasteurize at 80ºC for 15 minutes.

For soybean cream (p. 31-34) reduce the water content of the emulsion or add cream to the soymilk. The fat content may increase by over 80%, e.g. 2.4% in the milk and 4.5% in the cream. The odorous principle in the soybeans is soluble in water and Et_2O, volatilized by steam, and reduces

Fehling's solution. The nitrogen content of soybean cream is uncertain, and is probably affected by the composition of the soybeans. Address: Leningrad, USSR.

896. Burkill, I.H. 1935. A dictionary of the economic products of the Malay Peninsula. 2 vols. Published for the Malay Government by Crown Agents, London. 2,400 p. See p. 1080-86.

• ***Summary:*** These two densely-written volumes might be described as updates to the works of Sir George Watt. In the Malay peninsula, the soy bean is generally known as *Kachang bulu rimau* or *Kachang jepun* [the Japan bean]. In Java it is called *Kachang kedele, Dele, Gadele, Dekeman,* or *Dekenan;* in Sundanese, *Kachang bulu, Kachang jepun,* or *Kedele;* in Sumatra, *Kachang rimau* or *Kachang ramang;* and in Siam, *Tua luang* or *Tua praluang* [accents are included by Burkill].

"The word 'soy' came from a Japanese name for this plant, through the Dutch, who made it [the word 'soy'] known to Europeans. The first account was a result of the residence of their embassy surgeon, Kaempfer, in Japan, in 1691 and 1692; the second of the long service of their merchant, his contemporary, Rumpf, in Amboina."

The soy bean "is frequently cultivated in Siam, and seems to be a familiar plant in Kelantan [a state of Malaysia bounded on the north by Thailand]. Repeated experiments have been made with it elsewhere in Malaya; the Chinese, indeed, continually make them, usually without success, their failure being conspicuous when any available seed is used, instead of seed of races known to stand more or less tropical conditions. In 1918 advantage was taken of experiments in the Philippine Islands, to try, in Singapore, races which succeeded there and grew well. Races from the warmer parts of the United States were on trial in Selangor [Malaysia] in 1922. In 1924 a Chinese race was successfully grown by settlers in villages in the southern parts of Pahang [a state of Malaysia, bounded on the north by Kelantan and Trengganu].

"The soy bean has long been cultivated in Java, and in recent times this cultivation has become almost universal except at the western end of the island, where the climate is most uniformly humid. Probably it came to Java from India, for the name by which it is most known is Tamil and the seed is flattened as are North Indian races, while the Manchurian races have round seeds."

Note: Roxburgh (1832), in discussing the earliest known date for cultivation of soybeans in India states: "Reared in the Honourable Company's Botanic garden [across the Hooghly / Hugli River from Calcutta] from seeds received from the Moluccas [in today's Indonesia] in 1798.

"In Java a soy crop immediately follows rice, and this was the rotation apparently which Spring found the Chinese to use in Pahang."

The seed of the soy bean is rich source of nutrients. It "replaces meat very largely among the Chinese; and as rations for Japanese troops has played a large part." Because the ripe seed contains little or no starch, it is widely used in diabetic diets. "A kind of artificial milk can be made from the seed, and is in common use in Japan and China... This milk has only three-quarters of the full nutritive value of cow's milk." Soy-bean coffee, made from roasted soy beans, "is sold regularly in Japan, and into the coffee can be put soy-bean milk. The Chinese germinate the beans and eat the seedlings.

Legumin, or vegetable casein is best made commercially from defatted soy beans. The casein is precipitated from the milky fluid [soy-bean milk] by calcium sulphate. "The liquor is strained through muslin, and the precipitate treated with soda lye, which dissolves the casein; filtering gets rid of the impurities and acetic acid precipitates the casein from the filtrate in a more or less pure state. This casein is fit for use in all the industrial processes for which casein from cow's milk is used."

Soy beans can also be fermented to make témpé or "flavourings used in small quantities to make uninteresting dishes appetizing... Témpé is a food product made in Java from soy beans. It occupies a very important place in the diets of those who live in central and east Java." Detailed descriptions are given of two methods of preparation. (1) Initially, the seeds are parboiled then left soaking in water for 2-3 days. The "mush" [sic, cooked beans] is spread upon frames in flat cakes and inoculated with the fungus *Aspergillus oryzae* by the addition of some of the previous preparation. The cakes are wrapped in banana leaves; (2) This method requires greater care and time. "Meanwhile, a preparation of the fungus has been made in a somewhat elaborate manner, as follows: a portion of an older preparation is wrapped in a rather young teak leaf freely punctured with holes; this preparation is allowed to dry for two days, during which the fungus spreads to the teak leaf. Next, the soy-kernel mush [sic, the cooked soybeans] being ready, the teak leaf is emptied of its contents and sprinkled over the mush in order to convey the fungus. The mush is now put up in packets in banana leaves, heaped together, and covered up for twenty-four hours, after which it is exposed again to the air and cooled; the packets are then ready for sale." Note: This is the second English-language work to contain information about tempeh.

"The Chinese, throughout their own country and those domiciled in Malaysia, make a yet greater variety of preparations. Chief among these is teou-fu [tofu, usually precipitated with imported calcium sulphate]. "The 'teo-fu' does not keep well in a moist state, but can be treated for preservation. First, the cakes are colored yellow by a solution of turmeric or Gardenia flowers, then they are wrapped in cotton cloth and submitted to pressure. Thus made drier, they keep better. The use of this preparation is spreading."

The Chinese also make tao-cho and soy kechap (each fermented with an *Aspergillus* mould). K. Heyne describes

how kechap is made in Java using black soy beans, hibiscus leaves, and *Aspergillus oryzae* mold. Finally the sauce is boiled with Arenga sugar, star anise, and other flavourings until the solution is so thick that the salt begins to crystallize.

Large amounts of soy-bean oil ("kachang oil" [perhaps soy sauce]) are imported to Malaya. "In the East [East Asia] it is used chiefly as food, but has other uses such as lubricating, varnish-making, making printer's inks, waterproof goods (Chinese umbrellas and lamps) and also for illumination. A process was patented 20 years ago for making artificial rubber, starting with soy oil. Note: Burkill was a British authority on the flora of southern and southeastern Asia.

"Criminal use: The hairs on the pods seem to be capable of causing a certain amount of irritation within the digestive tract. Gimlette (Malay Poisons, ed. of 1929 p. 169) records a case of administration of them with food in a criminal attempt to poison. He calls them a substitute for bamboo hairs in such circumstances.

"Joss-sticks: Ash of the stem, mixed with resin of *Canarium*, is said to make joss-sticks in Indo-China (Crevost and Lemarié, Cat. Prod. Indochine, 1917 p. 106)."

897. Crespí, Luis. 1935. La soja y su cultivo [The soybean and its cultivation]. Spain. 32 p. Series: Catechisms for Farmers and Cattlemen/Stock-Farmers (*Catechismos del Agricultor y del Ganadero*). 17 cm. [Spa]

• ***Summary:*** Contents: I: Cultivation of the soybean (*la soja;* p. 3-18): 1. Description of the plant. 2. Origin of the soybean. 3. Varieties of soybeans (*Variedades de sojas*): Early maturing, semi-late, late. 4. Needs of the soybean: In water, in soil, in fertilizer. Fixation of nitrogen from the air in soybeans. 6. Place in the rotation. 7. Preparatory work. 8. Planting: Carrying out the sowing, the necessary seeds, depth of planting. 9. The seeds sprout. 10. Cultural care. 11. Maturity. 12. Diseases (*enfermedades*). 13. Harvest: As a forage plant, as a producer of seeds. 14. Yield.

II: Applications of the soybean (p. 19-28). 1. Composition of the plant: Composition of soybean forage, composition of the seeds, composition of the straw (*la paja*). 2. The soybean in the feeding of animals: As a forage plant, as a plant that produces seeds, soybean cakes (*tortas de soja*), soybean straw. 3. The soybean as a human food. 4. Industrial products from the soybean (from the oil: paints and varnishes, soap). 5. The soybean as a fertilizer.

III: Geographic distribution: 1. Worldwide cultivation of the soybean. 2. The soybean in Spain.

The soybean as a human food (p. 27): The seed is rich in protein. Whole soybeans (*Semillas de soja*) can be used like French beans and peas, mature and dry, and toasted like peanuts. The first two leaves of very small soybean plants (*Plantitas de soja*) can be used in salads or cooked. Soy flour can be used in bread, pastries, biscuits, or diabetic diets. Condiments, widely used in China and Japan, include natto, miso, tou-chiang, and shoyu. One can make soymilk (*leche de soya*), and use it to make soy cheeses (*quesos de soja*). The seeds of certain varieties can be roasted to make substitutes for cocoa or coffee.

Soybean cultivation worldwide (p. 29-30): In France, starting in 1880, the house of Vilmorin, started selling the variety Etampes. Also in 1880, the soybean was cultivated in Portugal in the Botanical Garden at Coimbra (in west central Portugal).

"The soybean in Spain (p. 30): Thirty five years ago [i.e. in 1900] my father tried cultivating soybeans in Pontevedra. [Note: Pontevedra is a province and city in the northeast corner of Spain, just north of Portugal, on the coast of the Atlantic Ocean. The city is near the mouth of the Ria de Pontevedra, at about 42.4º north latitude]. For two consecutive years, and using seeds of the variety Etampes from the House of Vilmorin seedsmen, he obtained identical results: excellent vegetation, but a small yield of seeds because the plants failed to fully mature.

"More than thirty years ago [i.e. before 1905], the count of San Bernardo tried growing the soybean, with excellent results, on his estate "El Alamillo," at Ecija (near Seville).

"In 1910 the soybean was cultivated by Mr. Noriega in Jerez (near Cádiz {Cadiz}), and the results obtained seem to indicate that the harvest was of medium size due to the poor condition of the seeds; but the plant responded brilliantly, showing healthy growth and resistance to the drought.

"In 1917 the ambassador of Spain stationed in Shanghai forwarded to the Commercial Information Center of the Spanish Secretary of State three varieties of soybean seeds: small black, yellow, and green. These seeds were very probably used in cultural trials, even though we do not know the results that were obtained. In the same year Mr. Juan Abril reported in the periodical *Revista Ibérica* [*Iberian Review*] of his successful soybean trials conducted in Tortosa (in Tarragona province [in northeastern Spain]).

"Finally, during the years 1914 and 1915, Mr. Santiago F. Valderrama, the brigadier general from Artillería [Artelleria], conducted soybean cultural trials in Montilla (in Córdoba / Cordova province).

"To his cultivation and enthusiastic encouragement of the cultivation of this plant in Spain, we owe the photograph on the cover of this little instruction book. It shows the top of a mature soybean plant grown by him in Montilla. Two more generations of soybean plants were cultivated in the same locality."

Illustrations (line drawings) show: (1) Leaves of the soybean and the common bean (*judía = Phaseolus vulgaris*) (p. 4). (2) Flowers of the soybean and the common bean. (3) A soybean stem, with 3 leaves and 2 pods; an opened soybean pod showing 3 seeds (p. 5). (4) An uprooted soybean plant, showing nodules on the roots, and abundant pods (p. 12). (5) Comparison of two soybean plants, with and without nodules. The one with nodules is larger and has

many more and larger pods (p. 13).

Note: This is the earliest document seen (Feb. 2001) concerning soybeans in Portugal, or the cultivation of soybeans in Portugal. This document contains the earliest date seen for soybeans in Portugal, or the cultivation of soybeans in Portugal (1880 at the botanical garden in Coimbra). The source of these soybeans is unknown. Address: Catedratico de Agricultura de Instituto-Escuela, Spain.

898. Kloss, Jethro. 1935. Back to Eden. Takoma Park, DC: Published by the author. 189 p. Mimeographed. 28 cm. Staple-bound (not saddle stitched).

• ***Summary:*** This treasury of herbal lore and vegan cookbook (it uses no dairy products or eggs, replacing them with soy products) is one of the most creative and original sources of early soyfoods recipes, and one of the two earliest Seventh-day Adventist cookbook to contain many soyfood recipes (see also Frances L. Dittes' *Food for Life* published in the spring of 1935). The predecessor to the popular published edition of Back to Eden, it has a dark imitation leather cover and contains many Biblical passages. This book has no title page, copyright page, publication date, or table of contents. The first page (verso) states: "Send orders for 'Back to Eden' to the author, Jethro Kloss, Takoma Park, Washington, D.C., U.S.A., when you cannot secure it from dealers in your locality. Special Notice: This book is now being revised. Some things may be eliminated, and many new things added. I have a regular experimenting outfit, and I am experimenting all of the time. No doubt there will be many new recipes made from soy beans in the Revised book... This Revised edition will be printed in Regular Book Form. Just as this book is being closed up, another most excellent article has been perfected, a Soybean, Whole Wheat Noodle. Send all orders for this product to The Royal Cookie Co., Takoma Park, Washington, D.C... This book is now being copyrighted. All rights reserved."

Underneath the copyright notice, Doris Gardiner has written "Copyright Jethro Kloss 1935." She does not recall where she got that information. No publisher is listed. Note: Takoma Park is now in Maryland, 6 miles north of Washington, DC.

This book is largely about herbs and natural healing. It contains many Biblical quotes.

Soy-related recipes include: Unleavened bread (with soy bean meal, p. 94). Gems (with soy bean flour). Soy bean bread (5:1 whole wheat flour to boiled soy bean meal, p. 97). Soy bean buns or cinnamon rolls (with soybean meal and soybean milk, p. 98). Soy bean cheese (fermented, with raw peanut butter, soy bean milk, and tomato puree, p. 104). Nut cheese No. 1 and 2 (made with raw peanut butter, water, and salt, p. 105. Can be made from different nuts; tastes like cream cheese made from whole milk). Ice cream (made with soy bean milk, dextro sugar, corn starch, and crushed fruits to taste, p. 105). Malted nut cream. Nut milk (with raw peanut butter and Soothe-a-lac {made with cocoa fat}). Soy bean milk (p. 106). Buttermilk (made from soy bean milk, p. 106). Malted nuts (with raw peanut meal), non-dairy butters (with ground peanuts and cocoa fat, p. 107). Nut sauce (made from Vegetarian meat). Peanut butter No. 4. Nayonnaise (with peanut butter and vegetable oil, p. 108). Canned soy beans (using soybeans sprouted about half an inch, p. 111). Soy beans and rice (using sprouted soy beans, p. 112).

How to sprout soy beans, lentils, and grains (p. 112). "Cover 1 pint of soy beans with water and let stand over night. Pour off water. Keep them moist. Rewash daily and keep moist for approximately three days until well sprouted. Allow to stand until sprouts are about ½ inch long. Lentils do not take as long as soy beans.

"Sprouting of any bean or pea turns the protein into peptogen to a very great extent and the starch into dextrose or maltose and the sprouts are very high in vitamines,..."

Original meat #1 and #2 (using gluten and peanuts, p. 112). Granola #3 (with only whole wheat flour and soy bean flour, p. 116). Soybean coffee (p. 118). Note that Kloss has no recipes using whole dry soybeans in an unprocessed or unsprouted form.

"Loma Linda Food Company, Loma Linda, California, Manufacturer of Health Foods," has an ad on p. 189. They list their products, but no soy products are mentioned. Nature's Original Food Co. in Muirkirk, Maryland, is listed on pages 196 and 198. They make or sell strictly vegetarian pure health foods, incl. "Fine grade soy bean flour."

One interesting section is titled "Aluminum utensils for cooking purposes" (p. 80-84); Kloss strongly advises against their use, presenting much convincing but anecdotal evidence describing health problems that both he and other people have had after using aluminum cooking utensils. For example, Kloss bought a tea kettle which was constantly standing on the stove with some water in it. He would drink 2-3 cups of this water each morning, then some more about an hour before dinner. He developed terrible bowel trouble. He tried all kinds of remedies but nothing worked. The conditions grew steadily worse until finally he said to his wife, "Unless something helps me, I will surely die." One day he described his condition to a man, and the man said that the symptoms were similar to those that aluminum poison would cause. He began to research the subject by reading various books and found that "every one who had any practical experience in it condemned aluminum cooking utensils." Yet Kloss does not say that when he stopped using aluminum utensils his health problems disappeared. Kloss then includes a 3-page statement by Dr. Chas. T. Betts of Toledo, Ohio, on the dangers of using aluminum cooking utensils. Dr. Betts became very ill soon after his family began using aluminum cooking utensils. He too investigated the subject in depth and regained his health within 8 weeks after he stopped using aluminum cooking utensils. He has

enjoyed good health for the past 17 years. While studying the subject in Washington, DC. he found that the U.S. government had made a thorough investigation of the matter from 1920 to 1925. The Federal Trade Commission Docket 540 contained more than 4,000 pages of closely typewritten testimony from 158 witnesses during the 5 years, after which an official report was made by Edward M. Averill. "Many of the witnesses above mentioned were professors, deans, biologists, and toxicologists from many colleges, some of which are the highest schools of learning in America." Averill's report noted. "The evidence in this record does not prove that they are harmless... It does prove that there are substantial grounds upon which to predicate an honest opinion that they are harmful."

Doris Gardiner notes (Oct. 1990) that "in the revised 1939 edition of Back to Eden, Jethro Kloss eliminated many Biblical texts. He didn't want to turn off anyone that was not religious. He wanted to help everyone." Kloss moved to Brooke, Virginia, in 1920. From there, in the early 1930s (by Sept. 1932), he and his family moved to Takoma Park. Address: Takoma Park, DC.

899. Kung, Lan-Chen; Fang, Wen-Yuen. 1935. A preliminary report on the nitrogen metabolism of preschool children. *Chinese J. of Physiology* 9(4):375-81. [6 ref. Eng; chi]
• ***Summary:*** In China, there is no good substitute for breast milk after feeding. Both parts of this two-part experiment compared "the efficiency of the protein from cow's milk and soybean milk when used in a controlled diet of preschool children..." using the nitrogen balance method.

Experiment 1 was conducted on two healthy boys, age 4-5 years, for 16 days. One boy drank 3-4 cups of modified soybean milk a day; the formula for the milk is given.

Experiment 2 was conducted on two healthy girls, age 3-4 years. "They were given a controlled mixed diet for 33 days divided into 3 periods, supplemented with soybean milk for the first and third periods and cow's milk for the second period."

No marked difference could be observed in the protein utilization in either experiment. The same result was reported by Tso, Yee, and Chen in 1928 for infants.

Note: This study is summarized in *Experiment Station Record* 76:273 (1937). Address: Dep. of Home Economics, Yenching Univ., Peiping [China].

900. Battle Creek Food Co. 1935? Appetizing health food recipes and menus. Battle Creek, Michigan. 25 p. Undated. Illust. 15 x 17 cm.
• ***Summary:*** On the cover of this booklet is a 3-panel illustration of a family seated at the table enjoying a meal; the daughter is in the left panel, the wife and husband (with suit and necktie) in the center, and the young son (also in suit and tie) in the right panel. The booklet promotes and shows how to use the vegetarian food products made by Battle Creek Food Co.

Contents: The story of Battle Creek Health Foods (and its free diet service). Where these recipes are triple tested (the company's modern test kitchen). Dinner menus and recipes (p. 4-7). Luncheon and tea menus and recipes (p. 8-11). Breakfast menus and recipes (p. 12-15). Reducing menus and recipes (p. 16-17). Wholesome diabetic foods (p. 18). Brawn-building menus and recipes (p. 19). A brief description of Battle Creek Health Foods (p. 20-21). Health candies (p. 22).

On almost every page of recipes is an illustration of one of the company's products in its container/package, and in a prepared dish, followed by a description of each product on p. 20-21. The only two soy-related products are "Soy Biscuits–Best bread for diabetics. Contains less than 2% starch but is rich in protein and strength-building elements. (Also furnished in the form of a meal)."

Other products are: Agar (made from Japanese seaweed). Almond butter. Bran biscuits. Cooked bran (from wheat). Bran gluten flakes (crispy toasted breakfast cereal). Branola (hot cereal). Fig and nut bromose (with malt honey). Brose (hot cereal with dates, figs or raisins, and cream). Sanitarium canned fruits and vegetables. Chocolate nut bar. Cooked whole wheat. Fig bran. Fig bran flakes. Food ferrin (supplies dietary iron from green vegetables). Fruit crackers. Gluten bread (Low in starch, shipped in air-tight cans, ready to eat. A healthful reducing food). Gluten biscuit (40%, containing less than half the starch of ordinary bread; fine for diabetic patients). Gluten flour. Graham crackers. Health chocolates. Health koko. Kaffir tea (caffeine free). Lacto dextrin. Laxa (a biscuit with bran and agar). Malted nuts (increases the flow of milk in nursing mothers). Marmalades. Meltose (a malt sugar made from grains). Minute brew (A caffeine-free cereal beverage). No-fat (for use in place of butter). Nuttolene ("A nut meat product having the consistency of cream cheese. Makes healthful croquettes, cutlets, and stews"). Oatmeal wafers. Paralax with agar. Paramels. Peanut butter (made from steamed rather than roasted peanuts to make it easier to digest). Preserved figs. Protose ("The vegetable meat–makes savory sandwiches, salads, meat pies, and roasts. Rich in iron, lime and protein for body-building"). Psylla. Ripe olives. Savita ("A vegetable [yeast] extract with a rich, meaty flavor, excellent for soups and gravies, Rich in vitamins, and wonderful for blood-building"). Sal-Savita (A vegetable seasoning with a meat-like flavor). Savita-yeast (new yeast with a rich meaty flavor). Starchless bran. Toasted rice flakes. Tomato soup. Vegetable gelatin. Vegetable soup. Vitamet (A savory vegetable meat that is rich in Vitamin B and food iron). Vita wheat (creamy hot cereal). Whole wheat cream sticks. Whole wheat flour. Whole wheat wafers. ZO ("The vitamin breakfast food, ready to eat with cream and sugar. Made from whole wheat and barley and enriched with Savita... Supplies the daily vitamins and minerals"). Zwieback.

On page 23 is an ad for a 64-page booklet titled *Healthful Living: Fundamental Facts About Foods and Feeding.* Address: Battle Creek, Michigan.

901. Kingsley, Ellen J. 1935? Soybean and soybean products for table use. Washington, DC: Bureau of Home Economics, USDA. 17 p. Undated. Mimeographed unpublished manuscript. *
• ***Summary:*** How to use: Green soybeans, dried soybeans, soybean sprouts, soybean flour, soybean milk, soybean curd [tofu], and soybean mash [okara]. Includes recipes.

Note: A stamp shows that this undated publication was received by USDA's National Agricultural Library on 1 Nov. 1935.

905. *Naturopath and Herald of Health* (*New York City*). 1936. Mail bag: Mahatma Gandhi turns raw fooder and reads book published by an American Naturopath, "The unfired food diet simplified."(Letter to the editor). 41(1):30. Jan.
• ***Summary:*** This is an undated letter written to Dr. James H. Faulkner, Cincinnati, Ohio. "Dear Friend: I thank you for your letter and the booklet. A friend had shown it to me some time ago. I cannot be satisfied that starchy vegetables and grains can be taken raw without injuring oneself.

"We have not yet been able to find a proper substitute for milk, much as I would like to do so. The Soya Bean is supposed to have such properties. A friend is making cautious experiments but he still combines milk with it. Sincerely yours, M.K. Gandhi.

When this book was published in 1923, Dr. Faulkner had an order or two from India; one copy went to a medical library in Delhi. One of these copies, no doubt, was showed to Gandhi by his friend.

906. **Product Name:** Vetose Soya Milk [Natural, or Chocolate].
Manufacturer's Name: Vetose Nutritional Laboratories.
Manufacturer's Address: Pting Liang Road, Shanghai, China.
Date of Introduction: 1936. January.
Wt/Vol., Packaging, Price: Half pint or quart glass bottles.
New Product–Documentation: Miller, Harry W.; Wen, C. Jean. 1936. "Experimental nutrition studies of soymilk in human nutrition." *Chinese Medical Journal* 50(4):450-59. April. "Such milk can be and is being manufactured as a dried milk powder under the name of Vetose Soya Milk Powder with claims of nutritive value the equivalent of other prepared powdered milk food for infants."

Miller, Harry W. 1944. "The Story of Milk from the Soya Bean." Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. "Milk routes were established in all parts of Shanghai, and the production doubled each succeeding month. Three types of liquid milk were produced: natural soya milk, chocolate soya milk and acidophilus milk, packaged in pint and quart bottles. The price to the consumer was less than that of cow's milk in Shanghai, which thus made available a milk rich in food value for all members of families whose circumstances did not permit them to buy the more expensive animal milk. It was here demonstrated that soya milk in every way filled the average family requirement for a milk, and that in countries where the economic conditions make impracticable dairies, where stock feed is scarce and costly, the people may still have an equally suitable milk." On 13 Aug. 1937 a Japanese bomb destroyed Dr. Miller's commercial soy milk plant.

Raymond S. Moore. 1961. *China Doctor.* p. 182. Dr. Miller established a soybean milk plant on Pting Liang Road in Shanghai, not far from his Shanghai clinic. "There the doctor worked with his production manager, Harry, Jr., who later was to become a consultant for the United Nations Food and Agricultural Organization. From the outset, however, the customers in areas without refrigeration were plagued by spoilage. After studying the American techniques for keeping milk drinks, Harry Miller and his helpers installed in-bottle sterilization equipment, and began deliveries anew. The milk kept indefinitely until uncapped. Malt and chocolate flavors were provided for the sophisticated taste... The price of the milk competed easily with that of cow and goat milk. In the late thirties, Japan was invading China. Within months after the soy-milk business began booming, a Japanese bomb blew up the Shanghai plant."

Interviews with Harry W. Miller Jr. 1981-87. Sold and delivered door to door in half pint and quart bottles, this was the earliest known commercial branded soymilk in East Asia. It was sold in wide-mouth glass milk bottles with Crown caps. The only labeling information was printed on the caps. The plant, which was connected with the Seventh-day

Adventist Shanghai Sanitarium, was destroyed on 13 August 1937 during the Japanese invasion.

Note 1. This is the earliest known commercial soy product made by a Seventh-day Adventist food company outside the United States.

Note 2. This is the earliest document seen (March 2001) concerning the work of Dr. Harry W. Miller with soyfoods.

907. Kellogg, John Harvey. 1936. Re: Growing soybeans in Michigan and making condensed soy milk. Letter to Mr. William J. Morse, Bureau of Plant Industry, USDA, Washington, DC, Feb. 13. 2 p. Typed, without signature (carbon copy).

• ***Summary:*** Dr. Kellogg thanks Morse for his letter or Feb. 7. "The 78-day bean which you sent me a number of years ago reaches the shell bean state in 60 days and matures in 78 to 80 days." "I am interested in what you say about variety 81,031 which scored one hundred. We will be glad to obtain a supply of this variety and as much as is available."

"I shall be glad to have your criticism of the condensed soy milk sent you.

"Thanking you for the valuable information and for your gracious assistance, I am, Sincerely yours."

Note 2. This is the earliest letter seen (Aug. 1999) of various letters exchanged between Dr. Kellogg and William Morse. Note that Morse apparently wrote Kellogg first on 7 Feb. 1936. Letter from Jennifer Jacobs at Bentley Historical Library. 1999. Sept. 8. She is unable to find a letter from Morse to Kellogg dated 7 Feb. 1936 in the Kellogg Papers at Bentley. Address: Miami, Florida.

908. *Revue Agricole de l'Afrique du Nord.* 1936. La culture de soja [Soybean cultivation]. 34(865):131-32. Feb. 28. (Institut Agricole d'Algerie, Alger). [1 ref. Fre]

• ***Summary:*** Although it has been recommended [in Algeria] on several occasions, especially by Dr. Trabut, soybean cultivation has been given only limited trials here, and then mainly for production of forage. Certain varieties of soya yield a very nutritious forage whose composition approaches that of lucerne. But in East Asia large amounts of soybean seeds are used as a source of oil, flour, a milk substitute, etc. In Algeria the soybean has not yet been used as food, except in feeding pigs. The various types of soybeans and their cultivation is discussed. Soybean cultivation is now expanding in Europe; last year soya was grown on 25,000 hectares in Romania. Soybeans have been grown successfully in Normandy, France. The results of these trials have been published by Guerpel in the *Journal d'Agriculture Pratique* (5 Oct. 1935); the importance of proper inoculation when planting for the first time is emphasized.

Because of the low price paid at European ports for soybeans grown in Manchuria, it seems that the cultivation of soya, intended for sale to oil mills, will not be remunerative in Algeria. But there would be interest in this country, especially in the irrigated areas, in growing soybeans for forage or for the seeds which could be fed to livestock. Address: Algeria.

909. *Good Health* (*Battle Creek, Michigan*). 1936. The world famine. 71(2):48-49. Feb.

• ***Summary:*** "For the four hundred millions of China and several other hundreds of millions in the Far East, that most marvelous of food plants, the soy bean, supplies an abundance of protein and fat of the finest quality, far superior to the proteins and fats of flesh meats, and wholly free from the loathsome parasites, trichinæ, tapeworms, etc., and the filthy colon germs which swarm in fresh meats of all sorts.

"From an economic standpoint, the soy bean offers not only a more than complete substitute for meats, but salvation from the great economic evils to which flesh eating inevitably leads, evils so mischievous that they threaten destruction to the race by making the world uninhabitable." "The soybean contains 40 per cent protein of higher quality than that of the choicest meats. Its easily soluble protein resembles that of milk, and is more easily and quickly digestible. The proteins of the soy bean are of the basic or alkali-ash sort, while those of eggs and meat are acid-ash and so tend to cause acidosis, an evil to which the physiologic chemists have for many years been calling attention. This makes the soy bean a curative food instead of a cause of disease.

"In the market one can buy protein in the form of soy beans at one cent a pound, whereas protein in the form of meat costs from $1.00 to $2.00 a pound"

The "soy bean also improves instead of impoverishing the soil. Its roots gather nitrogen from the air and so enrich the soil.

"The soy bean, which in the Orient fills in the diet the place of flesh, fish, fowl, eggs, milk, butter, and cheese, and suffices for infants as well as for adults, is beginning to receive some attention in this country. An excellent flour is now being made which, added to ordinary wheat flour, greatly improves the loaf in nutritive values, and at the same time improves its flavor and keeping properties.

"Condensed soy milk in tin cans is also now being made and various other most wholesome products, the use of which enables one, if he chooses to do so, to exclude all animal products from his dietary and not only without loss but with an actual gain."

910. *Good Health* (*Battle Creek, Michigan*). 1936. Increasing use of the soy bean. 71(2):50-51. Feb.

• ***Summary:*** "Henry Ford has aided in the development of the soy bean industry, having urged the planting as a new opportunity for farmers.

"Manchukuo still produces the world's largest crop of soy beans. The culture of this bean is spreading as people come to know its value for food and many other purposes.

Various attempts have been made to grow them in England, Germany, and other parts of Europe with poor success. But the *London Times* records the harvesting of twenty acres of soy beans on the Fordson estate, near Chelmsford [England]. Here Henry Ford has a farm of about two or three thousand acres. His direct interest is due to the fact that he uses this product in his automobile industry.

"Four years ago Dr. Kellogg discovered that milk made from the soy bean made a remarkable culture medium for protective bacteria or so-called 'friendly germs.' In soy milk more than twice the number of these germs can be made to grow than in cow's milk. Remarkable results have been obtained in cases of intestinal disorders through the use of this milk. The Canadian quintuplets are protected against bowel trouble by the constant use of soy acidophilus milk."

911. Kanga, D.D. 1936. The soya bean: An ideal foodstuff for India. *Vegetarian News* (*London*). Feb. p. 46-49. [3 ref]
• ***Summary:*** Discusses the many food and industrial uses of the soya bean. "Millions of people in India live on a purely vegetarian diet." "Hardly one person in a thousand even amongst our educated people has heard about this important foodstuff, much less seen or handled it."

"From several experiments made in private families, and public institutions like the Sir Ratan Tata Industrial Home and the Bengali Girls' School, and from the fact that soya bean preparations were made at the Soya Bean restaurant in the H.O.H. Fête held in Bombay and sold to the visitors, it seems that a number of table preparations can be easily made from the soya beans and soya bean products suitable to the varied tastes of our countrymen, such as coffee, cocoa, chocolates, biscuits, cakes, pastry, sandwiches, custard, pudding, soup, bread, milk, cheese, sauce, salad, macaroni, margarine, all sorts of sweets, *puri, ganthia, sev, bhajis, papads, vada, chevdo,* etc."

"If Mother India wishes to have a race of strong, healthy and virile sons and daughters she must see that soya bean is grown most extensively in the different parts of our country* and that it becomes a household word in every home and is included in the dietary of every family." (Footnote: *"It is gratifying to note that experiments carried out in Sindh, Poona, etc., show that the soya bean can be successfully grown in our country. It is also gratifying to note that the Saurastra Seva Samiti Ranpur, Kathiawad, is doing some good solid work in popularising and distributing soya beans among the cultivators of its own province. It is equally gratifying to note that the Baroda State has also begun the cultivation of the soya bean in its territories.–*Footnote in the 'Indian Humanitarian'"*).

Note 1. This article was reprinted from the Silver Jubilee Number of the *Indian Humanitarian* (Bombay). Note 2. *The Vegetarian News* was published by the London Vegetarian Society from 1921 to 1958. Address: Gujarat College, Ahmedabad, India.

912. Shoptaw, LaVan. 1936. Soybean flour as a substitute for cow's milk in feeding dairy calves. *J. of Dairy Science* 19(2):95-99. Feb. [5 ref]
• ***Summary:*** "One of the sources of continual worry for the dairy farmer and one which has to do with the very life of the industry is the problem of the economical rearing of calves. A vast amount of work has been done to produce calf meals which might displace milk in the diet of the calf. Recent work done in the Orient upon the value of soybean 'milk' in infant feeding has raised the question of the adaptability of this material as a feed for young dairy calves."

"Because of the success that was had in feeding infants on soybean milk, an experiment was planned to determine the effectiveness and economy of using soybean milk as a substitute for cow's milk in rearing dairy calves.

"Experimental: Four pairs of calves [averaging 25 days of age] were used in the experiment, the pairs being matched closely as to weight, height, and age. One calf of each pair was used as a check and was fed in a manner approximating common herd practice. The second calf in each pair was fed the same way except that cow's milk was replaced by soybean milk in the calf's ration." "The soybean milk was prepared by stirring one part of soybean flour into nine parts of warm water [without filtering]. The mixture was fed at body temperature." The feeding trial continued for 70 days. Grain and hay were allowed *ad libitum* to both groups.

"The general health of the calves fed soybean milk was not especially good. A great amount of diarrhea occurred in this group so that gruels of barley were often used to alleviate this condition. The hair coats of these calves were rather more rough than those of the check group."

"The average daily gain for the soybean calves was 0.9 pounds while that for the check calves was 1.24 pounds... Also there was some difficulty in getting the calves to relish soybean milk." Graphs show: (1) The average weight gain in pounds per week for the two groups. (2) The average gain in height (at withers) per week.

Note 1. This is the earliest document seen (Aug. 2013) describing the actual use of soybean milk as a calf-milk replacer.

Note 2. This is the earliest English-language document seen (Aug. 2013) concerning the use of soy in a calf-milk replacer.

Note 3. *Ad libitum* is Latin for "at one's pleasure." Here it means that animals could eat the available feeds whenever they wished to. This is the earliest document seen (Oct. 2008) that contains the term *ad libitum* in connection with soy. Address: Panhandle Agric. Exp. Station, Goodwell, Oklahoma.

913. Morse, W.J. 1936. Re: Chusei and Bansei soybean varieties, and making soy milk. Letter to Dr. John Harvey Kellogg, Miami Springs (Miami), Florida, March 7. 1 p.

Typed, with signature.
• ***Summary:*** "I have your letter of February 13 with regard to the variety of soybean which you have been increasing at Battle Creek [Michigan] for the past three or four years. The sample of beans was recently received from Battle Creek and in checking it over with our samples I find that it is identical with the type we are now calling Chusei. I may say that the seed is now being distributed under this varietal name.

"Concerning variety 81031, which I wrote you had given such good results in making a high quality milk, we have given the varietal name Bansei to this number. I think that we shall be able to furnish you with 4 or 6 pounds of seed and I feel that it should mature in ample time at Battle Creek. I take it that you wish this seed to be sent in your name at your Battle Creek address. Very truly yours, W.J. Morse, Senior Agronomist."

Note 1. This is the earliest document seen (June 2013) that mentions the soybean varieties Bansei or Chusei. Address: Senior Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, USDA, Washington, DC.

914. Kellogg, John Harvey. 1936. Re: Bansei soybean and making soy milk. Letter to Mr. William J. Morse, Bureau of Plant Industry, USDA, Washington, DC, March 9. 2 p. Typed, without signature (carbon copy).
• ***Summary:*** Dr. Kellogg thanks Morse for his letter or March 7. "I am very glad to know about the Bansei bean. I shall be greatly pleased if you will send me as many pounds as you can of this seed and tell me if it is possible for me to get a larger quantity for planting this year.

"We are using very considerable quantities of soy beans for milk and at the rate it is increasing will soon be requiring about a ton a week.

"I am anxious to get started with your new bean as raw materials as soon as possible. I should also like to know whether the bean you call Chusei can be obtained in quantity for seed. I am hoping to plant two hundred acres of this bean this year to be used chiefly as a shell bean for canning. Can this be obtained in quantity either in this country or in Japan? Can the Bansei bean be obtained in Japan? I should also like to know if you can give me information about a bean which I am purchasing through a local agency here under the name of Tokyo. It comes from Norfolk here and I am informed that it is imported direct from Japan."

"I consider the soy bean one of the most remarkable of the world's food products and expect to make increasingly large use of it. I have been experimenting with it for many years, but have made rather slow progress because of the multiplicity of other matters requiring my attention. I think from now on I shall make much more rapid progress.

"Could you tell me if anyone has succeeded in making a satisfactory dry evaporated soy milk which will keep?

"Hoping I am not troubling you too much, I am

"Sincerely yours," Address: Miami, Florida.

915. Morse, W.J. 1936. Re: Evaporated soy milk, soybean varieties, and green vegetable soybeans. Letter to Dr. John Harvey Kellogg, The Miami-Battle Creek, Miami Springs (Miami), Florida, March 26. 2 p. Typed, with signature.
• ***Summary:*** "I have your letter of March 9 and with reference to the Bansei soybean, I will say that we will try to spare you as many pounds as possible." There are no longer large sources of either the Chusei or Bansei soybean in this country at present... we obtained the seed from The Yamato Seed Co., Tokyo, Japan. The Bansei was obtained from them under the name *Bansei O Sayada Mame* [probably *Bansei O Saya Eda Mame*] and the Chusei under the name *Chusei O Saya Eda Mame."*

Note: In Japanese, *Bansei* and *Chusei* mean "late grower or late development" and "medium grower or medium development" respectively. *O Saya* means "large pod." *Eda Mamé*–pronounced ay-dah-MAH-may–means "green vegetable soybean."

"The sample of seed which you enclosed is the Tokyo variety and has been grown in this country for many years. During the past two or three years it has increased to a considerable extent especially in North Carolina, Tennessee, and Mississippi. It is not imported from Japan. All of the seed which is in this country was grown in the states mentioned above. It may interest you to know that in North China and southern Manchuria this light, greenish yellow bean is used in the manufacture of bean milk and bean curd. I am quite sure that you will have no difficulty in obtaining almost any quantity of Tokyo through North Carolina growers and seed dealers... In North Carolina and Virginia you can obtain the Tokyo through the following: T.W. Wood & Sons, Richmond, Virginia, Geo. Tait & Sons, Norfolk, Virginia, The Buxton White Seed Co., Elizabeth City, North Carolina, and F.P. Latham, Belhaven, North Carolina."

"Mr. J.H. Strawser of the Washington Sanitarium, Takoma Park, Maryland, sent me one of the nicest samples of evaporated soy milk that I have ever seen... I understand that Dr. Miller, who is associated with the Missionary College and now stationed in China, has one or two factories producing this soy milk powder. While Mr. Strawser was experimenting with the milk I understood that the soy milk was evaporated through the regular process used in evaporating cow's milk."

Note: This is the earliest document seen (Aug. 2013) concerning the work of Dr. Harry Miller with soyfoods or soy milk.

"The Seaboard Airline Railway, at its experimental farm near Hamilton, North Carolina, has been testing some of our green vegetable soybean varieties. Last year they froze some of the beans and have been sending samples to various places. From all reports it is evident that the frozen bean is a most excellent food product."

Note: This is the earliest document seen (March 2001)

concerning the work of a small Seventh-day Adventist food company (the Washington Sanitarium, Takoma Park, Maryland) with soyfoods. Address: Senior Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, USDA, Washington, DC.

916. Kellogg, John Harvey. 1936. Re: Soy Acidophilus Milk and the Dionne quintuplets. Letter to Mr. William J. Morse, Bureau of Plant Industry, USDA, Washington, DC, March 30. 2 p. Typed, without signature (carbon copy).
• ***Summary:*** "We are having great success with our soy acidophilus milk. It cured the [Dionne] quintuplets of serious trouble and keeps them in good health. They have been using it regularly in their daily food for more than a year and a half. Dr. Dafoe writes me that he cannot get along without it. When he stops the use of it the bowels get bad and he has to resume its use at once. I shall be glad to have a liberal sample of this milk sent to you if you would like to try it."

"Sincerely yours,

"P.S. Dr. Miller of China is one of my old students. He sent me a sample of his soy milk powder. It was very fine in appearance, but had a rancid flavor...

"I shall be very glad indeed if you will let me have as much seed as you can of rapid growing vegetable varieties of soy beans. I am planting 150 acres this year, but will be glad to plant 50 more if I can get sufficient seed for the purpose." Address: Miami, Florida.

917. Khankhoje, Pandurang. 1936. El frijol soya, Glycine hispida, Max [The soybean]. *Campesino* (*El*) (*Mexico*) 1(7):14-15. March. Revista Mensual. [Spa]
• ***Summary:*** "In Mexico, various experiments for the introduction of the soybean were made starting in 1911. There were repeated sporadically, always with poor results, until the years from 1928 to 1932 and 1933 when in Chapingo and Jalapa, the acclimatization of five varieties was achieved. In the following years, seeds from these 5 varieties were grown and matured in the experimental fields of the Biotechnical Institute (*Instituto Biotécnico*). The varieties Virginia and Laredo also did well there; it was hoped they would soon produced seeds suited for each of our climates."

Also discusses the importance, utilization (as oil, cheese [tofu], shoyu, and flour), and cultivation of the soybean. A photo shows two Laredo variety soybean plants and one Virginia variety soybean plant.

Note: This is the earliest document seen (Feb. 2009) concerning the cultivation of soybeans in Mexico or Central America (one of two documents). This document contains the second earliest date seen for soybeans in Mexico (1911), and the earliest date seen for the cultivation of soybeans in Mexico (1911) or Central America. The source of these soybeans is unknown. Note, however, that soybeans may well have been cultivated in Mexico as early as 1874 (see Carriere 1880). Address: Ingeniero, Jefe de la Oficina de Genetica, Ecologia y Botanica, Dirrecion de Agricultura, San Jacinto, D.F [Mexico City, Mexico].

918. Lager, Mildred. 1936. The House of Better Living Catalog. Los Angeles, California: Published by the author. March. 14 p. March. 28 cm. Second expanded edition, March 1938.
• ***Summary:*** On the front cover is a large illustration of the exterior of the House of Better Living, and a 4-stanza poem about the House by Mildred Lager. Below the poem we read: "Catalog. The most unusual store in Southern California. Owned and operated by Mildred Lager, food economist, author, and radio lecturer."

The first section, titled "The origin of the House of Better Living!" (p. 1) begins: "Is it fate? Often the handicaps and obstacles that we have to overcome lead us into our life work, help us to find ourselves. A few years ago a young school teacher was forced to give up her chosen profession because of arthritis deformans. It was a severe obstacle to overcome, but it was that experience that led Mildred Lager into the study of foods and their relation to health, and led to the founding of the House of Better Living. No one *has* gained recognition as rapidly as Miss Lager. In a little over two years she has won her place among the 'leaders,' has received both national and international recognition, and has established the House of Better Living as an institution in Southern California... Her perfect radio voice reaches thousands who cannot attend her classes.

"Miss Lager is teaching the ounce of prevention, the health insurance that pays dividends in years of health and happiness. Her slogan is that Pure Air, Pure Water, Pure Food and Constructive Thought plus exercise and sunshine build health.

"The House of Better Living is more than a Health Food Store. It is a bureau of food information and a place and means where Miss Lager can conduct her classes free of charge–and *that* is her goal. Two years ago it seemed an impossibility–very few thought it would ever succeed. They did not know the sincerity and the spirit behind it... It is but two and a half years old. We cannot predict its future nor that of its charming founder–we can only wait and see, knowing that achievement and not time is the measure of success.–By one who has watched the growth from the start."

At the top of page 2 in large letters: "The House of Better Living offers you: 1. The best of natural foods at reasonable prices. 2. Free delivery of all $3.00 orders in Los Angeles. 3. Free cooking classes every Wednesday afternoon at 1:30. 4. Food classes Monday and Thursday afternoon at 1:30 (except during June, July and August). 5. Miss Lager's Radio talks every Monday, Tuesday, Wednesday and Thursday morning at 7:45 over KFAC."

Product categories and products mentioned include: Coffee substitutes (Soyco, Hollywood Cup, Breakfast

Cup, Ficgo, Sipp). Broths (Vegebroth, Vegemineral Broth Concentrate, Hauser's Meatless Bouillon). Nut butters–Freshly ground (Soy Bean Butter, Almond butter, Cashew butter, peanut butter–dextrinized). Whole grain flour, meal, etc. (Soy Bean Flour, Bill Baker's Prepared Lima Bean Pancake or Waffle Flour, Bill Baker's Prepared Soy Bean Pancake or Waffle Flour {2 lb for $0.30}, whole wheat flour, wheat germ, bran, buckwheat flour, dextrinized flour, gluten flour, breakfast cereals–to cook {Cubbison's cracked wheat}). Ready to serve cereals (Soy bean breakfast food, wheat germ). Macaroni, noodles, etc. (Soy bean macaroni, garbanza shells). Legumes (soy bean {imported}, garbanza peas, natural brown rice, sesame seeds). Melba toast, crackers, cookies, etc. (Bill Baker's Soy Toast {$0.30/lb}, Cubbison's Melba Toast, Cubbison's Melbetts, Soy bean gluten cracker, Cubbison's whole wheat crackers, Cubbison's Whole Wheat Dunkeretts, Cubbison's wheat soda cracker, Cubbison's honey wheat cookies, Cubbison's Melba cookies, Soy bean wafers, soy bean macaroons, Bill Baker's 100% Soy Bean Fruit Cookies {$0.18/dozen}, Bill Baker's 100% Lima Bean Fruit Cookies {$0.18/dozen}, Olson's soy bean bread, sliced {$0.12}, Bill Baker's soy bean bread–unsliced {$0.16}, Bill Baker's Lima Bean Bread, unsliced {$0.16}). Natural aids (Agar, flaxseed, psyllium, Burbank kelp, kelp, Green kelp, Santay sea greens). Oils (Soy bean oil, sesame oil, Lindsay Cold Pressed California Oil). Meat substitutes (11 products, 5 with "Soy" in the name, such as Soyatose). Soy bean products (25 products! Makers incl. La Sierra, Loma Linda, etc.).

The 27 different soy products are: La Sierra Soy Beans, plain or with tomato sauce; Loma Linda Soy Beans, plain or with Proteena; Soy Beans, imported; Soy Beans, roasted; Soy Bean Loaf (meat substitute); Soy Bean Bologna; Soy Bean Spread; Soy Bean Butter (like peanut butter); Loma Linda Soy Mince Sandwich Spread; Soy Bean Sauce; Soy Bean Milk; Soy Bean Oil; Soy Bean Noodles, Macaroni, and Spaghetti; Soyco (Soy Coffee); Soy Bean Breakfast Food; Soy Bean Sprouts; Soy Bean Flour; Bill Baker's Prepared Soy Bean Pancake or Waffle Flour; Bill Baker's Soy Bean Bread; Olson Soy Bread (sliced); Bill Baker's Soy Toast; Bill Baker's Soy Bean Fruit Cookies; Soy Bean Macaroons; Soy Bean Wafers; Soy Bean Gluten Crackers.

Photos show: (1) A portrait of Mildred Lager smiling (p. 1). (2) Mildred conducting a free cooking class in her kitchen at The House of Better Living. Many men and women, all wearing hats, are seated around the perimeter of the kitchen (p. 6-7). (3) Packages of various "Bill Baker's Soy & Lima Bean Products" including Lime Bean Wafers, Pancake Waffle & Biscuit Lima-Bean "Neat Flour," Lima Bean Toast, Pancake Waffle & Biscuit Soya-Bean "Neat Flour," Lima Bean Bread, and Soy Bean Bread" (p. 10).

A small ad (3½ by 2¼ inches, p. 6) by the Cubbison Cracker Co. (3417-19 Pasadena Ave., Los Angeles, California) states: "Dextrinized and whole wheat products: Melba Toast, Melbetts, Cracked Wheat, Whole Wheat Crackers and Cookies." Note: This is the earliest document seen (June 2004) concerning the work of Sophie Cubbison with soyfoods.

A ¼-page ad (p. 12) titled "Hain 100% pure foods," describes Vege-Jell Puddings, Mal-Ba-Nuts (a powdered beverage), Potassium broth, and Col-Lax (whose ingredients are: Powdered psyllium, Powdered agar, and lactose). Address: 1207 West Sixth St., Los Angeles, California.

919. *Consumers' Guide*. 1936. Salute to the "wonder bean." 3(8):3-7, 22. April 20.

• ***Summary:*** A general introduction to the soybean and its uses, including "green soybeans" (used as a green vegetable), soy milk, soy oil, lecithin, and [whole dry] soybeans.

"Almonds, eggs, lean meat, milk, all have complete proteins. So do soybeans which sometimes, as in the case of many eastern [East Asian] people, are the only source of efficient protein within pocketbook reach."

"Soybean flour,... is both a rich and a cheap source of such minerals as calcium and iron." Calcium in the diet is necessary for strong bones and teeth. Soybeans are a probable source of vitamin A, and a good source of vitamins B and G (the "anti-pellagra" vitamin). Soybean sprouts have vitamin C (the "scurvy fighting" vitamin). Unlike most beans, soybeans contain little starch. "For this reason they are recognized as a good food for people needing a low starch diet."

Note: This is the earliest document seen (Aug. 2011) that uses the term "wonder bean" to refer to the soy bean. Address: U.S. Agricultural Adjustment Administration, Washington, DC.

920. J.G.C. 1936. The soya bean: Remarkable progress in cultivation. *Manchester Guardian* (*England*). April 27. p. 6.

• ***Summary:*** The soya bean is a major crop in Asia; about 25% of the area of Manchuria is used for growing it. The Japanese, like the Chinese, eat "soya bean foods" in their daily diet.

The soya "bean did not appear as a commodity in the Western world until 1907."

In 1910 in the United States, 2,000 acres of soybeans were grown; by 1920 the acreage had grown to 950,000 and today it is about 5,000,000. In 1931 the U.S. began to export soybeans to Europe.

In Soviet Russia, similar advances in the cultivation and utilization of soya beans have occurred recently.

Mr. Henry Ford has cultivated soya beans at Detroit, Michigan. During the past few years he had begun their full-scale cultivation in England, on the Fordson Estates near Chelmsford.

A list of the many industrial and food uses of soya beans is given.

An interesting account of the Fordson experiments

appears in the book *The Soya Bean*, by Elizabeth Bowdidge.

Mr. J.L. North, former curator of the Royal Botanical Society of London, during 20 years of breeding experiments in Regent's Park and elsewhere, has developed four soya bean varieties capable of maturing in England's climate. The Fordson Estates obtained these seeds and Mr. North's advice. In 1933 they did experimental plantings of about 50 soybean varieties collected from various parts of the world. In 1934 they planted about 20 acres of the most promising varieties.

Westerners obtain most of their fat and oil from meat, milk, eggs and bread. But these foods are relatively expensive, and many [especially in 1936 in the midst of the Great Depression] cannot afford them. The people of north China, who consume very little dairy products or meat, obtain an inexpensive, balanced diet from soya beans. Moreover, Chinese make a soya milk from soya beans. Although it is unpalatable to Western tastes, more refined processes can produce a palatable soya milk with good nutritional value.

Conclusion: "The soya bean provides a remarkably efficient method of providing supplies of food and raw materials."

921. Guy, Ruth A. 1936. The diets of nursing mothers and young women in Peiping. *Chinese Medical Journal* 50:440. April. *

• ***Summary:*** Dr. Guy has found little evidence that Peiping women have ever used soybean milk to feed their children. She notes that though the drink was available through street vendors, it was generally drunk by "old people in place of tea." Home preparation was difficult and laborious, and therefore avoided. Address: 1. M.D., First Health Station, Peiping Municipality, China.

922. Miller, Harry W.; Wen, C. Jean. 1936. Experimental nutrition studies of soymilk in human nutrition. *Chinese Medical Journal* 50(4):450-59. April. [15 ref]

• ***Summary:*** "Because of their small carbohydrate content soybean products have long been used as a diabetic food. Also hundreds of years ago, it was used in the form of soymilk, cheese, curd, various soy sauces, ferment products, bean sprouts, as salted roasted beans and as a coffee substitute. More recently it is used in ice-cream, ice-cream cones, in candies and confectionery, puddings, salad dressings, food drinks, breakfast-foods, etc., besides in the industries in making paints, linoleums, automobile parts, lacquers, celluloid substitute, glue, and vegetable casein. It is a valuable stock food, and in the human dietary the various soybean products not only give flavor and relish, but also supply a most valuable type of protein."

"The people in China use practically no dairy products and comparatively little meat, and yet have a well-balanced diet, which is obtained through the protective foods supplied them through the soybean. We have in China the common saying, '*Do-giang* [pinyin *doujiang* = soy milk] is the poor man's milk, *do-fuh* [*doufu* = tofu] is the poor man's meat.'"

"We have never observed soybean protein possessing an allergy in any single case. Recently a patient admitted to the sanitarium informed us that he could use neither wheat, eggs, nor milk. We placed him, therefore, on soybean protein as found in Vetose milk and soydophilus milk, and he got along remarkably well. We have never noted an instance where soybean has set up any reaction in the nature of skin eruptions, stomach or intestinal upsets" (p. 451-52).

"Much experimentation has been carried forward along the line of making palatable food products out of the soybean, of getting rid of the raw, beany, rather bitterish flavor in the uncooked or partially cooked bean. This objectionable beany taste has been shown by Schmalfuss and Treu [1927] to be a methyl-n-nonyl-ketone, which seems to be located in the outer layer of cotyledons.

"Since a process is now available for the removal of these ketone bodies immediately the possibilities loom before us of the use of soybean as an important element in the human dietary... we may have a true milk substitute.

"We have approached the formulae of cow's milk by the addition of a sufficient amount of carbohydrate in the form of a malt sugar and a little additional oil, together with vitamin C in the form of tomato juice, and by exposing this liquid to irradiation with ultra violet light to add vitamin D. Such milk can be and is being manufactured as a dried milk powder under the name of Vetose Soya Milk Powder with claims of nutritive value the equivalent of other prepared powdered milk food for infants."

"Our experimental work on infant feeding has been carried on over a period of more than two years, mostly in the Shanghai Sanitarium Clinic" (p. 454).

"In the Shanghai Sanitarium and Clinic, aside from the use of modified soya milk in the pediatrics department, the nurses and the helps have taken regularly the soya milk, with most satisfactory results. Our observations over this period of time lead us to believe that modified soya milk has every advantage over cow's milk; it is palatable and a liking for it is readily acquired. It is a complete food of very high nutritive value; it is readily digested, and free from all poisonous and deleterious substances. The standard formula used was protein 3.5%, fat 5%, carbohydrate 5.64%. The caloric value is a little higher than that of cow's milk, and will run 170 calories to the full glass" (p. 457).

Soya milk "can be used in cooking and baking; it makes delicious ice cream. At the same time it affords the advantages of being 100 per cent pure. Also the dread of so many diseases now known to be directly transferred from cows' milk, such as hoof and mouth diseases, undulant fever, typhoid fever, streptococcal infection, infection, dysentery, etc., is removed from users of soya milk.

"The new milk powder, which has now been used for upwards of a year, seems to be equal in quality with

the freshly made soya milk. It is a little better tasting. Its advantage is that it can be transported to any place without deterioration, and can be freshly made up as required, and does not require refrigeration" (p. 457).

"We use a soydophilus made by inoculating sterilized soya milk with the acidophilus organisms." Soydophilus "creates an intestinal flora that overcomes intestinal autointoxication."

Note 1. This is the earliest English-language document seen (Aug. 2013) that contains the word "soymilk" spelled as one word, or that has the word "soymilk" in the title. However, the word "soymilk" does not appear in the text. Instead, the term "soya milk" is used at least 22 times and the term "soy milk" is used once. The term "modified soya milk" is used many times but the meaning of "modified" is never explained.

Note 2. This is the earliest document seen (Aug. 2013) that contains the word "Vetose" in connection with the work of Dr. Harry Miller with soyfoods. Address: M.D. (both), Shanghai Sanitarium and Pediatric Dep., Shanghai, China.

923. Platt, B.S. 1936. An approach to the problems of infant nutrition in China. *Chinese Medical Journal* 50(4):410-24. April.
• ***Summary:*** "Whilst from our information it is found that soya bean milk is very rarely used [for feeding infants in China], much attention has been given to its preparation in various countries in recent years. It was introduced into paediatrics by Rühran in 1909 as a substitute for animal milk in allergic conditions and is still recommended for this purpose. Chinese and American workers have reported satisfactory results in clinical work. In the Dutch Indies good results are claimed using a mixture one part soya bean flour with seven parts of wheat flour. There are preparations marketed in various countries, including one in China at the present time, in the form of a powder from which by adding water the milk can be reconstituted. A freshly prepared milk can be bought in the local market; and attempts have been made to furnish a daily supply in bottles as is customary with cows' milk. Scepticism was found on a recent visit to exist in the minds of various workers in Malaya and Java as to the value of soya bean milk as a routine infant feed... The Chinese mother is found often to be aware of the property of soya bean milk of causing diarrhoea [diarrhea]; whether this is the result of the introduction of bacteria with the milk or to some cathartic action of the soya bean oil still remains to be studied." Address: Dep. of Medicine, Div. of Clinical Research, Henry Lester Inst. of Medical Research, Shanghai, China.

924. Siegmeister, Walter. 1936. Are vegetarians suffering from lecithin and vitamin deficiency? *Naturopath and Herald of Health* (*New York City*) 41(4):101, 120-21. April.
• ***Summary:*** Vitamin D and lecithin, essential for good health and sound teeth, are both present in the soy bean. "After over 15 years experimentation on various vegetarian, fruitarian, fruit-and-nut, raw food diets–living for several years at a time on each in turn, the writer was still in great uncertainty as to the nature of the best diet for physical and mental health. At this time, he first came across the soybean. At first he was somewhat prejudiced against this bean, as he was against all other legumes, believing that it formed uric acid in the system as peanuts and other legumes have a tendency of doing. But after eating some soybean bread, cheese, and soybean milk powder, he observed that there was something present in these foods which his body craved."

Note: Talk with Gordon Kennedy of Ojai, California. 2002. Oct. 18. Walter Siegmeister also wrote under pen name of Raymond Bernard, especially in his works about eugenics. He was also interested in longevity. Address: PhD.

925. Carver, G.W. 1936. Re: Soybean milk, peanut milk, and coconut milk. Letter to Mrs. J.F. (Alice D.) Musselman, R.R. 2, Lebanon, Pennsylvania, May 8. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** On May 4, Mrs. Musselman wrote Dr. Carver asking if he knew of a small, hand-powered machine that could be used to press the oil from peanuts. "I have read of a process of using peanuts to make milk for feeding babies in Africa, where cow's milk cannot be obtained. We could follow this same formula in Sierra Leone, West Africa, where my work is, if we knew how to express the oil from the peanuts by a simple process." Friends, Mr. and Mrs. Hursh of Westerville, Ohio, "told me of your great work and your beautiful spirit."

Carver replies "I know of no small mill sufficient to express the oil from peanuts. I wish also to say that peanut milk is not made direct from the oil. It is made from the whole peanut.

"You can make a rather satisfactory compound in much the same way that you make soybean milk, that is, you crush the soybean thoroughly, put into a vessel, and cover with water. Heat to almost the boiling point, stirring constantly. Strain and cool, and it is ready for use. You can do peanut the same way, and make a very satisfactory product. Much the same process is used in the coconut, which makes a very satisfactory milk." Address: Director, Research and Experiment Station [Tuskegee, Alabama].

926. Kloss, Jethro. 1936. Re: Trip from Houston, Texas, to San Francisco. Letter to his daughter Promise Kloss, May 11. 1 p. Handwritten, with signature on letterhead. Facsimile printed in Back to Eden, 1981 ed. center insert section.
• ***Summary:*** This letter is of interest both for its contents–it shows a loving and caring father–and for its letterhead, which states in large letters: "Scientific Food & Benevolent Association." Below that, next to a photo of Kloss is typewritten: Jethro Kloss, President. Herbalist, Public

Lecturer, Food Scientist and Demonstrator. Manufacturers, Jobbers, and Distributors. Home address: Takoma Park Station, Washington, D.C. A typed description of the Association continues at the bottom of the page: "Distributors of non-poisonous herbs for medicinal and culinary purposes. A very practical course in nursing, including hydrotherapy. Scientific feeding for every purpose. Unexcelled substitutes for meat, eggs, cow's milk and butter–cooking, canning, baking and health foods. How to live better on less money. A marvelous line of foods made from the soy bean, and their cultivation. Send for description of new book 'Back to Eden' (revised edition) revealing astounding truths on prevention of disease and revolutionary food and health methods not published before." Address: 913 Yale St., Houston, Texas.

927. *Agricultor Venezolano* (*El*) (*Ministerio de Agricultura y Cria, Caracas*). 1936. El cultivo de la "soya" [The cultivation the soybean]. 1(1):24. May. [1 ref. Spa]
• ***Summary:*** A short paragraph at the top of the article states: We have translated the monthly bulletin of the Royal Bank of Canada [actually The Royal Bank of Canada Monthly Letter, April 1936] which discusses the extraordinary importance acquired recently by the soybean, an agricultural product whose cultivation is being tested in Venezuela. The intensification of this crop in our country can come to signify a new and important source of national wealth.

The article begins: "To many people, the soybean has an oriental flavour; they know it as the basic ingredient in some of the most famous English meat sauces [Worcestershire, etc.] and have heard that it is an important Manchurian export. Against this background it is something of a surprise to learn from the *Wall Street Journal* of February 17, 1936, that in the previous year it had become, from the viewpoint of cash return to the farmers, the fourth most important cereal crop in the United States. The crop of 1934 was about 50 per cent larger than that of 1933 and the crop of 1935 was doubled that of 1934."

The many uses of the soybean are discussed, including soybean flour (with and without the original oil content of the seed), soybean milk, butter, cheese [tofu], and coffee. Among industrial uses, in 1934, 10 million lb of soybean oil were used by the paint industry in the USA. "In varnish and lacquers soybean oil is the principal base. The Ford car is finished with a soybean lacquer and the Ford Company is erecting a $5,000,000 plant in Detroit [Michigan] to make soybean products. In soaps, glues, linoleums and rubber substitutes, the ingredients of the soybean have come to be of predominant importance."

928. The Royal Bank of Canada Monthly Letter, April 1936. 1936. In: National Research Council of Canada. 1936. Proceedings of the Second Conference on Soybeans. Ottawa, Canada. 18 p. See Appendix C, p. C1-C2. Held on 4 May 1936 in the National Research Building, Ottawa, Ontario, Canada. [1 ref]
• ***Summary:*** An overview of the rapid growth of soybeans in the United States, and their potential as a crop in Canada. "To many people, the soybean has an oriental flavour; they know it as the basic ingredient in some of the most famous English meat sauces [Worcestershire, etc.] and have heard that it is an important Manchurian export. Against this background it is something of a surprise to learn from the *Wall Street Journal* of February 17, 1936, that in the previous year it had become, from the viewpoint of cash return to the farmers, the fourth most important cereal crop in the United States. The crop of 1934 was about 50 per cent larger than that of 1933 and the crop of 1935 was doubled that of 1934."

The many uses of the soybean are discussed, including soybean flour (with and without the original oil content of the seed), soybean milk, butter, cheese [tofu], and coffee. Among industrial uses, in 1934, 10 million lb of soybean oil were used by the paint industry in the USA. "In varnish and lacquers soybean oil is the principal base. The Ford car is finished with a soybean lacquer and the Ford Company is erecting a $5,000,000 plant in Detroit [Michigan] to make soybean products. In soaps, glues, linoleums and rubber substitutes, the ingredients of the soybean have come to be of predominant importance."

929. *Chicago J. of Commerce and La Salle Street Journal.* 1936. Soy bean field study is urged: Illinois manufacturers advised to investigate possibilities for use. June 2. p. 12.
• ***Summary:*** "Illinois supplies considerably more than one-half of the entire yield of soy beans in the United States."

"Some of the best known industrial uses for soy beans are soy bean milk, soy chocolate, soy sauce and other foods, including confectionery. It is used for feeding live stock by packing companies and baking companies substitute a portion of soy bean flour for wheat flour in bread. There is an increasing demand for soy bean oil in edible products, in paint, varnish, linoleum, soap and in foundries for core binding purposes. It is also utilized in glue.

"'Horn buttons, insulation material, tool handles are being made in increasing quantities from the residue of soy beans after the oil has been extracted.'"

"Fifth in State's Crops: 'The soy bean crop is now fifth among the various farm crops of the state, both in harvested acreage and in gross farm value.'"

930. LeClerc, J.A. comp. 1936. Partial list of references on soybean milk. Washington, DC: Food Research Div., Bureau of Chemistry and Soils, USDA. 4 p. June 16. Unpublished manuscript. [50 ref]
• ***Summary:*** The 50 references are listed in chronological order, from Trimble (1896) to Castagnol (1934). Address: Food Research Div., Bureau of Chemistry & Soils, USDA, Washington, DC.

931. Breedlove, L.B. 1936. Soy bean–The magic plant: Source of manifold foods for man, woman, and child. Article VIII. *Chicago J. of Commerce and La Salle Street Journal.* June 18. p. 12.

• ***Summary:*** Contents: Introduction (experiments on the diet of prisoners; the scientific knowledge of foods in relation to life and work). Removing bitter taste. Composition of soy flours. The count in amino acids.

One table shows the average composition of five types soy bean flours made from: (1) whole soybeans, (2) high fat content cake, (3) medium fat content cake, (4) low fat content cake, (5) solvent extracted cake. Flour made from whole soybeans contains 20.45% fat and 36.63% protein. Flour made from solvent extracted cake contains 1.58% fat and 68.74% protein. A second table gives the "Composition of the principal protein of various grains," as follows: Barley (hordein). Oats (glutelin, gliaden). Rice (globulin, glutelin). Rye (gliaden, glutelin). Wheat (glutin, gliadin, glutenin, leucosin). Soybean (glycinin). Navy bean (phaseolin).

A large diagram titled "Uses of the soy bean," shows 91 different uses. For example: The plants can be used for green manure, forage, pasture, or soiling. The beans can be used to make meal, oil, dried beans, and green beans. The oil can be used to make 13 different non-food industrial products plus food products and lecithin. These food products include butter substitute, lard substitute, edible oils, and salad oils. Lecithin is used in leather tanning, candy manufacture, medicines, and as an emulsifier. The dried beans can be made into 9 foods and beverages plus stock feed. The "vegetable milk" can be made into bean curd (which can be used fresh, dried, smoked, or fermented), "condensed soy milk, canned soy milk, fresh soy milk, soy milk powder, and soy casein." The casein can be made into "paper sizing, paints, textile dressing, waterproofing for textiles, drugs, or synthetic wool." Green beans can be used as a green vegetable, canned, or in salads.

"History indicates that the Chinese because of the soy bean were first among racial groups to have a well-balanced diet, and being better nourished, they were for centuries able consistently to drive off the barbarians.

"Western nations took little interest in diet other than that which grew up in the customs born out of trial and error methods. For more than one hundred years after experiments on prisoners began, the whole matter was looked upon as one of economy for the state and it was not until Carl von Voit laid down seventy years ago, his famous dictum, i.e., a man doing little work should have daily 118 grams of proteins, 500 grams of carbohydrates and 56 grams of fat, that any interest in a diet providing sufficient nutrition became manifest."

Note 1. This is the earliest English-language document seen (Aug. 2003) with the term "soy casein" to refer to isolated soy protein products.

Note 2. This is the earliest English-language document seen (Dec. 2004) that uses the term "synthetic wool" to refer to spun soy protein fiber used like a textile fiber (such as wool). Address: Staff member, Chicago Journal of Commerce.

932. Breedlove, L.B. 1936. Soy bean–The magic plant: Source of manifold foods for man, woman, and child. Article X. *Chicago J. of Commerce and La Salle Street Journal.* June 23. p. 11.

• ***Summary:*** Introduction and composition of "soy milk" (also called vegetable milk and soya milk). Producing soy bean milk (method of Max Adler). Food for diabetics. Curd base for many dishes (To Fu). American soya sauce superior.

"Soy bean milk is now produced, on a factory basis, in this country by five companies, of which three offer the soy milk in powdered form."

"The addition of magnesium or calcium salts or lactic acid to soy milk when hot, precipitates out a good part of the protein, forming a grayish white curd, leaving a yellow water liquid [whey]. This curd, after being drained and pressed, is the product known as 'To Fu,' which is an extensive article of diet among oriental, and also forms the basis for numerous fermented, smoked and dried cheeses in China and Japan. In all of the large cities of this country having a large oriental population such curd, made fresh each day, may be found in the food stores which cater to such populations.

Such cheeses or curds have not yet appealed to the occidental taste. They seem too strong in flavor and are of a sponge-like consistency... With the newer methods of conditioning the beans, it seems quite likely that the curds–not unlike cottage cheese–may be more palatable to the western taste.

"On the oriental table these curds, prepared in an infinite number of ways–it is said that most any self-respecting oriental chef knows at least 500 recipes–may appear in one form for an appetizer, in another form as the 'meat' course, in another as the salad, and in still another as the dessert."

"American soya sauce superior: Soya sauce, used extensively by oriental peoples in cooking, as a relish or condiment to increase the flavor of all dishes and as an aid to food assimilation, is made by crushing and grinding a mixture of cooked [soy] beans and pulverized barley, inoculating with a culture known as rice ferment and leaving in vats for six to eighteen months to ferment. The juice is then drained and filtered, salt and spices added.

"The recipe for this dark-brown liquid, used on chop suey and other typical dishes, has been a closely guarded secret handed down for generations in a limited number of Chinese families. However, within the last few years, the chemists of one American firm [Oriental Show-You Company, Columbia City, Indiana] discovered a more satisfactory recipe and the output of this factory, making the sauce from domestic beans, has so captured the market in

this country among the oriental reared citizens that imports of the sauce have been greatly reduced."

"Until very recently, when methods were found to remove the bitter taste, very little soy bean oil was used in this country for edible purposes. When properly treated, however, soy bean oil may serve in any one of the three important uses–either in lard substitutes, in margarin [margarine], or in cooking oils." Address: Staff member, Chicago Journal of Commerce.

933. **Product Name:** Sobee (Infant Food).
Manufacturer's Name: American Soya Products Corp.
Manufacturer's Address: Evansville, Indiana.
Date of Introduction: 1936. June.
New Product–Documentation: International Inst. of Agriculture. 1936. Manufacturers of soy products. p. 205. States that American Soya Products Corp. in Evansville, Indiana is the manufacturer of this infant food.

Note: This is the earliest known branded soy-based infant formula worldwide.

934. *Times of India* (*The*) (*Bombay*). 1936. Cultivation of soya bean: Nutritional value to India. July 16. p. 8.
• ***Summary:*** This excellent article about the soya bean, containing many photos, recently received from the USA, discusses the remarkable number of uses to which this farm crop is being put in America. It is only natural to ask whether its cultivation is being promoted in India. Soyabean milk is mentioned.

935. Live Food Cafeteria. 1936. Health Ice Cream (Ad). *California Health News* (*Hollywood, California*) 4(14):6. July 17.
• ***Summary:*** "From soy bean milk, fresh fruit, honey. A refreshing food. We make it. Delicious salads from garden to you. Send for free literature and health hints."

Note: This ice cream was served in the Richter's raw-food cafeteria; we have no evidence that it was a commercial product, sold elsewhere. Address: 325 West Third St., Los Angeles, California.

936. **Product Name:** Soy Milk (Canned). Condensed and Canned by 1940. Brand-named Soygal by April 1942.
Manufacturer's Name: Battle Creek Food Co.
Manufacturer's Address: Battle Creek, Michigan.
Date of Introduction: 1936. July.
Wt/Vol., Packaging, Price: 10 oz can.
New Product–Documentation: L.B. Breedlove. 1936. *Chicago J. of Commerce and La Salle Street Journal.* June 25. p. 14. "Soy bean–The magic plant. Article XI." "Battle Creek Food Factory, Battle Creek, Michigan: Milk (canned)."

Price List. 1940. 10 oz. can.

Good Health (Battle Creek, Michigan). 1942. April. p. 52-53. "Cow's milk a common cause of allergy." Soybean milk, now available under the commercial name of Soygal, is "wholly free from the unpleasant taste of the soybean."

937. Burlison, W.L. 1936. The soybean. A plant immigrant makes good. *Industrial and Engineering Chemistry* 28(7):772-77. July. [23 ref]
• ***Summary:*** Contents: Introduction and brief history. Description of the bean. Soybean culture. Industrial uses. Imports. Composition of soybean seed. Composition of soybean oil. Composition of soybean-oil meal. Methods of processing soybeans for consumption: Expeller method, hydraulic-press method, solvent extraction process. Disposition of the domestic crop. Products derived from soybeans. Industrial use of soybean oil. Soybean oil in the paint industry. Soybean oil as a core binder. Other uses for soybean oil: Lecithin, sulphonated oil. Plastic industry. Soybean glue. Further investigation needed.

This article begins: "The soybean is one of the oldest crops grown. It was described in a Chinese book on Materia Medica, *Ben Tsao Gang Mu*, written by Emperor Shen-Nung about 4800 years ago... Soybeans were introduced into the United States in 1804, yet a hundred years there were very few grown outside the southern states."

The section titled "Products derived from soybeans" (p. 775) contains an extensive list of commercial food, feed, and industrial products derived from soybeans and compiled from letters received by the University of Illinois during the latter part of 1931. "This list is increasing from month to month." Some products have brand names and others only generic names. The following products were on the market in the USA and Canada at that time.

"Food products: Soybean flour. Soybean-meal flour. Refined edible soybean oil. Soybean salad oil. Chocolate bars (30% soybean flour). Cocoa (up to 60% soybean flour). Sausages (up to 50% soybean flour). Bread (7½% soybean flour). Rolls (10% soybean flour). Macaroni (20% soybean flour). Soybean muffins. Soybean cookies. Soybean doughnuts. Vegetable shortening. Infant foods. Diabetic foods. Oleomargarine. Lard substitutes. Filled sweets. Soybean sprouts. Soybean cheese. Soya cream biscuits. La Choy soy sauce. Zoybeans (cooked beans). Bacon and Zoybeans. Zoy bouillon. Casein gluten flour. Non-fat mayonnaise. Fatless spread. Soyex-malt-cocoa drink. Soybean milk. Soybean ice cream.

"Feed products: Cake or meal. Commercial feed. Dairy feed. Hog chow. Poultry chow. Dog chow. Calf chow. Rabbit chow. 34% protein chow chow. Chick Startena.

"Industrial products: Paint. Varnish. Enamels. Oilcloth. Linoleum. Printers' ink. Glycerol. Celluloid. Lauxtex plastic

wall coat. Lauxtein waterproof soybean glue. Lauxein emulsifier. Soap. Core binders. Rubber substitutes. Plastics."

Photos show: (1) "A beautiful field of Illini soybeans, a variety extensively used for industrial purposes." (2) "A soybean plant loaded with pods and ready for harvest.

Tables show: (1) "Utilization of soybeans and soybean products in 1930" For example: Soybeans ground for food: 200,000 bu (bushels). Soybean oil used in various edible products: Oleomargarine: 750,000 lb. Lard substitutes: 500,000 lb. Other food products: 4,750,000 lb. Soybean oil used in industrial products: Paint and varnish: 9,000,000 lb. Linoleum and oilcloth: 4,000,000 lb. Soap kettle: 8,500,000 lb. Soybean meal used in: Commercial feed: 84,100 tons. Other 15,000 tons. Soy flour for food: 850 tons. Infant and diabetic foods: 50 tons. Other uses, including glue: 10,000 tons.

Table 2: "Adaptability of soybean oil to various products." Drying products: Paint, varnish, linoleum and oilcloth, waterproof goods. Soap products: Hard soaps (toilet, household, laundry), soft soaps (shampoos, automobile soaps). Edible products: Lard compounds, cooking oils, salad oils, fountain drinks, candy, mayonnaise, margarine. Miscellaneous: Foundry core oil, printers' ink.

Note: A revised and considerably expanded version of this article, with the same title and author but a somewhat different format, was published two months later as *Illinois Agric. Exp. Station, Circular,* No. 461. 15 p. Sept. Address: Univ. of Illinois, Urbana, Illinois.

938. **Product Name:** Soyol (A Vegetable Milk Substitute).
Manufacturer's Name: Dr. Julius F. Muller.
Manufacturer's Address: New Brunswick, New Jersey.
Date of Introduction: 1936. July.
New Product–Documentation: L.B. Breedlove. 1936. *Chicago J. of Commerce and La Salle Street Journal.* June 25. p. 14. "Soy bean–The magic plant. Article XI." "Muller, Dr. Julius F., New Brunswick, New Jersey: Soyol (a vegetable milk substitute)."

939. Lohse, H.W. 1936. The soya bean as a food product and industrial raw material. *Canadian Chemistry and Metallurgy* 20(7):224-25. July. (Chem. Abst. 30:6505).
• ***Summary:*** Contents: Introduction (incl. nutritive value of soybeans). Proteins and fats. Vitamins of soya bean. Soya bean as a food product. Soya bean milk. Soya bean flour. Soya bean oil (obtained by solvent extraction process, hydraulic press process, or expeller process; food and industrial uses). Uses for extracted meal (food and industrial; including lecithin).

According to statistics from the Dominion Bureau of Statistics, consumption of soya bean oil in Canadian manufacturing industries was as follows: Miscellaneous food industries 499,451 lb, slaughtering and packing 169,916 lb, bakeries 112,693 lb, and biscuits & confectionery 20,200 lb. Total: 802,260 lb worth $48,062.

Concerning soya bean milk, the author states in this paper presented at the Canadian Chemical Convention: "Soya bean milk has been manufactured here in Canada by Milqo Limited in Hamilton since 1919. This firm erected one of the first, if not the first, plants for the purpose of this manufacture on a large scale in the Western world." Milqo Ltd. (which may be related to Vi-tone or Vitone in Hamilton) is probably the same company in Hamilton that was named Milk-Ko Products in 1954 (Soybean Blue Book p. 102). Address: Milqo Ltd., Hamilton, ONT, Canada.

940. Monnier, Emile. 1936. La graine de soja: Les préparations à base de graines de soja dans l'alimentation des Annamites [The soybean seed: Preparations based on soybeans in the diet of the Annamites (of Central Vietnam)]. Marseille, France: Imprimerie Ant. Ged. 106 p. 24 cm. [91 ref. Fre]
• ***Summary:*** The title pages states that this is the published version of the author's PhD thesis at the Mixed Faculty of General and Colonial Medicine, and of Pharmacy at Marseille. The thesis was presented and defended before the Faculty of Medicine of Marseille on 10 July 1936 to obtain the degree of Doctor of Pharmacy. The author was born on 19 Nov. 1905, at Sarzeau (Morbihan); he is a *Licencié ès Sciences, Pharmacien-Capitaine des Troupes Coloniales.*

Contents: 1. Introduction. 2. The soybean: Historical summary and overview. Soybean botany, the production of soya; its cultivation in Indochina, soybean commerce and trade, chemical composition of the soybean seed (analysis of soybeans from Tonkin), the chemical constituents of the soybean seed, soy oil, food use of soya in Europe, industrial uses of soya, soya in therapeutics and dietetics. 3. Soy-based food preparations from Indochina: Soymilk, the fermentation and preservation of soymilk, tofu (*dâu-phù*), soy sauce, yuba (La crème de soja, *dâu-phù-chuc*). 4. Conclusion.

941. **Product Name:** Health Breads, Cookies, Date Bars, Soy Bean Sprouts, Soy Oil, Soy Milk, Soy Cheese, Soy Flour.
Manufacturer's Name: Soybean Health Products Company.
Manufacturer's Address: Oakland, California.
Date of Introduction: 1936. July.
New Product–Documentation: L.B. Breedlove. 1936. *Chicago J. of Commerce and La Salle Street Journal.* June 25. p. 14. "Soy bean–The magic plant. Article XI." "Soybean Health Products Company, Oakland, California: Health breads, cookies, date bars, etc.; soy bean sprouts, soy oil, soy milk, soy cheese, soy flour."

942. Siegmeister, Walter. 1936. Soy beans. *Nature's Path to*

Health (*Melbourne, Australia*). Aug. 15. p. 25-26.
• ***Summary:*** "Soy Beans contain a Complete Protein which can replace the proteins of meat, eggs, and milk.

"The verdict of modern biochemistry is that the alkalinity of the blood is the basis of physical and mental health, while a rise in acidity means lowered vitality and increased susceptibility to disease. Therefore it is of the highest importance to keep the blood alkaline. To do so, we must avoid acid-forming foods, consume those with an alkaline ration, and above all, thoroughly oxygenate the lungs with pure oxygen. Unless carbon dioxide is removed as quickly as it forms, there will be a rise in the carbonic acid content of the blood which means increased acidity.

"Chief among the acid-forming foods are meats, fowl, fish, eggs and grains. Flesh foods putrefy readily and hence are causes of constipation and intoxication... The soy bean is highly alkaline (as are potatoes and bananas)... It is one of the few vegetable proteins with a full biological value equal to that of meat, eggs, or milk. Soy bean powder [flour] dissolved in water makes a milk which has been found by experiments to be able to replace cow's milk in the feeding of infants."

"Butter is acid-forming; so are most vegetable oils. Soy bean oil is the only oil found to be alkaline in reaction and to contain vitamin D..."

Note: This is the earliest document seen (June 2002) concerning a vegetarian diet and mental health. Address: PhD.

943. Brewster, Clara M. 1936. The Soya bean: A four-star food. *Horizon* (*Tempo Books, New York City*) 1(3):9, 26-27. Aug.
• ***Summary:*** "Like the Fountain of Youth, the Perfect Food is a myth. There is, however, a well-nigh ideal substitute. It is 5,000 years old, yet fully appreciated only so recently that it can well be called the food of tomorrow. This food is the Soya bean–a four-star tiny seed, with one star for its exceptionally fine and healthful chemical composition, one star for its cheapness, one star for its taste, and the final star for its adaptability, which makes it a blessing to every health-minded housewife!

"In the Orient, the Soya bean takes the place of meat, eggs, milk, cheese, butter and wheat. Over its supply wars have been fought. On a diet of it entire races have been nourished and thrived. To approximately half the population of the world, it is food and drink day in and day out.

"And it is no wonder. An analysis of the chemical composition of the Soya bean shows that it is composed of 40% protein, 20% fat, and the rest is balanced carbohydrates and minerals. Also, research has shown that the Soya bean contains all the vitamins, both the fat-soluble and the water-soluble."

"The Soya bean is a complete vegetable protein containing all of the amino acids in assimilable form; one pound of Soya beans equals the protein value of two pounds of beef, which is much more expensive. Also, quite the opposite of meat, which is highly acid forming, the Soya bean is alkaline, possessing more than twenty times the alkalinity of cow's milk."

From Soya beans we can make Soya bean milk, oil, "a perfect substitute for lard and other kinds of indigestible shortening," a substitute for fresh butter (when the lard substitute is colored with a bit of carrot juice and seasoned with a little Nu-Vege-Sal), a delicious flour (good for use in pancakes, soups, etc.), toasted soya bean (which resemble peanuts in flavor and texture), coffee substitutes and chocolate substitutes (from toasted soya beans–alkaline in reaction and minus all harmful stimulants), toasted soya flour (which has a nut-like flavor), sprouted soya beans, green vegetable beans (picked when the plant is three quarters ripe; they are easy to shell after boiling in the pods for five minutes), tofu (one of the most popular foods made by the Chinese from soya beans, it is a cheese resembling our cottage cheese but pressed into cakes), the curds used to make soya cheese (use in salads or other recipes calling for cottage cheese).

"There are 250 varieties of soya beans. Recipes are given for: Soya beans a la Hauser (boiled [whole dry] soya beans, seasoned with Nu-Vege-Sal and made into a casserole). Raw soya bean salad (with sprouted soya beans). Soya milk. Clabbered soya milk ("The pulp [okara] strained out of the milk may be used in a multitude of ways..."). Mock oyster patties (with 1 cup soya pulp). Soya muffins (with 2 cups toasted Soya Flour). Soya waffles (with soya flour). Soya fiddle sticks (with soya flour, raw sugar, dates, and nuts). Soya flour fruit cake. Soya sand tarts (with soya flour).

Note 1. Nu-Vege-Sal ("Nutrofied salt") is made by Modern Health Products (Milwaukee, Wisconsin), which has a full-page ad in each issue and also makes Swiss Kriss (natural herbal laxative), Sym (formerly called "Slim"), Vitana (ripe banana food), Santay Swiss Teas, Santay Meatless Bouillon, Sea Greens ("sea vegetables" in tablet form), Sipp (drink instead of coffee), and Aydee Vitamin Tablets.

Note 2. This stylish, spiral bound, quarterly magazine, edited by Bengamin Gayelord Hauser, began publication in early 1936. It is published by Tempo Books (580 Fifth Ave., New York City), the publisher of Hauser's many books with titles like *Eat and Grow Beautiful, Food Science and Health, Harmonized Food Selection, New Health Cookery, Types and Temperaments, Dictionary of Foods, Child Feeding* (written for mothers), *Health Day* (*Gesundheitstag*), *Here's How To Be Healthy* (sensational "health cocktails"). Focusing on "Health, beauty, vitality," it emphasizes that all are related to a good diet. Hauser (whose full-page, dapper photo appears near the front of issue no. 1) "has been called into consultation by the world's most beautiful women, stars of

the stage, screen and opera; and for the past two summers he has been Dietetic Director of Elizabeth Arden's exclusive 'Siesta' in Maine." Hauser appears to advocate a vegetarian diet (though he does not say so); he makes no mention of meat, fish or poultry in the text or recipes in the first four issues.

944. Grulee, Clifford G.; Sanford, Heyworth N. 1936. The influence of breast and artificial feeding on infantile eczema. *J. of Pediatrics* 9(2):223-25. Aug. [1 ref]
• ***Summary:*** Soy is not mentioned. Address: Both: M.D., Dep. of Pediatrics, Rush Medical College, and the Infant Welfare Soc. of Chicago.

945. Kellogg, John Harvey. 1936. Regimen and technic for changing the intestinal flora. *Good Health* (*Battle Creek, Michigan*) 71(8):230-33. Aug.
• ***Summary:*** The author offers a four-step plan which "has been found efficient in the treatment of hundreds of cases requiring change of the intestinal flora." These include: "1. Liberal carbohydrate feeding (Lactose, Dextrin, Lacto-Dextrin). 2. Discarding of flesh meats (Combe) of all sorts. 3. Increasing the activity and efficiency of the colon so as to secure complete clearance of the intestinal tract at least once in twenty-four hours. 4. Liberal feeding of a potent culture of *L. acidophilus.*

In place of "animal proteins," one should use "milk and vegetable proteins." Note that "milk proteins are less putrescible than are flesh proteins, and besides are protected against putrefaction by the presence of lactose." "The peanut and the soy bean supply a high percentage of protein of most excellent quality... The soy bean provides a basic protein of high quality, and is rich in food minerals and vitamins and has the added advantage that it stimulates the development of the protective flora. This gives to the soy bean special value in efforts to change the flora by special feeding. All soy bean products are to be recommended, especially a milk prepared from this legume which closely resembles ordinary milk in appearance and composition."

Avoid all medical laxatives, which seriously interfere "with the effort to develop or implant a protective flora... Only purely physiologic means may be employed, such as liberal increase of bulkage (Kaba, psyllium seed, agar) and the enema."

946. Associated Press (AP). 1936. A vegetable wonder. *Advertiser* (*Montgomery, Alabama*). Sept. 8.
• ***Summary:*** "The soy bean is an immigrant from China... In Detroit, Mr. Ford is building a $5,000,000 plant to make soy bean products. He finishes all his cars with soy bean lacquer [paint].

"The soy bean is also being canned for human consumption. So versatile is this remarkable vegetable that there is soy bean milk, butter, cheese, coffee, breakfast foods, and macaroni on the market. It is remarkable because of a complete absence of starch and a high protein content. In soy bean flour the protein runs from 37 to 40 per cent, and has a high nutrition value."

Note: A cartoon on the same page tells the life story of George Washington Carver. "George worked his way through college. He extracted an oil from peanuts which has been used in treating infantile paralysis. Now, Dr. George Washington Carver, whose parents were slaves, is a great scientist–one of the few Americans to become a member of the Royal Society of Arts, London."

947. *Times of India* (*The*) (*Bombay*). 1936. Use of soya milk suggested. Sept. 8. p. 15.
• ***Summary:*** Dr. K.D. Dadachanji, who practices medicine in Bombay, has strongly urged the "adoption of vegetable soya milk as a substitute for cow's or buffalo milk." He says that it can be made for less than a pice per seer if prepared at home–and for still less if made in a modern factory.

He says that soya milk is widely used by the people of China, Korea, and Japan to good advantage. If the Municipal Corporation of Bombay were to start a soya milk factory in that city, he says, the problem of pure milk supply could be solved.

Note: This is the earliest of 117 articles or ads seen (Sept. 2010) in *The Times of India* that contains the term "soya milk," or that mentions soya milk (regardless of how it is spelled) in connection with India.

948. Meade, Mary. 1936. Soy beans are new dish on American table. *Chicago Daily Tribune.* Sept. 9. p. 26.
• ***Summary:*** It has taken agricultural America a long time to discover the soy bean. For centuries it has been a valuable human food in the Asiatic diet, "but only within the last few years has it come to the American table. And in what variety!" We have fresh and dried soy beans. We are using soy bean flour to make breads, drinking a soy bean milk, and cooking many of our foods in soy bean oil. "There is a soy bean 'coffee' on the market, a soy bean butter, which resembles peanut butter, soy sauce, and a roasted soy bean which is eaten like peanuts and which is gaining in popularity every day."

Soy beans are a valuable food, rich in "good quality protein and having a superior caloric content." Their low starch content makes them valuable for diabetics. Describes how to cook fresh soy beans and dried soy beans.

"Among the most edible varieties of soy beans are Easycook, Mammoth Yellow, Manchu, Dunfield, and Haberlandt. All are light in color." Gives a recipe for Soy bean nut bread; the nuts are chopped tree nuts.

949. Desai, Mahadev. 1936. Soya bean for the poor. *Harijan* 4(33):259. Sept. 26.
• ***Summary:*** "Sir Courtney Terrell, Chief Justice of the

Patna High Court, had a long interview during his visit to Japan with Prof. Saiki, Director of the Japanese Bureau of Nutrition, who showed him the various processes of making simple food products from soya bean for the poor people of India. Sir Courtney, it is interesting to note, writes with special reference to Bihar. The first is the preparation of *satu* [which resembles roasted soy flour] and the second is the preparation of milk. About the *satu* preparation he writes:

"'About two seers [i.e. 4 pounds] of bean preferably of the large white hard Manchurian variety, were heaped upon an iron or earthenware dish and this dish was placed over a fire, the dry beans being continuously stirred with a wooden spoon. When they assumed a golden brown colour they were allowed to cool and then ground in a small stone hand mill of the kind commonly seen in Indian prisons for preparing *atta.* The beans were reduced to a fine soft powder and the entire bean was ground without any waste. The flour so produced is already cooked and it may be used in any of the ways now known in India in connection with *satu.'*

"The process of preparing milk that Sir Courtney describes is rather elaborate. Far simpler is the recipe by Benjamin Hansen, the well-known Viennese Food Scientist." Address: India.

950. Burlison, W.L. 1936. The soybean. A plant immigrant makes good. *Illinois Agricultural Experiment Station, Circular* No. 461. 15 p. Sept. First printed in Industrial and Engineering Chemistry. 1936. 28(7):772-77. July. [24 ref]
• ***Summary:*** A shorter version of this article, with the same title and author but a somewhat different format, was published two months earlier in *Industrial and Engineering Chemistry* 28(7):772-77. July.

Contents: Introduction and brief history. Description of the soybean. Soybean culture. Industrial uses. Disposition of the domestic crop. Products derived from soybeans: Food, feed, and industrial products. Imports. Chemical composition: Soybeans, soybean oil, soybean oil meal. Methods of processing soybeans: Expeller, hydraulic-press, solvent extraction. Industrial use of soybean oil. Use of soybean oil in the paint industry. Soybean oil as a core binder. Other uses for soybean oil: Lecithin, sulphonated oil. Plastic industry uses soybean oil meal. Glue from soybean oil meal. Soybean oil meal for fertilizers. Further investigation needed.

The section titled "Products derived from soybeans" (p. 6-7) gives is an extensive list of commercial food, feed, and industrial products derived from soybeans. This list is almost identical to that published two months earlier. Address: Chief in Crop Production.

951. Fors, Alberto J. 1936. El frijol soya, materia prima para la produccion de aceite [The soybean, raw material for the production of oil]. *Revista de Agricultura* (*Cuba*) 19(8-9):64-66. Aug/Sept. [Spa]

• ***Summary:*** Briefly describes the importance of the soybean as a raw material for the production of oil. At the end of the article are listed the products obtained from the soybean. These include 24 food products (incl. refined soy flour, refined soy oil, chocolate and cocoa with soya, sausages with soy flour, soy bread, soy macaroni, gluten flour and soy casein, soy lard (*mantecado de soya* = shortening), foods for children and diabetics, oleomargarine, soy sprouts (*retoños de soya*), soy cheese (*queso de soya* = tofu), biscuits made with soy cream, La-Choy soy sauce, soya bouillon, low-fat soy mayonnaise, soymilk), 6 concentrated feeds for domestic animals, and 14 industrial soy products (incl. paints, enamels, linoleum, glycerine, varnish, artificial adhesive rubber, candles, lubricants).

The article begins: "The soybean (*el frijol soya*) is a bush which grows to a height of, at most, 3½ feet, but its industrial possibilities and its agricultural worth are gigantic. One cannot explain why the cultivation of this plant in Cuba is still at the test stage. During the past year of 1935, the United States harvested not less than 24 million quintales [1 quintal = 100 pounds] of this bean. The soybean also does well in our climate and in the majority of our soils, with the advantage over the black bean that two crops per year can be harvested.

"We are importing for our consumption about 6 million kg of oil extracted from this bean which, with some industrial products derived from the same, represent an annual expenditure which approximates, on average, one million pesos. The soybean is not a future possibility: it is money in the hand of those who plant it. Cuba has oil extraction plants which can process all the soybeans we can harvest. Why don't you plant soya? Not only do we import large quantities of soy oil, for we are large consumers of oils and fats, but we also bring in concentrated feeds for milk cows, chickens, and various other substances derived from the soybean." The article ends with these words written in large letters: Plant soybeans! Address: Propagaganda de la Inspeccion Provinical de Agricultura de la Habana. A Cargo de Ingeniero A.J. Fors.

952. *Good Health* (*Battle Creek, Michigan*). 1936. Soy milk versus cow's milk. 71(9):275. Sept.
• ***Summary:*** This editorial argues that soy milk is healthier and less subject to food-borne diseases than cow's milk. "The use of soy acidophilus milk is also recommended because it encourages the growth of *acidophilus,* the protective germ which stands guard in the intestine to prevent invasion by the disease-producing organisms."

953. *Good Health* (*Battle Creek, Michigan*). 1936. Heating milk prevents injury to persons sensitized to it. 71(9):280. Sept.
• ***Summary:*** "A better plan is to substitute milk prepared from the soy bean or cow's milk when the latter is found to

disagree. Soy milk looks like cow's milk, has essentially the same nutritive value when dextrin or milk sugar is added, and when properly prepared, has an agreeable flavor which infants do not dislike.

"Infants also profit greatly by the use of cultured soy milk, known as Soy Acidophilus Milk."

"Soy milk may now be obtained in condensed form, put up in tins resembling various brands of condensed cow's milk. It is hoped that a good quality of powdered soy milk may be available in dried form."

954. Lager, Mildred. 1936. New items. *House of Better Living* (*Newsletter, Los Angeles*) 3(10):3. Sept.
• ***Summary:*** "Dry Soy Milk, ready to mix with water. Soy Cocolette–soy milk cocoa not sweetened. Soy steel cut coffee. Soy milk prepared ice cream powder. Soy milk and soy milk chocolate bars. Soy milk and soy milk chocolate diabetic candy. Soy Gluten Noodles and wafers. Red Soy Beans–cook in 25 minutes when soaked over night... Soy bean oil."

On page 4 are recipes for Soy bean loaf (with 1 can Loma Linda Soy Beans) and Soy bean thousand island dressing (with Loma Linda soy mince spread). Address: 1207 West Sixth St., Los Angeles, California.

955. Loma Linda Foods. 1936. Soy milk (Ad). *House of Better Living* (*Newsletter, Los Angeles*) 3(10):4. Sept.
• ***Summary:*** "... with a pleasing taste, and full of nutrition, Soy Milk is one of several Loma Linda Soy Products." A logo, with "Loma Linda Foods" written on a black oval background, shows the company's name. Address: [California].

956. Slawson, H.H. 1936. Agriculture's Jack of all trades: Introducing the versatile soybean with which you may either build automobiles or run them and in which many people see possibilities for farm relief without benefit of subsidy. *Nation's Business* 24(9):24-26, 94. Sept.
• ***Summary:*** Contents: Introduction. A program for soybeans (Regional Soybean Laboratory, Urbana, Illinois). Wood glue from soybeans (I.F. Laucks). Helps bread stay fresh. A twenty-year development.

Five years ago at the Univ. of Illinois soybean researchers searched the USA and Canada for commercial soy products; they collected about 100. "Today that list numbers more than 300 and the ball seems just beginning to roll."

On 1 July 1936 a systematic research program on soybeans was started at the University of Illinois at Urbana. Funded by the federal government, with 12 midwestern state agricultural colleges cooperating, an industrial research laboratory as been established in Urbana. Dr. O.E. May of USDA's Bureau of Chemistry has been placed in charge, with the "help of Dr. W.J. Morse, government scientist, who has made the study of soybeans his life work." The program will have three objectives: "1. Improvement of present industrial uses and development of new industrial uses for soybeans." 2. Research on the effects of different processes on the quality and quantity of soybean processes. "3. Facilities for testing different varieties as to adaptability for industrial use."

In 1930 a research chemist in a private laboratory developed a new method for improving the head of foam on beer–using soy flakes. "Today soybean beer flakes are being made on a commercial scale in Chicago and from there they are pouring into many of the country's biggest breweries."

In the Pacific Northwest, five new fir plywood factories (making a total of 23) have been constructed this year–because glue made from soybeans is less expensive than and superior to (incl. more water resistant) traditional plywood glues. Together with several pine plywood factories in California and British Columbia, they are using tons of the new soybean glue each day.

The initial impulse for this new industry came from automobile manufactures who complained that the plywood they were buying was not sufficiently water resistant. So the Pacific Coast Plywood Manufacturers Association sponsored a contest to find a new glue. A newcomer, I.F. Laucks, Inc., of Seattle [Washington], won with some soupy stuff that did not look like glue at all. And "today this soybean glue–its formula a trade secret–is the standard glue of the plywood industry. Mr. Laucks discusses the reasons for the success of this new glue: (1) Most important is its low cost. (2) Since soybeans are an annual crop, "production can be increased as the demand grows. This is not true of casein or blood, which are by-products of other industries more or less fixed in their production." (3) It is more uniform. (4) It is more "foolproof" than other water-resistant bases.

At Iowa State College, Dr. O.R. Sweeney is producing gasoline from soybean oil; he cracks it by heating to 350ºC using animal charcoal as a catalyst. He then distils one of the fractions. The first person to make petroleum from soybean oil was the Japanese scientist Satow, who made a calcium soap from the oil then subjected it to destructive distillation to get light, middle, and heavy grades of petroleum. Forty gallons of soybean oil yielded about 25 gallons of soybean petroleum, 33 pounds of glycerine (for use in explosives), and 480 cubic feet of combustible gas.

The U.S. paint industry was one of the first to make large use of soybeans–especially in Illinois. Soybean flour helps bread to stay fresh longer. Soybean lecithin is used by confectioners. Tanners use soybeans to increase the grease-absorbing properties of chrome leather. Textile manufacturers use it to make their fabrics soft, supple, and lustrous. It is also used by rubber makers, linoleum makers, soap makers, and sausage and wiener makers. Doctors prescribe soybean 'milk' (which is practically free of starch) for some babies and many diabetics. Even the family dog

now consumes soybeans, which are less expensive than meat and make his [or her] coat sleek and shiny.

"Not half the story of this amazing development has been told here. U.S. soybean production jumped from around 5 million bushels in 1925, to 18.6 million in 1934 and 39.6 million in 1935. Illinois is the leading sate.

"Almost two decades ago, when the first president of the American Farm Bureau Federation, James R. Howard, was beginning that organization's constructive efforts to aid agriculture by other means than politics, he made a remark which is just beginning to be appreciated at its full significance.

"'The surest relief for agriculture,' Mr. Howard said, 'will come from the production of new agricultural output that will go to industry rather than to the human stomach.'

"The response to that, so far as soybeans are involved, is seen in a recent government statement that at present more than 120 industrial concerns are making soybean products. They include about 35 soybean mills in ten states and a number of cottonseed mills which crush soybeans for oil and meal; 15 soybean flour mills; 20 soybean food products factories and more than 50 plants where various industrial commodities are fabricated from the magic soybean.

"It looks as if industry is beginning to know its beans."

Photos show: (1) A tractor in a field of piles of soybean hay pushing a device designed to speed the job of getting the hay to the baler. (2) A warehouse in Manchukuo filled with piles of round soybean cakes. Two men are carrying 3-4 each on one shoulder up a wooden ramp. (3) A workman standing by a vat filled with a thick white liquid. "The first step in making auto parts is to feed the [soy] bean fibers into the rills that mix them." (4) Black auto parts grown on the farm, with a pile of some soybean powder that has not yet gone to the press. (5) "Powdered soybean fibers fed into this press come out in the form of distributor terminal plates for automobiles."

957. Kellogg, John Harvey. 1936. Re: Soy beans, soy milk, and okara. Letter to Dr. A.A. Horvath at University of Delaware, Newark, Delaware, Oct. 5. 2 p. Typed, without signature (carbon copy).

• ***Summary:*** "I have your letter of Sept. 24th. We have harvested and canned our shell beans and have about 250 bushels of seed of the 78-day variety of beans... It is an excellent green bean variety.

"I have been using the Tokyo bean for milk and find it very satisfactory. Do you know any other varieties of beans equal to it or better? I need a few tons more beans for milk before the new crop arrives, which I understand will be in about two months. I do not find the Manchu or the Dunfield as good for milk as the Tokyo. I find the Tokyo is out of the market. Can you give me any helpful information respecting other varieties that are still available?

"As regards to the effects of soy beans on laying hens, I have not the precise information I ought to have, but I can tell you this: I fed the hens with the residue left after making soy milk. They did not like it very well even when it was mixed with other foods. I used it as a substitute for meat meal and was very much disappointed with the results. The number of eggs began to fall off almost immediately, the chickens lost weight and though I soon discontinued the use of the soy bean they did not seem to recover, but continued to deteriorate. I left them in charge of an experienced poultryman who has hens of the same variety... They began to moult very early and 25 to 30 per cent of them died. It appeared as though feeding with soy residue produced a permanently damaging effect.

"This experience was certainly very disappointing because I thought the soy bean would certainly prove a complete substitute for meat. I even tried to encourage the chickens by feeding them Savita mixed with the residue. This seemed to help a little, but not very much. If you can give me any light on this problem I will be greatly obliged.

"Very truly yours,"

958. Smith, Wesley. 1936. The march of finance: Trading in soy bean futures spotlights latest arrival in farm commodity king row. *Los Angeles Times.* Oct. 6. p. A18.

• ***Summary:*** Yesterday, trading in soy bean futures started on the Chicago Board of Trade. The soy bean has risen dramatically from a minor product on American farms to the "fourth most important cereal crop" in terms of cash returns to farmers last year. It is a "story of the romance of American agriculture and industry."

In 1909 the value of the soy bean crop in the USA was only $17,000. In 1919 the value was $1,085,000–a 64-fold increase in only 10 years. In 1935, the value had risen to $35,000,000. An estimated 600,000 American farmers grown soy beans; the harvested acreage in 1935 was 5,211,000 acres compared with less than 500,000 acres in 1917. In 1935 some 39,637,000 bushels were produced, compared to 5,131,000 in 1925.

Many new industrial uses of soy beans have been developed; it is used to make high-grade paints, soaps, as a binder for foundry cores, celluloid, candles, printing ink, glycerin, linoleum, rubber substitutes, lecithin, and many other products.

A range of foods are now being made and marketed in America: Soy bean flour (with or without the original oil content of the seed), soy bean milk, butter, cheese, coffee, biscuits, bread foods and macaroni. The beans themselves are canned.

"The soy bean cake, which is the residue when the oil has been extracted from the bean, is one of the most satisfactory types of fertilizer."

959. *Time.* 1936. "Little honorable plant." Oct. 12. p. 76, 78, 80. [1 ref]

• ***Summary:*** "Last year 'the little honorable plant' put $35,000,000 into the pockets of U.S. farmers, outranking in value rye and barley. Soybean trading had grown so active that the [Chicago] Board of Trade could no longer overlook it as a potential source of commissions. First futures transaction in soybeans in the Pit this week was 5,000 bu. sold by Archer-Daniels-Midland Co. to Bartlett-Frazier Co. at $1.20 per bu...

"A Yankee shipmaster brought the first soybeans to the U.S. in 1804... Yet no more than 500,000 acres were planted to soybean in the U.S. in any one year until 1917."

"In the U.S. some 600,000 farmers grow soybeans in 27 states." Illinois produced more than half the total U.S. crop last year.

"Food. Soybeans are ideal for diabetics because they contain little sugar, no starch. They do, however, contain more than three times the protein of wheat or eggs, more than twice that of lean meat. Soybean vitamins are A, B-l, B-2, D, E. For vegetarians and diabetics, the bean is converted into cheese, soup, butter, salad oil, macaroni, breakfast food milk (from grinding the beans in water). To bakers soybeans mean a new bread which is expected to break sales records. Last year vegetable shortenings and other lard substitutes required no less than 52,450,000 lb. of soybean oil, compared to a 1934 consumption of 2,735,000 lb."

"Factory. Each ton of soybeans yields 30 gallons of oil and 1,600 lb of meal. Industry takes the oil and the meal, uses one or both to make glue, paints, combs, candles, radios, buttons, axlegrease, paper size, explosives, linoleum, oilcloth, printer's ink, billiard balls, rubber substitutes, cigaret holders, Christmas tree ornaments. Last year U.S. manufacturers consumed 91,166,000 lb. of soybean oil, of which 2,550,000 lb. went into soaps, 4,800,00 lb. into linoleum and oilcloth, 13,000,000 lb. into paints and varnishes."

"Ford & Future... The number 1 U.S. soybean man is Henry Ford. His reason: 'If we want the farmer to be our customer, we must find a way to be his customer.' Henry Ford began investigating the beans in 1930, spent more than $1,000,000 in the next few years growing them, finding out how they could be used. Few months ago the River Rouge works got a $5,000,000 addition in the shape of a soybean processing plant. Into Ford cars at present go the product of some 60,000 acres of soybeans. The oil goes into glycerine for shock-absorbers, enamel for body finishes [paints], binder for foundry cores. The meal, turned into plastics, rolls off the assembly line as horn buttons, gearshift knobs, window-trims, distributor cases.

"Said Mr. Ford few months ago: 'You will see the time when a good many automobile parts will be grown.'"

A portrait photo shows Henry Ford with the caption, "Motormaker Ford. A bean's best friend."

Note: This is the earliest document seen that mentions the "assembly line" in connection with Henry Ford. Mass production was pioneered on the Ford moving assembly line in April 1913 at the Highland Park plant–and with it began the rise of the consumer economy.

960. Kellogg, John Harvey. 1936. Re: Bifidus acidophilus and Soy Acidophilus. Letter to Mr. John M. Lonsdale, 46 Westwood Ave., Altrincham, Cheshire, England, Oct. 31. 2 p. Typed, without signature (carbon copy).

• ***Summary:*** "Yours of October 17 has reached me here at my winter headquarters [in Florida].

"I first obtained the organism bifidus acidophilus from Dr. Tissier, of the Pasteur Institute, in 1912, and have been making use of it ever since. A report from the laboratory that made the culture for me, a short time ago showed that between 1912 and 1935, we had received from the laboratory over 28,000 gallons of the culture.

"Dr. Tissier informed me that he could not make the organism grow in milk." Dr. Kellogg eventually succeeded in making it grow "in the whey of milk with the addition of peptone, and later a type of acidophilus was developed by making 25 or 30 transfers which grew quite well in milk.

"The trouble is, it seems to me, that the long process of adapting the organism to a cow's milk medium, denatures it so that it doesn't do so well... when attempts are made to reimplant it.

"The new type, Soy Acidophilus, is easily developed by planting the organism in soy milk under exacting laboratory conditions. It starts off a vigorous growth at once.

"The clinical results obtained by the use of the soy acidophilus type appear to be much better than those obtained from the dairy milk cultures, and the count is very much higher.

"It is easy to obtain cultures with a count of four or five billions per cc., which certainly is not often obtained with cow's milk." Address: [Miami, Florida].

961. Hermano, A.J. 1936. Soybeans a national food for Filipinos. *Agricultural Life* (*Exponent of Philippine Agriculture and Allied Industries*) 3(9-10):21-23. Sept/Oct.

• ***Summary:*** Rice is the chief staple food of the Filipinos. But the local diet would be improved by the addition of soybeans and their products. In April 1934 the Nutrition Research Laboratory, Bureau of Science, began to manufacture soybean milk. The method is described, the milk was used with good results in experiments with school children in Paco. Presently 8 liters/day of soybean milk are prepared for the Tondo and San Nicolas Community Health Social Centers.

The article concludes: "Various soybean products, like 'tokua' [tofu], 'toyo' or sauce, 'tahore' 'toho' 'tohu' and other products made by the Chinese are prepared in rather simple ways and could be easily made by the Filipinos."

Note: This is the earliest English-language document

seen (Oct. 2011) that contains the word "tahore" which probably refers to fermented tofu. Address: Chief, Nutrition Research Lab., Bureau of Science [Manila, Philippines].

962. Shoptaw, LaVan Neill. 1936. Gastric digestion of soybean flour when used as a substitute for cows' milk in feeding dairy calves. *Iowa State College J. of Science* 11(1):105-06. Oct. Based on his PhD thesis No. 356, submitted Dec. 1935. [1 ref]
• ***Summary:*** This is an abstract of his PhD thesis, No. 356, submitted Dec. 1935. "One of the most serious problems with which the dairy farmer is concerned is the economical rearing of calves. A vast amount of work has been done to produce calf feeds which may displace milk in the calf ration, many stations have been outstanding in their interest in calf meals and gruels. The problem has usually been attacked either (1) by attempting the use of milk products such as dried and semi-dried skimmilk and buttermilk, or (2) by using cereals, packinghouse by-products, sugar, starch etc., in the making of meals or gruels.

"The use of soybean products in the rations of mature animals, and even for human consumption, has been quite extensive."

Three trials were conducted. The soybean milk, used in all 3 trials, was a mixture of 1 part soybean flour and 9 parts warm water. Address: Dep. of Dairy Husbandry, Iowa State College.

963. **Product Name:** Vitasoy Soybean Milk Powder, Soya Vegetable Soup Powder, Soya Fruit Cereal, and Soya Meal. Packers and Distributors of Giant Soybean Nuts, Quick-Cooking Manchurian Soybeans, and Soya Butter.
Manufacturer's Name: Soya Health Products.
Manufacturer's Address: North Main St., Spring Valley, New York. Phone: 248 J.
Date of Introduction: 1936. October.
How Stored: Shelf stable; refrigerate after opening.
New Product–Documentation: Letter (1 page) from W. Siegmeister of Soya Health Products to Fearn Soya Foods in Chicago. 1936. Oct. 23. Concerning request for information on Soya Cereal. "Soya Health Products: Manufacturers of and specializing in Vitasoy Soybean Milk Powder, Soya Vegetable Soup Powder, Soya Fruit Cereal, and Soya Meal. Packers and Distributors of Giant Soybean Nuts, Quick-Cooking Manchurian Soybeans, Soya Butter." Fearn Soya Foods was 355 West Ontario St., Chicago. Sold Soya Cereal.

Note 1. This is the earliest English-language document seen (April 2012) that uses the term "Soybean Nuts" or the term "Giant Soybean Nuts" to refer to soynuts.

Note 2. This is the earliest English-language document seen (Dec. 2012) that contains the term "soya butter." It probably refers to soynut butter, but we cannot be sure.

964. *Nature's Path to Health* (*Melbourne, Australia*). 1936. Remarkable dietary properties of the soybean. Nov. 15. p. 8.
• ***Summary:*** Gives a brief history of the soybean and an overview of its nutritional benefits. "For 5,000 years the Soy Bean has replaced meat, eggs, and milk in the diet of millions of vegetarian Chinese. It has also been used for food in Japan, Indo-China, Siam and India. The Chinese make practically no use of dairy products, and use very little meat, yet they have lived for centuries in a state of prolific vigor on what appears to be a remarkably well-balanced diet by the use of the Soy Bean." Mentions soy bean flour and soy bean curd.

"Dresden, Germany–Dr. Ragnar Berg, famed city hospital food scientist, who wrote the Dictionary of Foods, recently conducted fundamental researches on protein requirements and found that Soy Beans are a splendid source of protein."

"Due to its content of lecithin and phosphorus, the Soy Bean is a nerve and brain food which is especially valuable in cases of neurasthenia for increasing nerve and brain energy."

965. Hill, Edwin C. 1936. Hill praises Henry Ford's soy beans. *Detroit Times.* Dec. 21.
• ***Summary:*** "Henry Ford is a great exploiter of the soy bean. Out near Dearborn he has 65,000 acres cultivated to a particular variety, called the 'Illini.' The fruit of these 65,000 acres goes into the millions of automobiles which are run off the assembly lines at River Rouge. The rich, lustrous paints of the sleek bodies have their basis in bean oil. The knobs of the gear shifts, the horn buttons and the scores of other parts of the body which are made of plastics, trace their origins back to the soy bean farm near Dearborn."

"The truth is that one must cultivate a taste for soy beans just as one does for olives and certain kinds of cheese. To the westerner, soy bean milk has a horrible taste, yet Manchurian babies cry for it, not at it, and thrive very well on it."

966. Fontoynont, Dr. 1936. Autour d'un beau voyage scientifique: suite et fin [About a fine scientific voyage: continued and end]. *Depeche de Madagascar* (*La*) 3(333):4. Dec. 25. [Fre]
• ***Summary:*** In Java an outstanding laboratory has been established for hygienic, chemical and bacteriological research and education. The director is Dr. Mortens. Remarkable research on beri-beri is being conducted there. The focus is on public health and hygiene. The Institute of Social Hygiene of Batavia was established by the Rockefeller Foundation. Its director is Dr. Hydvick. Educators go from village to village with motion pictures / films and a projector. The names of six films are given. No. 6 is: How to make milk from the soybean (black and white) (*6. La fabrication du lait fait avec le soja* {*haricot blanc et noir*}). The soybeans are cleaned by washing in a little water. Then they are soaked over night in water. The next day they

are ground to a powder. In a container 3 parts clean water are mixed with 1 part of soybean powder; the mixture is then cooked. From this one obtains a which liquid that resembles milk, which it can replace.

Milk is a rare substance in Java, and it is very difficult for the indigenous people to obtain it.

Also discusses the Pasteur Institute, which was transferred from Batavia [today's Jakarta] to Bandung a number of years ago. The population density of Java is high; about 40 million people live on the island. Thus, vaccinating them is a huge job.

967. *Hoard's Dairyman.* 1936. March of dairying. 81(24):644-45. Dec. 25.
• ***Summary:*** A chronology of major events connected with cow's milk from 1609 to 1937.

"1609–"First cows in U.S. landed in Virginia.

"1810–Earliest scientific feeding–Thaer, Germany, publishes table of hay equivalents with meadow hay as standard.

"1811–Dolly Madison serves ice cream at the White House." An illustration shows a portrait of Dolly Madison. Note: This is the earliest entry for ice cream in this article. However the 1978 book titled "The History of Ice Cream", by the International Association of Ice Cream Manufacturers (IAICM, Washington DC) states that Dolley Madison, wife of U.S. President James Madison, served ice cream at her husband's Inaugural Ball in 1813.

"1817–First Jersey imported into the United States."

"1851–First wholesale manufacture of ice cream, Baltimore" [Maryland]. Address: Wisconsin.

968. *Hoard's Dairyman.* 1936. Baby's milk from beans–Editorial comments. 81(24):636. Dec. 25.
• ***Summary:*** This editorial is critical of the article by H.H. Slawson about soybean milk that appears on pages 631 and 649 of this issue. "We consider the statements made as being extravagant... The soybean has very little vitamin A, no vitamin C, no vitamin D, and is low in calcium."

969. Slawson, H.H. 1936. Baby's milk from beans: Glowing news story of the soybean that staggers imagination. *Hoard's Dairyman* 81(24):631, 649. Dec. 25.
• ***Summary:*** "To the average Chinese in that cowless country, the taste of cow's milk is said to be 'well nigh intolerable.' The big news for the dairyman, however, lies in the fact that soybean milk is now being produced in this country on a commercial basis. And there is further news in the fact that soybean flour is being promoted as a substitute for milk in the making of bread, pastries, and other foods, which recipes have heretofore called for milk. And there is yet further news in the third fact that soybean casein, made from soybean milk, is being employed as a substitute for casein obtained from cow's milk and used by the paint, paper, textile, and adhesives industries."

"One Tsinan [soy] milk factory had a daily output of 250 bottles and patrons could get one bottle delivered daily for $1 (Mex.) per month." No soybean milk brand names are given.

The Chinese make a cheese, called tofu, by coagulating the soybean milk. "To this product the rich poetic fancy of the Oriental has given the classic name 'Li chi,' or 'the morning prayer,' which suggests the early morning hours devoted to its manufacture... The importance of this cheese in the Chinese diet can be inferred from the oft-repeated saying that soybean cheese is 'the poor man's meat,' just as the soybean milk is 'the poor man's milk.'"

Soybean casein is now competing with cow's milk casein. "How far the invasion has proceeded can be inferred from statistics furnished by a Detroit [Michigan] automobile manufacturer [Henry Ford]. In 1936 he used the entire output of over 61,500 acres of soybeans for use in his cars, including paints and such plastic parts as gears, distributor termina plates, and other accessories. For the plastic frame of the rear window alone 144,000 bushels of soybeans were required. All of the plastic parts might possibly have been made from milk."

970. *Agricultor Venezolano* (*El*) (*Ministerio de Agricultura y Cria, Caracas*). 1936. La soya: Alimento, abono, y material de gran valor industrial [Soya: Food, fertilizer, and material of great industrial value]. 1(8):15-16. Dec. [Spa]
• ***Summary:*** Soya is a species of plant closely related to the french bean (*caráota*) in its needs during cultivation and its basic nature. A large number of varieties have excellent flavor and nutritional value, and can be used in many different applications. Because the soybean is a legume, its seeds are rich in protein and very nutritious.

Other types of soybeans exist which produce large amounts of foliage for use as forage for cattle or as green manure.

In the latter case, the plants are plowed under so that they enrich the soil at the same time they improve its physical condition by increasing its porosity and its ability to retain humidity / water during droughts.

Edible varieties have a reputation among many for their good flavor. From their seeds you can make soy flour or soymilk. From the soymilk you can make a cheese [tofu], or various drinks and dishes. Breads and cakes are also widely enjoyed, and have excellent nutritional value. Some varieties are very rich in oil, and from them we can extract oil for either food use or industrial uses. The residue left after extracting the oil can serve as a concentrated feed for pigs, dairy cows, and other animals.

The Ministry of Agriculture and Husbandry has, for a long time, distributed different varieties of soybean seeds, whose adaptability to Venezuela has been verified with certainty. Anyone who wishes to obtain soybean seeds of these varieties should contact the Ministry; they will be sent

at once. Likewise, anyone with questions related to soya, such as varieties, methods of planting and cultivation, uses as forage, green manure or human food can contact the Ministry of Agriculture for reliable answers.

Photos show: (1) Two soybean pods, one unopened and the other open with 3 seeds showing. (2) Two large fields of soybean plants growing, apparently in Venezuela.

Note 1. This article states that soybeans have long been distributed in Venezuela by the Ministry of Agriculture and Husbandry, which strongly implies that the soybean has been cultivated in Venezuela. If it has, this would be the earliest document seen (May 2009) concerning the cultivation of soybeans in Venezuela.

Note 2. This periodical began publication in May 1936; 28 cm. From 1937 to 1961 this same ministry published another agricultural periodical titled *Memorias y Cuentas*.

971. Glassmann, B.; Gologorskaja, S. 1936. Verdauungsversuche an Milch und Sojanaehrpraeparaten [Digestibility experiments on milk and soyfoods (soy sour cream, soy "quarg," and tofu)]. *Zeitschrift fuer Untersuchung der Nahrungs- und Genussmittel* 72(5-6):450-52. Nov/Dec. (Chem. Abst. 31[16]:5886). [2 ref. Ger]

• ***Summary:*** Artificial digestion experiments were made with soy sour cream (*Sojasauerrahm* or *Sojamilchrahm*), soy quarg (*Sojaquarg*), tofu (*Sojaeiweiss* = soy protein (*Tophu*)), sour cream from cow's milk, and 'quarq' from cow's milk. (1) To make soy sour cream, sterile soymilk is cultured with lactic acid bacteria for 18 hours at 35ºC, and the resulting product is homogenized by whipping or beating (*durch Schlagen*). (2) To make soy quarg, soymilk is brought to a boil, allowed to cool to 42ºC, inoculated with *Streptococcus acidi lactici*, then allowed to stand at 40ºC for 8 hours. The resulting quarg is pressed. (3) To make tofu, soybean flour or meal (*Sojamehl*) in a vat or tub is slowly stirred with water for 30-45 minutes. The mass is then poured into a sieve to separate the milk from the residue. The milk, in a kettle with an automatic stirring device, is heated to 95ºC, then curded with calcium chloride. The protein curds are pressed.

The digestibility of the soy sour cream was 2-3 times greater than that of the sour cream from cow's milk, but the digestibilities of the other products were about the same. Without the addition of some material to better the flavor, the soy preparations would be difficult to use.

The nomenclature *Sojasauerrahm* is erroneous. The product must be designated as *Sojasauermilch, "Sojaprostokwascha."*

Note 1. Sojaquarg is a unique and interesting product which resembles tofu, except that the coagulation is done by a microorganism with which warm soymilk is inoculated. This is the earliest German document seen (April 2013) is which the word *quarg* is used to refer to tofu.

Note 2. This is the earliest German-language document seen that uses the word "Sojanaehrpraeparaten" in the title to mean "Soyfoods."

Note 3. This is the earliest document seen in any language that contains the term "soy sour cream" or any product resembling sour cream made from soy. Address: Laboratorium des Troustes "Koopchartsch" in Odessa.

972. Original Health Food Store. 1936. Soybean products (Ad). *Naturopath and Herald of Health* (*New York City*) 41(12):381. Dec.

• ***Summary:*** Down the left side of this 4.75 by 5½ inch ad is a list of soybean products by brand a price is also given for each: "BakerLust" brand: Soybean milk powder, plain or banana flavored, 14 oz, 1½ lb, or 5 lb. Soya bean vegetable soup powder, trial size, 14 oz, 1½ lb bag. Soy muffins, ½ dozen. Soy bean bread, 14 oz or 26 oz loaf. Soy beans–raw, per lb.

"Vita-Soy" brand: Soybean milk powder, 1 lb, 2 lb, 5 lb. Soya bean vegetable soup powder, ½ lb or 1 lb. Soya confection powder, ½ lb or 1 lb. Soya date sugar, 1 lb.

Madison brand: Soy fruit stix, 6½ oz. Soy date stix, 6½ oz. Soy koff, 12 oz.

Morey brand: Soy cocoa, 4 oz, 8 oz, or 16 oz cans.

Pfaffman brand: Soymac macaroni, 7 oz package. Soy noodles, 7 oz package.

Winroy brand: Soy nuts–roasted, 1½ oz, 8 oz, or 16 oz.

Coyle-Lawson brand: Soy malt–chocolated or plain, ½ lb.

Down the right hand side, under the title "Products of the marvelous soybean," is a brief description of each type of product. The first item, and that with by far the longest description, is "soybean milk powder."

Note 1. This is the earliest English-language document seen (Nov. 2009) that contains the word "BakerLust." It appears to be used as a brand name only for soy products.

Note 2. Benedict Lust apparently owned this store (See ad in the Feb. 1937 issue, p. 64). His brother, Louis Lust, owned a bakery (established in 1903) at Corner 105th St. and Park Ave., New York City. He baked wholegrain breads and related baked goods. Louis used (and may have coined) the brand name "BakerLust" to refer to products he made or sold.

Note 3. This ad also appears (with the same content but in a different form) in the Jan. 1937 edition of this magazine (p. 27), and of *Nature's Path* (New York City) (p. 38). It appeared in the same form in the July 1937 (p. 224) issue. Address: 343 Lexington Ave., New York City.

973. **Product Name:** Manchu Soybean Milk.
Manufacturer's Name: Eastern Health Food Stores Assoc.
Manufacturer's Address: Washington, DC.
Date of Introduction: 1936.
New Product–Documentation: Gray. 1936. All About the Soya Bean. p. 122. This is the 2nd earliest known commercial soyfood product made in Washington, DC.

974. **Product Name:** Vi-Zoy (Chocolate Flavored Powder for Drinks), Lektizoy (Infant Food), and Soybean Spray-Dried Flour (Soy Bean Vegetable Milk Powder).
Manufacturer's Name: Harshaw Essential Foods Corp. (or Inc.).
Manufacturer's Address: 1945 East 97th St., Cleveland, Ohio.
Date of Introduction: 1936.
New Product–Documentation: L.B. Breedlove. 1936. *Chicago J. of Commerce and La Salle Street Journal.* June 25. p. 14. "Soy bean–The magic plant. Article XI." "Harshaw Essential Foods, Inc., Cleveland: Lektizoy (infant food), soy bean vegetable milk powder, Vi-Zoy (chocolate flavored powder for drinks)." Gray. 1936. All About the Soya Bean. p. 122. International Inst. of Agriculture. 1936. *Le Soja dans le Monde* [The Soybean in the World]. See: Manufacturers of edible soy products. p. 206. The company makes Lektizoy (an infant food), powdered soymilk, and Vi-Zoy (a chocolate flavored soymilk).

975. LeClerc, J.A. 1936. Information on soybean milk. Washington, DC: U.S. Bureau of Agricultural Chemistry and Engineering. 5 p. Unpublished manuscript. Reprinted 194? * Address: USDA.

976. **Product Name:** Mull-Soy (Non-Dairy Soy-Based Weaning Food for Young Children). Spelled Mullsoy from about 1955 on.
Manufacturer's Name: Muller Laboratories.
Manufacturer's Address: 2935 Frederick Ave., Baltimore, Maryland.
Date of Introduction: 1936.
Ingredients: Incl. soy flour, water.
New Product–Documentation: Ad (1/6 page) in *Proceedings of the American Soybean Assoc.* 1937. p. 79. "Mull-Soy. Vegetable milk substitute." "The Muller Laboratories, 2935 Frederick Ave., Baltimore, Maryland." Ad also in 1938 (p. 69) and 1939. p. 14. "Mull-Soy." 1939 address is 3156 Frederick Ave.

Note 1. This ad also appeared in the 1939 Proceedings, p. 14. A ½ page ad appeared in the 1940 Proceedings, p. 18.

Note 2. Mull-Soy can be thought of as the second (after Sobee) precursor to the modern soy formula, because it was more sophisticated than simply soy flour and water, but lacked many of the nutrients, and the isolated soy protein, found in modern soy formulas.

Ad (¼ page, black-and-white) in *Soybean Digest.* 1941. Sept. p. 28. "Mull-Soy Soy Bean Milk-Substitute."

Fomon. 1967. p. 230. The product is made with soy flour and has a PER of 1.83.

Shurtleff & Aoyagi. 1984. Soymilk Industry and Market. p. 26. "In 1934, while director of allergy research for the Borden Co., Dr. Julius F. Muller developed a soymilk for his own child, who was highly allergic to dairy milk. Muller formed his own company, Muller Laboratories in Baltimore, introduced Mull-Soy commercially in early 1936, and promoted it by his own efforts. It was a liquid suspended soymilk, made by homogenizing together soy flour, water, and added nutrients. In early 1942 Muller's company was purchased by The Borden Company, which continued to promote the product well. A powdered version became available in the late 1940s."

Note 3. This is the earliest known commercial soy product made in Maryland.

977. **Product Name:** U.D. Vita-Full (Chocolate Flavored Soy Powder for Use as a Beverage).
Manufacturer's Name: United Drug Co.
Manufacturer's Address: Boston, Massachusetts.
Date of Introduction: 1936.
New Product–Documentation: L.B. Breedlove. 1936. *Chicago J. of Commerce and La Salle Street Journal.* June 25. p. 14. "Soy bean–The magic plant. Article XI." "United Drug Company, Boston: U. D. Vita-Full (chocolate flavored powder for drinks)."

International Inst. of Agriculture. 1936. *Le Soja dans le Monde* [The Soybean in the World]. See: Manufacturers of edible soy products. p. 206.

978. Carqué, Otto. 1936. Vital facts about foods: A guide to health and longevity. 3rd ed. Los Angeles, California: Published by the author. 208 p. *
• ***Summary:*** Note: Since this "3rd ed." has the same number of pages as the 2nd ed. (Dec. 1934) the contents are probably the same. Address: Los Angeles.

979. Fearn, Charles E. 1936. The soya bean and its value in our national dietary. Chicago, Illinois: Fearn Soya Foods. 10 p.
• ***Summary:*** "Modern methods of treating the Soya Bean to remove the unpleasant taste without injuring any of its food values, have now placed at the disposal of the public a really palatable and highly nutritious product with a higher protein value than any other known food, and this protein is biologically fully as efficient or 'complete' as that of meat muscle itself.

"To illustrate how recent is the development of this new food in the United States, it was not until 1930 that a really palatable and edible soya bean flour was first introduced by Dr. Charles E. Fearn. Prior to that there were certain beany tasting products made, which rapidly turned rancid, and were, generally speaking, quite unfit for food purposes."

Discusses: Soya protein. Soya fats. Soya carbo-hydrates. Soya vitamins. Minerals.

The Fearn Soya Foods Co. now sells the following "soya foods:" Soya cereal (with whole wheat and soya). Cereal for diabetics (composed entirely of soya, contains no starch

and less than 1½ per cent of reducing sugars). Pure soya bean flour (Contains all the natural fats; nutritional analysis given). Proteinized cocoa (liquid). Soya milk powder: Ideal in cases where milk disagrees. Soya-date breakfast food. Dr. Fearn's general food (concentrated): For children and adults. Address: Chicago, Illinois.

980. Gray, George Douglas. 1936. All about the soya bean: In agriculture, industry and commerce. London: John Bale, Sons & Danielsson Ltd. ix + 144 p. Introduction by James L. North. Late curator, Royal Botanic Gardens, Regent's Park, London. Index. 28 cm. [19 ref]

• ***Summary:*** A comprehensive, early work on the soybean. Gray was a Scotch physician. Contents: 1. Introducing the soya bean. 2. The soya bean plant and its cultivation. 3. The soya bean as food: Dietetics, immature green beans, mature dried beans, soya bean coffee, soya bean chocolate, soya bean sprouts, soya bean milk, soya bean flour (incl. Berczeller flour, Soyvita bread made by Messrs. Wm. Beattie, Ltd., Glasgow), bean curd [tofu], soy (also called soya bean sauce, Chinese bean sauce, or shoyu), miso, fermented bean curd (p. 66-67). 4. Soya bean oil. 5. Soya bean trade. 6. The soya bean in agriculture.

Addenda: Soya bean products in the USA. Dieting and recipes. Statistics. India. Bibliography.

In the chapter on "Soya bean oil" we read (p. 75): "In England, the bean oil trade is carried on by the following firms:–The British Oil and Cake Mills Ltd., the ordinary shares of which are held by Lever Bros., Ltd., so that they are a branch of Unilever, Ltd.

"The Hull Oil Manufacturing Co., Ltd., Hull, now merged in the foregoing concern.

"The Premier Oil Extracting Mills, Ltd., Hull.

"Messrs. Wray Sanderson & Co., Hull.

"The Medina Refinery Ltd., Deptford, London.

"Messrs. J. Bibby & Sons Ltd., Liverpool.

"The Erith Oil Works Ltd., Erith" [Kent].

The first addendum, titled "Soybean products exhibited by the American Soybean Association" (at Washington, DC, p. 120-24) lists the following companies and each of the soy products that they manufacture: American Lecithin Corp. (Atlanta, Georgia), Archer-Daniels-Midland Co. (Milwaukee, Wisconsin), Armstrong Paint and Varnish Works (Chicago, Illinois), Battle Creek [Food] Factory (Battle Creek, Michigan), The Blanton Co. (St. Louis, Missouri), Cereo Co. (Tappan, New York), The Davies-Young Soap Co. (Dayton, Ohio), Detroit Graphite Co. (Detroit, Michigan), Eastern Health Food Stores Association (Washington, DC), Funk Brothers Seed Company (Bloomington, Illinois), Harshaw Essential Foods, Inc. (Cleveland, Ohio), Keystone Macaroni Mfg. Co. (Lebanon, Pennsylvania), Kloss, Jethro (Takoma Park, Maryland: Fresh [soybean] milk. Pumpkin pie [soybean milk and soybean flour]. Soybean cheese. Soybean bread [20% soybean flour]. Soybean buns. Soybean sprouts. Soybean cake), Laucks, I.F., Inc. (Bloomington, Illinois–home office, Seattle, Washington), Madison Food Company (Madison, Tennessee; Vigorost, Cheese [Tofu], Soybeans canned with Tomato, Soybeans canned plain, Dixie Fruit Crackers), Mead Johnson and Co. (Evansville, Indiana; Makes Sobee [Infant Formula]), Oriental Show-You Co. (Columbia City, Indiana), Paintcraft Co. (Galesburg, Illinois), Prince Macaroni Mfg. Co. (Boston, Massachusetts), Purina Mills (St. Louis, Missouri; makes Cresol disinfectant, Purina turkey and growing fattening chow, Purina lay chow, Purina egg chowder, Purina breeder egg chowder, Purina fitting chow, Purina rabbit chow, Purina chick Growena chow, Purina 34% cow chow, Purina chowder, Purina bulky cow chow, Purina 24% cow chow, Purina pig and hog chow, Protena all mash starting and growing food), Shellabarger Grain Products Company (Decatur, Illinois), Soyex Company, Inc. (Nutley, New Jersey), Staley Sales Corporation (Decatur, Illinois), The Stamford Rubber Supply Company (Stamford, Connecticut), Dr. Roy Monier, President, Board of Managers, State Hospitals (Jefferson City, Missouri), United Drug Company (Boston, Massachusetts), Vi-tone Company (Hamilton, Canada), Woolsey Paint and Color Co., C.A. (Jersey City, New Jersey), Bureau of Chemistry and Soils, Department of Agriculture (Washington, D.C.). Page 120 adds: "The exhibit also contained some 200 soybean products, mostly foods, brought from the Orient by Mr. W.J. Morse, Senior Agronomist, Department of Agriculture, Washington, DC, U.S.A." Note 1. Morse and P.H. Dorsett were in East Asia from 1929 to 1931, when they collected many samples of soybeans and soyfoods.

In the second addendum, recipes, the author notes that soy flour is widely used in diabetic diets. Two leading firms who make soy flour in England and who also incorporate it in various products are: Soya Foods, Ltd., Rickmansworth, Herts, and Dietetic Foods Ltd. 124 Victoria St., London, S.W. 1. "The former specialize in Soyolk which is flour prepared on the principles laid down by Professor Berczeller; it is a mealy powder, fatty to the touch. The latter firm are the sole distributors in Great Britain of the well-known 'Heudebert' Dietetic Food products, a French concern which makes different kinds of diabetic breads." The following recipes are then given; * = Calls for Soyolk soy flour: Soybeans, southern style. Soybean salad. Roasted soybeans [like dry-roasted peanuts]. Soybean croquettes. Soybean soufflé. Stuffing for baked fish*. White sponge pudding*. Shortbread*. Madeira cake*. Soya soup à la Reine (uses Heudebert soya flour). Soya chocolate (with soya flour). Soya vegetable soup (with soya flour). Soya bean sprout salad.

Note 2. This is the earliest English-language document seen (Jan. 2013) that uses the term "soya bean sprouts" to refer to these sprouts. Address: M.D. (Scotch physician) England. Late medical officer to H.B.M. Legation, Peking,

China. Lieut.-Colonel, Retired.

981. Heiser, Victor. 1936. An American doctor's Odyssey: Adventures in forty-five countries. New York, NY: W.W. Norton & Co., Inc. viii + 544 p. Illust. (portrait). Index. 25 cm.

• ***Summary:*** In the Philippines, Dr. Heiser found that poor nutrition was the major cause of the high infant mortality. "The use of milk on a large scale was practically unknown in the Philippines, as well as in many other tropical countries." Whatever milk the poorer classes consumed came almost entirely from the caraballa, or female water buffalo (the male is the carabao)–a dirty animal whose habits tend to contaminate its milk.

Ultimately Dr. Heiser discovered several "substitute's for fresh cow's milk." It was discovered at the Peiping Hospital that a substitute for milk could be made from the soya bean. "With the addition of cod-liver oil and calcium, it closely resembled natural milk." Children fed on this milk from the time they were 3 weeks old, were found "to be healthy and normal in every way." Children "who had never had any other food loved this soya bean milk," but "to an adult it was one of the worst-tasting decoctions that could be imagined."

"A Filapina graduate student in chemistry from Columbia University then made her contribution. She found that extract of banana added to the soya bean mixture made it taste like fresh milk. The Filapina housewife can now make this milk in her own kitchen, using a little handpress for the bean and adding other ingredients according to the prescribed directions.

"The soya bean has proved of inestimable value to the East and promises to enlarge the dietary. I once attended a delicious full course lunch in the Bureau of Science Laboratory in Manila where everything from soup to cake was made from this bean."

Note: Heiser, a physician, was born in 1873. Address: M.D.

982. Institut International d'Agriculture (International Institute of Agriculture). 1936. Le soja dans le monde [The soybean in various countries of the world]. Rome, Italy: Imprimerie de la Chambre des Deputes, Charles Colombo. viii + 282 p. Bibliography, p. 276-82. No index. 25 cm. [90 ref. Fre]

• ***Summary:*** A superb early work, containing extensive original information, looking at developments with soybeans and soyfoods country by country, worldwide. Contents. Preface (p. 1). A. Culture of soy (*soja;* p. 4): 1. Botanical description, selection, classification of the varieties. 2. Culture properly said. 3. Enemies and illnesses.

4. Culture in the various countries: 4a. The Americas (p. 38): Antigua, Argentina, Bermuda, Brazil, Canada, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, USA (gives details on all varieties grown, and describes production, history, varieties, and cultural practices in North Carolina, Illinois, Indiana, Iowa, Maryland, Massachusetts, Mississippi, Missouri, New York, Ohio, West Virginia, Wisconsin, Conclusion), Guadeloupe, Guatemala, British Guiana, Dutch Guiana, British Honduras [Belize], Jamaica, Barbados, Martinique, Mexico, Montserrat, Peru, Puerto Rico, El Salvador, Trinidad and Tobago, Uruguay.

4b. Europe (p. 101): Germany, the Danubian countries, Austria, Spain, France, Great Britain, Hungary, Italy, Netherlands, Poland, Romania, Switzerland, Czechoslovakia, Turkey, USSR.

4c. Asia (p. 128): Ceylon, China and Manchuria, Cyprus, Federated States of Malaysia, British India (incl. Punjab, Bihar and Orissa, Burma, Berar, Madras Presidency, Bombay Presidency, Bengal (incl. Nepal, Bhutan, Sikkim, and the district of Darjeeling), Assam, North-West Frontier Province, United Provinces), Netherlands Indies, Indochina (incl. Tonkin, Annam, Laos, Cambodia, and Cochinchine), Japan, Palestine, Siam.

4d. Africa (p. 146): French West Africa, Algeria, Belgian Congo, Cyrenaica, Egypt, Eritrea, Madagascar, Morocco, Mauritius (Ile Maurice), Reunion (Réunion), Rhodesia, Anglo-Egyptian Sudan, Tripolitania, Tunisia, Union of South Africa.

4e. Oceania (p. 153): Australia, Fiji Islands, Hawaii, New Caledonia, New Zealand, Philippines.

B. Utilization of soya (p. 158): 1. The soybean in human nutrition and in industry: Whole soybeans, chart of the uses of whole soybeans, use of soya in the green state (green vegetable soybeans), soy sauce (*dau-tuong* of the Annamites, or *toyo*, named shoyu by the Japanese, or *chau-yau* or *chiang yoo* by the Chinese), condiments and sauces based on soya in the Netherlands Indies (*tempe, ontjom, tempemori* and *tempe kedele* [various types of tempeh and onchom, p. 168-70]), *tao tjo* [Indonesian-style miso], *tao dji* [fermented black soybeans], *ketjap, ketiap benteng* [Indonesian-style soy sauce], soymilk (*le lait de soja*), yuba (*crème de lait de soja*), tofu (*le fromage de soja*) and fermented tofu (*des fromages fermentés*, made by Li Yu-ying near Paris), soymilk casein (*caséine du lait de soja*, for industrial use, including vegetable albumin, or galalithe [galalith]" [isolated soy protein], and artificial wool), soy lecithin (*lécithine de soja*), soy flour (*la farine de soja*, incl. soy bread, soy pastries, and soy cocoa).

Note 1. This is the earliest document seen (Sept. 2010) that uses the term *benteng ketiap benteng* to refer to an Indonesian-style soy sauce.

2. Soy oil (p. 194): Food uses, industrial uses (including soaps, products resembling petroleum, paints, varnishes, linoleum, and artificial rubber), extraction, directory of U.S. manufacturers of materials and equipment for soybean processing, directory of U.S. and Canadian manufacturers of food products based on soya (*produits alimentaires à*

base de soja, p. 205-06), directory of U.S. manufacturers of industrial soy products (p. 206-07).

3. Soybean in the feeding of domestic animals (p. 207): Forage, hay, silage, pasture, soybean seeds, the minerals in soybeans, soya as a feed for dairy cows, cattle, buffaloes, sheep, hogs, horses and mules, poultry.

4. Use of soya as fertilizer (p. 257). C. The trade of soya and of its by-products (p. 363): Production of soybeans in the principal countries, economic importance of soybean culture in the USA, soybean trade/commerce including tables of the major importers and exporters, and amounts traded annually in 1931-1934, price of soybeans, cost of production.

List by region and country of people and organizations that responded to a questionnaire sent by IIA (p. 273-76). Bibliography of main publications consulted, listed by region and country of publication.

Reunion (*Ile de la Réunion*)*:* "The soybean (Le Soja) is only cultivated as an experimental crop, on a few square meters at the agronomic station" (p. 148).

Fiji (*Iles Fidji*)*:* Soybean cultivation is not yet practiced in this colony; however soybean seeds are currently being imported in order to conduct a trial.

New Caledonia: In 1928 soybean cultivation was introduced to New Caledonia.

Note 2. This is the earliest document seen (Dec. 2007) concerning soybeans in Bhutan, Costa Rica, Dominican Republic, El Salvador, Guatemala, Israel, Jamaica, Madagascar, Morocco, New Caledonia, Palestine, Peru, or Réunion, or the cultivation of soybeans in Bhutan, Costa Rica, Dominican Republic, El Salvador, Guatemala, Israel, Jamaica, Madagascar, Mexico, the Middle East. Morocco, New Caledonia, Palestine, Peru, or Réunion. It is also the earliest document seen (Dec. 2007) concerning soybeans in connection with (but not yet in) Cyprus; it is stated that soybeans are not grown on the island of Cyprus. Soybean culture is not practiced in the Italian colonies of Eritrea (Erythrée, now part of Ethiopia) or Cyrenaica (Cyrénaïque, now part of Libya).

Note 3. This document contains the earliest date seen for soybeans in Bhutan, New Caledonia, or Réunion, or the cultivation of soybeans in New Caledonia (1928), or Bhutan or Réunion (1936) (One of two documents).

Note 4. This is the earliest French-language document seen (Sept. 2011) that mentions tempeh, which it calls "tempe" (p. 168). It notes that, in general, the indigenous people of the Netherlands Indies use soybeans mainly to make *tempe,* a product which, throughout central and eastern Java, takes the place reserved for *ontjom* in western Java. Tempeh is found in two forms: either in large flat cakes which are cut at the time of sale into small square morsels, or wrapped in folded banana leaves. A detailed description of the preparation of each of these two types of tempeh is given as well as another type of tempe, called *tempemori,* which is made with soybeans and coconut presscake.

Soybean culture is not known to be practiced in the following countries or colonies: Antigua, Barbados, British Honduras (renamed Belize in about 1975), Trinidad and Tobago. Address: Rome, Italy.

983. Kale, F.S. 1936. Soya bean: Its value in dietetics, cultivation and uses. With 300 recipes. Baroda State, India: F. Doctor & Co. xxxi + 375 p. Illust. Index. 22 cm. 2nd ed. 1937.

• ***Summary:*** Contents: Preface. 1. Deficiencies in the Indian diet and soya bean as a means to rectify them. 2. History of the origin and growth of soya bean. 3. The use of soya bean. 4. World trade in soya bean. 5. Botany of the soya bean plant. 6. Classification of soya bean. 7. Cultivation of soya bean. 8. Diseases and pests of soya bean. 9. Cultivation of soya bean in India. 10. The constituents of soya bean. 11. Soya bean milk. 12. Soya bean flour. 13. Industrial uses of soya bean. 14. Enriching soil by addition of nitrogen and use of soya bean as fodder. 15. Food requirement of the human body. 16. European and American soya bean recipes. 17. Diabetic dishes, Mahatma Gandhi's experiments at Magan Wadi and opinion of scientists on soya bean. 18. Chinese and Japanese soya bean dishes. 19. Indian soya bean dishes: Hindustani dishes, Moglai dishes, Gujarati dishes, Maharashtrian dishes, Bengali dishes, Goa dishes, Tanjore dishes. Appendix.

For a more detailed table of contents and summary of the work, see the 2nd edition (1937).

Photos on unnumbered pages show: (1) H.H. the Maharaja Gaekwar of Baroda, the first Indian ruler to inaugurate the soya bean planting ceremony in his state–24 Nov. 1933. (2) H.H. The Maharaja of Baroda, seated in a chair, lecturing on the dietetic and industrial importance of soya bean. (3) The mature soya bean pods of Mammoth Yellow variety grown in Baroda territory. (4) Map of Baroda state showing areas of soya bean cultivation. (5) Map of Baroda state showing local distribution of soya bean. (6) A field of soya bean in rows grown by Patel Hargovan Bavabhai of Achisara Baroda District (with two white bullocks) who has been awarded the first prize for his good cultivation.

(7) Bavabhai B. Patel, a farmer age 65 who is interested in cultivation of soya bean; dressed in white, he is standing in a field of soya beans behind two large white bullocks. (8) The author's own child, three months old, fed on soya bean milk.

(9) Mahatma Gandhi who uses soya bean at Maganwadhi; he is seated in a chair reading.

Note 1. This is the earliest English-language document seen (Sept. 2006) that uses the term "soya bean" in a new way–as a singular noun, like the words "corn" or "wheat," not preceded by "the." Examples: "2. History of the origin and growth of soya bean. 3. The use of soya bean. 4. World trade in soya bean... 6. Classification of soya bean. 7. Cultivation of soya bean. 8. Diseases and pests of soya

bean." This usage originated in developing countries.

Note 2. This book was written as the princely state of Baroda was studying the possibility of growing the soya bean plant for food, feed, and fodder. It looked promising, but little headway was actually made in either production or utilization. Address: Food Survey Officer, Baroda State, India.

984. Mumford, H.W. 1936. A year's research at Illinois. *Illinois Agricultural Experiment Station, Annual Report* 48:1-331. For the year ended June 30, 1935.

• ***Summary:*** Soybeans are discussed in the following sections and pages: Soils and crop investigations: Soybean hay and seed yields sensitive to soil fertility (p. 27-29; Two bar charts show the dramatic effects of soil treatments on yields. Seed yields are highest when the soil is treated with R = residues, L = limestone, and P = rock phosphate. Soybeans are more acid-tolerant than most of the widely grown legumes. Nitrogen is usually deficient in acid soils). Soybean acreage sets new record in crop adjustments (p. 40-41; In 1934, for the first time in history a single legume occupied more than a million acres of farm land in Illinois; soybeans occupied only 1,000 acres in 1914 in Illinois. The 10 varieties with the highest seed yields (in bushels per acre) at Urbana in 1934 were: Type 117, 38.1. Manchuria 13-177, 36.4. Mansoy, 36.3. Scioto, 34.9. A.K. 125, 33.9. 04002-B, 33.4. Illini, 33.2. Macoupin, 32.7. A.K. 146, 32.0. Manchu, 31.5). Work for better soybean varieties is continued (p. 41-43). Susceptibility to nodulation inherited characteristic (p. 43-44; "The Peking soybean variety shows scanty nodulation, whereas Illini is abundantly nodulated"). Quality of inoculant outweighs its ease of application [in affecting yields] (p. 44; Those "recommended for use with water were superior to those designed to be used dry"). Experiments keeping pace with interest in new crops (p. 69-72; "Investigations on the use of soybean oil for paint purposes have been continued with satisfactory results").

Livestock investigations: Home-grown proteins being brought into wider use (p. 78-79; "Discovery that soybean oil meal and animal tankage can be used successfully in fattening cattle has made considerable in the protein buying habits of Illinois farmers. Formerly all standard protein concentrates used for balancing beef-cattle rations were produced mainly outside the corn belt"). Tankage proves satisfactory supplement for steers (p. 81-83; Ordinary steam-rendered tankage is less palatable and less digestible that dry-rendered tankage, or meat scrap. Rendering is the process that converts waste animal tissue into stable, value-added materials, including fats such as lard and tallow). Lespedeza hay equals alfalfa for feeding steers (p. 83-86; In this test, soybean hay was slightly inferior to alfalfa- or lespedeza hay). Soybeans found richer in certain vitamins than corn (p. 90-91; vitamins A, B, and G were tested). Supplemented [corn] silage equal to soybean hay for sheep (p. 118-20). Soybean meals are compared further for chick feeding (p. 128-30).

Entomology investigations: Prompt control halts insect threat to soybean crop (p. 159-60; Cutworms and armyworms caused heavy damage, but were controlled by poisoned bait).

Agricultural economics investigations: Accounting studies show ways to reduce farm costs (p. 200-02; net profit per acre in 1932, 1933, and 1934 is given for soybeans {harvested with a combine}, soybeans {threshed}, and soybean hay. Farmers lost money on all three in 1932 and 1933, but made a profit on all 3 in 1934). Demand is one of the factors affecting [soy] bean prices (p. 218-19; "Production of soybeans in Illinois and also in the United States in 1934 was the highest on record, owing largely to the AAA {Agricultural Adjustment Act of 1933, which paid farmers to reduce crop acreage} programs and to the severity of chinch bug damage").

Home economics investigations: Best varieties of soybeans for food being located (p. 298-300; There "is a rapidly expanding list of manufactured food products made of or containing soybeans,–that is, soybean flour, oil, and milk." About 35 "varieties of soybeans which are known as vegetable types have been used and compared with the so-called commercial types." "The beans while immature all had a vivid green color which makes them a very promising fresh vegetable." Some varieties, such as Illini, are very acceptable as a garden vegetable in both the green and mature states. Freedom from shattering in the field is probably directly connected with difficulty of shelling the beans in the green state). Address: Dean and Director of the Station, Urbana, Illinois.

985. Rouest, Leon; Guerpel, Henry de. 1936. Le soja français et ses applications agricoles et industrielles [The French soybean: Its agricultural and industrial applications]. Chateauroux, France: G. Langlois. xxiii + 99 p. 28 cm. [42 ref. Fre]

• ***Summary:*** Contents: Preface, by L Brétignière (Prof. at Grignon, Member of the Academy of Agriculture). Preface to the first edition, by Louis Forest (1921). Introduction to this new edition: Soviet Russia and the soybean (*le Soja;* includes the story of Rouest's stay in the Northern Caucasus, Russia, from 1930 to 1933), Germany and Poland take up the soya question, the canons [guns] of Germany versus the Manchurian soybean, a secret contract to provide the weapons of war, organization of a Polish bank in Manchuria, Germany cultivates soybeans in Romania and Bulgaria in preparation for the war, France and the cultivation of soybeans.

1. What is soja? 2. History of the propagation of soja: Introduction of the soybean into France and Europe, the soybean is cultivated in central Europe, in Austria, in 1875, in France the soybean is the object of numerous trials from

1876 to 1881, its cultivation worldwide, the study and acclimatization of soya become generalized.

3. Botanical characters of the soybean: And the varieties of soybeans. 4. Chinese varieties: The soybean in China, the production of soya in China in 1916 and 1917, production of soya in the Far East during the year 1928, exportation of soya from the Far East to Europe.

5. Japanese varieties: The soybean in Japan, varieties of soya from Indochina and from other Asian countries. 6. The soybean in America: American varieties, cultivation of soybeans in Ohio, selection of soya using pure lines in Connecticut.

7. The soybean in Europe: Italy, Russia, France, French climatic zones for the cultivation of Soja hispida, the Atlantic zone, the continental zone, the Mediterranean zone and climate, can the soybean be cultivated in all the French climates including those in the north, northeast, and northwest, speedy production of soybeans in view of agricultural production and of the creation of early varieties for the regions in north and northeast France.

8. Instruction for growing soja in France. 9. Soja in Manchuria. 10. Soja seeds. 11. Selection of soja. 12. Varieties of soja. 13. Different ways of planting soya seeds. 14. Soy yield. 15. Nitrogen fixation in soya seeds. 16. Tilling and preparing the earth. 17. Soja fodder. 18. Soja, striking and improving. 19. Harvesting soja grain. 20. Soja oil. 21. Soja oil-cake for animal feeding. 22. Vegetable milk, soja milk and industrial casein.

23. Soja in human food: Soy flour and its applications, soy bread with wheat, nutritional composition of soja compared to dry legumes, soy viewed as a dry legume to replace meat, comparative production of nutritive elements among the various legumes used for human food, comparative value in calories of the usual foods and of soja, preparation of soy soups and meals in compressed tubes, what varieties of soy can serve the special needs of human nutrition, Sojenta, potatoes stuffed with soy, force meat balls (*boulettes*) of rice and soy, bread of rice and soy, pudding of soy and rice, soy sprouts and their food value, fresh soy sprouts in a salad, soy sprouts with vegetables, soy preserves and confections, soy chocolate, soy coffee, soybeans conserved in containers, soy with smoked fish, soup with soy vegetable meat, soymilk soup, omelet with smoked soy vegetable ham, green soy sprouts, soy cake, soy force-meat fritters.

24. The utilization of soja in the Far East: Vegetable cheese (tofu), soy-based condiments, Japanese natto (2 types), Japanese miso, Chinese miso, soy sauce (*soyou* or *schoziou*), making soy sauce in Kwantung, China, making soy sauce in Japan, koji or molded rice.

25. The culture of soja in North Africa (Rouest has varieties that would grow and yield well in the French colonies of Tunisia, Algeria, and Morocco). 26. Opinions of some authors on soja. Conclusions. Bibliography on soja.

A small photo on the "Dedication" page shows Léon Rouest (born in Paris on 11 Nov. 1872).

Concerning soy in Russia (USSR) (p. 52-53): In Russia, the soybean has been known for quite a long time, specially in the Ukraine and Bessarabia, but it was never grown over a large area, and was given a back seat (low priority) in agriculture until after the revolution of 1917. It was not until 1926-27 that cultural trials were conducted on farms in the state of Northern Caucasus (*d'Etat du Caucase du Nord*). In the regions of Rostov-on-Don (*Rostow-sur-Don; Rostov-na-Donu*), Eisk (near Krasnodar), Stavropol, Prim-Koumsk, Yessentuki / Essentuki in the Kuban and Kuban River area of the North Caucasus region of southern Russia, the yields were 11 to 16 quintals.

In 1927 there were 600 ha planted to soybeans, increasing to 17,000 in 1928, in the *kolkhoz* (collective) farms or the *sovkhoz* (state owned) farms.

In 1929-1930 and until 1932-1933 there were very laudable / praiseworthy efforts to propagate soybeans in favorable regions, especially in the North Caucasus, but the soils of this region, although they are very rich and well suited to soybeans are also very rich in bad weeds and the results obtained up to the present do not seem favorable. As I said earlier, the soybean is a technical plant of the intensive cultivation type. It is very well suited to the soil and climate of Russia, but it is less well suited to the indolent character of people who are accustomed to cultivating only small parcels and who are suddenly, through collectivization, thrown into cultivating immense fields. In spite of the remarkable efforts at mechanization, the peasants who submit to collectivization and who do not yet understand it very well, the cultivation of soybeans does not assume the importance hoped for (p. 52).

Note: This is Rouest's first book about soy since 1930. Address: France.

986. Rouest, Leon; Guerpel, Henry de. 1936. Le soja français et ses applications agricoles et industrielles: La Russie Sovietique et el Soja [The French soybean: Its agricultural and industrial applications: Soviet Russia and the soybean (Document part)]. Chateauroux, France: G. Langlois. xxiii + 99 p. See p. xv-xvii. 28 cm. [Fre]

• ***Summary:*** The propagation of new edible plants for man requires a true apostleship. I could say, along with Mr. Paillieux, who was the first in France to draw farmers' attention to Soy, and now fifty years later: "Our point of departure was not fortunate." Since 1921, date of the first publication of my study, *Le soja et son lait végétal* ("The soybean and its vegetable milk"), after having exerted every possible effort in France to propagate Soy, I expatriated myself in 1930 to study and propagate Soy in Soviet Russia where I found excellent agrologic and climactic conditions. Back in France, towards the end of my life and my agronomic carrier, will this new study shake my fellow citizens' inertia? Will they wait, once more, to be tributaries

to foreigners while they themselves are in a position, if not to take the lead, at least to step at a level worthy of our needs and our agriculture?

More than ten years have passed and already, in 1930, *la Librairie Agricole de la Maison Rustique* [my publisher] informed me in Russia, where I had gone to cultivate Soy varieties that I had already acclimated in France, that the first edition of my book had completely sold out and that it would be useful and necessary to produce a new edition and complete it with new documents.

If I did not answer sooner to this invitation, it is because I wanted to finish studying several problems related to Soy: the problem of selecting varieties suited to different agricultural regions, the cultivation of pure lines, and above all the possibility of cultivating Soy on large areas and thus mechanizing the harvest.

I bring thus, with this new edition, the experience acquired in Russia where Soy has been cultivated since 1930, on rather large areas, although these areas have not reached the numbers proposed in the Five Year Plan, which called for several million hectares.

For the time being, Soy is remaining stationary in Russia because once it was noticed, a bit late according to my point of view, that Soy could not be cultivated in the same manner as wheat which is the typical extensive cultivation plant, that is a poorly tended type of cultivation. They noticed this after a considerable number of years of experiments that are more of the social realm rather than of the agronomic realm.

It was finally understood that Soy is and remains the intensive type of industrial crop and that one could, even against a formidable apparatus, cultivate it in a collective social regime.

Furthermore, this disfavor that reigns in Russia towards Soy farming also accounts for to its poor utilization.

Following the mandatory collectivization of the soil in 1932 and 1933, the peasants having refused to work collectively, a famine followed that was not total, truth be told, but that was particularly felt in the regions most favorable to Soy cultivation, in the richest black farmland of Ukraine and the Northern Caucasus.

Deprived of bread and other food items, people jumped on Soy which had never before entered into their diets. The main cause of this was the lack of knowledge on processes and means of Soy utilization as are practiced in the East Asia.

This Soy availability indeed saved the life of thousands of individuals but these same individuals retained a dislike of it, and it will be difficult to make that dislike go away. The ignorance of the need for preliminary preparation of the soy bean was its sole reason.

At the beginning of the introduction of Soy in Russia, the Soviet leaders had many hopes that did not materialize. The hope first of creating a real / veritable monopoly of the export of Soy, encouraged by the Germans, who were expecting to have on their side, fats and food by-products necessary to their policy of expansion and, on the Russian side, the immense expanses of land that they own, enabled them to contemplate an economic power that they alone in Europe would be able to possess. But, unfortunately for them, they had not understood that Soy cultivation is only suited for countries whose large population is obliged to live of fairly small plots of land and devotes to this nourishing plant all the care that people of Mongolian origin are capable of.

Soy cultivation is an intensive cultivation wonderfully suited to a society based on the family and not a society based on the collective spirit which, through its shear size, tends to practice an extensive type of cultivation where little care is exerted.

Soy cultivation can only be undertaken by hard-working individuals. It is neither suited to the temperament or the psychology of the Russian people.

The psychological error generated, among the Russians, an agronomic error. Russia, as it stands to-day under the communist regime, will never export soy because the social framework that it adopted is not compatible with the care and work that it requires.

By merely looking at and observing the cultivation of Soy as it is done on vast expanses of land among their neighbors of Mongolia, Manchuria and China, it is possible to perceive the error that was going to be committed in introducing this crop, but it is common in Soviet Russia, not to take into account what is viewed as the survival of old customs and work that must disappear under the drive of modern mechanization and social concepts professed in that country.

As in many other things, the Bolshevik pride has rejected as unnecessary and mostly hampering the observations mentioned earlier. Among the hopes that did not realize and that probably never will be, is the hope to create, for the needs of the collectivization, Soy varieties that are sufficiently early and a tall plant that would yet remain highly productive; this is physiologically impossible and mostly having the first row of bean pods at a height such that these could be harvested with the machines that are actually used for the wheat harvesting.

Thus what is required is creating the plant for the machine and not creating the machine for the plant. That is a reversal of all the theories that form the background of modern, scientific agriculture. But that's is the way it is!

I did not linger in attempting to solve such problems because I confess not being capable of solving such problems.

Thus the soy cultivation is, just as it is for beets and all cultivated plants (*plantes sarclees*), a crop of the intensive type. Those who have neither the will or the physical strength should not attempt this crop. One should not believe however that large fields do not suit Soy. I saw in 1933, at

Kropotkine (in Northern Caucasus), in a German concession, five hundred hectares on a single plot of land, without a single weed, in a state of perfect cleanliness. The yield reach from 15 to 18 quintals (1 quintal = 100 kg) [per hectare] even though the soil was poor and no fertilizer was used. These yields, that are not extraordinary if these are compared to the small Manchurian or Chinese plots which generally reach from 20 to 30 quintals may be considered good and normal due to the poor soil.

A few days after my visit to this German agricultural project, I learned that this concession had been liquidated and that its personnel had returned to Germany. At the same time, Russian newspapers were beginning a violent campaign against the Hitler's Germany, and were publishing the documents that are inserted later in this book.

At that time I decided to leave Russia and take with me all the French Soy varieties introduced in the 1930s. My duty as a French agronomist was dictating my return to my Motherland in the hope of bringing back with me the same arms of national and economic defense. Address: France.

987. Shoptaw, LaVan N. 1936. Gastric digestion of soybean flour when used as a substitute for cows' milk in feeding dairy calves. PhD thesis, Iowa State University. In: Doctoral Dissertations Accepted by American Universities, 1936. * Address: Iowa State Univ., Ames, Iowa.

988. Van Gundy, Dorothea. 1936. La Sierra recipes. Campus and Maitland, Ontario, California: Published by the author. 47 p. 19 cm.

• ***Summary:*** Most (but not all) of the recipes in this book call for soy-based ingredients. Contents: Dedication. "This book is lovingly dedicated to the memory of my father." Foreword: "Due to the increase of disease in the animal kingdom, the diet should be as free as possible from these elements, including meat, eggs, and milk." Approximate composition for La Sierra Products: Soy butter [soynut butter] (27.6% protein, 47.1% fats). Soy breakfast food. Soy flour. Cooked soy beans. Soy loaf. Milk. Bean sprouts. Soy cheese [tofu]. Soy spread. Soy bologna. Dry soy beans.

1. The soy bean as a human food: Nutritional value, varieties of soy beans, flour, soy milk, soy milk from flour, soy milk from raw beans, soy cream (made by homogenizing / blending equal parts of soy milk and soy oil or other vegetable oil), soy cheese, soy bean sprouts, soy sauce.

2. Soups: Incl. Soyament bouillon. Many use Soyament (Soy Sauce), soy milk, or soy cream. 3. Entrees. Recipes incl. Soy croquettes (with Soy Bean Pulp and Smoein). Walnut Loaf (with Smoein and soy milk). Soy protose (with soy butter and Mamenoko flour). Gluten patties (with Smoein). Soy cheese with tomato sauce. Soy cheese croquettes. Soy cheese and Soyament sauce. Baked macaroni with La Sierra Vegetable Bologna. Soy loaf. Soy loaf a la king. Baked soy noodles. Chow mein (with La Sierra Soy Cheese). Lentil patties (with Smoein).

4. Sauces and gravies: Many use soy milk, Smoein, or soy sauce. 5. Vegetables. Incl. Creamed vegetables (with soy milk). 6. Salads and salad dressings. Soy recipes include: Carrot and soy cheese. Tomato and soy cheese. Pineapple and soy cheese. Stuffed celery (with soy cheese). Soy loaf salad. Cabbage and banana salad (with soy mayonnaise). Head lettuce (with soy butter dressing). Salad dressing (uses soy milk in place of eggs). Soy mayonnaise [Note: This is the earliest recipe seen for a soy mayonnaise]. Tomato mayonnaise (tomato juice beaten into soy mayonnaise). Thousand island dressing (with soy mayonnaise). Parsley and olive dressing (with soy mayonnaise; uses ¼ cup chopped olives, not olive oil). Soy cream dressing. Soy butter dressing [with soynut butter]. Cream golden dressing (with soy cream). French dressing (with soy oil or any vegetable oil).

7. Desserts. * = with soy milk. + = with soy cream. Cream rice pudding*. Rice pudding+. Blanc mange*+ [Blancmange]. Orange cream pudding+. Lemon fluff+. Fruit fluff+. Cream tapioca*+. Frozen pudding*+. Vanilla Ice Cream*+. Almond cream [Almond ice cream] (incl. 1 cup chopped almonds)*+. Strawberry sherbet+. Raspberry sherbet+. Butterscotch chiffon pie+. Lemon pie+. Banana cream pie*+. Pumpkin pie without eggs*. Soy pastry with soy flour. Soy cookies+.

8. Bread: Soy bread (with 4 cups entire wheat flour and 1 cup soy flour). Entire wheat bread (with 2 cups soy milk). Entire wheat sticks (with 3 parts wheat flour and 1 part soy flour). Corn meal crisps (with 4 parts corn meal, 3 parts wheat flour, and 1 part soy flour). Short cake (with 2 parts soy milk, 5 parts wheat flour, 1 part soy flour). Waffles (with 12 parts wheat flour, 2 parts soy flour, and 7 parts soy milk).

9. Sandwiches: Soy bean filling. Vegetable bologna. Soy delight filling (with soy[nut] butter). Soy cheese and raisin sandwiches. Soy butter (soynut butter thinned with tomato juice). Soy butter and honey. Soy cheese and olive [chopped green olives]. Soy spread [Made by La Sierra]. Sandwich salad (with many soy possibilities).

10. Beverages: "A very fine coffee substitute is made [by La Sierra] from the Soy Bean, and tastes remarkably like Coffee. It is particularly fine from an alkaline standpoint, and is particularly excellent to be used in connection with high alkaline diets." Soy-co (Beverage) Add 1 rounding teaspoon to 1 cup of water. "Percolate or boil until desired strength. Serve plain or with Soy Cream." Also delicious iced. Soy-co (Made with soy milk). Soy milk shake. Soy banana drink. Mamenoko drink (uses 3 tablespoons Mamenoko, which is processed soy flour). Soyament cocktail ("A very refreshing beverage may be made by using 1 to 2 tablespoons Soyament sauce to 1 cup of water").

11. Healthful confections: Beanut brittle (2 cups each Soy Beanuts and brown sugar). Victoria fudge (with "3/4 c Soy Milk").

Use of soy beans in the diet: Outline for 3 meals. Suggestion for 3 days' menus, using soy products.

La Sierra Industries manufactures the following 14 foods from soy beans: Canned soy beans, plain or with tomato sauce. Soy loaf. Soy vegetable bologna. Soy milk. Soy breakfast food. Soy butter [like peanut butter]. Soy-co (beverage) [coffee substitute]. Smoein (smoked meat flavor). Soy spread. Soy flour, raw and processed. Soy beanuts (parched soy beans).

Soyament brand bean sauce. This soya bean sauce is "prepared from soya beans by splitting up the bean protein by a special process which thoroughly decomposes it into Amino Acids. A number of Amino Acids, each possessing a sweet taste, is the most remarkable feature of the Soyament Sauce and makes it different from many of the so-called soy sauces... On sale at all grocery stores or write to Soya Bean Products Co., 3522 East Third St., Los Angeles."

In the section on "Soy milk" (p. 8) is a long quotation from Dr. [Walter] Siegmeister: "So well has the Soy bean served as a source of vegetable milk, that the records tend to show that it has proven superior to cow's milk in certain important respects. The most marked of these is the almost complete absence of rickets in China, which is quite probable in view of the fact that not only is the Soy bean rich in Vitamin D, but also in Calcium and Phosphorous, the chief requirements for healthy bone development."

Note: This is the earliest document seen (Dec. 2003) that mentions a soy-based shake. It is also the earliest English-language document seen (Dec. 2003) that uses the term "Milk Shake" to refer to a non-dairy soy milk shake or that contains the term "Soy Milk Shake" (p. 41). The recipe with that title states: "Soy Milk may be mixed with any of the fruit juices and beaten with a small amount of chipped ice. It fluffs up and is very palatable. Soy Milk and orange juice combine splendidly." Address: Dietitian, Box 203, Ontario, California.

989. Fearn, Charles E. 1936? Your children's future health and happiness (Leaflet). Chicago, Illinois: Fearn Soya Foods Co. 4 panels each side. Each panel: 22 x 9 cm. Undated.
• ***Summary:*** "In conclusion let me say that I know of no better way of giving Soya Foods to children than in the form of the Fearn's Soya Food products such as: Soya Cereal (to be cooked), Pure Soya Milk Powder, Fearn's General Food, Soya-Date Breakfast Food (ready-to-eat) and Dr. Fearn's Proteinized Cocoa as a drink or when making cakes, etc."

The distributor of these products is Malcolm McBride, Los Angeles, California. Phone: PArkway 3232. Address: Fearn Soya Foods Co., Chicago, Illinois.

990. Jones Grain Mill. 1936? Natural foods: Catalog, recipes, information. Los Angeles, California. 74 p. Undated. 22 cm.
• ***Summary:*** On the cover is a white mill behind a mill wheel (unrealistic) on a mill pond. Contents: Foreword. Health recipes: Cereals (incl. Soy bean or Mamenoke {Mamenoka, Mamenoko} breakfast cereal), breakfast cakes (incl. soy hot cakes with soy milk and Mamenoka flour, soy waffles, soy bean griddle cakes), desserts, breads (incl. soy bean flour gems, whole wheat bread), candies. Vital information: Vitamins and minerals essential to life.

Price list (prices are given for each item listed on pages 46-72): Alberty products, Alvita products, Battle Creek Sanitarium Health Foods [Michigan] (p. 47-48), beverages–coffee substitutes (Loma Linda Breakfast Cup, Soyco {soy bean coffee}, Javex {soy bean}, Carque's Soy Bean Coffee), books (by Dr. Benjamin Gayelord Hauser, Paul C. Bragg, Mrs. Alberty, Martin W. Pretorius, Otto Carque, Clark Irvine, Dr. Harry Finkel), Dr. Paul Bragg products, Jones Grain Mill Bakery (operated by Alberty Specialty Bakers), Burbank products, Carque's products, crackers and toast (Cubbison's bulk or packaged), honey, jams & jellies, juices (fruit & vegetable), KAL products, kelp products (products of the sea, incl. sea lettuce, dulse, Parkelp), Kovac products, Loma Linda Foods (Soy products: Soy beans–plain, tomato, or tomato and Proteena, Soy milk–8½ oz, No. 1, or No. 2, Soy Mince sandwich spread), macaroni & noodles (incl. soy bean macaroni, soy bean noodles), meat substitutes (incl. Simoein [Smoein], Soy loaf, Alfa Soy Spread, Soy Mince) McCollum products, maple syrup and candies, Martin Pretorius products, nuts and butters, Nature Ade products, Nutro Links (Santay, Swiss, Hauser), oils, olives, Radiance products, salts (vegetable, vegetized, and vegetablized), salad dressing and mayonnaise (made with lemon and vegetable oil), health sugars and sugar substitutes, seeds, soya bean products, teas.

The price list of "Soya bean products" (p. 72) reads as follows: "Breakfast Cereal with Carob Flour ([and soya beans] tastes like Grape Nuts), pkg., 25¢. Breakfast Cereal (prepared [with soya beans]), pkg., 25¢. Soya bean flakes, pkg., 30¢. Soya bean grits, pkg., 25¢. Soya bean bread, lb. loaf, 14¢. Soya bean melba toast, lb., 30¢. Soya bean wafers, lb., 40¢. Soya bean cookies (sweetened with dextrose), doz., 15¢. Soya bean coffee cakes (sweetened with honey), each, 5¢. Soya beans cooked: Soya beans (plain cooked), No. 2 can, 13¢. Imported soya beans from Manchuria, lb., 10¢. Pre-cooked soya beans (easily prepared in 30 minutes), lb., 15¢. Soya beans with tomatoes (ready to serve), No. 2 can, 15¢. Cooked soya beans with Proteena, No. 2 can, 15¢. Other soya bean products: Non-fattening [sic] soya bean oil (for all cooking purposes), pint, 40¢. Soya bean coffee, lb., 25¢. Soya bean flour, lb., 10¢; 3 lbs., 25¢. Dextrinized soya bean flour, lb., 15¢. Soya bean milk flour, lb., 60¢. Soya bean candy (with pure chocolate and Dextrose), lb., 50¢. Soya bean sandwich spread, 25¢. Soy sauce, 20¢. Soya bean loaf, No. 2 can, 25¢. Soya bean milk, No. 2 can, 15¢. Soya bean cheese (made from soya bean milk), lb., 30¢. Soya bean mince, 8-oz. can, 25¢. Soya bean spaghetti, lb., 25¢. Soya bean macaroni, lb., 25¢. Soya bean noodles, lb., 25¢. Soy beverage (Cocoalette), 10¢.

Ads include: Hollywood Cup (p. 20). Otto Carque Co. (Glendale, California, p. 30). Loma Linda Foods (p. 33, sells soy wafers, three styles of soy beans, liquid soy milk, soy mince). Vita-Pekan (p. 46, formula includes soya bean as a major ingredient). Alberty dried brewers yeast (p. 50). Kovac Laboratories (p. 67). Cubbison (p. 73, incl. Soya Toast, Soya Cookies, Soya Gluten Crackers).

Note: This catalog was probably published in 1933, since the company's location in Beverly Hills is not mentioned; it opened in 1934. Moreover, the book titled *Vital Facts about Foods*, by Otto Carque was first published in 1933. Address: 322 So. Hill St. and 504 So. Broadway. Both: Los Angeles, California.

991. Dafoe, Allan Roy. 1937. Re: The Dionne quintuplets, dried soy bean milk, and soy acidophilus milk. Letter to Dr. John H. Kellogg, Miami-Battle Creek, Miami Springs, Florida, Jan. 4. 1 p. Typed, with signature on letterhead. • ***Summary:*** Dr. Dafoe is the attending physician for the Dionne quintuplets. He thanks Dr. Kellogg for the shipment of fruit which arrived today. "Since writing you last you have also favored us with the dried soy bean milk and the gallon shipment of acidophilus, both of which, you may be sure, are appreciated."

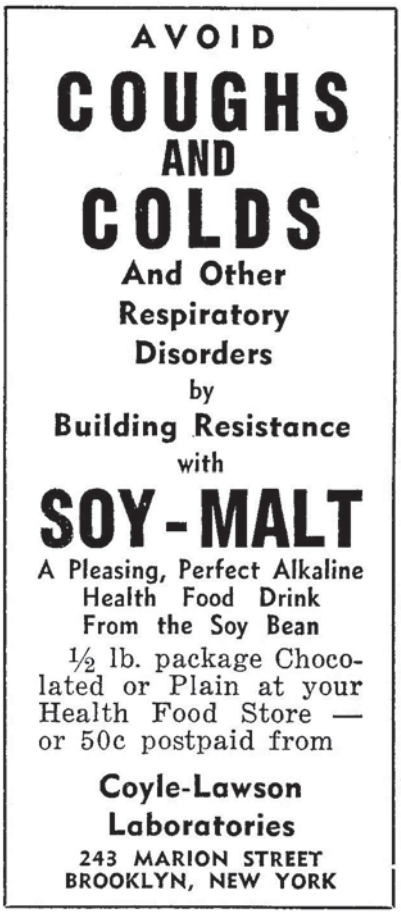
Note: On the letterhead is a photo of the five babies with their names printed under each: Yvonne, Cecile, Marie, Annette, and Emilie [spelled Emelie by Feb. 23].

On Jan. 27 Dr. Dafoe writes Dr. Kellogg requesting that he double the amount of acidophilus sent each week. On the letter is written by hand: "1 case been shipped weekly for 6 months." Next to it is a stamp: "Approved–Jan. 29 1937. Credit Dept."

On Jan. 29 Dr. Kellogg writes that he is sending a number of special foods especially designed for infants, made by his Battle Creek Food Company in Michigan. One of these is made from the soy bean. "It may interest you to know that the specimen of soy acidophilus milk which I sent you is particularly rich in vitamins B and G, containing 50 units per 10 grams of vitamin B and 90 units of vitamin G." He then raises the idea of using a picture or pictures of the quintuplets in connection with the sale of these infant foods if is agreeable to the trustees of the Guardianship to do so.

In another letter of 29 Jan. 1937 to Hon. David Croll, Minister of Public Affairs, Parliament Buildings, Toronto, Ontario, Canada, he proposes the same idea, but now with a royalty payment: "We have an application from two other milk companies who desire to manufacture and distribute our soy acidophilus milk. We will be greatly pleased if you can see your way clear to quote us terms for a royalty arrangement." Address: The Dionne Quintuplet Guardianship, Callander, Ontario, Canada.

992. **Product Name:** Soy-Malt [Plain, or Chocolated].
Manufacturer's Name: Coyle-Lawson Laboratories. Renamed Soy-Malt Corp. by Jan. 1940.
Manufacturer's Address: 243 Marion St., Brooklyn, New York.
Date of Introduction: 1937. January.
Wt/Vol., Packaging, Price: ½ lb, 1 lb, or 5 lb tins.



New Product–Documentation: Ad (2 by 4.75 inches) in *Nature's Path* (New York City). 1937. Jan. p. 29. "Avoid coughs and cold and other respiratory disorders by building resistance with Soy-Malt." "A pleasing, perfect alkaline health food drink from the soy bean. ½ lb. package Chocolated or Plain at your Health Food Store–or 50¢ postpaid from Coyle-Lawson Laboratories, 243 Marion Street, Brooklyn, New York." Note: A similar, but somewhat different, version of this ad appears in the November (p. 421) issue of this magazine.

Ad (2¼ by 2 inches) in *Nature's Path* (New York City). 1940. Jan. p. 33. "Make Nature your partner: Soy-Malt." "Gives you in pleasantly palatable form the *vitamins, minerals, and enzymes* of the soybean which Nature provides so generously for your benefit–plus the starch-digestive ability of diastatic *malt.* Rich in *proteins, iron, copper and lecithin.* Unsweetened. Plain or chocolated... Sample at your health food store or on request from us. Or we'll mail half-pound tin for 50¢ postpaid; both flavors $1." Address:

234-A Marion St., Brooklyn, New York. Note: It is not clear whether this dry product is made from dry soy milk or soy flour.

USDA Bureau of Plant Industry. Div. of Forage Crops and Diseases. 1942. Firms manufacturing or handling soybean food products. p. 3. Soy-Malt Co. company is listed as making or handling the product listed above.

993. *Good Health* (*Battle Creek, Michigan*). 1937. Cow's milk harmful to both infants and adults. 72(1):22. Jan.
• ***Summary:*** "Allergic reaction, or sensitization, to cow's milk is most common in infants and young children but no age is exempt from it." And it is becoming more and more widespread, according to an article by Dr. Charles G. Kerley in the *New York State Journal of Medicine.* The allergy in children may take one of three forms: Shack, gastrointestinal symptoms, or skin reactions (eczema, urticaria, giant hives, etc.).

"The best plan for securing quick relief in these cases is to feed Malted Nuts or a vegetable milk prepared from the soy bean. Milk prepared from almonds or pecans may also be used successfully." Address: USDA, Washington, DC.

994. Lager, Mildred. 1937. If you cannot use milk. *House of Better Living* (*Newsletter, Los Angeles*) 4(14):1. Jan.
• ***Summary:*** "Milk can be made from soy beans and it is a common food in Asia. You can buy it or make it. When bought, it comes in cans, usually unsweetened, sweetened with dextrose, or with chocolate flavor. It also comes in powdered form and then one only needs to add water. It can be made from soy flour. Use 1 cup flour to 4 cups water. Mix and cook in double boiler 20 minutes. Strain.

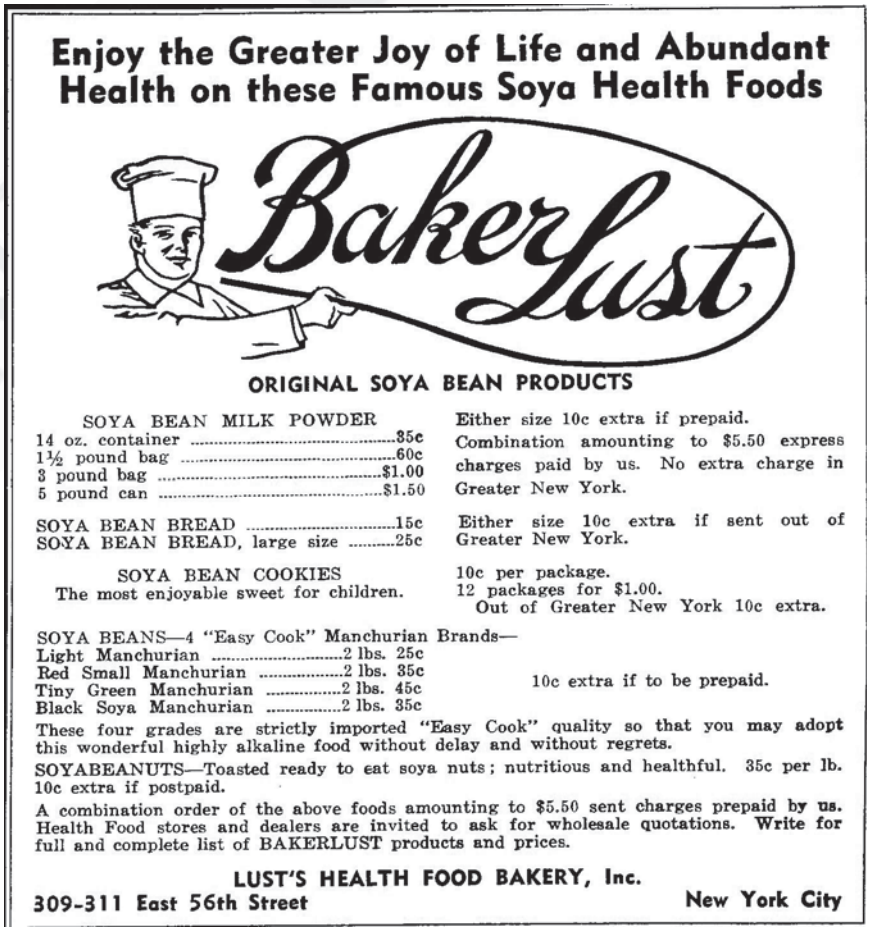
"Almond milk is made from raw almond butter. Use 1 tablespoon to 1 cup water."

995. Lust's Health Food Bakery, Inc. 1937. Enjoy the greater joy of life and abundant health on these famous soya health foods: BakerLust–Original soya bean products (Ad). *Nature's Path* (*New York City*). Jan. p. 19.
• ***Summary:*** A 1/3 page ad. (1) Soya bean milk powder: 14 oz. container–35¢. 1½ pound bag–60¢. 3 pound bag–$1.00. 5 pound can–$1.50. (2) Soya bean bread–15¢. Soya bean bread, large size–25¢. (3) Soya bean cookies: The most enjoyable sweet for children–10¢ per package. 12 packages for $1.00.

(4) Soya flour. 1 lb.–20¢. 5 lbs.–90¢.

(5) Soya beans–4 "Easy Cook" Manchurian brands–Light Manchurian, 2 lbs.–25¢. Small red Manchurian, 2 lbs.–35¢. Tiny green Manchurian, 2 lbs.–45¢. Black soya Manchurian, 2 lbs.–35¢. "These four grades are strictly imported 'Easy Cook' quality so that you may adopt this wonderful highly alkaline food without delay and without regrets."

(6) SoyaBeanuts–"Toasted ready to eat soya nuts; nutritious and healthful. 35¢ per lb.



Note 1. This is the earliest English-language document seen (Dec. 2012) that uses the word "SoyaBeanuts" or the term to "soya nuts" to refer to soynuts.

"A combination order of the above foods amounting to $5.50 sent charges prepaid by us. Health food stores and dealers are invited to ask for wholesale quotations. Write for the full and complete list of BakerLust products and prices."

Note 2. It seems possible, even likely, that Louis Lust (who owned this bakery), purchased soya beans, then milled and baked them himself to create the above line of six different soy products.

Note 3. The large logo near the top of the ad shows the outline of a baker, from the chest up, wearing a baker's hat, and holding out his right hand, in which is a sort of light wand that has taken the shape of the word "BakerLust." Address: 309-311 East 56th St., New York City.

996. Ingham, A.G. 1937. Soybean milk vs. milk. *Hoard's Dairyman* 82(3):78. Feb. 10.
• ***Summary:*** There is no possibility of making a complete substitute for cow's milk out of the soybean.

997. Marlatt, Abby L. 1937. Soybean dishes: New and old. *Wisconsin Agricultural College, Extension Service, Special Circular* 9 p. Feb. Revised ed.
• ***Summary:*** This revision of the 1935 edition contains 2 more numbered pages, plus a recipe for soybean milk. Contents: Introduction. Soybean milk (recipe from U.S. Bureau of Home Economics). Supplies satisfactory proteins. Soybean flour useful. Enriches bread. Muscle building value. Blood building food. Soybeans good sources of vitamins. Homemade soybean meal [roasted soy flour]. Use of the dry soybeans (6 recipes, incl. black soybeans). Green soybeans. Quick breads using soya flour or meal. Soyflour in place of wheat and wheat products: Wheat allergy diet (8 recipes). Soya flour in fish dishes. Desserts. Uses for soybeans and successful combinations with other foods.

"Within the last two years the green soybean has been grown in Wisconsin and found to be most palatable and especially attractive in its clear emerald green color. The bean grows in long pods from which it is shelled after the whole pod is kept five minutes in boiling water. Then the beans come out easily when the pod is pressed. These beans cook in from 10 to 15 minutes in boiling water and require only salt and butter or salt and cream–being served as you serve the small lima beans or the French haricot bean." Four recipes are then given: Green soybean salad, Soybean perfection salad, Canned green soybeans, and Puree of green soybean soup. Address: Madison, Wisconsin.

998. *Nature's Path* (*New York City*). 1937. Directory of health aids (Ad). Feb. p. 80.
• ***Summary:*** A full page ad. (1) Soya products: Soya Bean Milk Powder (Plain or banana flavored). Soya Bean Soup Powder (Soy-Veg). From: Lust's Health Food Bakery, Inc., 309-211 E. 56th St., New York City.

(2) Buy soybean milk powder in bulk. At new reduced prices. "Vitasoy" 25 lbs. @ 20¢ per lb–$5.00 100 lbs. @ 18¢ per lb–$18.00. From: Soya Health Products. North Main St., Spring Valley, New York.

"Natural treatments. Let Nature make you well. She can if you allow her to! Dr. Jesse Mercer Gehman. P.O. Box 1725. Paterson, New Jersey."

999. **Product Name:** Soybana.
Manufacturer's Name: New Century Foods, Inc.
Manufacturer's Address: Burbank, California.
Date of Introduction: 1937. February.
New Product–Documentation: Ad in California Health News. 1937. 5(4):5. Feb. 19. "Announcing !Soybana! A delicious new food made of powdered bananas, powdered soy bean milk, and powdered honey."

Note: This is the earliest known commercial soy product that contains powdered (or spray-dried) soy bean milk.

1000. *Revista de Agricultura* (*Cuba*). 1937. La pequena planta honorable [Little honorable plant]. 20(2):67-69. Feb. [1 ref. Spa]
• ***Summary:*** This is a translation by Prof. Miquel A. Valdiva of the *Time* magazine article of 12 Oct. 1936. Discusses the value of the soybean crop to the United States, the increasing acreage planted in soybeans, their uses as food, and in the factory, and the utilization of the beans in the Ford Motor Co. plant. Address: Chicago, Illinois, USA.

1001. Siegmeister, Walter. 1937. Dietary value of soybean milk in infant feeding. *Naturopath and Herald of Health* (*New York City*) 42(2):36, 55, 59. Feb.
• ***Summary:*** This article is largely composed of carefully cited quotations from many authoritative articles about the value of soybean milk in infant feeding when mother's milk is not available–starting with Ruhrah (1915, p. 502). "Since soy bean milk is deficient in milk sugar [lactose], as compared with human milk, [Dr. J.H.] Kellogg advises sweetening it with honey." Address: Dr.

1002. *Madison Survey* (*Madison, Tennessee*). 1937. Experimental work with foods. 19(9):35-36. March 3.
• ***Summary:*** "Soy milk, fresh every day, is used in quantities by the institution. Soy milk in cans is on the market, its sale increasing continually as people become acquainted with the value of this product.

"Not only is Madison publishing the virtues of soy milk, but scientists in various places are advocating its use instead of dairy milk. Professor Madder of the University of Frankfurt, Germany, showed recently that infants fed on soybean milk are able to resist infection to a remarkable degree. This is attributed to the alkalinity of the soy milk,

which increases the resistance of cell tissues.

"An experiment conducted in Cleveland, Ohio, in the feeding of over 200 infants on soy milk and gruel [with okara, probably], shows that the cellulose of soybean gruel relieves constipation. When soybean milk is used, the intestinal flora show a predominance of gram-positive organisms, thus resembling the stools of normal breast-fed babies."

1003. *Madison Survey* (*Madison, Tennessee*). 1937. Home economics and nutrition courses. 19(9):33-34. March 3.
• ***Summary:*** In recent years, the college has provided liberally for science courses and "other departments for the education of workers in the Southland. But the Home Economics Department has been operating in temporary quarters, and with meager equipment, waiting for the hour to strike, for the opportune time to arrive for advancement." Now the time has come. Madison College is eminently fitted to operate a strong department in Diet and Nutrition. Its medical department, known as Madison Rural Sanitarium and Hospital, makes a specialty in its treatment of diet in disease. In its Food Manufacturing Department it is experimenting with foods and is placing on the market a variety of health products. Its experimental work with the soy bean has brought it into prominence in that field.

"Students in Diet and Nutrition have the privilege of practical demonstration and daily work in the Sanitarium diet kitchens and in the preparation and service of foods in the College Cafeteria. They are at work with foods in the Food Manufacturing Department, in the Cannery and Soy Milk departments, and it is from the college diet classes that the City Cafeteria draws its cooks and dietitians. Dr. Frances Dittes, who heads the college Department of Home Economics, has been Sanitarium dietitian for years. She is author of the cook book, to which you have been introduced, entitled "Food for Life.' Something of her equipment for her work both as teacher and writer is voiced in the review, of "Food for Life," written by Dr. H. A, Webb, head of the Department of Chemistry, Peabody College, for the Magazine Section of Nashville *Banner,* issue of July 26, 1936. He says: "'This book makes a real contribution to the literature of cookery and nutrition from at least two standpoints: First, it is written by a Southern author who knows the Southern taste in sickness and in health; second, it is the vegetarian school, whose life work consists in administering foods as a true medicine to those who seek for health.'

"By education, by close association with the Sanitarium staff of physicians in their care of patients, and by collaboration with Dr. Philip Chen of the College Department of Chemistry who is also chemist for the Food Manufacturing Department, Miss Dittes has a wide background for training dietitians and for leadership in the Department of Home Economics. Students otherwise qualified and who are interested in food work are unhesitatingly directed into this section of the college.

"It is in recognition of the wide field of usefulness open to those who are well trained in food preparation and food service, that Madison College is now preparing to equip new headquarters for this department of instruction, and solicits your cooperation."

1004. Chieh, Sung; Chu, Fu-tang. 1937. The vitamin C content of food articles available for young infants. *Chinese Medical Journal* 51:315-24. March. [9 ref. Eng]
• ***Summary:*** The vitamin C content of soybean milk is negligible. It was obtained from the Child Health Institute, Peiping, prepared by Tso's method. Address: Div. of Pediatrics, Dep. of Medicine, Peiping Union Medical College, Peiping.

1005. *Food Industries.* 1937. Keeping right on soy beans. 9(3):119. March.
• ***Summary:*** What is the best way to utilize soybeans in the United States?–a very important question addressed by this interesting editorial. "There is considerable danger that over enthusiastic friends of the soy bean may attempt to develop the new industry into directions that are unwise and may retard its development. Properly exploited, the soy bean should add to our national welfare; but improperly exploited the soy bean may go into disfavor. It has not yet won its way to the point where Americans will recognize its possible misuse, despite the propaganda of the Farm Chemurgic Council at Dearborn, Michigan.

"Oriental foods such as soy bean milk and cheese are not very palatable, we are advised, and are more expensive than cows' milk and cheese. Until there is a shortage of cows' milk it is unwise to create fears of new competition and the consequent antagonism of the dairy crowd.

"Another possible weak spot lies in the marketing of inferior tasting soy bean products, yet putting them over by a sales talk on nutritive values. Any food that earns a permanent place on the American dinner table does so because it tastes good–not because it ought to be eaten.

"Again: emphasizing the value of soy beans as a food for diabetics lays stress on one of its lesser values. To most of us, diabetic foods seem like foods that have been deprived of all pleasure and zest in eating. Butter, green vegetables and poultry are good foods for diabetics, but a big sales drive on that angle alone will not build volume business.

"And finally, it is a mistake to give the public the notion that soya flour and soy bean products are luxury foods by demanding prices that are out of reach of the masses. Soy beans are almost as cheap as corn and are usually cheaper than wheat. Soya products belong in the grocery store–not exclusively in the so-called health store."

1006. Shoptaw, LaVan; Espe, D.L.; Cannon, C.Y. 1937.

Gastric digestion of soybean flour. *J. of Dairy Science* 20(3):117-28. March. [9 ref]
• ***Summary:*** "A soybean gruel made by mixing one part of soybean flour with nine parts of water was compared with whole and skim milk for calf feeding..." Address: Dairy Husbandry Section, Iowa Agric. Exp. Station.

1007. Chubbuck, Dorothy. 1937. The many wonders of the soy bean. *Herald* (*Edison Inst., Dearborn, Michigan*) 4(7):1, 3. April 30.
• ***Summary:*** Describes the work of the Ford Motor Co. with soy beans. "Let us now see how the soy bean was first introduced to the Ford Motor Company and Greenfield Village. In the chemical plant in the Village, a group of young men were experimenting with several different vegetables–carrots, beets, cabbage, etc.–to discover which of the vegetables was the most complete food. Among these vegetables was the soy bean, which proved to be the most promising. About 1928 Dr. Ruddiman started experimenting with the soy bean; however, it was not until about 1930 that the young men in the chemical plant began work on it.

"The number of acres planted with soy beans has increased greatly. In 1917 about 50,000 acres were planted in the United States; in 1935 over a million and a half acres were sowed. Evidently people are beginning to realize the value of the soy bean." Michigan ranks seventh in amount of soy beans grown...

"Soy beans even play a part in the production of Ford cars. Every car that comes off the assembly line at the Rouge Plant will require several pounds of soy bean plastics for horn buttons, electrical apparatus, window frames, and many other parts. The use of the soy bean in the factory draws closer together the link between agriculture and manufacturing... Soy bean plastics are used not only in the factory but also in the hospital for table tops and coverings for either curved or flat apparatus. Soy bean plastics give a modern as well as a serviceable appearance to the hospital."

Photos show: (1) The author interviewing "Dr. E.A. Ruddiman, director of the food laboratory, concerning the many uses of the soy bean. On the table are biscuits, waffles, cake, cheese, soy butter, sandwich spread, soy sprouts, milk, and canned beans–all made from or containing soy bean products." (2) The author and Dr. Ruddiman in a laboratory standing by distillation tubes; he is showing her how to estimate the ingredients the ingredients of the soy bean using these tubes. (3) The author looking into a microscope in order to examine "some of the meal from which the protein has been extracted."

Note 1. This journal is "Published by Students of the Edison Institute." This article contains the earliest date seen (1928) for the Ford Motor Company's involvement with soybeans.

Note 2. This is the 2nd earliest English-language document seen (Jan. 2013) that contains the modern term "soy sprouts."

1008. Dittes, Frances L. 1937. Soybeans and human nutrition. *Health* (*Mountain View, California*) 4(4):18-19, 26. April. [3 ref]
• ***Summary:*** Discusses history of the soybean, food uses, nutritional value, recent scientific studies. Address: PhD, Dietitian, Madison College, Madison, Tennessee.

1009. Lager, Mildred. 1937. Something new–delicious. *House of Better Living* (*Newsletter, Los Angeles*) 4(17):4. April.
• ***Summary:*** "No chocolate is added to real soy chocolate. The dark color is from the browning of the bean. We have soy cocolette as well as the soy candies. We also have new banana soy milk powder."

1010. Fearn, Charles E. 1937. Re: Mr. Paul Richard of Oak Park, Illinois. Letter to Dr. A.W. Stokes, 4755 Fullerton Ave., Chicago, Illinois, May 3. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** "Dear Dr. Stokes, I had a call from an old friend of mine, Mr Paul Richard of Oak Park today and he tells me you are interested in the possible use of Soya in infant feeding, and especially so in cases that are Allergic to milk protein. It so happens that I have had quite a considerable experience of these, and the results have invariably been satisfactory. Some years ago in London (England) I treated a large number of these allergy cases with Soya as a substitute for milk, but I found it was essential to prepare it from a blend of beans, as these vary very considerably in the Amino-Acid values of the protein; since doing this there have been no difficulties whatever, and all cases progressed very favorably."

Dr. Fearn recommends use of "the cereal I make here, as to my mind it is probably the best way possible to use Soya in the ordinary cases, and particularly in Pre and Post natal ones.

"With this I am sending you samples of the Soya Milk which I suggest you try in these allergic cases, leaving out milk entirely of course."

It "is not possible to make this Soya Milk entirely soluble without robbing it of its most important constituents, so the milk when fed to the baby should be shaken occasionally to prevent any settling.

"Directions. Use five heaping teaspoonfuls to a pint of water and boil gently for 15 minutes, adding sugar and salt as desired." Actually, Dr. Fearn usually starts with 3-4 heaping teaspoonfuls, then increases the amount "as the infant becomes used to it, but it depends somewhat on the age and the number of feedings. It occasionally takes a few days for the child to get used to this diet, but in most cases there is not the least trouble even at the start."

"This particular product is not yet on the market." Dr. Fearn is no longer practicing medicine. "Believe me my Dear Dr Stokes, Very Sincerely Yours... M.D. Eng. [England] late Royal Army Medical Corps."

Note: Dr. Fearn had known Paul Richard well since the mid-1930s. Address: M.D. [Fearn Soya Foods Co., 355 West Ontario St., Chicago, Illinois].

1011. Miller, Harry Willis. 1937. Process of making vegetable milk. *U.S. Patent* 2,078,962. May 4. 2 p. Application filed 3 Dec. 1935.

• ***Summary:*** This patent is "especially for the production of vegetable milk from the soya bean, the various steps of the process being physical and at no time chemical."

It has "been found of decided advantage to grind the soaked beans in a burr mill and during the grinding operation to constantly add a small stream of water to the beans. The beans should be ground to the finest possible state.

"During the grinding operation the water added is such as to result in the formation of about twenty gallons of pulp [okara] for twenty-five pounds of beans."

The saturated mass is added to boiling water in a "kettle and stirred or agitated while being heated to the boiling point, such boiling being continued until the pulp has lost its viscosity stickiness so that when separated the pulp comes out quite dry..."

"After the fluid has been heated to the boiling point it is then strained through a very fine straining cloth to separate cellular residue from the milk allowing only the food particles in solution to pass through. This straining operation is preferably facilitated by use of a centrifuge making 2,500 revolutions per minute."

To the hot milk are then added a cereal sugar (7 lb), a vegetable fat (7 lb) and salt (3 oz). The mixture is then reheated to the boiling point and during this heating and cooking the fluid is agitated very carefully until the entire taste of the milk is "changed from a beany flavor to what might be termed a 'nutty' flavor." After proper cooling, the milk is run through a colloid mill or homogenizer.

This improved process extracts from the soya bean approximately 85% of its protein and 70% of its fat, together with vitamins A, B, E, and G and the larger portion of the mineral ash. Address: Shanghai, China.

1012. Alwines, C.W.D. 1937. The soya bean (Letter to the editor). *Tropical Agriculturist* (*Ceylon*) 88:304-05. May.

• ***Summary:*** "When in charge of the Balance Diet Experiment at St. Patrick's Boarding House last year, I was anxious to get a quantity of these beans, to see how much they would cost in a daily diet and whether they could go to make palatable dishes. Enquiries from [sic, to] the Department of Agriculture elicited the information that these beans were not grown in Ceylon. The Market Commissioner gave the address of a Colombo firm that sold the beans. A trial order was placed. The cost however militated against the regular use of these beans." A small quantity of yellow soybeans was roasted and ground. "To all intents and purposes the powder passed off as coffee. That was the easiest way of preparing the bean as food." The beans were passed three times through a flour mill to obtain a fine, golden flour, almost like gram flour. "The flour was used to make bread, buns, tarts and a cake. These were very tasty." One part of soya was mixed with two parts of [wheat flour] dough to make bread and buns... The nutty flavour as eliminated by a liberal addition of butter, sugar and essence of vanilla. The number of eggs uses was less" since soya flour contains 20% at. Rotti, Vadai, and other indigenous dishes were also tried.

"Undaunted by the fact that Soya Bean was not grown in Ceylon, an attempt was made to grow it at Paranthan and at St. Patrick's Boarding House gardens. The variety tried belonged to the black group (with flat black seed)." They grew well and the flour tasted good in the dishes described above. "An attempt to make Soya Bean milk and curds is contemplated." Address: St. Patrick's College, Jaffna, Ceylon.

1013. Lust's Health Food Bakery, Inc. 1937. Enjoy the greater joy of life and abundant health on these famous soya health foods: BakerLust–Original soya bean products (Ad). *Naturopath and Herald of Health* (*New York City*) 42(5):157. May.

• ***Summary:*** This 1/3 page ad is identical to that which first appeared in the Jan. 1937 issue of *Nature's Path* (New York City)–except that the large logo near the top of the ad has a horizontal bold black rectangle (1½ by 3½ inches) as background. On it, in white, is the outline of a baker, from the chest up, wearing a bakers hat, and holding out his right hand, in which is a sort of light wand that has taken the shape

of the word "BakerLust." Address: 309-311 East 56th St., New York City.

1014. *Popular Mechanics.* 1937. The bean that made good. 67:660-62, 120A, 122A. May.
• ***Summary:*** Photos show: (1) William Morse in his office at USDA in front of shelves of soybean food products. (2) Native 2-wheeled carts drawn by horses or mules (and widely used to carry soybeans) in front of storage silos in Manchuria. (3) "Soybeans from Japan used as green vegetables"–their pods. (4) A soybean storage yard Manchuria, with many horse-drawn wooden carts and tall cylindrical storage containers. (5) William Morse inspecting candied soybean products. (6) Two men in a hay-strewn field. (7) Boiled soybeans being crushed in a wood mortar in Japan. (8) Earthenware jars for making soy sauce in China; each is topped with a conical woven bamboo lid. (9) Two men, possibly including Morse, examining the root systems of soybean plants.

A chart (p. 120A) is titled "Soybean Utilization."

This digital photo, with caption and date, was sent to Soyfoods Center by Joyce Garrison (William Morse's granddaughter) of West Hartford, Connecticut (July 2004).

1015. *Revista de Agricultura* (*Cuba*). 1937. El frijol que se ha hecho famoso [The bean that has become famous]. 20(4-5):30-36. April/May. [Spa]
• ***Summary:*** Describes the soybean, its history in the United States, the advantages of planting it, its uses as oil and vegetable milk, its use in industry, and prospects for the future. Contains eight photos: (1) William Morse of the USDA standing in front of many floor-to-ceiling shelves filled with food products made from soybeans. (2) Green vegetable soybeans in their opened pods. (3) Horse-drawn carts with sacks of soybeans and silos filled with soybeans in Manchuria. (4) William Morse pouring whole soybeans into his left hand from a can held in his right hand. On a nearby wooden box, apparently containing the same type of soybeans, is written in Japanese (from right to left) *"Hakka mamé,"* which means "peppermint soybeans." (5) Two farmers in a field of shocked soybeans. (6) A Korean girl pounding soybeans in a tall wooden mortar. (7) A Chinese courtyard filled with vats of fermenting soy sauce, each covered with a conical braided bamboo lid. (8) Two farmers wearing straw hats inspecting soybeans in a field.

1017. Carver, G.W. 1937. Re: Peanut milk. Letter to Mrs. L.C. Barnes, 459 Marlborough Road, Yonkers, New York, June 21. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** "Dear Madam: Peanut milk is not on the market and is not being manufactured. I suggest that you get in touch with the Nashville Agricultural Normal Institute, Madison College, Madison, Tennessee. They manufacture many kinds of health foods from soybeans including soybean milk, which is similar in many respects to peanut milk. They make an excellent product."

John Ferrell, who located this document, adds (Dec. 1992). "Carver seemed to like Madison College. I've noted maybe six letters much like this one to people who enquired about soybeans." Address: Director, Research and Experiment Station [Tuskegee, Alabama].

1018. Carver, G.W. 1937. Re: Soybean milk. Letter to Joseph Horsham, M.D., 623½ Kanawha St., Charleston, West Virginia, June 26. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** Dr. Horsham wrote Carver on June 22: "I was also much interested in the preparation [soybean milk] that you made for Mr. Mahatma Gandhi. I have a patient who is suffering from an obstruction of the pyloric end of the stomach..."

Dr. Carver replied: "I suggest that you try out the following beverages. First, soybean milk. Grind the soybeans and cover them with cold water; heat slowly, stirring constantly. When it reaches the boiling point, remove from the fire and strain through double cheese cloth. This milky liquid can be sweetened, lemon juice or any other fruit juice added, making a very palatable drink. Peanut milk can be made the same way from either parched or raw peanuts." Address: Director, Research and Experiment Station [Tuskegee, Alabama].

1019. Carver, G.W. 1937. Re: Soybean milk, peanut milk, and Madison College. Letter to Mr. N.A. Alexander, Harrison, New York, June 27. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** "Dear Sir: Our station has never issued any publications on the soybean or peanut milk. I just received yesterday a can of chocolate milk and one that is of the same composition as cow's milk. Both are made by the Madison College, Madison, Tennessee. They are supreme authority on the use of the soybean, and it would be well for you to get their literature, as I do not know of an institution that is doing more remarkable things with the soybean along food lines as they are." Address: Director, Research and Experiment Station [Tuskegee, Alabama].

1020. Megee, C.R. 1937. Soybean production in Michigan. *Michigan Agricultural Experiment Station, Circular Bulletin* No. 161. 14 p. June.
• ***Summary:*** Contents: History, adaptation, and uses. A high protein emergency or annual hay crop. Digestible nutrients and feeding value per acre of soybeans and other Michigan crops. Soybean oil meal. A supplementary

protein feed. Soybeans for silage. A cash crop. Soybeans as a soil improving crop. Cultural practices: Varieties, time of planting, rate and methods of planting, inoculation. cultivation, harvesting for hay, harvesting for seed, threshing, storage of soybean seed. Industrial and commercial uses of soybeans: Soybean oil, soybean oil meal, dried beans, for human food.

"As early as 1902 and for 20 years afterwards, E.E. Evans of West Branch, Michigan, took an active part in introducing, breeding, and distributing varieties of soybeans. The Ogemaw is an introduction of Mr. Evans and is the result of a cross between his No. 6 Early Black and Dwarf Brown. Since 1918 the Michigan Agricultural Experiment Station has conducted numerous variety tests for both hay and seed production at East Lansing and at various points over the state" (p. 3).

Table 4, titled "Soybean variety adaptation" (p. 10) lists the following: Manchu, Ito San, Mandarin (Canada), OAC 211 (Ontario), Dunfield, Illini (Illinois), Mandell (Indiana), Sciota (Ohio), Cayuga (New York), Ogemaw (Early Michigan), Wisconsin Early Black, Virginia, Wilson, and Mammoth Yellow. For each variety is given the name, maturity, seed color, and adaptation. "The Manchu is the leading general-purpose variety for hay, seed, and commercial uses in Michigan."

Under "Industrial and commercial uses of soybeans," a table shows 10 industrial and food uses of soybean oil, 15 industrial and food uses of soybean oil meal (incl. diabetic foods, flour, crackers, soy milk, bean curd [tofu], soy sauce), and 12 industrial and food uses of dried beans (incl. roasted beans, coffee substitutes, soups, baked beans, boiled beans). "When soybeans are to be used as a green vegetable, the Easycook and Hahto are preferred because of their milder flavor." Address: Section of Farm Crops, East Lansing.

1021. *Naturopath and Herald of Health* (*New York City*). 1937. Recipe for soya bean milk. 42(6):183. June.
• ***Summary:*** This recipe by Clara M. Brewster is from *Horizon* (Aug. 1936, p. 9, 26-27).

1022. Radcliffe, Jack B. 1937. Soybean: The perfect protein. *Nature's Path* (*New York City*). June. p. 210.
• ***Summary:*** "Packed into the tiny soya bean is a wealth of nutrition; minerals, tiny vitamins, easily assimilated carbohydrates, and the greatest hoard of proteins that any food in the vegetable kingdom contains." Just imagine. "A vegetable product equal to most, and superior to some animal products in proteins, the body building element in food, without which there would be no life."

Unlike meat and fish, the soybean is one of those rare foods that alkalinize the body. Milk and butter made from soybeans are better than their dairy counterparts. Its oil is equal to the best grade of olive oil. It is the world's leading source of lecithin, and the source of protein-rich soy flour, soy sauce, roasted soybeans, vegetables, cheese, etc. Dr. Kellogg is making increasing use of "soy acidophilus" [a type of liquid fermented soy milk].

1023. Carqué, Lillian R. 1937. Sensible feeding of children. *Nature's Path* (*New York City*). July. p. 244, 264-65.
• ***Summary:*** "Pure roasted and unsalted Almond Butter, diluted with warm water to the consistency of milk," to which a little honey has been added, may occasionally take the place of animal milk. "Almond milk should be made fresh every day."

"In China and Japan, soy bean milk is frequently used in feeding infants and children in place of animal milk."

Note: This last sentence may possibly be true about China but it is not true of Japan. Address: [Los Angeles, California].

1024. Lanzing, J.C.; van Veen, A.G. 1937. Sojamelk [Soymilk]. *Mededeelingen van den Dienst der Volksgezondheid in Nederlandsch-Indie* 26(1&2):60-74. [9 ref. Dut]
• ***Summary:*** This is the earliest Dutch-language document seen (Aug. 2013) that uses the term *sojamelk* to refer to soymilk. As of Oct. 2003 *sojamelk* is the modern Dutch word for soymilk. Address: Both: Dr., Geneeskundig Laboratorium, Batavia.

1025. Voellmig, Gertrude. 1937. Modern science discovers the soy bean as very nearly perfect food: New leaflet on soy bean now ready. *Detroit News.* Aug. 29. Home and Society section. p. 14, col. 4.
• ***Summary:*** "The Detroit News Household Department receives so many requests from readers for information about soy beans" that they have compiled a table and leaflet (with 21 recipes). It has been grown in China since 2800 B.C. [sic]. Readers want to know why it is recommended so highly by doctors for special diets. Now grown in the United States, it is used in industry and to make the steering gear of cars. "But did you know that this bean comes nearer to being a complete food for humans than any other known product?" The beans are often served green in the pods. First the pods are dipped in boiling water for 1-2 minutes, then the beans can easily be pressed out of the pods. The mature beans can be made into milk, and the milk into cheese [tofu]. Soy bean butter is similar to peanut butter. Many U.S. margarines are made from soy bean oil. "Salted Soyas," toasted and salted, make a fine tid-bit [tidbit] after dinner. "The most commonly known soy bean product is the flour." If 5-10% of the wheat flour is replaced by soy flour in the recipe for any bread or baked good, the result will be more tender and last longer.

Three photos, titled "This product has many uses as a food," show: (1) Jars of: Soy bean–Salted Soya. Soy beans–Mature, pressure cooked. Soy beans with carrots. Soy bean–Green. (2) Jars of: Soy bean cheese. Soy bean milk. Soy bean

cheese with pimento. Soy bean butter, Soy bean sprouts. (3) A loaf of Soy bean bread–25% bean flour. A jar of Soy bean flour–Not processed.

Of the 5,000 varieties, only about 10 are grown in the USA to any great extent. "Mammoth Yellow is one of the few preferred for food stuffs because it does not have a strong flavor."

Gives many reasons that soy beans are very important in the diet, 6 reasons why the "soy bean is an excellent food stuff," a listing of industrial uses, plus two recipes. Address: Asst. Household Editor, The Detroit News.

1026. *Food Field Reporter.* 1937. Russians make soybean milk, use it for chocolate candy. 5(18):35. Sept. 6. [Eng]
• ***Summary:*** "Leningrad, Russia–How to make soybean milk and soybean cream and the uses of soybeans in confectionery have been investigated by V.M. Voskresenski and T.K. Dobruinina of this city. The scientists say that soybean milk is made by soaking the beans for 2 hours and thoroughly emulsifying. In commercial production, they state, the material may be hulled or whole beans, thoroughly ground and homogenized in water at least one hour and then thinned with water and emulsified at least 30 minutes. The milk may be pasteurized at 80ºC for 15 minutes.

"In making soybean cream there are 2 methods. The water content of the original emulsion may be reduced, or the soybean milk may be creamed. Pressed soybean milk has been used to make chocolate candies of good quality, it is reported. Also soybean-milk residues have been mixed with jam or jelly to make pie fillings."

1027. League of Nations Health Organization–Bandoeng Conference. 1937. Report of the Intergovernmental Conference of Far-Eastern Countries on Rural Hygiene. *International Conference of Far Eastern Countries on Rural Hygiene* (*Preparatory Papers*) Vol. 3, page 74-76. Held 3-13 Aug. 1937 at Bandoeng, Java. Published 8 Sept. 1937. Official No. C.H. 1235.
• ***Summary:*** In Chapter 4, titled "Nutrition," section I discusses "Composition of food and methods of its preparation." The soya bean and its uses in French Indo-China (today's Vietnam) are discussed on pages 75-76. "Apart from rice an maize, one of the most important food crops in that Far East is the soya bean (*Glycine hispida*). This bean is rich in proteins and fatty matter, but has a very low carbohydrate content. Eaten in its natural state as a vegetable, or better still, in the form of a variety of appetising preparations in which the casein is partly disintegrated, the soya bean makes good the deficiency of fatty and nitrogenous matter in the native diet, which consists almost entirely of the rice carbohydrates.

"Its chief derivatives are nuoc-dâu, or soya milk; dâu-phu, a fresh soya cheese obtained by precipitating the casein of soya milk; dâu-tuong, or soya sauce, which is often used instead of nuoc-mam, especially in Tongking; and dâu-phu-chuc, or soya cream [yuba].

"Soya milk is a yellowish-white liquid with a slight smell of burnt bread and a peculiar flavor greatly appreciated by the Annamites. It is prepared by peeling the beans, pounding them in water, straining, and boiling up the resulting liquid.

"Soya cheese [tofu] appears in trade in the form of faintly yellowish-white rectangular cakes, weighing about 150 grammes each. Ten kg. of soya beans will produce 100 liters of milk, which in turn yield 300 cakes, or 45 kg., of cheese. This very cheap product, of which several thousand kilogrammes are sold every day in the Hanoi market alone, is eaten either raw with salad, or stewed with vegetables, or fried in oil.

"Soya sauce, or dâu-tuong, is a preparation obtained by fermenting a mixture of glutinous rice [*Oryzae sativa glutinosa*, called 'nêp' by the Annamites] and roasted soya beans. It is a condiment both salty and sweet, which frequently replaces nuoc-mam, a relatively dear food, especially in regions distant from the sea.

"Dâu-tuong is commonly found in commerce in the form of a heterogeneous mixture, consisting of a liquid (nuoc-tuong) in which floats a somewhat coarse paste called tuong-cai, made of incompletely powdered soya beans.

"Dâu-phu-chuc is prepared by drying the skin that forms on the surface of soya milk after prolonged heating. It is sold in shiny, pale yellow, crinkly sheets, and smells like cow's milk. It is a food rich in proteins and fatty matter, and is consumed by the Annamites in small pieces, either in soup, or in pork, beef, or chicken stew."

Note: This is the earliest English-language document seen (Dec. 2012) that uses the term "roasted soya beans" to refer to soynuts. Address: Geneva, Switzerland.

1028. League of Nations Health Organization. 1937. Report of the Intergovernmental Conference of Far-Eastern Countries on Rural Hygiene. *International Conference of Far Eastern Countries on Rural Hygiene* 3:65, 74-77. Held 3-13 Aug. 1937 at Bandoeng, Java. Published 8 Sept. 1937. Official No. A.19.1937.III.
• ***Summary:*** Chapter 4, titled "Nutrition" has a section on "Recommendations About Diet" (p. 74-77). It encourages the inclusion of some animal protein in the diet, praises "under-milled rice" over highly-milled rice for its greater content of vitamin B-1, protein, and mineral salts, and praises the nutritional value of fish, eggs, milk, pulses, and soya bean. "Soya bean contains a high percentage of protein and fat, and preparations of soya bean are an important dietary ingredient in Eastern countries. While soya bean is a valuable food, it does not make good all the deficiencies of diets based on rice. Soya bean "milk" has little in common with mammalian milk beyond a white colour. Suitably supplemented–e.g., by egg yolk, malted sugar, and mineral salts–soya bean

"milk" may be useful in infant feeding." Address: Geneva, Switzerland.

1029. Morse, W.J. 1937. Soybean variety studies of the United States Department of Agriculture. *Proceedings of the American Soybean Association* p. 16-18. 17th annual meeting. Held 14-16 Sept. at Urbana, Illinois.
• ***Summary:*** "One of the outstanding results of soybean improvement work in the United States has been, the realization of the importance of varietal adaptation... Varietal adaptation is obviously the reason why practically every locality in the soybean regions of the Orient has its own local varieties... Of the large number of introductions obtained from Asia, the same variety rarely has been secured a second time unless introduced from the same locality... Before numerous introductions were made by the Department, beginning in 1898, there were not more than eight varieties of soybeans grown in this country, and the culture of these varieties was confined to limited areas in a few states... Seed samples were obtained through consuls, missionaries, seedsmen, government agencies, and foreign explorers until by 1909 we had 175 varieties; by 1913, 427 varieties; by 1919, 629 varieties, by 1925, 1133 varieties, and at the present time more than 2,500 distinct types. Since 1989 the Department of Agriculture has made more than 10,000 introductions of soybeans from China, Manchuria, Japan, Chosen [Korea], Java, Sumatra, Siberia, and India. This large collection, ranging in time of maturity from 75 to 200 or more days, has show wide differences in adaptation to soil and climatic conditions..."

After preliminary testing at Arlington Farm, Virginia, the introductions are sent to various experiment stations for cooperative studies...

"The soybean has been used chiefly as a forage crop in the United States and for many years breeding work tended largely toward the development of varieties for hay, silage, and pasture. With the rapid development during the past few years of the soybean for oil, food and industrial purposes, acreage for bean production has increased greatly. The improvement and development of varieties adapted to a wide range of conditions and uses undoubtedly has been one of the most important factors in increased acreage and seed production."

"Extensive cooperative investigations with more than 3,000 introductions and selections of soybeans have been carried on during the last three or four years with experiment stations and special cooperators in 44 states and the insular possessions, Hawaii and Puerto Rico. Many of these selections gave outstanding results when compared with standard varieties in different sections and are being increased for more extensive field tests. Several of the varieties in different sections were found especially suitable for use as green shelled beans, dry edible beans, or beans of high oil and protein content, as commercial beans.

"In 1936, more than 5,000 individual soybean plant selections from introductions and natural hybrids were under test at Arlington Farm. Although improvement work at Arlington has been largely plant selection, some hybridization work has been started, especially with the wild soybean and the most promising cultivated types. Oil and protein studies have been conducted along with the breeding work, analyses being made of introductions grown in the same and under different environmental conditions. An extensive series of varieties, introductions and selections at Arlington Farm ranged from 12 to 26 per cent oil and from 28 to 50 per cent protein... In view of the interest in soybean oil for paint purposes, studies were conducted to show the range in iodine number. The results of these investigations showed a range from 118 to 143 for domestic varieties and 155 for the wild soybean.

"The increasing use of soybeans for food has resulted in a demand for varieties especially suited for various food purposes. Extensive cooperative cooking experiments with the Bureau of Home Economics of the Department of Agriculture and with several state experiment stations have shown considerable variation in flavor and cooking quality in both the green and dry beans of edible varieties from the Orient. The most promising of these have been named and distributed to special cooperators by several state experiment stations. Some of these varieties are especially valuable as green shelled beans, flour, dry edible beans, roasted salted beans [soynuts], bean curd, bean milk, and bean sprouts." Address: Bureau of Plant Industry, USDA, Washington, DC.

1030. Muller Laboratories (The). 1937. Mull-Soy. Vegetable milk substitute (Ad). *Proceedings of the American Soybean Association* p. 76.
• ***Summary:*** A 1/8-page horizontal, rectangular ad with no graphics.

Note: This is the earliest ad seen (July 2013) that mentions "Mull-Soy." Address: 2935 Frederick Ave., Baltimore, Maryland.

1031. *Times of India* (*The*) (*Bombay*). 1937. Rs. 2,00,000 [200,000] for free milk for municipal school children: Bombay Corporation's decision. Oct. 8. p. 14.
• ***Summary:*** Starting next year, under-nourished, needy children, who attend municipal primary schools in Bombay, will be given a free supply of milk every day at the expense of the Bombay Municipality–as announced at a meeting of the Municipal Corporation held last Thursday.

Various amendments were offered and debated. Mr. Hirjibehedin noted that many foreign countries had similar programs. "In that connection, he suggested that the Schools Committee might try soya bean milk, which, in his opinion, was more nutritious than cow's milk or buffalo's milk."

1032. *Chicago J. of Commerce and La Salle Street Journal.*

1937. Ice cream, milk from soy beans: Tennessee scientists start new industry. Oct. 13. p. 9, col. 8.
• ***Summary:*** In a small group of buildings located a few miles from Nashville, a small group of chemical and agricultural scientists are doing "big things with the soy bean..."

It all started some 25 years ago when some agricultural chemists at the small, self-supporting the Nashville Agricultural Normal Institute started experimenting with the soy bean, then used mainly as forage.

Today, in a small group of buildings housing the 3-month old industry, E.M. Bisalski, his staff of assistants, and Dr. Philip Chen (a research chemist from China) are making "milk, meat, coffee, and automobile accessories from the vegetable."

Chen says there was soy bean milk in China 3,000 years ago, yet it has taken the scientists about 25 years to "neutralize the bean flavor and approximate that of the cow." Experiments in the institute laboratory showed that many generations of rats living exclusively on soy bean milk grew strong and produced prolific offspring. The scientists believe that the "bean milk can be produced more cheaply than dairy milk and that it can be produced under conditions of chemical sterility, almost germ free."

Having developed good milk, the group next "sought to compete with cattle as food producers in the form of beef.

"A product called soy-burger has been produced. It tastes like hamburger.

"The scientists have made ice cream and buttermilk and even chocolate flavored milk. They also have a cheese [probably tofu] which is said to be the closest thing to pure protein known to chemistry. It tastes like Swiss cheese but costs only a fraction as much."

Note: This is the earliest document seen (Jan. 2007) concerning a meatless burger made from soy. This is also the earliest English-language document seen (Jan. 2007) that contains the term "soy-burger."

1033. *Agricultor Venezolano* (*El*) (*Ministerio de Agricultura y Cria, Caracas*). 1937. Consultorio agricola [Agricultural information bureau]. 2(18):62-63. Oct. [Spa]
• ***Summary:*** One of the sections, by Bartolomé Valero, dated July 1937, is about soymilk (*Leche vegetal de soya*) and tofu (*Queso de habas de soya, ou cuajada de soya*). Describes briefly how each is made.

1034. Kellogg, John Harvey. 1937. Special health values of the soybean. Paper presented before the Section of Food and Nutrition at the American Public Health Assoc., 68th meeting. Oct. 5. 7 p. typescript. Reprinted in 1937 by Soya Foods Ltd., Rickmansworth, England. 6 p. [9 ref]
• ***Summary:*** This paper begins: "The rapid development of the production and use of the soybean (*Soja hispida*) in this country within the last quarter of a century, and the multitudinous uses to which it is being put, fully justify the name 'wonder bean', which it has been called by American writers, and the appellation, 'little honorable plant', by which it is known in China.

In South China, the soybean so completely replaces other sources of protein that there is no dairy industry, and meat, fish and even eggs, are very little used. The soybean is the chief source of protein for the common people and is referred to as 'the poor man's meat.'

"Studies of this most remarkable of food products, especially in the United States and Germany, have shown it to possess not only extraordinary nutrient properties, but also some highly important prophylactic and therapeutic values, knowledge of which ought to be popularized as rapidly and widely as possible.

"Although botanically classed with legumes, the soybean rather closely resembles the nut in its very low content of starch and high percentage of protein. It easily takes precedence over all other natural foodstuffs in the great percentage of protein which it contains, and protein of such superior quality that in animal feeding experiments it has proved itself to be capable of replacing proteins of all other sorts, even milk proteins. The soybean protein content is 40%, nearly twice that of average meat and four times that of eggs, three to four times that of wheat and other cereals, five to six times that of bread, twice that of lima and navy beans, walnuts, filberts and most other nuts. The protein of the soybean (glycinin) is of high quality, like that of milk, containing certain amino acids of which the proteins of nearly all other legumes and all cereals are deficient."

Contains a long discussion of soy acidophilus milk, changing the protective flora, and the experience of Dr. Dafoe with the Dionne quintuplets in Canada.

"Forty years ago, I was requested by Dr. Dabney, then Assistant Secretary of the United States Department of Agriculture, to prepare from plant sources a substitute for meat, and found in a combination of the gluten of wheat with peanuts a product having not only the essential nutrient values of meat, but a fairly close approximation in flavor and appearance. The soybean solves the problem so completely and so satisfactorily that with the proper development of its culture and use, there need be no fear of protein shortage and no need of a substitute. There is, indeed, evidence that Americans might profit greatly as the Chinese have by giving the soybean a large place in the national bill of fare.

"A few years ago (1923), Dr. Arthur Hunter, Chief Actuary of the New York Life Insurance Company, in an international study of blood pressures, found the systolic pressure of the average Chinaman to be ten points lower than that of the average American and gave conclusive evidence that the cause is to be found in the difference in the dietary habits of the Chinese and Americans. In concluding an address before the American Life Underwriter's Association, Dr. Hunter said, 'Taking the population of the United States

as a whole, I believe that a better adjusted diet, with less animal food, would result in a lower blood pressure and in greater longevity with an equal ability to carry on their occupations.'

"In view of the facts cited in this paper, is it not reasonable to believe that the general use of the soybean in this country would tend to lessen the mortality rate from intestinal infections and many other acute and chronic disorders, and to increase individual life expectation?" Address: M.D., LL.D., F.A.C.S., Medical Director of the Battle Creek Sanitarium, Battle Creek, Michigan, and of the Miami-Battle Creek, Miami Springs, Florida.

1035. *Nature's Path to Health* (*Melbourne, Australia*). 1937. Soy bean–The perfect protein. Sept/Oct. p. 34.
• ***Summary:*** "Packed into the tiny soya bean is a wealth of nutrition; minerals, tiny vitamins, easily assimilated carbohydrates, and the greatest hoard of proteins that any food in the vegetable kingdom contains. Think of it! A vegetable product equal to most, and superior to some animal products in proteins, the body building element in food, without which there would be no life. And this same Soya Bean, so rich in all the food essentials, produces an alkaline reaction in the body. It sounds almost unbelievable!

"The chief argument against a heavy meat diet is the acid reaction in the human system. So it is with all highly protein foods commonly used as meat substitutes–fish, eggs, etc.; but here is the most nearly perfect substitute for meat known to man, and it is one of the extremely rare foods which alkalinize the body."

"Milk and butter made from soya beans are richer and more satisfactory than dairy products. Its oil equals the best grade of olive oil."

"Lecithin, in which the soya bean is rich, is a nerve, brain, and sex building food. Calcium builds bone, teeth, finger nails and accessories.

"From the seed comes meal and oil. Out of the meal can be made a flour for use of infants, macaroni, breakfast foods, bread, cakes... From the dried beans come soya sauce, soups, roasted beans, vegetable, milk, liquid and powder, cheese, soy cultures that taste like buttermilk, beverages, confections and so-called candy.

"Another valuable property of the soy bean is its high alkalinity, which amounts to twenty-four times that of cow's milk. Concerning this point, Dr. Kellogg says: 'We are certainly eating too much meat and not enough alkaline products.' A meat diet is heavily charged with acids which lower the alkalinity of the blood and tissue fluids and tend to cause acidosis, thus inducing chronic fatigue, lowered resistance to disease, and setting up degenerative processes in the liver, kidneys, blood vessels and other parts of the body. More people die in this country from these causes than from any other." Address: Australia.

1036. Salgues, René. 1937. Étude agronomique et chimique de quelques Sojas cultivées en France [Agronomic and chemical studies on some varieties of soybeans grown in France]. *Revue de Botanique Appliquee & d'Agriculture Tropicale* 17(194):724-37. Oct. [1 ref. Fre]
• ***Summary:*** The author has conducted soybean trials with various varieties since 1921 in the region of Brignoles, France. Some of the best studies on soya in France have been written by Mlle. Marie-Thérese François, Professor at the Faculty at Nancy, France. They appeared during 1935-36 in the *Actes et Compte-rendus de l'Association Colonies Sciences.* A table gives statistics for the world's principal countries importing and exporting soybeans and soy oil, during 1925-29, 1932, 1933, and 1934.

Details are given on soybean trials conducted in the region of Brignoles. Eleven varieties were grown, obtained from various locations. For each variety is given: Variety names or numbers. Germination percentage. Density. Weight of 100 seeds. Plant habit. Flowering (usually none). The date obtained, varietal names, and seed weights, when given, are shown in parentheses. The locations are: 1. Botanical Garden of Eala, Belgian Congo (3 numbered varieties; 100 seeds weigh 28.6, 27.9, and 31.4 gm). 2. Botanic Gardens, Peradeniya, Ceylon (23.5 gm). 3. State Botanical Garden, Buitenzorg, Java (2 numbered varieties; 29.1 and 15.5 gm). 4. Botanic Gardens, Singapore, Straits Settlements [incl. Malaya] (22.3 gm). 5. Botanic Gardens, Sibpur, Calcutta, British India (22.3 gm). 6. Agricultural Service, Beirut, Lebanon (Service de l'Agriculture, Beyrouth; Etat du Grand Liban) (1924; 35.6 gm). 7. Botanical Garden, Tabor, Czechoslovakia (1924; 18.4 gm). 8. Technische Hoogeschool Culturtuin voor Technische Gewassen, Delft, Netherlands (4 varieties–alba 34.3 gm, nigra 26.5 gm, ochroleuca 23.8 gm, Sangora 21.2 gm). 9. Bureau of Plant Industry, USDA, Washington, DC, USA (2 varieties–alba 27.8 gm, nigra 24.3 gm). 10. College of Agriculture, Univ. of Wisconsin, Madison, Wisconsin, USA (3 varieties–Mandarin 54 23.6 gm, Manchu Ped. 3 19.6 gm, Ito San 57 27.3 gm). 11. Dr. Trabut, then Pr. Maire, Direction du Service Botanique, Algers, Algeria (4 or 5 varieties–Haberlandt 1929 19.8 gm, Black No. 6 (black eye) 23.7 gm, Précoce 1 1922 23.9 gm, Mamouth [Mammoth] 26.7 gm.).

An analysis of the chemical composition of the seeds of most of these varieties is given on p. 722, and a detailed analysis of the oil of six varieties is given on p. 733.

Details on large scale cultivation of 11 other varieties of soybeans at Vaucluse are also given (p. 734-36). The variety names (in French) are: *Jaune de Pologne, Soja brun, Soja saumon, Mandarin, Hato tacheté noir, Vert monstre, Hato noir, Tokyo noir, Sun Yat Sen, Mandchou* [*Manchu*], *206 vert.* For each is given: Color of the seeds, color of the pods, density, yield in 100 liters per hectare, yield in kg/ha (ranged from a high of 2,870 for *Hato tacheté noir* to a low of 1,530 for *Soja brun*). weight of 1000 seeds in grams, number of

seeds per kg, seeding rate (kg/ha), number of times the seeds were harvested.

A final section on soymilk gives the composition of soymilk made by the author from 5 varieties of soybeans.

Note: This is the earliest document seen (Dec. 2007) concerning soybeans in Lebanon, and (probably) the cultivation of soybeans in Lebanon. This document contains the earliest date seen for soybeans in Lebanon, or the cultivation of soybeans in Lebanon (1924, probably). The source of these soybeans is unknown. Large green soybean seeds were sent from Beirut to France in 1924. Address: Fondation Salgues de Brignoles (France) pour le developpement des sciences biologiques.

1037. Siegmeister, Walter. 1937. Developing a business on the soybean. *Bean-Bag* (*The*) (*Lansing, Michigan*) 20(5):9, 15, 19. Oct.

• ***Summary:*** "About two years ago I first became interested in the soybean and began to study the various foods that could be made from this bean. I then commenced to send out to some friends some 'Soybean Powder,' processed from steamed soybeans, and having a delicious milky taste when eaten raw. So great was the demand for this, that we got our own containers and labels and started to pack it, and in a short time orders came from all over the country for our products both from stores and individuals.

"Since then we added a number of other products to our line, including a soup powder, a soybean-banana powder that makes a tasty drink, a soy butter, a soy coffee; a soy cereal; etc. The name of our firm is Soya Health Products, which is a mail order company situated at Spring Valley, New York. We also publish a magazine devoted to the soybean called 'Regeneration,' and we will gladly send a sample copy to anyone who writes us."

On page 15 (lower right) we read: "And from the Soya Health Products, Spring Valley, New York, we received samples of a lot of soybean products that really are superb. There is a soy bean milk, a soy breakfast food, roasted soybeans, and soy flour. Write this firm and see for yourself."

Then on page 19 (lower right) is the expected small advertisement: "Soybean milk powder. A protein substitute for meat, eggs and dairy products. 40¢ per lb.–$1.00 for 3 lbs. Free sample on request. Write for free sample copy of 'Regeneration.' The soybean magazine contains valuable information on the soybean and diet. $1 per year. Ask for price list on New Soybean Health Foods. Soya Health Products, Spring Valley, New York." Address: Dr., Soya Health Products, Spring Valley, New York.

1038. Radcliffe Soya Products. 1937. Soya foods sweep America (Ad). *Health News* (*Hollywood, California*). Nov. 5.

• ***Summary:*** In a large white circle: "Radcliffe's 38 assorted soya alkaline foods. Also diabetic foods." In bold white letters on a black background: "Radcliffe's Malted Soya Milk. Also: 100% Soya Beverage–Just like breakfast coffee. Natural Soya Butter–Soya Milk. Write for catalogue."

Note: This is the earliest English-language document seen (Sept. 2011) with the term "Soya foods" in the title. Address: 146 Fillmore St., San Francisco, California.

1039. *Madison Survey* (*Madison, Tennessee*). 1937. Manufacture of foods. 19(42):167. Nov. 10.

• ***Summary:*** "Madison is giving a message of healthful living to the public, and in this program the food factory plays an important part. Among the products it is placing on the market are crackers of various composition; foods to use in place of meat, such as, Vigorost, Soy Cheese, Soybeans canned with Tomato; a beverage to take the place of coffee called Soy-Koff. Kreme O'Soy Milk, plain and chocolate, is also on the market in cans."

1040. **Product Name:** Kreme O'Soy Milk (called Kreme-O-Soy in 1947) [Plain, or Chocolate].
Manufacturer's Name: Madison Foods.
Manufacturer's Address: Madison College, Madison, Tennessee.
Date of Introduction: 1937. November.
Ingredients: Fall, 1948: Soybeans, soy oil, dextrose, calcium phosphate, sodium chloride.

Wt/Vol., Packaging, Price: 15 oz, 19 oz, or 20 oz can.
How Stored: Shelf stable.
Nutrition: Protein 3.5%, fat 3.9%, carbohydrates 4.9%, ash 0.7%, calcium 0.34%, iron 4.4 mg/k.
New Product–Documentation: Madison Survey. 1937. Nov. 10. p. 167. "Kreme O'Soy Milk, plain and chocolate, is also on the market in cans."

Madison Health Messenger. 1938. "The only homogenized soymilk on the market to date."

Madison Health Messenger. 1948. Fall. p. 3. "A unique food developed." A black-and-white photo shows a can of Kreme O'Soy." A table compares the composition of Kreme O'Soy, human milk, and cow's milk. A list of ingredients is given on p. 4. Madison Health Messenger. 1949? V. 49-2. p. 5.

Shurtleff & Aoyagi. 1984. Soymilk Industry and Market. p. 25-26. "By May 1929 fresh soymilk and tofu were being served occasionally in the dining hall and sanitarium, and soymilk was used in place of water in some yeasted breads. Soymilk was first sold commercially in 1931 and canned in 1932. It became popular nationwide." Soybean Blue Book. 1947. p. 69. Sold in Chicago by Dietetic Supply House. Soybean Blue Book. 1950. p. 88. No brand name given. Soybean Blue Book. 1956. p. 100. "Kreme-O-Soy."

Note: This is earliest commercial soymilk product seen worldwide to be fortified with calcium. It is also the second earliest commercial soy product seen introduced by a Seventh-day Adventist company that contained chocolate.

1041. **Product Name:** Radcliffe's Soya Milk [Malted, or Plain].
Manufacturer's Name: Radcliffe Soya Products.
Manufacturer's Address: 146 Fillmore St., San Francisco, California.
Date of Introduction: 1937. November.
New Product–Documentation: Ad in *Health News* (Hollywood, California). 1937. Nov. 5. "Soya Foods Sweep America. Radcliffe's 38 Assorted Soya Alkaline Foods. Also Diabetic Foods." "Malted Soya Milk... Soya Milk."

Ad in House of Better Living Catalog. 1938. March. p. 21. Similar to ad above.

1042. Gutierrez, Marciano. 1937. Soybean milk, the poor man's milk: A close approximation to natural milk can be easily prepared from soybeans. *Agricultural and Industrial Monthly* (*Manila*) 5(3):3, 17, 37. Dec. [Eng]
• ***Summary:*** Contents: Introduction. Food value. How to prepare soybean "milk." Extensively used in China and Japan. Composition.

"That milk can be made from beans seems incredible. It sounds like one of Ripley's 'believe-it-or-nots.' But it is true. From the soybean an artificial 'milk' which is a close approximation of natural milk can be easily prepared and at very little cost.

"It seems that in the Philippines very little is known about the soybean, aptly called by some the 'wonder bean,' when for centuries it has played an important part in the diet of the teeming millions of China."

Dr. Roxas, chief of the technical staff of the National Development Company, states that the soybean can be grown in all parts of the Philippines." As an added incentive, one should consider that annual importation of soybeans to the Philippines far exceeds domestic production.

Photos show: (1) Trays of soybeans, ground soaked beans, bean residue [okara]. (2) All implements used in the preparation of soybean "milk" at the U.P. School of Hygiene and Public Health in Manila, plus a bottle filled with soybean "milk" to the left of the hand-turned stone mill. Address: Ph.C., M.D., School of Hygiene and Public Health, Univ. of the Philippines.

1043. *Nature's Path to Health* (*Melbourne, Australia*). 1937. Nutrition: Bernard Shaw, Gandhi, Henry Ford advocate soy beans and vegetarianism. Nov/Dec. p. 13-14.
• ***Summary:*** "In a recent visit to this country, Bernard Shaw was observed drinking a glass of milk. When questioned why he used milk, since he opposed exploitation of cows, Shaw replied that it was not cow's milk he used, but Soybean Milk. Bernard Shaw has been a vegetarian for a long time and has lately become interested in the Soybean.

"Gandhi becomes a champion of soybean–Abandoning his famous goat-milk, Gandhi, who is also a vegetarian, has become an advocate of soybean milk. Gandhi is a great believer in the soya bean. He thinks that soya milk will eventually replace the dairy product." A long article about the soya bean published in a recent issue of *Harijan* is quoted.

"Ford predicts vegetarian world. Dearborn, Michigan–Henry Ford, billionaire, automobile maker, has visioned a future world without ham sandwiches, juicy steaks, and chicken dinners, but with a worthy substitute produced by science from grains and vegetables... Ford is now 73 and is in excellent health."

"In a recent interview with newspaper men, Ford predicted: 'The farm animal will go, but the farm will become larger. The horse is dying out through the increased use of machines. The cow is losing its economic importance through the great advances in chemistry. The farmer of the future will grow vegetable foods instead of livestock.'

"According to Dr. Kellogg, a vegetarian diet is not new to Mr. Ford. For many years he has been practically a vegetarian. He owes to a vegetarian diet the health and vigor necessary to conduct successfully the gigantic industries his remarkable genius has created.

"Henry Ford, looking into the future, sees that the use of meat will have to be abandoned for economic reasons." Address: Australia.

1044. Bordas, Jean. 1937. Le soja et son rôle alimentaire [The soybean and its role as a food]. Paris: Hermann & Cie. 36 p. 24 cm. Series: Actualités Scientifiques et Industrielles, No. 557. [24 ref. Fre]
• ***Summary:*** Contents: Introduction. 1. Botanical characteristics and principal varieties. 2. Chemical composition of soya. 3. Alimentary physiology and the nutritional uses of soya: Seeds (energy value, protein, vitamins, use as a milk substitute), forage. 4. Different uses of soya: Agricultural, industrial (oil, casein, sterol), as human food (sprouts, tofu, fermented tofu, shoyu, miso, tuong of Annam, roasted soy coffee, soy bread for diabetics, the future of soya). 5. The economics of soya: Production, imports, exports. Conclusions. Address: Director, Station d'Agronomie et de Pathologie vegetale d'Avignon, France.

1045. Fearn, Charles E. 1937. Soy-O cereal: Compared with ordinary cereals (Leaflet). Chicago, Illinois: Fearn Soya Foods Co. 2 panels each side. Each panel: 18 x 8.8 cm.
• ***Summary:*** The company also sells: Soy-O pancake flour. Soya milk powder. Whole wheat and soya flour. Address: M.D., Fearn Soya Foods Co., 355 West Ontario St., Chicago, Illinois.

1046. Fishbein, Morris. 1937. Your diet and your health. New York and London: McGraw-Hill Book Company, Inc. x + 298 p. See p. 51, 204. Index. 21 cm. Whittlesey House Health Series. See also 1967 ed.
• ***Summary:*** Chapter 7, "Protein," contains two tables (p. 51): (1) "Food rich in proteins: Beans (dried), cheese, crab, eels, eggs, fish, fish roe, gluten products, lentils (dried), lobster, meats, nuts, peanut butter, peas (dried), poultry shrimp, soy-bean products, wheat cereals. (2) "Food poor in proteins: Beans (string), cabbage family vegetables, carrots, eggplant..."

Chapter 19, "Milk and milk products," contains a paragraph on soy-bean milk which states (p. 204): "Soy-bean milk is a product prepared from the soy bean. It seems to be a satisfactory food in the diet of invalids. It can be furnished at a reasonable price and is gaining importance in nutrition in this country. The soy bean, dried, provides [contains] 7½ per cent water, 33 per cent protein, 21 per cent fat, and 29.6 per cent carbohydrate. It provides 1,993 calories to the pound. This has also been used in the case of children who are sensitive to cow's milk."

Chapter 26, "Conclusion" states (p. 253-54): "Perhaps the most significant of all information offered in this volume is that concerning the protective foods: These are the substances like milk, fruits, vegetables, eggs, cod-liver oil, liver, lamb's kidneys and similar substances which are essential in providing the diet with necessary vitamins and mineral salts."

Appendix B (p. 263) lists "Protein for building muscles and all tissues: Good protein foods: milk (all forms), cheese, eggs, meat (lean, all kinds), poultry (all kinds), fish, shellfish."

Note: Only animal proteins are included. Legumes (beans, peas, etc.) and nuts are not mentioned. Milk is listed first, implying its believed superiority.

Appendix C: "Approximate food value table. Showing percentage composition" (p. 264, 269-70). In this table the same categories appear as on page 263, however nuts are added here. Legumes are, again, not mentioned.

Chapter 5, "Debunking diets" includes a section on vegetarianism as a cult diet (p. 27-30). He notes that many religions advocate some avoidance of meat. "Such avoidance of meat, of course, is entirely without scientific foundation." Address: Editor, J. of the American Medical Assoc., Chicago, Illinois.

1047. Kale, F.S. 1937. Soya bean: Its value in dietetics, cultivation and uses. With 300 recipes. 2nd ed. Baroda State, India: Baroda State Press. xxx + 375 p. Illust. (35 leaves of plates, described in a separate record). Index. 22 cm. 2nd ed. 1937. [66 ref]
• ***Summary:*** Contents: 1. Deficiencies in the Indian diet and soya bean as a means to rectify them. 2. History of the origin and growth of soya bean: Derivation of the word soya bean, origin of soya bean, literature, primitive man and soya bean, name of the plant, home of soya bean and its expansion, varieties of soya bean, the culture of soya bean is very remote (It "has been the chief article of diet in China for over 7,000 years."), reference of soya bean in old Chinese records, how and when soya bean became known to Europeans, soya bean in England (from 1890; J.L. North and Henry Ford), soya bean in France (from 1739), soya bean in Italy, soya bean in other countries of Europe, soya bean in United States of America, India and soya bean.

3. The use of soya bean: Importance of soya bean, dietetic importance, industrial importance, agricultural importance (Russia, Mussolini in Italy), medical importance, soya bean is alkalising in its effect ("Soya bean milk as well as its flour is used in foods for invalids and infants, like Nestle's food"), longevity and soya bean.

4. World trade in soya bean: Imports to Europe, production of soya bean in Manchuria (58% in North Manchuria), exports from Manchuria, oil and cake industry in Manchuria, soya bean production in Japan, in America, in Africa, in Australia, in Europe, in Java, in India, in other British possessions, estimate of world production of the soya bean, the desirability of the expansion of soya bean cultivation, imports and exports of soybeans, soya bean oil, and soya cake–1913-1927: Denmark, Holland, United States, Great Britain, Japan, France, Russia, China, Germany, Norway, Korea. Source: International Institute of Agriculture, Bureau of Statistics, 1921, p. 420-21. A table (p. 38) shows statistics for world production of soybeans "as estimated by the leading firm of London soya bean dealers"

for various years from 1923 to 1929. This includes individual statistics each year for China [incl. Manchuria], Japan, and USA. The world totals in tons are: 3,095,000 (for 1923-25). 3,397,000 (for 1926). 4,325,000 (for 1927). 6,000,000 (for 1928), and 6,570,000 (for 1929; incl. China 5,250,000; Japan 550,000; USA 250,000; Java & Dutch East Indies 120,000; Other Asiatic countries & Africa 400,000).

5. Botany of the soya bean plant. 6. Classification of soya bean. 7. Cultivation of soya bean. 8. Diseases and pests of soya bean. 9. Cultivation of soya bean in India. 10. The constituents of soya bean. 11. Soya bean milk. 12. Soya bean flour. 13. Industrial uses of soya bean. 14. Enriching soil by addition of nitrogen and use of soya bean as fodder. 15. Food requirement of the human body. 16. European and American soya bean recipes. 17. Diabetic dishes, Mahatma Gandhi's experiments at Magan Wadi and opinion of scientists on soya bean. 18. Chinese and Japanese soya bean dishes: Toffu [tofu] or soya bean curd: Digestibility, utilization, toffu khan, toffu nao [doufu nao], tze toffu (fried bean curd), chien chang toffu (thousand folds), hsiang khan, kori toffu (frozen toffu), preservation of toffu. Natto. Tokio natto and Kyoto natto etc. Hamanan natto [Hamanatto]. Yuba. Misso [miso]. Soya sauce. Soya bean confectionery. Roasted beans (Chinese).

19. Indian soya bean dishes: Hindustani dishes, Moglai dishes, Gujarati dishes, Maharashtrian dishes, Bengali dishes, Goa dishes, Tanjore dishes. Appendixes. 1. Acreage of soya bean in Manchuria during the last 5 years. 2. Total figures of export during last 5 years. 3. Bibliography. 4. Some opinions about the first edition of this book.

The preface begins (p. iii): "This little book is written in response to innumerable inquiries I have had from time to time after the inauguration of the plantation ceremony of Soya Beans at the State Agricultural Experimental Station by H.H. the Maharaja Gaekwar of Baroda in November 1933.

"A few months after this a food exhibition was held in Baroda where many Soya Bean dishes–Indian, European and Chinese–were exhibited. The leading papers and journals all over the country spoke in very glowing terms about the Soya Bean dishes that were exhibited... Later on at the request of Messrs. Mitsui Bussan Kaisha Ltd., a leading Japanese Firm in Bombay, a Soya Bean Exhibition and Restaurant were run in the Japanese village at the H.O.H. fete. So keen was the interest and enthusiasm evinced by the cosmopolitan public of Bombay that seats in the restaurant had to be reserved in advance. The presence of H.E. the Governor and Lady Brabourne and many Indian princes was an additional evidence of the ever growing popularity of the tasty Soya Bean dishes served there.

"At the closing of the H.O.H. fete many prominent people of Bombay requested me to continue the restaurant at a convenient place in the city, and asked me to open soya-bean milk centres for the children of the poor who could not afford to buy cow's milk. Many were ready to finance any scheme that I would propose, but unfortunately my time was not my own as I had to attend to my duties in the State and could not take advantage of their generous offer.

"The Departments of Agriculture of the various provinces of India as well as many Indian States asked me to supply them with literature regarding the cultivation and the uses of this most useful bean. The Department of Commerce and Industry of the Government of Bombay inquired if I could furnish them with information about the machinery for the extraction of Soya-bean milk. Letters of inquiries from private individuals kept pouring in daily from all parts of India. All this has induced me to undertake the preparation and the publication of this book...

"From the number of experiments carried on in the Baroda territories and outside it, I feel sure that the Indian soil is most suitable for the cultivation of soya bean...

"The leading thought of the day in India is, 'Village uplift,' and 'Rural reconstruction.'

"Baroda, 7th January 1936, F.S.K. (p. iv)

"Preface to the Second Edition: I feel grateful to the public for having given such a hearty reception to the first edition of my book. It is running into a second edition within a year...

"Now, Soya Bean Bakeries and Restaurants have been started in the city of Bombay and in many other towns in India, and Soya Bean products are exhibited in almost all the exhibitions...

"I feel highly thankful to His Highness the Maharaja of Baroda who gave me an opportunity last year of visiting Russia, where I have seen that seven to ten per cent. of Soya Bean flour was being added to the wheat flour in order to enhance the nutritive value of the bread. The Soya Research Institute at Moscow is making researches into the nutritive, industrial and economical values of Soya Bean. I have seen there the actual working of the Soya-bean milk extracting plant. They make casein out of Soya-bean milk. Soya-bean cream is sold in the market.

"I visited the dietetic clinics in England, France, Germany, Austria and other European countries, where doctors prescribe Soya Bean bread for diabetic patients. In Russia, rickets and consumption are treated by Soyolk extracted out of Soya Bean...

"France is growing Soya Bean on côlt de jura [sic, Côte d'Azur, on the Mediterranean?]. In England, through the efforts of Mr. J.L. North, Soya Bean is realised as a field crop for the last two years.

"Paris, 3rd April 1937. F.S.K. (p. ix)." Address: Food Survey Officer, Baroda State, India.

1048. Kale, F.S. 1937. Soya bean: Its value in dietetics, cultivation and uses. With 300 recipes. 2nd ed. Photos and illustrations (Continued–Document part II). Baroda State, India: Baroda State Press. xxx + 375 p. Illust. (35 leaves of plates). 22 cm. 2nd ed. 1937. [66 ref]

• ***Summary:*** Photos (mostly original) show: (1) "H.H. the Maharaja Gaekwar of Baroda the first Indian Ruler to inaugurate the soya bean plantation ceremony in his State 24th November 1933" (frontispiece, facing the title page). (2) "Dedicated to my noble master, His Highness the Maharajah Sir Sayajirao Gaekwar, G.C.S.I., G.C.I.E., Farzande-Khas-e- Daulate-Englishia (p. 1). (3) Soya bean ready for shipment at port Dairen, South Manchuria (p. 28). (4) View of Dairen harbour with bags of soya bean ready for shipment (p. 30). (5) Transport of soya beans [on sleds] on the frozen Liao-ho River near New-chwang [Newchwang, later Yingkou], North Manchuria (p. 31). (6) The Maharaja of Baroda seated in a chair, lecturing on the dietetic and industrial importance of soya bean (p. 37). (7) The Indian method of interculturing; two bullocks in a field (p. 80). (8) Bavabhai B. Patel, 65-year-old farmer interested in the cultivation of soya bean, in a field of soya beans with two bullocks (p. 82). (9) A field of soya beans grown [in 1934 or 1935] by Hargovan Bavabhai Patel, of Achisara, Taluka Sinor, Baroda District; he has been awarded the first prize for his good cultivation (p. 84). (10) A soya bean plant having more than 500 pods, fodder type variety grown at the Agricultural Experiment Station, Baroda (p. 86). (11) Poona fodder type green variety grown at the Agricultural Experiment Station, Baroda (p. 89). (12) Bags of soya bean seeds grown as Baroda State crop of 1935 (p. 91). (13) The luxuriant growth of the fodder type variety at the Baroda Agricultural Experiment Station (p. 103). (14) "The biggest soya bean milk factory at Moscow (Russia)." Four small photos show the plant at work, "Milking the earth" (p. 138). (15) "The author's own child 3 months' old fed on soya bean milk" (p. 144). (16) "Soya bean oil pressing mill worked by hydraulic power" (p. 158). (17) The Palace Bakery–"The first soya bean Bakery in India" (p. 196). (18) "Mahatma Gandhi who uses soya bean at Maganwadi" (p. 251). (19) Many people seated at tables in the "Soya Bean Preparation Restaurant" at the H.O.H. Fete, Bombay (p. 278). (20) Many Indian men standing at the "Soya Bean Restaurant at the Rural Life Exhibition, Baroda, on the occasion of H.H.'s Diamond Jubilee, 7 Jan. 1936 (p. 332).

Illustrations show: (1) "Shen-Nung. The Chinese emperor 2838 B.C. called 'the heavenly farmer.' He used to plant Soya bean every year with great ceremony" (p. 17). (2) A plant with branches showing the various ways in which the soya bean plants and seeds are used (p. 23). (3) Cartoon (from the American Medical Assoc. cartoon series) of a skeleton raising a glass of milk in one hand; he is standing behind a table on which is a bowl labeled "impure milk." The caption: "'I drink to the death of the whole table'–the dangers of contaminated milk" (p. 132). Address: Paris, France; Formerly: Food Survey Officer, Baroda State, India.

1049. Morse, W.J.; Cartter, J.L. 1937. Improvement in soybeans. *Yearbook of Agriculture* (*USDA*) p. 1154-89. For the year 1937. [67 ref]

• ***Summary:*** Contents: History of the soybean. World distribution and production. Utilization of the soybean (with chart). Improvement of soybean varieties. Methods in breeding: Natural and artificial crossing, mutations. Inheritance studies and cytology: Plant characters (flower, stem, pubescence, and foliage; height of plant and maturity; pod-bearing habit and pod characters; sterility, growth habit), seed characters (color of seed coat, hilum, and cotyledon; other seed characters), yield of seed. Disease resistance. Identification of genes and chromosomes. Selected references on genetics of the soybean. Appendix: 1. Workers identified with soybean improvement: United, States, foreign countries. 2. List of soybean genes (table). 3. Linkage of soybean characters (table). 4. Soybean varieties: Origin and varietal characteristics (table listing 101 named soybean varieties; for each is given the place and date of introduction or origin, days to mature, flower color, pubescence color, and seed characters {coat color, germ color, hilum color, seeds per pod, seeds per pound}, uses {dry-edible beans, forage, green-vegetable beans, grain}).

The section titled "History of the Soybean" states: "The early history of the soybean is lost in obscurity. Ancient Chinese literature, however, reveals, that it was extensively cultivated and highly valued as a food for centuries before written records were kept. It was one of the grains planted by Hou Tsi, a god of agriculture. The first record of the plant is contained in a materia medica describing the plants of China, written by Emperor Sheng Nung [sic, Shen Nung] in 2838 B.C. The crop is repeatedly mentioned in later records and it was considered the most important cultivated legume and one of the five sacred grains essential to the existence of Chinese civilization. Seed of the plant was sown yearly with great ceremony by the Emperors of China, and poets extolled its virtues. The records of methods of culture, varieties for different purposes, and numerous uses indicate that the soybean was perhaps one of the oldest crops grown by man."

Note 1. This is the earliest English-language document seen (June 2003) which states that: (1) The soybean was one of the "five sacred grains." (2) "The early history of the soybean is lost in obscurity." (3) The soybean was planted at an early date by "Hou Tsi, a god of agriculture." (4) The "soybean was perhaps one of the oldest crops grown by man." It is also the earliest document seen (June 209) in which William Morse mentions the mythical Chinese emperor "Sheng Nung" in connection with soybeans.

More broadly, this entire story linking Shen Nung with the earliest written record of the soybean, is completely incorrect. Yet because the story was written by Morse (highly regarded as America's leading authority on the soybean) in a USDA publication, it has unfortunately been repeated, and this source cited, again and again down to the present day (see Hymowitz 1970; Hymowitz and Shurtleff 2005).

Note 2. This is the earliest document seen (June 2003) in

which the emperor's name is spelled "Sheng Nung."

Note 3. This is the earliest document seen (July 2007) in which William Morse tries to write an early history of the soybean in China. Unfortunately, he does not cite his sources.

The section titled "Improvement of soybean varieties" states: "In the United States, more than 50 percent of the acreage devoted to soybeans is used for forage and pasture; breeding work, therefore, has tended largely toward the development of varieties for hay, silage, and pasture. The development of such varieties as Virginia, Laredo, Otootan, Wisconsin Black, Manchu, Wilson-Five, Kingwa, Peking, and Ebony by selection from introductions has been the principal factor in the increased use and acreage.

"Beginning with 1929, the use of soybean seed by oil mills has led to a demand for yellow-seeded varieties of high oil content. Agronomists and plant breeders have attempted to meet this demand by making large numbers of selections from foreign introductions and locally grown varieties and by analyzing these for oil content. This has brought about the development of several superior oil varieties and has resulted in a large increase in production of beans for milling purposes. The most popular of these varieties are Illini, Dunfield, Mukden, Mandell, Scioto, Mansoy, Manchu, Mamredo, Delsta, and Mandarin. Results of analyses with more than 1,000 selections and varieties have shown a range of from 12 to 26 percent in oil content. From studies of the oil content of varieties grown in a given locality, it seems possible, from the breeding standpoint, to produce varieties high or low in oil, at least within the known ranges of variation exhibited by common varieties." (p. 1161-62).

Soybean varieties that have excellent flavor and become soft in less than 2 hours of cooking include Easycook, Bansei, Rokusun, Jogun, Chusei, and Sousei. These are "now in the hands of growers and seedsmen. Experiments by commercial firms have shown that these varieties are superior to commercial varieties for the manufacture of food products, such as bean flour, roasted beans, bean milk, and bean curd [tofu].

"In Japan, certain varieties of soybeans were found that were used solely as green shelled beans. Ranging in maturity from 75 to 170 days, many of these introductions, and selections from them, have been found especially promising for the various sections of the United States. The vegetable soybean offers an excellent food of high nutritional value, especially in the fall when other green beans are lacking and in sections where the Mexican bean beetle prohibits the growing of garden beans. As a result of selection, cooking tests, and adaptation studies, eight green vegetable varieties–Hahto, Kura, Kanro, Hokkaido, Higan, Chusei, Sousei, and Jogun–have been introduced in various sections of the country" (p. 1163).

Photos show: (1) "The late Charles Vancouver Piper, agronomist, United States Department of Agriculture, 1902-26. Pioneer in the introduction and development of soybean varieties for United States conditions." (2) "Storage yard of a Chinese grain merchant near Kungchuling, Manchuria. More than 80 osier bins, each holding four cartloads of soybeans, were in this yard." (3) A Manchurian farmer and how he harvests, threshes and cleans soybeans by methods learned from his ancestors; comparison with modern U.S. machine harvesting. (4) "Millions of soybean oil cakes are stored in warehouses in Manchuria awaiting shipment to Japan, Chosen, China, and the East Indies, where they are used for fertilizing purposes and for cattle feed." A person looks up at the towering stacks. (5) Coolies loading large sacks of soybeans on a freighter for shipment to the oil mills of Europe. One man has hoisted a huge sack onto his back. (6) Five Manchurian farmers who have been awarded certificates and prizes for producing high-quality soybeans. (7) Twenty seeds of a natural soybean hybrid showing peculiar types of coloration. (8) Illustration (line drawing) of a soybean flower and its parts enlarged. Front view, side view, parts of the corolla (standard, wing, one of the keel petals), stamens, pistil. (9) A. Stems and pods of fasciated soybean plants; B. Determinate pod-bearing type; C. Indeterminate pod-bearing type. 10. Chromosome chart showing four groups of linked genes in soybeans.

A table (p. 1157) shows: "Increase in production of soybeans over an 11-year period, 1924-25 to 1935-36, inclusive, in the principal producing countries of the world" (Manchuria, Chosen [Korea], Japan, United States, Netherland India).

Soybean seed size (p. 1177): "The range in size of soybean seed varies according to the variety, each variety having its own typical seed size. Varieties and introductions tested at the Arlington Experiment Farm ranged in average weight of 100 seeds from about 4 grams for the smallest to about 40 grams for the largest." Address: 1. Senior Agronomist; 2. Assoc. Agronomist. Both: Div. of Forage Crops and Diseases, Bureau of Plant Industry [USDA, Washington, DC].

1050. Woertge, Karl Heinz. 1937. Entwicklung und weltwirtschaftliche Bedeutung der Sojabohnenerzeugung und -verarbeitung [Development and international economic significance of soybean production and processing]. Thesis, Friedrich Alexander University, Erlangen, Coburg, Germany. 119 p. 28 cm. [112 ref. Ger]

• ***Summary:*** Contents: Foreword. Part I: History and culture of the soybean. 1. History, natural requirements and technology of soybean production; chemical composition of the soybean. 2. Occurrence of the soybean and methods of production in various countries: Asia (Manchuria and China, Japan, Korea, Formosa, Dutch East Indies, other Asian countries incl. British India, Cochin China, Ceylon), America, Europe (Southeast Europe, Austria, USSR, France, Italy, England, Poland, Switzerland, Czechoslovakia,

Germany), Africa and Australia.

Part II. Scale and global economic significance of soybean production in the main producing areas. 1. General overview of world soybean production: Production for seeds, for fodders. 2. Scale of soybean production in the main producing areas: Asia (Manchuria, Japan, Korea, Formosa, Dutch East Indies [Java and Madura/Madoera]), America, Europe (Southeast Europe, USSR).

Part III. Development and global economic significance of soybean processing. 1. Soybean processing possibilities: A. Processing soybeans to make foods: Asia (general, methods used in China and Japan to make vegetable-type soybeans and salads, koji, soymilk, shoyu [soy sauce], miso, natto, tofu, methods used in the Dutch East Indies), Europe (general overview, preparation of soybean meal, soymilk, coffee- and chocolate substitutes). B. The soybean as an oilseed: General, methods of obtaining the oil (in Asia, Europe, USA), use of soy oil (as human food, other). C. Obtaining lecithin from the soybean. D. Use of soybean press-cake for livestock feed. E. Use of the soybean meal for fertilizer. 2. World trade in soybeans, soy oil and soybean cake/meal (*Sojakuchen/Sojaschrot*)*:* World trade in soybeans (Manchuria, Asia, Europe, USA), world trade in soy oil, world trade in soybean meal.

Closing remarks: The state of the world soybean market with special consideration for the current German conditions. Appendixes and tables. Address: Nuerenberg, Germany.

1051. Fearn, Charles E. 1937? Soy-o Cereal: Compared with ordinary cereals (Leaflet). Chicago, Illinois: Fearn Soya Foods. 2 panels each side. Each panel: 18 x 9 cm. Undated.
• ***Summary:*** On the front panel is an illustration of a package of Soy-o Cereal. “The main objections to ordinary cereals are, the excess of Starch, the absence of high grade Protein, and the limited amounts of Minerals and Vitamins.”

On the 2nd panel: “All cereal grains are “Acid Foods” but the soya is definitely alkaline, and in Soy-o Cereal the excess acid of the Whole Wheat is neutralized, forming a bland, easily digested and very nourishing food...” On the 3rd panel: “A message to mothers.” On the back panel: Fearn Soya Foods Co. also makes: Soy-o Pancake Flour, Soya Milk Powder, and Whole Wheat and Soya Flour. Address: M.D., Fearn Soya Foods, 355 West Ontario St., Chicago, Illinois.

1052. Landy, Pierre. 1938. Le commerce et l’industrie du soja [The commerce and the industry of soya]. *Annales de Geographie* (*Paris*) 47(265):9-24. Jan. 15. [13 ref. Fre]
• ***Summary:*** This is basically a summary or review of the literature; the main sources used are cited on page 9.

Contents: Introduction. I. Soybean production: The plant, the crop (used for forage or seed; in Manchuria, in Japan), distribution of the crop geographically (Manchuria, China, Korea, USA, etc.). II. Soybean industries: The ancient industries of the Far East (oil, meal, soymilk, shoyu), the great modern soy industries (in Asia, in Europe, in the USA). III. Soy commerce (local transport, exportation, trade routes and markets).

Figures: (1) A soybean plantation in Manchuria. (2) A field of soybeans in Manchuria. (3) Distribution of the cultivated area in 1934. (4) Production of soybeans in 1934. (5) Transport of soybeans over the Manchurian plain. (6) Collecting soybeans in sacks at a railroad station. (7) A group of soybean silos. (8) Soybean depots at the port of Dairen. (9) Soybean imports to Europe in 1935.

1053. *American Cookery* (*Formerly The Boston Cooking School Magazine*). 1938. Recipe for soy bean milk (Letter to the editor). 42(7): Feb. *
Address: 221 Columbus Ave., Boston, Massachusetts.

1054. Lager, Mildred. 1938. The House of Better Living Catalog: Finer natural foods. Los Angeles, California: Published by the author. 36 p. March. 23 x 10 cm.
• ***Summary:*** The single most important document showing the creative development of commercial soyfoods in California in the late 1930s. This catalog contains a large section on Diabetic Foods, consisting mostly of soyfoods, and an even larger section titled “Soy Bean Products.”

The Foreword (p. 1) begins: “The House of Better living is as unusual as its name. Its aim is to teach better living, and has made possible Mildred Lager’s free educational program by radio and class work. Become a member of our ever-growing family. Secure one of our creed cards–Realize life can be a game and not a battle, and if you give to the world the best you have, the best will come back to you.

“The House of Better Living has grown in four years from what was called a brain storm to an institution. It is outstanding, unique, and built on the ideals of sincerity and service. It is teaching the ounce of prevention–the health insurance that pays dividends in years of health and happiness. It carries for you, Finer Natural Foods, selected by Mildred Lager.”

A full page of delivery and order information (p. 2) shows that Mildred was shipping foods (such as California nuts and fruits, fresh and dried) all over the United States.

This catalog contains a total of 42 soyfood products, including 26 such products not found in the 1936 catalog. Soy (and other interesting) products are listed as follows (prices and weights are given for each): Beverages–Coffee substitutes: Radcliff’s soy bean, Soy-Co. Other beverages: Dr. Fearn’s Proteinized Cocoa, Radcliff’s Malted Soya Milk, Radcliff’s Soya Bean Cocolette, Soy-Malt (plain or chocolate). Sugars and syrups: Radcliff’s Golden Soya Honey Spread (4-oz. glass). Natural sweets–Candies: Carque’s health candies, bar, 5¢, Halvah bars, Sesame brittle, Soya candy sticks, 1¢ each, Soy milk “chocolate” bars, in Bavarian, cocoanut, mint, cherry, pineapple, and creme de mint flavors, Soy milk “chocolates,” ½-lb. box or 1-lb. box,

Soy chocolate, 1¢ square, ½-lb, 1 lb, 60¢, or bulk.

Desserts: Agar–Parfait mix, Agar–Hain Vege-Jell, Agar–Sanitarium vegetable gelatin. Diabetic foods: Gluten flour, Soy bean flour, 10¢ lb, Soy Bean Pancake and Waffle Flour (Bill Baker's Prepared; 2-lb. pkg. 30¢), Dr. Fearn's Soya Cereal, Dietetic Soyrina Cereal, Dr. Fearn's Soya-Date Breakfast Food, Battle Creek Dietetic Bran, Battle Creek toasted gluten bran flakes, Soy breakfast food, Cubbison's soy-gluten crackers, Soy-gluten wafers, Loma Linda soy bean wafers, Bill Baker's 100% soy-fruit slices, Bill Baker's soy bean bread, Olson's soy bread, Soy bean macaroni, spaghetti and noodles, Soy beans–imported, Soy beans–cracked, Soy beans–red, Soy beverages (without sweetening), Bill Baker's soy melba toast, Cubbison's soy melba toast.

Nut butters: Almond butter, Almond meal, Cashew butter, Peanut butter (dextrinized or raw), Pecan butter, Soy bean butter (lb or 8-oz. can). Whole grain flours, meals, etc.: Lima bean flour, Soy bean flour (1 lb, 3 lbs, or 10 lb), Soy bean pancake and waffle flour (Bill Baker's prepared), Soy bean pancake and waffle flour (Mrs. Hauser's), Whole wheat flour, wheat germ. Breakfast cereals (to be cooked): Mildred Lager's quick cooking cracked soybeans, Dr. Fearn's soya cereal, Dietetic Soyrina Cereal. Breakfast cereals (ready to eat): Battle Creek Zo, Dr. Fearn's soya-date breakfast food, Soya breakfast food, Bill Baker's 10% soya cereal. Melba toast, crackers, cookies: Cubbison's soy toast, Bill Baker's soy toast, Cubbison's Soy-Gluten crackers, Soy-gluten crackers, Loma Linda soy bean wafers, Cookies: Cubbison's soy cookies, Bill Baker's 100% soy fruit slices. Bread: Olson's soy bean bread (sliced loaf), Bill Baker's soy bean bread (unsliced loaf 16¢). Macaroni noodles: Soy bean macaroni, spaghetti and noodles. Legumes: Soy beans–imported, Soy beans–cracked, Soy beans–red. Meat substitutes: Nuteena (7 oz. can 15¢), Nut Meat, Nuttose (Battle Creek), Proteena, Protose, Soy bean butter (30¢ lb.), Soy mince sandwich spread, Soy bean spread, Soy bean ravioli (12¢ and 20¢ can).

Soy bean products (40 products; those mentioned above may be omitted here): Loma Linda soy beans (plain or tomato flavored, No. 1 can), Loma Linda soy beans with Proteena (No. 1 can), Dry soy beans (quick cooking red), Soy bean spread, Soya bean honey spread, Loma Linda soy mince sandwich spread, Soy bean sauce (5 oz for 18¢ or 2 oz bottle for 10¢), Soy bean oil (45¢ pint bottle), Soyco (Soy coffee), Soya bean milk powder, Milk of soya bean (6 oz or 12 oz can), Soy-Malt, Proteinized cocoa, Radcliff's 100% soya bean beverage (1 lb package), Cubbison's soy bean cookies, Cubbison soy-gluten crackers, La Sierra Soy breakfast cereal, Diamel Soyarina cereal, Diamel breakfast cereal. Salad dressings: Imitation Worcestershire sauce (Carque's, 5 oz bottle for 25¢). Powdered dry vegetables: Dulse, Dulse leaf, Irish moss, Kelp, Kelp–fancy, Sea lettuce (leaf or powdered), Soy-banana powder. Laxative foods: Agar, Psyllium, Swiss Kriss, Sym, Tam (laxative jam). Natural aids: Savita yeast tablets, Sesame seeds, Theradophilus (4 oz bottle 75¢, 8 oz bottle $1.25). Electric appliances: Electric juicers are not yet on the market. Index (p. 36).

There are ads for the following: Battle Creek Sanitarium Foods (p. 5; ask for literature). Ficgo coffee substitute (display ad, p. 6). Racliffe's Soya Products (p. 9, 21). Mildred Lager's quick cooking family (incl. cracked soy beans), Bill Baker's soy and lima bean products (photo display, p. 16). Therapy, Ltd.–Foods for Better Living (Theradophilus, soy bean milk, p. 19, 29).

A photo (p. 1) shows Mildred Lager.

Note. This is the earliest English-language document seen (Aug. 2013) that contains the term "soya bean beverage," which probably refers to powdered soya milk. Address: 1207 West Sixth St., Los Angeles, California.

1055. **Product Name:** Radcliffe's Soya Milk Bon Bons, and Bars (Sweetened with Honey and Dextrose).
Manufacturer's Name: Radcliffe Soya Products.
Manufacturer's Address: 146 Fillmore St., San Francisco, California.
Date of Introduction: 1938. March.
New Product–Documentation: Ad in House of Better Living Catalog. 1938. March. p. 9. "Sugarless and non-fattening." This company also made diabetic products, sweetened with Saccharin.

San Francisco City Directories. 1938-44. The term "Radcliffe's Soya Products" never appears. But 1938 shows: Radcliffe, John B. Confectioner. 146 Fillmore and 504 Gough. Home 1165 Fell St. In 1940 John is listed as a confectionery manufacturer 504 Gough and Health Foods 146 Fillmore. In 1942 his wife is given as Louise. Now he is doing only health foods at 146 Fillmore. 1944 is the same.

Rosenberg's Original Health Food Store. 1940. Catalog of Health Foods... p. 52. Radcliffe's Famous Soya Products: Soya Bob Bons, light and dark. 1 lb for $0.75."

Note 1. This is the earliest nutritious "Bar" seen (May 2000) in which soy is a featured ingredient.

Note 2. This is the earliest known commercial soy product in which soy milk is used as an ingredient.

1056. **Product Name:** Malted Soya Milk [Banana, Soya Mocha, Nut, or Choklateen].
Manufacturer's Name: Unknown. Perhaps Hain or Radcliffe's.
Manufacturer's Address: Los Angeles, California.
Date of Introduction: 1938. March.
Wt/Vol., Packaging, Price: 8 oz or 16 oz can.
New Product–Documentation: House of Better Living Catalog. 1938. March. p. 22. 8 oz. can for $0.40 or 16 oz. can for $0.70. Talk with Ben Kahan of Kahan & Lessin. 1988. Sept. 24. He thinks that Hain Pure Foods in Los Angeles may

have made this. The company was first sold during World War II. They were one of the pioneer companies, founded by Harold Hain. They used to have retail stores as well as manufacturing, but they gave up the stores to concentrate on manufacturing. A very interesting company.

1057. **Product Name:** Soy Milk "Chocolate" Bars [Bavarian, Cocoanut, Mint, Cherry, Pineapple, or Creme de Mint].
Manufacturer's Name: Unknown. Probably Svea Candy Co.
Manufacturer's Address: Los Angeles, California.
Date of Introduction: 1938. March.
New Product–Documentation: House of Better Living Catalog. 1938. March. p. 10. 5 cents each. Talk with Ben Kahan of Kahan & Lessin. 1988. Sept. 24. He thinks Svea Candy Co. made this. Dr. Hollie's Products near Los Angeles made a similar candy.

1058. **Product Name:** Soy Milk "Chocolates" (Natural Candies).
Manufacturer's Name: Unknown. Probably Svea Candy Co.
Manufacturer's Address: Los Angeles, California.
Date of Introduction: 1938. March.
New Product–Documentation: House of Better Living Catalog. 1938. March. p. 10. 8 oz. box for $0.50. 1 lb box for $1.00. Talk with Ben Kahan of Kahan & Lessin. 1988. Sept. 24. He thinks Svea Candy Co. in Los Angeles made this. Dr. Hollie's Products near Los Angeles made a similar candy.

1059. *Christian Science Monitor.* 1938. China is finding soya bean important food supply source. April 4. p. 9.
• ***Summary:*** "The humble soya bean, grown in China for generations, has become known as the 'cow of China' due to relief needs requiring the uncovering of new sources of cheap but nourishing food supplies."

This according to Julean Arnold, Commercial Attaché of the United States Department of Commerce, speaking today in Boston before a group of professors called together by Harold T. Smith, New England manager of the U.S. Bureau of Foreign and Domestic Commerce.

After 30 years of service in China, Mr. Arnold "has earned a reputation as one of the world's outstanding authorities on the Orient."

Arnold spoke of issues confronting the Chinese today, including the need to feed the millions of war refugees. "Through chemistry, he said, the soya bean has become the chief substitute for beef and milk at costs approximating 20 per cent of milk and beef."

From the soya bean one can extract a synthetic milk that sells for one-twentieth the cost of real milk [i.e., for 1 cent a quart], including delivery, "yet this bean liquid has all the nourishing qualities of milk. By substituting the soya bean for milk and beef, he added, Chinese refugees at Shanghai are being fed at the rate of $1 a month."

Regardless of the war and massive disruptions, trade between China and the U.S. continues. Chinese imports from the USA in 1937 totaled $103.6 million and exports from China to the USA $49.7 million, or about 40% greater than in 1936.

A large photo shows a group of nine men, looking very distinguished, sitting in two rows. Among them are Julean Arnold, Prof. Norbert Wiener of MIT, etc.

Note 1. This is the earliest English-language document seen (Dec. 2011) that contains the term "cow of China" used to refer to the soya bean.

Note 2. This is the earliest English-language document seen (Aug. 2013) that uses the term "bean liquid" to refer to soymilk.

1060. *Lancet.* 1938. Soya-bean milk at Shanghai. April 9. p. 349.
• ***Summary:*** An estimated 350,000 destitute Chinese are living in camps and elsewhere in Shanghai. But it is the children who suffer most from shortages of food and nutrition. A report received from the International Red Cross at Shanghai through the Lord Mayor's Fund for China states that all refugees suffer to some degree from beri-beri, and attempts are being made to prevent this by supplying them with soya-bean milk and cakes, which contain vitamin B-1. This milk is made at one of the local hospitals as follows: The beans are soaked then ground to a slurry in a mill powered by a small motor, which has the capacity to give 15,000 lb. of milk in 12 hours. Unfortunately, at present, only 6,000 to 7,000 lb per day is made, due to the limit of the cooking facilities. The hot soya-bean milk is delivered twice a day to the camps, where sugar and calcium lactate are added; each child is given one pound a day. There are said to be about 15,000 children under age 6 in the International Settlement and French Concession, for whom bean milk is a necessity, but there is only enough for about 7,000.

The "bean residue" [okara] after milk production is mixed with its own weight of whole-wheat flour and baked into cakes at cost price by a Shanghai company. About 3,200 children, ages 6 to 12, receive two of these cakes each day. The total cost of this project is about $11,000.

Note: Why are there Chinese refugees in Shanghai? Because the Japanese military has invaded northern China and is moving southward.

1061. *American Cookery* (*Formerly The Boston Cooking School Magazine*). 1938. Queries and answers: Soy bean curd. 42(9):564-66. April.
• ***Summary:*** "Query No. 5886. 'In your February I noticed a recipe for soy bean milk that referred to one for soy bean curd. Will you now please supply me with that recipe?'"

Ans: "The following recipe is quoted from the Bureau

of Home Economics. To make soy bean curd with vinegar, heat four quarts of soy bean milk, add two cups of vinegar and stir until will mixed. Let stand a few minutes. Put in a cheesecloth bag and dip the bag of curd in cool water several times to wash away the excess acid. Drain for about an hour and press out the remaining liquid. Season with salt and pack rightly into a dampened mould. Cover and store in a cold place until firm enough to cut.

"To make soy bean curd by fermentation, keep the milk in a warm place overnight, or until it forms a curd. Stir to break the curd. Add an equal amount of water heated almost to boiling and let stand ten minutes. Pour into a cheesecloth bag and drain for several hours. Press out the remaining liquid. Season with salt and pack into a dampened mould. Cover and store in a cold place." Address: 221 Columbus Ave., Boston, Massachusetts.

1062. Goessel, Fritz. Assignor to General Soya Corp. (New York, NY). 1938. Treating soya beans. *U.S. Patent* 2,117,315. May 17. 3 p. Application filed 11 Oct. 1935. Address: Frankfurt-am-Main, Germany.

1063. *Evening Telegram* (*Superior, Wisconsin*). 1938. Superior girl success as manager of 'health store.' May 27. p. 4, col. 6.

• ***Summary:*** Mildred Lager, who left Superior after doctors gave her only a few years to live, is now manager of a health food store in Los Angeles, California, "supplying special nutritive aids to patients under doctor's care."

A graduate of Superior State Teachers' College, Miss Lager was active in college affairs and a member of Tau Alpha Chi sorority. She "became a saleslady in a shoe store in Superior soon after her graduation, then became a co-partner in the store when ill health forced her to quit.

"As a result of intensive study of foods and their value to health, she became a demonstrator for Dr. Frank McCoy, noted health specialist whose health talks appear daily in *The Evening Telegram* [this newspaper in Wisconsin] in the column, 'How to keep well.'

"Traveling throughout the United States appearing before large audiences of both men and women showing how health advocates prepare food, Miss Lager returned here six years ago [i.e., about 1932] to conduct a cooking school and institute at Concordia Lutheran Church. Large crowds attended.

"Four years ago, Miss Lager left the McCoy institute to go into business for herself, opening a health food store [named The House of Better Living, on 25 Oct. 1933] in Los Angeles, the largest of its kind in the United States.

"The store handles special canned foods for diabetics, imported flour and fruits, fruit juices and other products not in stock at the regular grocery store. Patients on special diets are sent to the store on advice of their physicians. A mother in Texas sends regularly for special almond milk, necessary for her child's health because it has an allergy to cow's milk.

"Two years ago Miss Lager went to Honolulu [Hawaii] to spend several months studying the pineapple industry and how the fruit affects health when used in the diet. She herself is strict in her own food desires.

"In connection with the store, Miss Lager conducts a cooking school once a week supplemented by talks by prominent foot specialists, chiropractors, dieticians and doctors. A writer of note herself on nutrition, one of her articles was printed recently by a magazine in England.

"She conducts a 15-minute radio program [in Los Angeles] five times a week which is rated by critics as having one of the largest followings for a program of its kind on the west coast."

A portrait photo shows pretty Miss Mildred Lager.

Note: Frank McCoy's "health institute" was in Los Angeles, where he lived from roughly 1924 to 1931; he wrote a book on health and had a column in the *Los Angeles Times.*

1064. Horvath, A.A. 1938. The nutritional value of soybeans. *American J. of Digestive Diseases* 5(3):177-83. May. Earlier edition in Deutsche Medizinische Wochenschrift. 19:733. 1937. Amaral 1958. [114 ref]

• ***Summary:*** Contents: Introduction. Composition and properties. Nutritive value. Conclusions. This article contains a good review of the literature, with 114 references. Individual foods discussed include: Fresh soybean curd, smoked soybean curd, frozen soybean curd, soybean milk, soybean milk powder ("mostly nothing but a finely ground soya flour..."), soybean flour, soy acidophilus milk, immature green soybeans, boiled mature soybeans, soya bread.

"In the Orient soybean curd (tofu) has been in daily use since times immemorial, and is called 'the meat without the bones,' as it serves as a food rich in protein."

"The low basal metabolism of the orientals was to a certain extent attributed to their being vegetarians, and the basal metabolism was accepted as a measure of efficiency of a nation until recent studies showed the basal metabolism of the Maya Indians to be about 5 per cent above that of the white race" (Shattuck & Benedict 1931, p. 518).

"It has been shown that while alkalinization of a human being by the administration of sodium salts (bicarbonate or citrate) is followed by a retention of water amounting to one Kilo [kg] and greater perspiration during exercise, the alkalinization by the corresponding potassium salts results in a one Kilo loss of water by the body and a marked reduction in perspiration during exercise (H. Dennig, 1937). The deficiency of the soybean ash in sodium and the large excess of potassium places the soybean in the latter class of alkalizing agents."

"Besides bread and bakery products (such as coffee cake and doughnuts) the other main outlets for soya flour are for the manufacture of crackers (only solvent extracted soya

flour gives a product that will keep indefinitely), pancake flour, cocoa-malt mixes, baby foods, chocolate puddings, ice cream powders, macaroni products, and sausages*. (Footnote: * Mostly meal flours are used today for sausages. Since sausages containing a substantial amount of soya flour can be sold at a reduced price, this may provide the packing industry of our country with a means of expanding the consumption of meat").

Note: This is the earliest English-language document seen (June 2009) that uses the term "immature green soybeans" to refer to green vegetable soybeans. Address: Chemist, Agric. Exp. Station, Newark, Delaware.

1065. Lager, Mildred. 1938. New items. *House of Better Living* (*Newsletter, Los Angeles*) 7(29):3. May.
• ***Summary:*** Includes: Bulk soy candies. Cocoanut milk. Improved electric juicer. Small cans of soy bean ravioli.

1066. *Madison Health Messenger* (*Madison, Tennessee*). 1938. Soy bean milk, coffee, meat, and cereal. 1(1):1, 4, 6. Spring.
• ***Summary:*** "More versatile than any other food is the soy bean. Previously used as stock feed, it has gradually won its way into many wholesome foods that are distinctly different, yet palatable and reasonable.

"Madison Foods, in conjunction with Madison College, has spent years in experimental research developing soy bean foods. Dr. Philip S. Chen, Professor of Chemistry at Madison College, a native of China who received his doctorate degree in chemistry at Michigan State College, together with Dr. Frances L. Dittes, Professor of Nutrition at Madison College, whose doctorate degree is also in the field of Chemistry and Nutrition, have successfully exploited the ancient bean, discovering its versatility as is evidenced by the possibilities of its use as milk, coffee substitute, meat substitute, breakfast cereal, flour, etc."

Kreme O'Soy Milk is the only homogenized soy bean milk on the market to date; it is made of soy beans, added soy bean oil, dextrose, and organic calcium. Zoy-Koff is an alkaline coffee substitute made from soy beans and grains. Kreme O'Soy Crisps is Madison's new ready-to-eat alkaline breakfast cereal. It is made of whole soy bean flour, whole wheat, and malt.

Foods made by Madison Foods that contain soy as an ingredient, described in this first issue are: Soy-Koff (with photo of front of package in front of Mr. Hubert Henken, assistant production manager of Madison Foods, from Albia, Iowa, and a "strict vegetarian"). Thin Things (a new soy wafer). Date-Stix (a natural sweet, with Kreme O' Soy Flour). Fruit Stix (a soy flour biscuit). Breakfast Crisps / Kreme O'Soy Crisps (with photo of front of package). Soyburger Loaf. Soy Beans (in 5 oz, 14 oz and 30 oz cans, with tomato sauce or plain). Soy Cheese [Tofu]. Vigorost ("Madison's finest protein food representing the 'steak' of its variety." A photo shows Vigorost sliced and ready to serve on a platter). Kreme O'Soy Flour. Kreme O'Soy Milk.

Note: This is the earliest document seen (Jan. 2013) that contains the word "Soyburger" (spelled as one word, regardless of capitalization) or the term "Soyburger Loaf."

1067. Melick, Weldon. 1938. Self-supporting college. *Reader's Digest.* May. p. 105-08.
• ***Summary:*** About Madison College in Tennessee. "In 1904 the Nashville Agricultural Normal Institute at Madison, Tennessee, consisted of 11 students and some dilapidated farm buildings on 400 acres of worn land purchased with the last cent of its founders–Dr. E.A. Sutherland and four other teachers. In addition, however, it had one invaluable asset: Dr. Sutherland's idea that a college education should be made available to any boy or girl willing to work for it."

Today "Madison's curriculum includes 27 campus industries, run by the students to support the college and themselves... 15 years of research in food chemistry have resulted in new food products too useful to confine to campus menus.

"Hence, Madison Foods–an industry that is largely responsible for making the soy bean appetizing to Americans. The school's food chemists, experimenting with 200 varieties of soy beans, eliminated objectionable taste and produced savory breakfast foods, bread, coffee substitute, condensed milk, and meat substitutes which look and taste like beef but are even more nutritious and digestible. Vigorost, made from soy loaf after the milk is extracted [i.e. okara], is featured by a cafeteria chain in New York City. More than $60,000 worth of Madison's packaged and canned foods was sold in 27 states last year, and the Institute runs its own health-food cafeterias in Nashville and Louisville.

"Madison Foods have developed soy milk until it is now not only cheaper than cow's milk but, on the authority of the American Medical Association, better for babies. Observers have come from Africa, India, and other countries where milch cows are scarce, to study the methods of Madison's soy bean 'dairy.'...

"With twice as many applicants as can be provided for, Madison as a rule accepts only those who could not otherwise arrange for a college education."

Note 1. As a result of this article, the school received nearly 5,000 inquiries concerning the school plus a flood of student applications. The next year was the highest in the history of the College with a total of 450 college students enrolled.

Note 2. This is the earliest article on soy seen (Aug. 2002) in *Reader's Digest* magazine.

1068. *Good Health* (*Battle Creek, Michigan*). 1938. A special milk for bottle-fed babies. 73(6):179-80. June.
• ***Summary:*** This special milk is prepared from the soybean, which the Chinese call "the honorable bean" and which has

"for thousands of years been found a perfect substitute for breast milk [sic] in the feeding of babies deprived of their natural food supply. Soybean milk looks like cow's milk, and tastes much like it, and is more easily digestible and richer in lime and iron, though in other respects much like dairy milk. The great virtue of soy milk is that it encourages the growth of the wonderful protective germ acidophilus with which every nursling is inoculated by contact with its mother's breast."

"Many foods discourage the growth of the acidophilus, especially greasy and fried foods, hamburger steak and sausage, as do also alcohol, tobacco and laxative drugs. Bread and milk, breakfast foods, bananas and fresh fruits and vegetables of all sorts encourage the growth of friendly germs, which differ from ordinary buttermilk germs chiefly in the fact that they are able to grow in the colon, whereas the buttermilk germs die at the level of the stomach because they cannot survive without oxygen, while acidophilus can obtain its oxygen from sugar of milk, dextrin and some other carbohydrates.

"One to three glassfuls of soy acidophilus milk taken daily will keep the colon free from offensive gases and foul odors, clear the skin and the tongue, sweeten the breath and promote better appetite and a sense of fitness to a remarkable and almost unbelievable degree. Every bottle-fed baby should receive a teaspoonful of soy acidophilus milk at each feeding as an almost certain protection against the bowel troubles of bottle-fed infants."

1069. Sanford's Cafeteria. 1938. "World's most unique cafeteria!" ... Say previewers and you'll agree! (Ad). *Los Angeles Times.* July 26. p. 4.

• ***Summary:*** This big ad announces the grand opening of a healthy cafeteria on Tuesday, July 26. "Fully air-conditioned. We acknowledge with gratitude the co-operation of the firms listed below: Acidofilac–Radiance Products Co. Bragg Meal & California Mint Tea–Live Food Products Co. (Paul Bragg). Cocoanut Milk Powder & Cocolette–Radcliffe Products. Cottage cheese & buttermilk–Knudsen Creamery Co. Healthful Candies–Hassey Candy Co. KAL–The calcium phosphorus food–Makers of KAL. Mal-Ba-Nuts & vegetable juices–Hain Pure Food Co. Nuteena, Syl-Dex & Savorex–Loma Linda Food Co. Papaya & guava juice–Milo Frank. Soy milk powder–Viana (Malcolm McBride). Soy waffle flour & soy macaroni–Mrs. Hauser's Food Products Co. Swiss Kriss, Vitana, Staf & Juicex [electric juicer]–Modern Health Products Co. (Gayelord Hauser). Soyolate, The soy chocolate–Theo. Hollie Co. Theradophilus & Theradiet–Therapy, Ltd. Unsulphured figs & jumbo prunes–F.E. Hadley & Sons. Virgin olive, peanut & soy bean oils–Solar Food Products Co.

Keep fit by eating right. Modern cooking insures digestibility ("Either whole wheat and soy bean flours, vegetable shortening in baked goods–no cheap artificial substitutes Whatever!"). "Outstanding features to help you keep fit:" Cafeteria, Dietetic food store, bakery (using "whole wheat and soy bean flours"), health bar ("An exclusive feature of Sanfords. Fresh fruit and vegetable juices squeezed right before your eyes and concocted into tantalizing non-alcoholic cocktails that will send you along with a new spring in your step and sparkle in your eye"). "All employees required to pass a physical examination. Open every day of the year, 7 a.m. to 8 p.m." "Cooking that's kind to your stomach."

Photos show: (1) The inside of the cafeteria with white tablecloths. (2) Thirteen waitresses in uniform. (3) Bar stools around the health bar. (4) The dietetic food store.

Note: This is the earliest document seen (June 2006) that mentions the Juicex, an early electric juicer. Address: 720 South Hill St. [Los Angeles, California].

1070. Guy, Ruth A.; Yeh, K.S. 1938. Soybean "milk" as a food for young infants. *Chinese Medical Journal* 54(1):1-30. July. [16 ref]

• ***Summary:*** "Conclusions: 1. Soybean 'milk' reinforced with calcium lactate, sodium chloride, starch and sugar and well boiled was taken readily by young infants, even by those a few days old. When properly diluted and given in suitable slowly increasing amounts, remarkably few, and only mild and transient, gastrointestinal disturbances have been noted.

"2. Vitamins C, A and D were provided in addition. 3. Vitamin C was provided by cabbage (*Brassica pekinsis* or *Brassica chinensis*) soup... 4. Vitamins A and D were supplied in this study by cod liver oil, 12 cc daily."

"5. Soybean 'milk', supplemented as specified, has contributed to good growth and development. All the infants had a little human milk, but some who had very little, as evidenced by their need for more than 100 calories of artificial food per kilogram, developed well. None was suspected of anemia.

"6. All the infants, as compared with those in this clinic who were fed entirely by maternal milk, have shown less muscular vigor, although they have all sat up and stood alone at the usual ages, and appeared to their mothers to be quite normal."

"9. The present method of making soybean 'milk' is impracticable. Improvements are needed and are being made." Address: M.D. (both), Dep. of Public Health, Peiping Union Medical College, and the First Health Station of the Municipality of Peiping.

1071. **Product Name:** Mary McBride's Soya Powder. Formerly named Soya Milk Powder.
Manufacturer's Name: McBride Products Company.
Manufacturer's Address: 811 Fairview Ave., South Pasadena, California. Phone: PY. 1-1314.
Date of Introduction: 1938. July.
Ingredients: Soya beans.

Wt/Vol., Packaging, Price: 12 oz or 5 lb boxes. Wholesales for $0.39 or $2.25 respectively.
How Stored: Shelf stable.
New Product–Documentation: Leaflet/catalog/price list. 1938. 12 by 17 inches. Blue and red on beige. "McBride's Soya Foods." A photo shows the box. The front panel shows a glass of milk next to a bowl of steaming breakfast cereal. "Modern Nutrition. Fully Prepared. Delicious and nourishing. The best in soya foods. Contains no salt." The poster states: "Rich in calcium and phosphorus. Made by an exclusive method with especially selected soya beans exceptionally high in amino-acids, calcium, phosphate, etc. This is a bone, muscle, brain and nerve building food with only traces of starch, and is alkaline.

"Soya powder can be used daily the same as cow's milk for drinking, cooking, baking and table use. When added to cow's milk it is delightful on cereals, fruits, etc. It is ideal in making custard pies and puddings. Delicious recipes are enclosed in each package. Infant foods are greatly improved in nutritive value by the addition of a level teaspoonful of the powder to the bottle three or four times a day. This aids in the building of sound, healthy teeth, bone structure and strong muscular tissue, reduces the tendency to flabbiness, so common in infants fed on cow's milk, and fortifies the baby against the ravages of rickets."

1072. **Product Name:** Mary McBride's Soya-Malt (Plain, Chocolate, Banana, or Almond).
Manufacturer's Name: McBride Products Company.
Manufacturer's Address: 811 Fairview Ave., South Pasadena, California. Phone: PY. 1-1314.
Date of Introduction: 1938. July.
Ingredients: Soya beans.
Wt/Vol., Packaging, Price: 12.5 oz jar or 5 lb boxes. Wholesales for $0.85 or $4.25 respectively.
How Stored: Shelf stable.
New Product–Documentation: Leaflet/catalog/price list. 1938. 12 by 17 inches. Blue and red on beige. "McBride's Soya Foods." A photo shows the jar. "Modern Nutrition. Contains no salt." The poster states: "A delicious soya malted food drink in four flavors. A highly nourishing and easily digested liquid food, of particular value as a building and restorative food for young and growing children, expectant and nursing mothers, convalescents, invalids, and elderly people, and for use in all cases where a rich, nourishing and easily digested liquid food is needed. A glass of Soya-Malt supplies quick energy between meals. Children really enjoy this delicious drink.

"A hot Soya-Malt before retiring is soothing to the nerves and an aid to restful sleep."

Note: This is the earliest commercial non-dairy soy product seen (Jan. 2005) that is flavored by almonds.

1073. **Product Name:** McBride's Morena: A General Food. Formerly called McBride's General Food.
Manufacturer's Name: McBride Products Company.
Manufacturer's Address: 811 Fairview Ave., South Pasadena, California. Phone: PY. 1-1314.
Date of Introduction: 1938. July.
Wt/Vol., Packaging, Price: 1 lb jar and 5 lb package. Wholesales for $1.22 and $4.60 respectively.
How Stored: Shelf stable.
New Product–Documentation: Leaflet/catalog/price list. 1938. 12 by 17 inches. Blue and red on beige. "McBride's Soya Foods." A photo shows the jar. The poster states: "Ideal for infants, children and adults. A wholesome nourishing liquid food especially prepared for infants, children, invalids, convalescents, elderly people and in cases of gastro-intestinal disturbances, when solid foods are discontinued.

"General Food is rich in practically all essential food elements, contains 'superior' protein, vitamins A, B, G, E and minerals. It is extremely valuable in all below par cases, or an adjunct to the ordinary diet, and can be taken either with meals, between meals or both. It is a rich, palatable and satisfying drink for young and growing children and adults, and in pre-natal and post-natal cases. A glass at bedtime is soothing to the nerves, and an aid to restful sleep. It is starch free and contains absolutely no cereal grains."

1074. **Product Name:** McBride's Soycocoa.
Manufacturer's Name: McBride Products Company.
Manufacturer's Address: 811 Fairview Ave., South Pasadena, California. Phone: PY. 1-1314.
Date of Introduction: 1938. July.
Ingredients: Incl. soya flour, cocoa, milk solids, diastatic malt, and calcium phosphate.
Wt/Vol., Packaging, Price: 12.5 oz jar and 5 lb package. Wholesales for $0.75 and $3.25 respectively.
How Stored: Shelf stable.
New Product–Documentation: Leaflet/catalog/price list. 1938. 12 by 17 inches. Blue and red on beige. "McBride's Soya Foods." A photo shows the jar. The entire front panel is visible. Note: The "Soya product" referred to may be soy lecithin. The poster states: "Soycocoa is prepared in the same manner as ordinary cocoa, however, it is unlike ordinary cocoa in that it contains an abundance of life giving protein, vitamins and minerals essential to health. Taken regularly, it is inclined to have a mildly laxative action that is characteristic to soya foods. It makes a very palatable drink and a highly nourishing one, especially for children."

1075. Ferri, Nicandro A. 1938. Soybeans: The wonder food! A brief treatise on modern nutrition. Boston, Massachusetts: Bruce Humphries Inc. 62 p. March. 17 cm.
• ***Summary:*** The Modern Health Foundation (Chicago, Illinois) copyrighted this book in 1938. Contents: Foreword by Charles E. Fearn, M.D. ("World renowned authority on the Soybean). Introduction. Historical. Human dietary habits.

The soybean industry. The economics of nutrition. The proteins in nutrition. The proteins of the soybean. The role of mineral salts. The mineral content of the soybean. The fatty oil in the soybean. The vitamin and the soybean. The soybean in disease. Child feeding. Making dairy products with soybeans. Baking with the soyflour. The use of the soybean itself. Special soybean recipes.

On page 36 the author makes an astonishing claim: "One other feature of the soybean oil is the fact that it does not tend to increase body weight. Seldom, if ever, one sees in the Orient obese people. This is due to the high percentage of lecithin-phosphoric acid, 1.64%, present in the soybean which greatly enhances the oxidation of fatty acids of soy oil. Thus in spite of the high fat content present in the soybean, the tissues and organs readily oxidize this fat instead of storing it as excess weight. And so soybean products are considered as non-fattening foods.

"However, in order to receive the full benefit of the fatty oil contained in the soybean, one should eat the soybean itself, or a full fat soyflour."

On pages 44-45 the author uses the terms "soyflour" and "soy meal (the latter differing from the former in that it contains all of the valuable fatty oil)." He also discusses "soymilk" and its use in "making dairy products with soybeans." Address: M.D., USA.

1076. Lyman, J.F. 1938. The soybean as food for man. *Proceedings of the American Soybean Association* p. 25-30. 18th annual meeting. Held 12-14 Sept. at Wooster and Columbus, Ohio.

• ***Summary:*** "The Chinese and other Eastern peoples have solved the problem of food seasoning without the use of meat. They have found that a meaty flavor can be obtained from the soybean through a fermentation process. Soy sauce is to the Chinese what gravy is to the American. Even more important is soy sauce in China because the use of food flavors and condiments in that country is much more restricted than with us. The Chinese have simple tastes. Soy sauce, salt and pepper are the only food flavors commonly used by them.

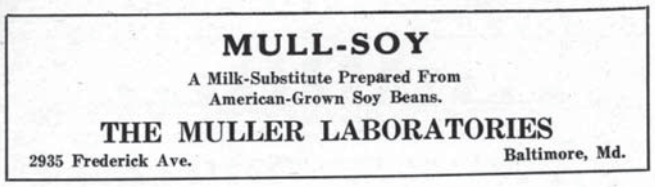
"While the chemist has made but little study of food flavors and the physiologist has done but little also, enough is known of the problem so that soy sauce can be made by chemical methods as well as by the ancient fermentation process. The chief meaty-like taste of soy sauce is known to be the salt of an amino acid, mono-sodium-glutamate. This salt is now manufactured for use as a condiment. The process involves the disintegration of the soybean of other protein, preferably wheat gluten, with hydrochloric acid. A mixture of about 20 amino acids is obtained among which mono-sodium-glutamate makes up about one-fifth in the case of soybean protein and two-fifths in the case of wheat gluten.

"The mono-sodium-glutamate can be crystallized from the mixture by adjusting the acidity to pH 3.2, or the mixture can be neutralized to a desired acidity and used without refining just as soy sauce is used" (p. 25).

"In Japan mono-sodium-glutamate of good purity is sold at a wholesale price of about two dollars a pound under the name Ajinomoto" (p. 26).

A diagram (p. 28) shows "Some possible food products from the soybean," including sprouts, soybean milk, soybean curd, soybean cheese, soy sauce, meat sauce, meal, flour (for use in breakfast cereal, bread, sausage, meat loaves, or ice cream), refined oil (for use in lard substitutes), crude oil (for us in margarine or dressing), and lecithin (an anti oxidant or emulsifier). Address: Dep. of Agricultural Chemistry, Ohio State Univ.

1077. Muller Laboratories (The). 1938. Mull-Soy. A milk substitute prepared from American-grown soybeans (Ad). *Proceedings of the American Soybean Association* p. 69.



• ***Summary:*** A 1/6-page horizontal, rectangular ad with no graphics.

Note: This is the 2nd earliest ad seen (July 2013) that mentions "Mull-Soy." Address: 2935 Frederick Ave., Baltimore, Maryland.

1078. Wightman, Henry B. 1938. Soybean sensitivity with a case report. *J. of Allergy* 9(6):601-03. Sept. [7 ref]

• ***Summary:*** Begins with a discussion of the many food- and industrial uses for the soybean worldwide. The author reports a case of soybean sensitivity in a 33-year-old man who had been suffering from nonseasonal asthma for 2½ years. Asthma was induced when the air was contaminated by soybean pollutants in areas of industrial use of its products. Sensitivity occurred on inhalation (of soybean dust) and on digestion (of Sobee soy milk); It was detected by direct skin test and by passive transfer. "Because of its widespread and increasing utilization, sensitivity to soybean should be constantly suspected." Address: M.D., Dep. of Allergy, the Roosevelt Hospital, New Rochelle, New York.

1079. George, S.E. 1938. New industries: The versatile soya bean. *Nature's Path to Health* (*Melbourne, Australia*). Oct. 1. p. 17, 38.

• ***Summary:*** Discusses utilization of soya beans throughout the world to make soya bean oil and meal, industrial products (glycerine, paints, soaps, linoleum, rubber substitute, printing inks, explosives, etc.), bean-milk, bean-curds or tofu, salted bean-curd (resembles Roquefort cheese), coffee substitutes (sold today in America and Europe), soya bean

flour, and beef-like extracts for use in soups ("one of the most famous European brands of soup-cubes has a soya-bean base"). "Sacks of [soya] beans make excellent substitutes for sandbags [in wartime], as was proved in the recent Manchurian struggle. Buddhists in China use bean-curd [probably yuba], shaped in molds, to make many products that resemble animal products: fish with sauces, a whole chicken swimming in a golden chicken soup. A number of other products made from soya beans are listed. Discusses the work of the Ford Motor Co. with growing and using soybeans in England and the USA.

A cartoon shows a figure of "The Versatile Soya Bean" smiling and dancing with hands on hips.

Note 1. This is the earliest document seen (April 2003) that mentions a meat alternative which is described as an alternative to fish or seafood. Address: Australia.

1080. Woodruff, Sybil. 1938. Soybean products as competitors of dairy products. *National Butter and Cheese Journal* 29(20):30-31. Oct. 25. Summarized by W.V.P. in J. of Dairy Science (1939) 22:A16.

• ***Summary:*** Discusses food uses of soybeans and the nutritive value of soybeans. Predicts that food use of soybean oil and soybean protein will probably increase. Relatively little soybean oil is used in salad oils, margarines, and shortenings which are sold at retail to consumers because of "problems of flavor which may arise. These three soybean oil products are sold rather to wholesale manufacturers of other food products with an expectation of a rapid turnover. It is a fact admitted frankly by soybean oil chemists that refined oil may undergo a 'reversion' of flavor on standing even after hydrogenation, which restricts its salability as food. The cause and means of preventing this unpleasant flavor, described by some as 'fishy' are not yet understood but are the subject of considerable research in the industry at present."

Soybean oil suddenly jumped to prominence as an edible oil in about 1935-36. Margarines and shortenings made from soybean oil both compete with the dairy industry.

A table shows factory consumption of soybean oil for food and industrial uses from 1932 to 1936. Use in lard compounds and vegetable shortenings jumped from 4,889,000 lb in 1932 to 113,897,000 lb in 1936. Use in margarine jumped from 3,000 lb in 1932 to 14,262,000 lb in 1936. Use in other edible products increased from 180,000 lb in 1932 to 21,598 lb in 1936. Thus total food uses skyrocketed from 5,072,000 lb in 1932 to 149,757,000 lb in 1936–a 30-fold increase in only 5 years. Total industrial uses of soybean oil increased steadily from 19,039,000 lb in 1932 to 25,847,000 lb in 1936. In 1935 food uses first exceeded industrial uses.

Soy flour is being used extensively in the sausage industry. "The grits are being added to bread and other bakery goods. Home use of soybean flour is at present almost non-existent" except where small amounts are used as a substitute for wheat flour in cases of allergies, or as a low-carbohydrate in special [diabetic] diets. "At present it is not available on the retail market except in food specialty shops at fancy prices.

"Soybean oil and flour are at present the only manufactured food products of any importance." Address: Dep. of Home Economics, Univ. of Illinois.

1081. *Health and Life* (*London*). 1938. Health services. Oct. p. 330.

• ***Summary:*** This ½-page listing of companies and products includes "Vi-Tone: The lecithin nerve-food beverage with Soya Milk basis."

Note: In 1929 Vi-Tone Company in Hamilton, Ontario, Canada, made Soybean Malter Milk, and Chocolate Malter Milk. It is not clear if the Canadian company is related to this product in England.

1082. Schroeder, Franz. 1938. Die Sojabohne, ihre wirtschaftliche Bedeutung und ihre Verwertung fuer die menschliche Ernaehrung [The soybean, its economic significance and its use as human food]. *Ernaehrung* (*Die*) 3(9):245-57. Sept.; 3(10):281-93. Oct. [61 ref. Ger]

• ***Summary:*** Adaptations of soybeans to Western food habits are discussed in detail. Page 89 mentions efforts to commercialize and popularize the use of soy flour (*Sojamehl*), for example the little Edelsoja Cookbook from the New Edelsoja Co. in Berlin (*das kleine Edelsoja-Kochbuch der Neuen Edelsoja-Gesellschaft in Berlin*) and the Edelsoja Cookbook from the Edel Soja Workshop in Lübeck (*das Edelsoja-Kochbuch des Edel-Soja-Praktikums in Lübeck*). Address: Oberregierungsrat und Mitglied des Reichsgesundheitsamts i. R., Wilhelmshoeher Strasse 3, Berlin-Friedenau, Germany.

1083. Whiteman, Elizabeth Fuller; Keyt, Ellen Kingsley. 1938. Soybeans for the table. *USDA Leaflet* No. 166. 6 p. Oct.

• ***Summary:*** Contents: Introduction. Food value of soybeans and their products. Soybeans as a green vegetable. Dry soybeans (Recipes: Soybean casserole {with "2 cups cooked soybeans, chopped"}, Chile con carne with soybeans. Soybean souffle {with "3 cups soybean pulp" [sieved or ground cooked soybeans]}. Salted soybeans {"they are good fried in deep fat and salted to serve like salted nuts"}).

Soybean sprouts. Soybean milk and "mash" [okara] (Recipes: Soybean milk sour. Soybean macaroons (with cooked soybean mash)). Soybean curd (Recipes: Vegetable chowder with soybean curd. Chop suey with soybean curd and bean sprouts). Soybean flour (Recipes: Soybean flour muffins. Soybean nut bread. Soybean piecrust).

Concerning "Dry soybeans" (p. 2-3): "Dry soybeans are cooked and served in a variety of dishes in practically the

same way as other dry beans, except that some varieties of the soybeans require longer cooking. They should always be soaked overnight first.

"Of the varieties tested, Easycook, Chusei, Rokusun, Jogun, Hokkaido, and Kanro require the least cooking, but Mammoth Yellow, Dixie, Hahto, and many other varieties may be used successfully, especially with the pressure cooker. After soaking overnight, drain, add fresh water, and simmer. The first varieties named will cook tender in about 2 hours, or sometimes less.

"With a pressure cooker at 15 pounds pressure, the cooking time is only a matter of 15 to 30 minutes, depending on the variety.

"For baking, the dry soybeans should be partly cooked first in an open kettle or the pressure cooker, then combined with the seasonings and baked in a slow oven for 3 to 4 hours, or until the beans are tender and savory. Any standard recipe for baked beans may be followed.

"Sometimes the cooked soybeans are pressed through a coarse sieve or ground in a food grinder and the pulp used in making soup, croquettes, loaf, or souffle. The cold soybean pulp also makes a nutritious and flavorful filling for sandwiches when mixed with chopped onion and enough salad dressing or milk to make it easy to spread. Or the pulp may be used like pumpkin or squash with milk, eggs, and spices as a filling for pie.

"The following recipes are typical of the many ways of using cooked dry soybeans. The beans themselves contain so much fat that they need only enough added for flavor."

Concerning "Soybean sprouts" (p. 4): "Soybeans, like mung beans, can be sprouted in a flower pot, a sink strainer, or any container that has holes in it for drainage and can be covered. Be sure the container is large enough, for the beans swell to at least six times their original bulk as they sprout. Soak overnight, and next morning put the beans in the container, cover, and leave them in a warm place. Flood with lukewarm water at least four or five times each day during the sprouting period. In 4 to 6 days the sprouts will be 2 to 3 inches long. Then they should be kept in a cool place, just as any fresh vegetable.

"Bean sprouts are a good addition to raw salads or to omelet, souffle, meat stew, or fricassee. The sprouts are very tender and to hold their crispness should not be added to hot mixtures until a few minutes before serving. They are also often used with soybean curd and vegetables in chop suey (p. 6)."

Concerning "Soybean 'milk' and mash" (p. 4-5): "Soybean 'milk,' though not the equal of cow's milk in food value, may be used like it as a beverage or in cooking. It is of value in diets for persons allergic to cow's milk, but in infant feeding must be properly supplemented.

"Of the varieties of soybeans tested, the best to use for making milk are Bansei, Hokkaido, Haberlandt, Mammoth Yellow, Dixie, and Rokusun. The milk may be made by either of two methods.

"Method 1.–Wash the dry soybeans and soak overnight. Remove the skins and grind the beans very fine. Put the ground beans in a cheesecloth bag, in a bowl of lukewarm water, using 3 quarts of water to each pound of dry beans. Work thoroughly with the hands for 5 to 10 minutes. Wring the bag of pulp until dry. Boil the milk on a low fire for 30 minutes, stirring frequently to prevent scorching. Add sugar and salt to taste. Keep in a cold place.

"Method 2.–After washing the dry soybeans, let them dry thoroughly. Crack them; then grind them fine. To each pound of beans add 3 quarts of water, and soak for 2 hours. Boil for 20 minutes, stirring constantly; then strain through cheesecloth. Add sugar and salt to taste. Keep in a cold place.

"The creamy white soybean milk can be used in practically any recipe calling for milk. For instance it may serve as one of the chief ingredients in a creamed vegetable soup, or with eggs in custard, or in cocoa or other hot beverages.

"The ground bean pulp or mash has very little flavor, but may be used for its nutritive value in combination with foods of more pronounced flavors. It spoils quickly, however, and should be heated to prevent it from souring.

"To cook soybean pulp or mash [soybean mash], put the desired amount of mash into the top part of a double boiler. Add one-half teaspoon of salt to each pint of mash. If the mash is too dry, moisten it with soybean milk. Stir occasionally and cook for about an hour or until the raw soybean flavor is gone. Keep in a covered jar in a cold place. The cooked mash makes an inexpensive ingredient in the macaroon type of cooky [cookie]." There follows recipes for "Soybean milk soup" and "Soybean macaroons."

Note: This is the earliest English-language document seen (June 2013) that uses the term "soybean mash" to refer to whole soybeans than have been cooked, then mashed or ground to a paste. Address: 1. Junior home economics specialist; 2. Junior scientific aide.

1084. *Post-Dispatch* (*St. Louis, Missouri*). 1938. Pictures. Nov. 6. *

• ***Summary:*** Photos show: (1) Aerial view of "Madison College, Tennessee. Its campus covers 700 acres." (2) "At one wing of the Madison College hospital, a student nurse wheels a patient past a pre-medical student, delivering a tray."

1085. *Eagle* (*Dothan, Alabama*). 1938. Soy bean milk is fine. Nov. 16.

• ***Summary:*** "Tuskegee Institute's versatile Dr. Carver has produced milk and many other things from peanuts–an amazing variety of food and other products... The chemist is a resourceful scientist and research uncovers no end of wonders.

"The soy bean, too, is proving to be the prolific mother

of many palatable and nourishing products.

"Two or three years ago, says Editor William Allen White's Emporia Gazette, he was a luncheon guest of Secretary of Agriculture Henry Wallace. 'We lunched in his private office. A cafeteria in the building supplied the order which the writer hereof ordered. A big bowl of milk and crackers appeared at Wallace's place.' The greedy eyes of the editor of The Gazette fell on it and Wallace said, 'That is our favorite luncheon dish. Would you like a glass of milk?' At a nod of acquiescence the Secretary told the waiter to bring some milk like his. It appeared. It was good. When we had disposed of our milk, the Secretary grinned and asked us, 'Did you like it?' We said 'Yes.' He said, 'I thought you would. I drink it every day. It isn't milk at all. It's a milk substitute made of soy beans and is much richer for my purposes in nourishing qualities than milk itself. And someway I like it better.' 'Ditto here.' To that the writer of The Gazette article adds the following:

"This story is told to illustrate another story. A state food inspector was in the office the other day, examining The Gazette's advertising columns. He spotted the advertisement he was looking for. It was a line in a grocer's advertisement advertising this soy milk as a cheap brand of milk but without calling attention to the fact that it was not cow's milk. In other words it was false advertising. Cases and crates of this good soy bean milk are sold in this town as cheap canned milk

"Of course this advertising is false advertising and the dealers are subject to arrest, as are the canners who pack it. How much better it would be if they would frankly advertise their product as soy bean milk. Those who consume this fake milk because it is cheap are fooled but they are not swindled. They are getting a good pure product. They know now that it is better milk than the real milk. They will buy it advertised for what it is.

"Why not be honest? It really pays. Quite apart from the morality involved, honesty–commercially–is the best policy. Soy milk branded as soy milk will have its place in the commercial world. But branded as a cow-milk product it will have tribulation. Try that soy milk sometime and as the old-fashioned advertisements used to read, 'You will use no other.'

"Yet as a matter of fact probably in many cases the real milk is just as good as the imitation.

"Yes, it really pays to be honest, but it does not pay to come into competition with the great American dairy block.

"Southern farmers are greatly interested in the production of oleomargarine, 'the poor man's butter.' Oils which enter into its composition are produced abundantly in the South, but the dairy interests of the northern and western states are powerful enough to keep a law on the statute books which forbids the sale of margarine butter to which coloring matter has been added.

"And if soy bean milk, or any other vegetable milk begins to be produced in quantity in this country, it will have the dairy interests on its neck in short order–via the Congress of the United States, which seems to jump obediently when the dairy lobby in Washington [DC] says jump."

Note: Perhaps Wallace got the idea for soy bean milk from his friend, G.W. Carver, whom Wallace had known since he (Wallace) was a baby. Carver had "made some very acceptable milk from the soy bean" by Oct. 1930.

1086. Chiu, Yan-Tsz. 1938. Analyses of Chinese foods. *Chinese Medical Journal* 54(5):435-41. Nov. [9 ref. Eng]
• ***Summary:*** "Soybean milk: My first problem is to study the manufacture and properties of soybean milk to be used as a substitute for cow's milk, which is too expensive for poorer children. In North China soybean milk has been a common food for both adults and children, while in South China only its products (mostly bean curd) are used. Ten years ago the manager of a local department store introduced bean milk as a beverage to take the place of soda water. But many people do not like it because of its unpleasant taste. It is found that the unpleasant odor of bean milk can be eliminated by washing the beans thoroughly and then soaking them in a large volume of water."

Table 1 gives a nutritional analysis of 4 types of soybean milk (including a condensed soybean milk with cocoa), human milk, goat's milk, and various types of cow's milk (condensed, evaporated, fresh, and powdered).

"Condensed soybean milk can be used to make a very cheap ice cream. Dean Koo and the writer have made for the first time several quarts of soybean milk ice cream which contains 60 per cent condensed soybean milk, 30 per cent cream (having 40 per cent butter fat) and 10 per cent cow's milk, with 5 per cent fat. The condensed soybean milk contains about 52 per cent water. 0.3 per cent gelatin is added. Flavored with lemon or vanilla or chocolate it has a good taste."

Note: This is the earliest English-language document seen (March 2007) that uses the term "soybean milk ice cream" to refer to soy ice cream. Address: Prof. of Chemistry, Lingnan Univ., Canton, China.

1087. Hastings, Milo. 1938. A college that feeds itself. *Physical Culture.* Nov.
• ***Summary:*** About Madison College near Nashville, Tennessee. About 500 people now live on the campus, of which 300-350 are students. About 90% of the vegetables (including soybeans) consumed by all these people are grown by student labor. The college has its own mills for whole-grain products and its own bakery, "which also serves whole-wheat and soy-bean bread to over one hundred retail stores in the nearby city of Nashville."

"The address Madison College, Tennessee, has become familiar to patrons of health food stores as the place of origin of a distinctive line of products made from soy-beans."

The reason for that grew out of an interesting combination of circumstances. First, the college was founded upon the idea that the "students should by their own labor produce as nearly as possible all their own food supply for a completely nourishing diet. Second: Madison College and Sanitarium are strictly vegetarian, and, as at the Battle Creek Sanitarium, the vegetarianism has been worked out as part of the school dietary as well as the sanitarium dietary. To students and patients alike the importance of proper food for the body is emphasized.

"Third: one phase of the work at Madison College has to do with the training of medical missionaries. That has not only brought to the teaching staff people who have had experience in the Orient, but has also brought students from those countries. (At present there are six Japanese and ten Chinese students.)

"Out of these circumstances came the development of a new line of foods which we may call the Americanization of the second most important food material in the Eastern world and the greatest of all vegetarian sources of protein–the soy-bean."

To Madison College, with its interest in perfecting a vegetarian diet, came Perry A. Webber, as professor of chemistry. He had taken his doctor's degree at Michigan State College after a fourteen years' residence in Japan. It was a happy combination of circumstances, and the American chemist, with his Japanese experience, set to work to Americanize the soy-bean as a source of human food.

"It also happened that one of Dr. Webber's Chinese friends, Philip S. Chen, was a fellow student of chemistry at Michigan State College, having come to America to study science. When he had completed his chemical work for a doctor's degree at Michigan, he entered Madison College as a special student to take up practice teaching in the Department of Chemistry under Dr. Webber. The two men, each with a knowledge of soy-beans as used in the Orient, now worked together as chemists in the American college.

"After two years of this cooperation Dr. Webber was called back to Japan to become the head of a school there. Dr. Chen then became the professor of Chemistry at Madison College and continued to work on soy-bean products."

Though Dr. Chen says soy-bean milk has been used in China for 3,000 years, the type made at Madison "is new because it is different and superior to the older forms of the Oriental product." It has been made "more acceptable to American tastes and to the more exacting demands of present-day nutritional science. This also applies to the substitutes for meat and the cheese products made from soy-beans, and to the use of soy-bean flour as an ingredient in bakery and cereal products. Today all this is of special interest to vegetarians and to those who follow the latest forms of health foods. These advances in food science will later become of far greater significance."

Dr. Frances L. Dittes, head of the Department of Nutrition, specializes in soybeans, "both in nutritional research and menu applications. Thus, the new food products developed from soy-beans, along of course with other vegetarian dishes, were worked out and tried out in the students' dining hall and also in the Madison Sanitarium. Patients cured at the sanitarium naturally wished to continue the use of the food products after returning home. This gave the nucleus of a health food manufacturing business.

"This, in turn, provided another campus industry for the work-your-way college, giving occupation for the students in which they could take an especial interest and pride, since the business grew out of the research work of the college and was closely tied in with both their agricultural and their health work."

Note: This article is reprinted near the back of the 1989 edition of *Madison–God's Beautiful Farm.*

1088. *Post-Dispatch* (*St. Louis, Missouri*). 1938. A college supported by its own industry: Madison College, Tennessee–the country's most unusual educational institution. Dec. 7. Rotogravure section. p. 10-11. *

• ***Summary:*** This 2-page center spread is about Madison College in Tennessee, to which it brought much favorable publicity. Photos by Jack Schutz show: (1) Five women students with many Madison Foods packages. (2) Soy milk being made in the food plant. "Soy milk may be substituted for cow's milk by those who require a strictly vegetarian diet" [i.e., a vegan diet].

1089. Bulatao, Emilio. 1938. Statistical note on the effect of supplementary feeding of powdered milk, soya bean milk, cod liver oil, and tomato juice on height-weight of children. *Natural and Applied Science Bulletin* (*Univ. of the Philippines*) 6(4):357-76. Dec. [2 ref]
• ***Summary:*** Conclusions: "4. Whichever and whenever one of two groups was given milk as a dietary supplement, that group put on weight at a significantly faster rate than did the other group taking only the basic diet."

"6. Although the soya bean group showed greater rate of weight increment than did the control, the difference is small and not significant." Address: Dep. of Physiology and Biochemistry, College of Medicine, Univ. of the Philippines.

1090. Concepcion, Isabelo; Paulino, Peregrino. 1938. The influence of certain dietary supplements on the growth of Filipino children. *Natural and Applied Science Bulletin* (*Univ. of the Philippines*) 6(4):337-56. Dec. [14 ref]
• ***Summary:*** Various dietary studies have shown that the Filipino diet has a deficiency of milk and dairy products, is low in calcium, animal protein, and fat, and is deficient in vitamins, especially A, B-1, and C. The high cost of milk and dairy products in the Philippines prevents their widespread use among infants and children.

Four supplements were tested in the diets of 67 children. The authors found that the addition of liquid milk (reconstituted from whole milk powder) to a basic diet produced an acceleration in both weight and height, and an apparent increase in the red blood cell count. "The addition of soya bean milk and a mineral mixture to the same diet, although it caused an increase both in height and weight more than the control group, is not significant however, specially with regards to height. There was also a marked increase in the hemoglobin content of the blood."

They conclude: "Of the four supplements that we have studied milk was the most effective and from the standpoint of nutritive value, the most economical." Efforts should be made to reduce the price of milk. Address: Dep. of Physiology and Biochemistry, College of Medicine, Univ. of the Philippines.

1091. *Madison Health Messenger* (*Madison, Tennessee*). 1938. Price list. 1(3):6. Fall-winter.
• ***Summary:*** This is the earliest known list of foods made by Madison Foods. The name of each food that contains soy as an ingredient is preceded by an asterisk (*). The foods are divided into categories and the flavor, size and price of each size are given.

The categories are: Breakfast cereals. Beverages. Crackers. Canned protein foods. Flour.

The foods containing soy as an ingredient are: Kreme O'Soy Crisps. Soy-Koff. Kreme O'Soy Milk (plain and chocolate). Thin-Things. Fruit Stix. Date Stix. Soyburger Loaf. Vigorost (3 sizes of cans). Soy Cheese seasoned (3 sizes of cans). Soy Beans with Tomato (3 sizes of cans). Kreme O'Soys [whole soybeans]. Kreme O'Soy Flour.

PRICE LIST

BREAKFAST CEREALS		
Minute Wheat	12 oz.	15c
*Kreme O'Soy Crisps	9 oz.	13c
BEVERAGES		
*Soy-Koff (No Caffein)	12 oz.	20c
*Kreme O'Soy Milk plain, liquid	15 oz.	15c
*Kreme O'Soy Milk plain, liquid	29 oz.	25c
*Kreme O'Soy Milk chocolate, liquid	15 oz.	15c
*Kreme O'Soy Milk chocolate, liquid	29 oz.	25c
CRACKERS		
*Thin-Things	5 oz.	12½
Whole Wheat Wafers	5 oz.	12½
Bran Wafers	6½ oz.	12½
*Fruit Stix	6½ oz.	15c
*Date Stix	6½ oz.	15c
CANNED PROTEIN FOODS (used in the place of meat)		
*Soyburger Loaf	14 oz.	20c
*Soyburger Loaf	30 oz.	40c
Nut-Meat	5 oz.	10c
Nut-Meat	14 oz.	25c
Nut-Meat	30 oz.	50c
*Vigorost	5 oz.	12c
*Vigorost	14 oz.	30c
*Vigorost	30 oz.	60c
*Soy Cheese seasoned	5 oz.	10c
*Soy Cheese seasoned	14 oz.	25c
*Soy Cheese seasoned	30 oz.	50c
*Soy Beans with Tomato	5 oz.	7c
*Soy Beans with Tomato	14 oz.	15c
*Soy Beans with Tomato	30 oz.	30c
*Kreme O'Soys	14 oz.	15c
FLOUR		
*Kreme O'Soy Flour	2 lbs.	35c
*Kreme O'Soy Flour	5 lbs.	85c

*(Soy Bean Foods.)

1092. **Product Name:** Soymilk.
Manufacturer's Name: Canton Mission School.
Manufacturer's Address: Canton, China.
Date of Introduction: 1938.

1093. **Product Name:** Soymilk, Tofu-Pimiento Spread, Okara Spread, and Gluten Cutlets.
Manufacturer's Name: Miller's Soy Foods.
Manufacturer's Address: Utica, New York. Washington, DC.
Date of Introduction: 1938.
Wt/Vol., Packaging, Price: Soymik: Bottled. Gluten products: Canned.
New Product–Documentation: Herbert P. Ford. 1958. *The Life Story of Dr. Harry W. Miller.* p. 131. "In 1939 Dr. Miller returned to the United States having been so thoroughly convinced of soy milk being destined to have world-wide acceptance... His son, Harry Willis Miller, Jr. had returned preceding his father and had started a small soy milk plant in

Utica, New York, where he made and bottled soy milk and also made and canned some of the protein foods out of wheat gluten for which they had developed recipes. This plant was later moved to Mt. Vernon, Ohio, after they started the soybean plant at Mt. Vernon."

Interview with Willis Miller. 1981. After he returned to the USA from Shanghai, Willis started this company, named Miller's Soy Foods, in Utica, New York, in 1938. Later that year he moved it to Washington, D.C. and was successfully making and marketing canned soymilk, tofu used in a tofu-pimiento spread, okara spreads, and gluten cutlets. When Dr. Miller returned to the U.S. he suggested that he and his son go into business together. Willis liked the idea.

1094. Zaporozcev, N.S. 1938. Sojove mleko [Soy milk]. *Lekarska Revue* (*Medical Revue*). [Cze]*
Address: Czechoslovakia.

1095. Abreu Velho, H. de L.; Gossweiler, John. 1938. A soja [The soybean]. Luanda, Angola: Imprensa Nacional. 48 p. (Conselho de defesa da producao e do comercio). [8 ref. Por]
• ***Summary:*** Cover title: Soja; o que os agricultores devem saber sobre a sua cultura (Soya: What farmers must know about its culture). In the section titled "Possibilities for soybean culture in Angola," it is noted: "Although on a relatively small scale, some soybean trials have been conducted in Angola. At the Experimental Station of Algodao, in Catete, some soybean trials were conducted in 1929 and 1930 with a yellow variety, with the intent of studying the crop for use in rotation with cotton and with maize (corn). The sowing went well and the germination was rapid and uniform, but none of the plants grew to a height of more than 30 cm (1 foot)."

At the experiment station of *Policultura Planáltica at Bié,* from 1928 to 1931, the soybean was one of the crops tested for use as a green manure. A summary of the results was given by the station's director in the *Boletim da Direcçao dos Serviços de Agricultura e Comércio,* volume 4, numbers 12-15, 1931. A long extract from that Bulletin concerning the soybean is given, focusing on the year 1930.

Soybean trials have also been conducted at the Station for the Reproduction and Improvement of Seeds and Plants (*Estaçao de Reproduçao e Melhoramento de Sementes e Plantas*) at Planalto de Malanje, since the beginning of 1935.

This publication also contains a long section on food uses of the soybean, including soy flour (*farinha de soja*), soy milk (*leite de soja*), tofu (*queijo de soja; queijo duro*), soy sauce (*Shoju, Soyu, Shoyu, tao yu*), and soy oil (*óleo de soja*). In Austria and America, and also in the Orient, soybean seeds are roasted, ground, and used as a substitute for coffee (*substituto de café*).

Note 1. This document contains the earliest date seen for soybeans in Angola, or the cultivation of soybeans in Angola (1928). One source of these soybeans was France.

Note 2. This is the earliest Portuguese-language document seen (Nov. 2012) that refers to soy coffee, which it calls *substituto de café* (a substitute for coffee).

Note 3. This is the earliest Portuguese-language document seen (Aug. 2013) that mentions soymilk, which it calls *leite de soja.* As of Aug. 2013 *leite de soja* is the modern Portuguese term for soymilk.

Note 4. This is the earliest Portuguese-language document seen (April 2013) that uses the word *queijo de soja* or the word *queijo duro* refer to tofu.

Note 5. This is the earliest Portuguese-language document seen (Sept. 2006) that mentions soy oil, which it calls *óleo de soja.*

Note 6. This is the earliest Portuguese-language document seen (April 2012) that uses the word *Shoju* or the word *Soyu* or the word *Shoyu* or the term *tao yu* to refer to soy sauce. Address: Angola.

1096. Anderson, Hans Steele. 1938. Science of food and cookery. 7th ed. Mountain View, California, Portland, Oregon, Cristobal, Canal Zone, and Omaha, Nebraska: Pacific Press Publishing Assoc. 297 p. Illust. 23 cm. [7 ref]
• ***Summary:*** Soybeans are discussed, with recipes, on pages 157-60. A recipe for making soy bean milk is given on p. 282; the remaining pulp is called "soy bean cake."

A 5th edition (same publisher, number of pages, and size) was published in 1929, and a 6th edition in 1932.

1097. Balzli, Hans. 1938. Kleine Soja-Fibel. Geschichte, Anbau und Verwertung einer einzigartigen Nutzpflanze [A little soybean primer. History, culture, and utilization of a unique useful plant]. Zurich and Leipzig: Albert Mueller Verlag. 88 p. Index. 16 cm. [26 ref. Ger]
• ***Summary:*** Contents: Foreword. Economic questions. Botanical. Historical. Chemical composition of the soybean seed. Utilization in East Asia: Koji, miso, shoyu, soymilk, yuba, tofu (*Sojakäse*, like Quark), soy oil and press-cake. Utilization in Europe and America: As fertilizer and feed, as food (soy flour, roasted soybeans, soy coffee, green vegetable soybeans (*den jungen Sojakern... wie junge gruene Erbse*), soy sprouts), and industrial products (incl. "soybean steel," an invention of Henry Ford). Medicinal significance. Cultivation and yield. Epilogue. Bibliography. Author-subject index.

In the chapter on History (p. 24), the author notes: "The poet Johann Heinrich Voss (lived 1751-1826) once said: 'Young Calcuttans... with your sharp soy sauce from Jakarta (*Junge Kalkuten... mit scharfer batavischer Soja*).' Then he adds to that the observation: 'Soy sauce (*Soja*) is a powerful sauce, which is prepared from soybeans (*Sojafasele*), Dolichos Soja, which originate in the East Indies and are subject to fermentation, together with brine and spice.'"

Balzli continues on page 25: "The *Deutsche Woerterbuch der Naturgeschichte* (German Dictionary of

Natural History) contained in the *Allgemeinen Polyglotten-Lexikon der Naturgeschichte* (General Multilingual Encyclopedia of Natural History) by Philipp Andreas Nemnich (1793) contains the entry: 'Sojablume. Dolichos soja.' (Soya flower. Dolichos soja)."

"In the world-famous work *Geist der Kochkunst* (Spirit of the Culinary Art), the art historian C.F. von Rumohr (lived 1785-1843) also mentions soya in the second edition (1832, p. 155) and conjectures that the Garum sauce of the Romans was an imitation of the East Indian sauce (Sulze) made from soybeans (Soja)."

Page 29 reports that "During the war of 1870 (*des siebziger Krieges*, in which Bismarck of Germany defeated Napoleon III of France) the German head artillery man, O. Wehrman, saw in the botanical garden of Montigny-les-Metz a plant that was unknown to him. It was the soybean. He took 4-5 seeds with him and planted them in early 1872 on his property / estate near Meissen (in Sachsen/Saxony, near Dresden in today's Germany). He harvested 80 to 100 seeds, with which he continued his investigations successfully for some years" [Note: Haberlandt (1878, p. 5) tells this same story].

On page 57 the author uses the term "Sojaspeisen" to refer to soyfoods. Address: Switzerland.

1098. Fiene, F.; Blumenthal, Saul. 1938. Handbook of food manufacture: A handbook of practical food information... New York, NY: Chemical Publishing Co. vi + 603 p. See p. 89. Index. 24 cm.

• ***Summary:*** This book contains many commercial scale formulas / recipes. Chapter 2, "Description of raw materials," includes brief descriptions of "corn oil (maize oil), cottonseed oil, arachis oil (also called peanut, ground nut, and earth nut oil), sesame oil (gingli oil, teel oil), soy bean oil, and rape oil" (p. 70-71).

Chapter 3, "Milk and milk products," includes subsections titled "Infants' milk, synthetic" (a recipe for a dry mix in which "Soya bean powder, 125 g." is the main ingredient), "Soya bean vegetable milk" and "Soya bean curd" (p. 89). Concerning the milk: "Soya bean meal after the oil is extracted or whole soya bean meal may be utilized quite as well as the whole bean. The milk can be used successfully in numerous preparations, such as breads and cakes, in creaming vegetables, in milk chocolate, and in custards. After separating the liquid from the solid material, the residue is still very rich in nutritive substances and can be dried and used for cattle feed or made into flour for human food."

Note: This is the earliest English-language document seen (Aug. 2013) that uses the term "Soya bean vegetable milk" to refer to soymilk.

Concerning the curd: "This curd, after being drained or pressed, represents bean curd of [sic, or] tofu, which is extensively eaten and forms the basis of numerous fermented, smoked, and dried cheeses in China and Japan... In many cities of the United States having a large oriental population fresh bean curd may be found in Chinese and Japanese markets."

Chapter 5, on canned foods, notes in the section titled "Dried beans" (p. 126) that "Soya" beans sold in cans.

Chapter 17, on "Bread" contains two formulas (p. 378-79) for "Soya bean flour bread," the first containing 260 lb. wheat flour, 65 lb. "Soya flour," etc., and the second containing 25 lb. "Whole soya flour," 25 lb "Whole wheat flour," etc. The straight dough method is used.

Chapter 23, titled "Health foods" begins (p. 445): "Natural and vitamin-laden health-building foods and drinks are essential for healthy muscles, nerves, glands, and for the growth and maintenance of a healthy, vigorous, and sound mind." The best diets are those containing plenty of fresh foods and juices. "Nuts and soya beans are good substitutes for meats, fish, eggs, and sea foods." A section in this chapter on the "Soy bean" begins (p. 447): "The soy bean is justly entitled to be called the king of the legumes. Not only because it is lowest in starch but also because, firstly, it is the most complete and best protein for both growing children and adults and, secondly, because of its unusually high mineral content being quite high in alkaline potassium, calcium, and magnesium... it is an alkaline food."

Formulas for health foods include (p. 454-55): "Health dry cereals" (six formulas, two if which contain "Soy bean middlings" [medium size soy grits, probably made by cracking whole soybeans]). Coffee substitutes and health drinks (three formulas, the 3rd containing only 75 oz. roasted whole wheat and 25 oz. roasted soy bean middlings). The next health-food subsection, titled "Flour, meals, etc." states (p. 455): "Soy bean flour, with or without a high percentage of fat, is used to make bread, biscuits, noodles, mayonnaise, candy, etc."

Chapter 24, "Acid-forming and alkali-forming foods," states: "When foods yielding an acid ash predominate in the diet, a condition of acidosis may result unless the resulting constituents are neutralized with alkaline ash foods."

Next come two lists: (1) "Acid-forming foods, starting with those foods having the least amount of acid-forming ash." The foods with the *most* acid-forming ash are: 1. White bread. 2. Cheese. 3. Meat, chicken. 4. Fish, haddock. 5. Meat, venison. 6. Meat, beef, lean. 7. Meat, veal.

(2) "Alkali-forming foods, starting with those foods having the least amount of alkali-forming ash." The foods with the *most* alkali-forming ash are: 1. Soy bean. 2. Olives. 3. Beans, lima, dried. 4. Linseed oil meal. 5. Spinach. 6. Raisins. 7. Beans, dried. 8. Almonds. Address: 1. PhD, Food Research Chemist; 2. B.S., Consulting Food Chemist and Director of Shirley Labs., New York City.

1099. Glotova, E.V.; Chebotareva, S.V. 1938. [The influence of lactic acid microorganisms on the formation of toxin by

B. botulinus in acid soybean milk preparations]. *Voprosy Pitaniia* (*Problems of Nutrition*) 7(3):132-39. (Chem. Abst. 34:7325). [8 ref. Rus; ger]

1100. Hauser's (Mrs.) Food Products Co. 1938. Mrs. Hauser's recipe book: Soya formulas for better nutrition. Los Angeles, California. 32 p. 24 cm.
• ***Summary:*** The cover of this booklet is light blue on beige. Contents: The purpose of this book. The nutritional marvel–*Soy or Soya Beans "Soya max."* Soya Bean high lights. Analysis of Soya Bean Flour. Soy Bean facts. Soya briefs. Hot and cold food stuffs. Eat relaxing alkaline foods. Breathe correctly. Five day efficiency diet. The water we drink. Practical "low carbohydrate" diets. Soups. Drinks. Salad dressing. Bread–biscuits–muffins. Meat substitutes. Recipes to be used when preparing Mrs. Hauser's paste goods. Cakes. Cookies. A good breakfast for health. Desserts. Sandwiches. Miscellaneous (incl. Baked delight {with ground Soya Nuts}, Tofu or Soya Bean Cheese {made from soya milk curded with lemon juice or citric acid}). About vitamins: Vitamin A, B, C, D, E, G. Soya beans are a good source of vitamin G. Foods and their minerals. Soya beans are rich in copper, iron, phosphorus, and calcium. Food which are alkaline: Incl. soya beans.

The types of soyfoods called for in these recipes include: Mrs. Hauser's "Soy" Sauce. "Soy" Brand Elbow Macaroni (p. 18-19). "Soy" Brand Hot Cake and Waffle Flour. "Soy" Brand Macaroni. "Soy" Brand Noodles. "Soy" Brand Spaghetti. Soya bean flour (also called "Soya flour"–by far the most common ingredient called for). Soya bean mush (p. 25). Soya beans (canned or cooked). Soya milk. Soya nuts (p. 15-16). Soya oil.

The booklet ends with these words (p. 32): "A liberal use of the Soya Bean and Soya Bean Products in the average diet is a very distinct aid in the digestion of meats, poultry, fish, and, in fact, all animal foods. (Recipes of this nature will be given in future publications.)"

Note 1. Many of the recipes call for "Mrs. Hauser's Sea Salt." Note 2. Mrs. Hauser is apparently not related to Gayelord Hauser, who is also in the health foods business in Los Angeles. Address: 4617 Melrose Ave., Los Angeles, California.

1101. Miege, M.E. 1938. Les cultures complémentaires au Maroc [Complementary crops in Morocco]. French Morocco: Service de l'Agriculture et de la Colonisation. 339 p. Preface by J. Lefevre. Illust. Index. 22 cm. [10 ref. Fre]
• ***Summary:*** Miège considered the extension of any crop as subordinate to the utilization of varieties that withstood drought and were high yielding. Within irrigated zones, the soybean furnished yields of 14,000 to 16,000 kg/ha of excellent green forage. But the seed yield was very small, usually not exceeding 1,000 kg/ha when unirrigated. That would not make the crop financially viable.

On the other hand, the bean can be used to make a great variety of preparations: transformed into flour, into milk, into cheese [tofu], or consumed green, dried, or grilled [roasted], it enters into the daily feeding of several millions of human beings, for whom it represents a very rich food, as it contains, on average, 38 to 40% proteins, 16 to 22% lipids, and 14 to 15% carbohydrates.

In Morocco, this legume has so far, only been used on a small scale as forage or green manure; however, they are beginning to use the beans, boiled or ground into flour, to raise calves and baby pigs, as well as to make oil (in Casablanca).

Note: "Complementary" in this sense means alternative, secondary or additional to the main or primary crops. It could also mean a source of protein and/or oil to make up for a shortage of traditional protein and/or oil sources.

Also discusses: Peanuts (p. 20-25; 5 refs). Sesame (p. 52-55; 1 ref). Address: Director, Center for Agronomic Research, French Morocco (Directeur du Centre de Recherches Agronomiques du Maroc).

1102. Montagné, Prosper. 1938. Larousse gastronomique [Larousse gastronomique]. Paris: Librairie Larousse. 1087 p. See p. 989-90. [Fre]
• ***Summary:*** The following are defined under *"Soja ou Soya":* Introduction. Tofu (*fromage de soja*), soymilk, (*lait de soja*), soy sauce (*sauce ou extrait de soja*), soy meat (*viande de soja; viande végétale*). The soy meat, which resembles smoked ham, is said to be very complicated to make, requiring industrial equipment. An illustration (p. 990) shows a soybean plant, including enlarged insets of the flowers and pods.

Note: This is the earliest French-language document seen (Nov. 2003) that uses the term *viande de soja* or *viande végétale* to refer to meat alternatives. Address: France.

1103. Nuxo Nussnahrungs. 1938. Zur Bereitung koestlicher Rohkostspeisen [For the preparation of delicious raw-food dishes and meals (Ad)]. In: Bircher-Benner, Maximilian Oskar; Bircher, Max Edwin. 1938. Fruechtespeisen und Rohgemuese. 26. Auflage [Fruit dishes & raw vegetables. 26th ed.]. Zurich, Switzerland, Leipzig, Germany, Vienna, Austria: Wendepunkt Verlag. 59 p. Ad faces title page. [Ger]
• ***Summary:*** Nut mayonnaises made from Nuxo = Nutmeats. Breakfast foods with Nuxocreme. Almond milk and fruit milk made from Nuxo Almond- and Nut products. Dextrinized Nuxo = flakes from cereal grains, chestnuts, and the like. Our logo is the sign of natural purity (*Naturreinheit*) and wholeness (*Vollwertigkeit*). Established in 1905. Address: Nuxo-Werke, Rothfritz & Co., Hamburg 1, Germany.

1104. Platt, B.S.; Gin, S.Y. 1938. Chinese methods of infant

feeding and nursing. *Archives of Disease in Childhood* 13:343-54. [14 ref]
• ***Summary:*** Page 345 mentions a number of foods that are believed by Chinese to promote lactation in nursing mothers. At the end of this paragraph it is stated: "Another preparation that is sometimes used is the 'milk' prepared from the soya bean with powdered walnut added."

Page 347 shows a graph of the foods fed to 390 infants after introduction of solid foods while nursing continued. Rice was by far the most widely fed, followed by Chinese red dates (Chinese jujubes). Soy bean milk was one of the least frequently fed foods. The weaning diet was studied in 305 Chinese infants. Only one case was seen where soya bean milk was fed. Guy (1936), a woman pediatrician in Peking, found that "soya bean 'milk' is never used in infant feeding; a hot weak solution sold in the streets of Peiping is taken by old people as a beverage. At a recent conference of nutrition experts in the Far East, it was recorded (Bandoeng Conference, 1937) that soya bean milk had little in common with mammalian milk beyond a white colour. A soft bean curd may, however, be used with advantage (Platt, 1936) in a mixture for weaning purposes." Address: Dep. of Medicine, Henry Lester Inst. of Medical Research, Shanghai, China.

1105. Silva Cortes, Cesar. comp. 1938. El poroto soya [The soybean]. Santiago, Chile: Ediciones Ercilla. 87 p. Illust. Index. 19 cm (Colleccion Manuales Ercilla). [Spa]
• ***Summary:*** Contents: Introduction: General outline off its importance and use, composition of various legumes, general characteristics of the meal (*harina*), oil, lecithin, cake and other derivatives of the soybean (*poroto soya*). Part I: Cultivation of the soybean. 1. Botanical characteristics of the plant: Leaf, flowers, pods, seeds, roots and nodules. 2. Varieties and desired characteristics: Various varieties, those most suited to Chile, characteristics of other varieties. 3. Cultivation of soybeans: Climate, the soil and its preparation, fertilizers, inoculation of the seeds, planting, cultivation, harvest, diseases, enemies, and their cures.

Part II: Utilization of the soybean. 1. Generalities: Applications of the plant and its seeds. Summary of the uses. 2. Soy oil and its derivatives: Extraction of the oil, edible oil, industrial uses of the oil, soya phosphatides and lecithin (*Fosfáticos y lecitina de soya*), soybean cake, commercial enzymes. 3. Soybeans in human nutrition: Green vegetable soybeans (*porotos verdes*) and whole dry soybeans, soy sprouts (*vástagos de soya*), soy flour (*harina de soya*), nutritive and caloric value, types of flour, bread with soy flour, doughs (*pastas*) and biscuits, sausages with soy flour, soymilk (*leche vegetal de soya*), soybean curd (*cuajada de soya* [tofu]). 4. Soya for livestock: Soybean straw, soybean pasture (*pasto*), soya for silage, soybean hay, soybean hay for animals to be slaughtered, soy meal (*harina de soya*) for various animals.

A table (p. 19-20) lists soybean varieties suited for different uses: For hay: Barchet, Chiquita, Goshen Prolific, Laredo, Old Dominion, Otootan, Virginia. For green forage: Dixie, Easycook, Hahto, Hollybrook, Mammoth Brown, Mammoth Yellow, Southern Prolific, Tarheel Black, Tokio. For silage: Biloxi, Mammoth Brown, Mammoth Yellow, Tarheel Black, Tokio. For beans (oil, cakes, flour, etc.): Biloxi, Chiquita, Dixie, Hollybrook, Mammoth Yellow, Southern Prolific, Tokio, Ito San, Dunfield, Illini, Manchu.

Varieties most suited to Chile (p. 20): About 27 varieties have been tested at various locations in Chile. Those which gave the best results were Ito San, Dunfield, Illini, and Manchu. Ito San gave good results from Aconcagua to Bío-Bío. It performed especially well at Maule, Ñuble, and Bío-Bío. Dunfield and Illini gave very good results in Curicó and Talca. Manchu, which matures a little later than Ito San and Dunfield, is very appropriate for the Central Zone.

Note 1. This is the earliest document seen (July 1998; one of two documents) that uses the word *"poroto"* or *"porotos"* in connection with soybeans.

Note 2. This is the earliest Spanish-language document seen (June 2009) that uses the term *porotos verdes* to refer to green vegetable soybeans.

Note 3. This is the earliest Spanish-language document seen that uses the word *"lecitina"* to refer to lecithin, or the term *Fosfáticos y lecitina de soya* to refer to phosphatides and soy lecithin.

1106. Simonds, William Adams. 1938. Henry Ford and Greenfield Village. New York, NY: Frederick A. Stokes Co. xiv + 268 p. Illust. No index. 20 cm.
• ***Summary:*** In chapter 9, titled "Industry and Agriculture," Henry Ford's work with soybeans is discussed on pages 230-35. Ford developed plastics using soybeans. "The cost of one pound of soybean molding material has as yet proved higher than that of a pound of steel, but the polishing and finishing of the steel makes the cost of its finished part somewhat greater than that of the finished plastic. When a molded plastic part replaces one of steel, weight is decreased with consequent reduction in gasoline consumption.

"Two years before experiments with the soybean in its relation to industry were commenced, the bean was the subject of another definite line of research in the food and diet laboratory maintained by the Company in the rear of the Engineering Laboratory directed by Mr. Ford's old seatmate, Dr. Edsel Ruddiman... Many will doubtless recall the howl of laughter that went up when Mr. Ford informed a reporter one day of his belief that synthetic milk could be produced. Nevertheless, milk has been produced from the soybean in the Ford laboratories and elsewhere. It is even better than cows' milk for certain infants' cases, where skin afflictions make use of the latter undesirable...

"When Dr. Victor Heiser, author of 'An American Doctor's Odyssey,' visited Greenfield Village he told me of the wide use of soybean milk among the Filipinos, and how

the addition of a little oil of banana had made it much more palatable...

"With this milk soybean cheese, similar to cottage cheese except in flavor, may be made. While somewhat insipid in taste, the cheese proves very useful when mixed in salads, sandwich spreads, croquettes with a food having a strong flavor. The whole bean has many food uses, among them soups, baked beans, salads, and canning. As the flavor of the soya is slightly stronger than that of the ordinary bean, onions and tomatoes are often used to cover it. The process of canning the green soybean was first demonstrated under Dr. Ruddiman's direction. Production of soybeans in 1935 totaled 590 cans; and in 1936 it reached 1,000."

Defatted soybean flour "finds a ready market among visitors at the Village. It is used in many common baked goods such as bread, rolls, muffins, biscuits, cakes, cookies, and so on... Another product that has proved popular with visitors is the salted soya, put up in small packages like nuts. In preparing these, the bean is soaked in water for a time, then roasted in hot soya oil. The salt is added to taste." Lecithin can be used to make a "chocolate sauce and coating for soybean candies, with which the Ford men have done much experimenting.

"As a practical demonstration of the possibilities of the soybean in a variety of foods, a dinner was served one August evening in 1934 at the Ford exhibit in the Chicago Century of Progress Fair. Every dish on the menu was comprised, in part at least, of the legume. Following was the list [of 15 dishes served].

"Tomato juice seasoned with soybean sauce. Salted soybeans. Celery stuffed with soybean cheese. Purée of soybean. Soybean crackers. Soybean croquettes with tomato sauce. Buttered green soybeans. Pineapple ring with soybean cheese [tofu] and soybean dressing. Soybean bread with soybean butter. Apple pie (soybean crust). Cocoa with soybean milk. Soybean coffee. Assorted soybean cookies. Soybean cakes. Assorted soybean candy."

Note 1. This is the earliest English-language document seen (Dec. 2012) that uses the term "soybean butter." It is not clear whether this was a soynut butter (made from roasted soybeans and resembling peanut butter) or whether it was made with hydrogenated soybean oil and resembled dairy butter.

Note 2. The listing and spelling of the items in this menu differs slightly from the original menu of 17 Aug. 1934.

Note 3. No mention is made of soy ice cream being served at this meal in Aug. 1934. Yet shortly thereafter, and definitely by Aug. 1935 soy ice cream for dessert was served at similar meals in the pine-paneled dining room in the Ford Engineering Laboratory (Strother 1961).

Chapter 10, titled "Little Factories," discusses Ford's rural industries, including the mills at Saline, Tecumseh, Milan, and Ypsilanti. At Tecumseh, in the heart of soybean country, the Hayden Mills, after its restoration, "was used for cleaning and sacking soybeans for seed, preparing them for distribution to neighboring farmers in the spring." At "the village of Saline where the Chicago pike crosses the Saline River a few miles north of the soybean farms..." the old Shuyler mill and its dam were restored. "The fall of 1936 also found workmen busy at the town of Milan east of the soybean area..."

An excellent panoramic view of and guide to Greenfield Village are shown inside the front cover and on the facing page. #11 is a "soybean extraction plant." Address: Dearborn, Michigan.

1107. White, Ellen G. 1938. Counsels on diet and foods: A compilation from the writing of Ellen G. White by the Board of E.G. White Trustees. Takoma Park, DC: Review and Herald Publishing Assoc. 511 p. Index. 17 cm.
• ***Summary:*** The Foreword states: "Early in 1926 there was issued by the Loma Linda college press, a paper-bound volume entitled 'Testimony studies on diet and foods.' This was compiled by Dr. H.M. Walton from the writings of Mrs. E.G. White for use in the College of Medical Evangelists... The continued call for the book... justifies the issuance of this new and enlarged edition."

Quotations from previous writings by a founder of the Seventh-day Adventist faith are arranged by the following subjects: Reasons for reform. Diet and spirituality: The relation of diet to morals. Health reform and the third angel's message. The proper dietary: The original diet, the simple diet, the adequate diet, diet in various countries. Physiology of digestion. Improper eating a cause of disease. Overeating. Control of appetite. Regularity in eating: Number of meals, eating between meals. Fasting. Extremes in diet. Diet during pregnancy. Diet in childhood. Healthful cookery. Health foods and hygienic restaurants. Sanitarium dietary. Diet a rational remedy. Fruits, cereals, and vegetables: Fruits, grains, bread, vegetables. Desserts: Sugar, milk and sugar, pie, cake, pastry, puddings. Condiments, etc.: Spices and condiments, soda and baking powder, salt, pickles and vinegar. Fats: Butter, lard and grease, milk and cream, olives and olive oil. Proteins: Nuts and nut foods, eggs, cheese. Flesh meats (proteins continued): Progressive dietetic reform in Seventh-day Adventist institutions. Beverages: Water drinking, tea and coffee, cereal substitutes for tea and coffee, cider, fruit juice. Teaching health principles: Instruction to be given on health topics, how to present the principles of health reform, cooking schools. Appendix: Personal experience of Ellen G. White as a health reformer, a statement by James White relating to the teaching of health reform. General subject index.

Concerning the consumption of milk, dairy products, and eggs, Ellen G. White stated (year of quotation, number in book): "Fruits, grains, and vegetables, prepared in a simple way, free from spice and grease of all kinds, make, with milk or cream, the most healthful diet. They impart nourishment

to the body, and give a power of endurance and a vigor of intellect that are not produced by a stimulating diet" (1890, #601).

"Some, in abstaining from milk, eggs, and butter, have failed to supply the system with proper nourishment, and as a consequence have become weak and unable to work. Thus health reform is brought into disrepute... The time will come when we may have to discard some of the articles of diet we now use, such as milk and cream and eggs; but it is not necessary to bring upon ourselves perplexity by premature and extreme restrictions. Wait until the circumstances demand it, and the Lord prepares the way for it" (1909, #602).

"Milk, eggs, and butter should not be classed with flesh meat. In some cases the use of eggs is beneficial. The time has not come to say that the use of milk and eggs should be wholly discarded. These are poor families whose diet consists largely of bread and milk...

"Let the diet reform be progressive. Let the people be taught how to prepare food without the use of milk or butter. Tell them that the time will soon come when there will be no safety in using eggs, milk, cream, or butter, because of wickedness among men" (1902, #603).

"If milk is to be used, it should be thoroughly sterilized; with this precaution, there is less danger of contracting disease from it" (1905, #607).

"We place no butter on our table. Our vegetables are generally cooked with milk or cream and made very palatable... We think a moderate amount of milk from a healthy cow is not objectionable" (1870, #611).

Concerning the idea that the strictest diet is not the best, especially for the poor, see White's letter of 1901, #612. She feels that all people should stop consuming flesh meats, tea and coffee, but that the subject of giving up milk, eggs, cream, and butter needs to be handled carefully, especially by poor families. "No extremes in health reform are to be advocated. The question of using milk and butter and eggs will work out its own problem."

"The health food business is in need of means and of the active cooperation of our people, that it may accomplish the work it ought to do. Its purpose is to supply the people with food which will take the place of flesh meat, and also milk and butter, which, on account of the diseases of cattle, are becoming more and more objectionable" (1900, #583).

"Large quantities of milk and sugar eaten together are injurious. They impart impurities to the system. Animals from which milk is obtained are not always healthy. They may be diseased... Could we know that animals were in perfect health, I would recommend that people eat flesh meats sooner than large quantities of milk and sugar" (1870, #533). Large amounts of milk and sugar "clog the system, irritate the digestive organs, and affect the brain" (1870, #534). "Especially harmful are the custards and puddings in which milk, eggs, and sugar are the chief ingredients" (1905, #536).

Concerning cheese (made by fermentation): "Cheese is still more objectionable [than butter]; it is wholly unfit for food" (1905, #633).

Other entries: Why use secondhand food? "The diet of the animals is vegetables and grains. Must the vegetables be animalized, must they be incorporated into the system of animals, before we get them? Must we obtain our vegetable diet by eating the flesh of dead creatures?" (1896, #703). Note: A revised edition was published in 1946.

1108. Edison Institute. 1938? Recipes for soy bean foods. Dearborn, Michigan: Edison Institute. 19 p. Undated.
• ***Summary:*** This undated booklet begins with 1½ pages of nutritional information about soy beans and recipes containing them. "Fresh green soy beans contain about 10% of protein compared with 7% in green lima beans or green peas. The varieties Willomi and Rokusun "are preferred because they do not have such a strong taste." Many of the 58 recipes are based on soy flour, e.g. soy-bran bread, steamed soy bean bread, cinnamon buns, muffins, waffles, lady fingers, apple sauce cake, soy bean "paste," doughnuts, etc. A number of others use "cooked soy beans" (soy loaf, chile con carne [chili], baked beans), "boiled soy beans" (salad) or "cooked and ground soy beans" (soup).

Note. This is the earliest English-language document seen (June 2013) that uses the term "ground soy beans" or the term "cooked and ground soy beans" to refer to whole soybeans that have been cooked and ground.

More unique recipes include: Soy loaf (with "soy cheese" [tofu], p. 9). Cheese croquettes (with soy bean cheese and soy milk, p. 9). Green soy beans (p. 10). Scalloped green soy beans. Omelette (with tofu, p. 10). Salad (with tofu, p. 11). Salad soy bean sprouts (p. 11). Sandwich spread (with "soy nut butter," p. 12). Honey soy bean icebox cookies (with soy bean butter or Crisco [shortening], p. 14). Brittle cookies (with soy bean flour and roasted soy beans, p. 14). Coconut balls (with roasted soy beans, p. 15). Soy bean custard (with soy bean milk, p. 18). Candy-milk chocolate clusters (with freshly roasted soy beans, p. 18). Candy-roast soy brittle (with fresh roasted soy beans, p. 18).

The last page (p. 19) gives basic recipes for: Cooked soy beans. Green soy beans. Soy bean milk. Soy bean cheese [tofu], coagulated with dilute acetic acid or vinegar; salt to taste. Roasted soy beans. Soy bean nut butter. Soy bean butter.

"Roasted soy beans: Soak beans in water 3 or 5 hours. Drain off water and roast beans for 9 to 11 minutes in deep, purified soy oil or Wesson oil heated to about 325ºF. Drain and sprinkle with powdered salt."

"Soy bean nut butter: Grind about 2½ cups of roasted soy beans and mix with about 2 tbsp. of purified soy oil or salad oil.

Soy bean butter: Mix hydrogenated soy oil with salt,

coloring matter and diacetyl to color and taste.

Note 1. Robert Boyer stated in an interview in the 1980s that this booklet was published in the mid-1930s, and the recipes were developed mostly by Dr. Edsel Ruddiman. However mention of the varieties Willomi and Rokusun makes it more likely that this booklet was published after mid-1938.

Note 2. This is the earliest English-language document seen (Nov. 2012) that uses the term "soy nut butter" or the term "soy bean nut butter" to refer to soynut butter. Address: Dearborn, Michigan.

1109. Photographs of Madison College in Madison, Tennessee. 1938? Undated.

• ***Summary:*** These black-and-white prints were sent to Soyfoods Center in 1983 by Ed Bisalski. Most are pasted onto heavy brown cardstock paper in a 3-ring scrapbook, which has a neat, handwritten description of each photo in black ink.

The photos are: (a) A display of Madison Foods featuring Soy-Koff ("coffee flavor without coffee effects, alkaline," 20 cents for 25 cups), Kreme O'Soy Milk ("a pure tasty vegetable milk," plain or chocolate, homogenized, 15 cents or 25 cents) and Kreme'O-Soy Crisps (ready-to-eat, malted soy crumbles, 13 cents or 2 for 25 cents).

(b) "Madison Foods college industry. Bread molding. specializing in the manufacture of soy bean foods–bread, crackers, cereals, flour, cheese, milk, coffee substitute, canned soy beans, meat substitutes. Sold in 48 states–Health Food Stores, Department stores, Specialty Grocers, etc."

(c) Madison Foods plant.

(d) The 400-acre farm provides for the stock [animals], for the college kitchen, sanitarium kitchen, and campus store. A female student in the "Soy bean patch."

1110. Stegman, Henry M. 1939. The soybean a blessing to mankind. *Good Health* (*Battle Creek, Michigan*) 74(1):11. Jan. [1 ref]

• ***Summary:*** "A promising field in this country is the employment of soybean milk for medicinal purposes. In the stomach this gives a very fine, flocculent precipitate instead of the large, tough curds of cow's milk. The period of stay in the stomach is thus made much shorter, and the peristaltic motion of the stomach is less and more coordinated. It also curdles at a lower acidity...

"The deficiency of the soybean ash in sodium and the large excess of potassium makes the food an important alkalinizing agent... The standard which gives milk an alkalinity of 0.5, places that of the soybean at 12...

"The soy acidophilus milk which the Dionne quintuplets take today is given them to prevent the recurrence of the severe bowel trouble infection which they suffered when four months old. They were relieved by this after other measures had failed."

1111. *New York Times.* 1939. Chemists patent new sleep potion. Feb. 19. p. 39.

• ***Summary:*** The section titled "Flavor of soya products" states that U.S. Patent No. 2,147,097 has been granted to Artemy A. Horvath of Newark, Delaware. The patent is assigned to Soya Corporation of America.

Soya beans have long been seen as potential source of food products (such as flour or milk) in the USA. However the objectionable soya flavor and odor impeded the use of

these products. This invention is intended to overcome this problem by treating soya with carbon dioxide under pressure and at low temperatures. When the soya is heated both the carbon dioxide and the volatile flavors and odors also evaporate, leaving a good tasting soya product.

1112. Pynaert, L. 1939. Le Soja au Congo Belge [The soybean in the Belgian Congo]. *Revue Internationale des Produits Coloniaux et du Materiel Colonial* 14(158):61-65. Feb. Summary in Revue de Botanique Appliquee (1939) 19:233. [3 ref. Fre]

• ***Summary:*** Contents: Preface. Soybean yields obtained in the Belgian Congo. The utilization of soya in Europe: Dry seeds (whole dry soybeans), soy sauce, soymilk, yuba, tofu, soymilk casein, soy lecithin, soy flour and chocolate, soy oil. Net cost. In short, Pynaert describes all the basic types of soyfoods and encourages their introduction to the Congo.

Yields: "In 1915 the agronomist Mestdagh made it known that at the end of an experiment well conducted at Lusambo in the district of Sankuru [Belgian Congo], he had harvested 1,472 kg/ha of a light yellow variety of soybean, and 1,786 kg/ha of a black variety.

"The agronomist J.B.H. Lejeune, who worked in the Congo for nearly 20 years, recently furnished information of great interest on the subject of the soybean cultivation which he had undertaken in the colony as well as in Rwanda-Urundi.

"In 1922 he cultivated a yellow soybean which he had obtained from Vilmorin-Andrieux & Co. in Paris under the name of Mammoth Yellow. He obtained yields ranging from 500 to 1,500 kg/ha.

"In 1926 the same agronomist introduced the black soybean O-Too-Ton [Otootan] cultivated in Georgia. This variety adapted itself remarkably well to the conditions of the Eala milieu and gave soybean yields of 1,000 to 2,000 kg/ha.

"In 1927 trials were recorded at four stations in Rwanda-Burundi, a country of higher altitude with conditions that are very different from those forested central Africa.

"At Lusunyu, which enjoys a temperate climate, the yields of a variety of O-Too-Ton varied from 90-540 kg/ha during a 4 month cycle. At Bugarama, in a much warmer climate, the average yield of seeds was 556 kg/ha. At Kisozi the variety O-Too-Ton gave yields of 100 to 400 kg/ha. A variety named Biloxi furnished a yield of more than 500 kg/ha. At Rubona, still in Rwanda-Urundi, the following seed yields were obtained from 1931 to 1935. Biloxi: 300 to 652 kg/ha. O-Too-Ton: 150 to 1,300 kg/ha. Eala Yellow (Jaune d'Eala): 214 to 261 kg/ha." Also discusses yields at: Kisozi from seeds introduced by Mr. Lejeune; at the Agronomic Station at Yangambi, near Stanleyville, from 1937; at Nioka in Upper Ituri (*Haut-Ituri;* Ituri is a district in the oriental province of the Belgian Congo) where yields are 450-500 kg/ha in poor soil but 700-800 kg/ha in good soil, and even up to 1,000 kg/ha; it is concluded that indigenous crops will probably not give yields of greater than 400-500 kg/ha.

This document contains the earliest date seen for soybeans in Ruanda-Urundi, or the cultivation of soybeans in Ruanda-Urundi (1927) (one of two documents). Address: Directeur du Jardin Colonial de Laeken (Belgium).

1113. Heiser, Victor George. 1939. You're the doctor. New York, NY: W.W. Norton & Co., Inc.; London: J. Cape. 300 p. April. Index. 21 cm.

• ***Summary:*** The legumes (peas, beans, lentils), once so highly praised for their proteins, have fallen rather into disrepute as a staple article of diet, because it has been shown that they are lacking some of the most important amino acids–the building blocks of nutrition. But there is one noteworthy exception. "The easily digested 'little honorable plant,' the soy bean, known in the Orient as 'the meat without the bones,' is the richest in proteins of any food except dried egg white and is possessed of more of the properties of animal proteins than any other vegetable."

Note: This is the earliest English-language document seen (June 2012) that refers to the soy bean as "the meat without the bones"; in all previous documents, that phrase was used to refer to tofu.

In the tropics, milk is difficult to obtain. In Peking, China, a soy bean decoction was developed as an alternative. "To me, it was one of the vilest mixtures I've ever tried." Nevertheless, babies reared on this "nauseating beverage loved it;" they clamored for it and consumed it greedily. When given fine fresh cow's milk, they promptly spat it out.

"The addition of banana oil [or bananas] does wonders for the taste of soy bean milk... With the addition of calcium and certain vitamins it becomes an almost ideal food."

Henry Ford has always wanted to produce a "tin cow." He and his researchers have done a great deal "to popularize the soy bean; he practically lives on it himself. He drinks it and eats bread made from it, and with what is left over he produces buttons and insulators for his automobiles." Recently, at age 77, "to prove he was free of arthritis via soy beans, he showed me how he could jump over a table."

After lamenting the ways of "food faddists" (such as Mussolini [in Italy] and Hitler [in Germany]) he says that, in all his travels, he has never met a person who eats a strictly vegetarian diet. He states (incorrectly) that those who consume milk and eggs are not "true vegetarians."

Victor George Heiser, born in 1873, has long worked with the Rockefeller Foundation. Address: M.D.

1114. Primmer, George H. 1939. United States soybean industry. *Economic Geography* 15(2):205-11. April.

• ***Summary:*** Contents: Introduction. Recent phenomenal acreage increase. Soil relationships. Effect of slope. Climatic influences. Relation to pests and diseases. Use of soybeans for food and feed (coffee substitute, "cooked as a green

vegetable," "soy sprouts of about two inches receive praise as a winter vegetable," "Duluth confectionary counters display 'Salted Soys' alongside other exotic nuts," "Recipes for preparing soybean 'milk' circulate widely").

Note. This is the 3rd earliest English-language document seen (Jan. 2013) that contains the modern term "soy sprouts."

Industrial uses of soybean oil and residue: the regional industrial products in Urbana, Illinois

Figures show: (1) Bar chart of the world principal soybean producing countries in 1924-25, and in 1935-36. In 1936, Manchuria was by far the leader, followed by the USA, Chosen [Korea], Japan (whose production has decreased since 1925), and Netherland India [today's Indonesia].

(2) A map of the eastern half of the United States, with carefully located 50,000-acre dots showing areas of heaviest soybean production. Between 1934 and 1939, the area increased 5-fold in Mississippi and 21-fold in Minnesota. The area in Oklahoma decreased.

(3) A graph shows that the number of combines used to harvest soybeans in Illinois skyrocketed from 0 in 1924, to about 20 in 1925, to about 75 in 1926, to about 300 in 1927; by 1935 the number had increased to an estimated 3,000. (4) A photo shows a combine harvesting soybeans.

(5) A photo of a "Superior field of Indiana soybeans probably cultivated for the last time as plants shade most of the field's surface. Two-row corn cultivators or "beet cultivators may till four such soybean rows simultaneously.

(6) A graph shows soybean oil imports into the United states; these imports increased dramatically during World War I, peaking in 1918 [at 335.98 million lb].

(7) A map shows the location of soybean oil mills in the United States. There are large numbers in Illinois, Indiana, Ohio, Iowa, and North Carolina.

(8) A bar chart shows "Utilization of soybean oil processed in the United States" in 1934, 1935, and 1936. In 1934 the 30 million lb was used mostly by the drying oil industry. In 1935 the 140 million lb was used mostly for [lard] compounds and vegetable shortenings. In 1936 the 280 million lb was still used mostly for compounds and vegetable shortenings, but a significant amount was used for oleo, other edible, the drying oil industry, and soap.

(9) A photo shows a mill for removal of oil from Corn Belt soybeans; the processing plant serves an area tributary to Champaign, Illinois, and ships the oil to Chicago factory area.

"Soybeans provided some of the none-too-kindly remembered 'coffee' rations to Union Civil War soldiers. Sausage makers, at times, put up to 50 per cent soybean flour in part of their product."

Note: This is the earliest English-language document seen (Dec. 2012) that uses the term "Salted Soys" to refer to soynuts.

1115. *Detroit News.* 1939. Milk from soy beans. May 14. p. 1, cols. 6-1. Editorial.

• ***Summary:*** Milk and butter from soy beans are being made experimentally in Muskegon, Michigan. Neither product is for sale yet. Senator John Vanderwerp of Muskegon has introduced a bill in the Michigan Legislature. But the dairy industry appears to be alarmed and in same districts the Grange is opposing the measure on grounds that new competition could damage dairy interests. Their "argument is not convincing. Soy beans have proved a valuable asset to farming. This crop has the big advantage of yielding the ground more fertile after yielding tons of stuff that can be made into milk or butter or automobile steering wheels."

1116. Mihaeloff, S. 1939. L'utilité économique d'introduire et d'encourager la culture du soja en Égypte [The economic benefit of introducing and encouraging the culture of soybeans in Egypt]. *Egypte Contemporaine* (*L'*) 30(185):493-501. May. [2 ref. Fre]

• ***Summary:*** The soybean is one of the most ancient and important crops cultivated in East Asia. It is of interest both as a food and industrial crop. From it is made the famous liquid shoyu. Its flour is useful in making bread for diabetics, a vegetable milk can be made from the seeds, and its casein has many industrial applications. In France, Mr. J. Bordas, Director of the Agronomic Research Station at Avignon, has shown that it can play an important role in solving the current agronomic and economic difficulties in France. Various tables give the nutritional composition of soybean seeds from Egypt and France. The author then discusses soybean cultivation and production worldwide, including Algeria. Based on this information, the author believes that soybeans have a good chance of success in Egypt, and should be tested in lower (north) Egypt, with tests gradually moving toward upper (south) Egypt.

In addition to the role it can play as a human food, the soybean can also be used as a feed for animals (in the form of forage, defatted cake, or milk), and as a source of vegetable oil. The oil can be used as a solvent for rubber, in the production of dynamite or margarine, as a lubricant for automobile motors, and in making soaps. The soy protein (casein) can be used as a binder for lime in agriculture, to make industrial plastics, and as a substitute for gelatine in the manufacture of paper.

In short the soybean could play a very useful role in Egyptian national economy. Address: Doctor of Sciences (*Docteur ès-sciences*).

1117. El Molino Mills. 1939. Free! Be sure to ask at your health food store for leaflet–Diet–Soya flour as an admixture–reprint from "American Miller" (Ad). *Health News* (*Hollywood, California*) 7(12):7. June 23.

• ***Summary:*** "Do not miss this instructive article–it has information on Soya flour you cannot afford to miss! Soya

flour is used by all leading bakers in Soya bread–nutritious, healthful, non-acid, non-fattening. One fifth to one fourth El Molino Soya Flour can be used in baking bread, cake and cookies, also soya milk, soya cheese, and soya candy. Get your soya recipes at your health food store." Address: 5604 Valley Blvd., Los Angeles, California.

1118. Black, M.A. 1939. Soya beans. *New Zealand J. of Science and Technology* 21(1A):46a-60a. June. [23 ref]
• ***Summary:*** Contents: Introduction. Description. Chemical composition. Utilization: Human food, stock food, industrial uses (paint, soap, glue, plastics). Production: General, agriculture, effect of temperature on yield, vernalization, acclimatization, soils and manures, inoculation, seeding, cultivation, harvesting, storage, conclusion. Appendices: A. Soya-bean oil. B. Soya-bean varieties tested in New Zealand. C. Prices. D. Average analysis of soya beans grown in new Zealand.

"Summary: Under existing conditions the growing of soya beans in New Zealand cannot be recommended because–(1) The climate is generally unsuitable. (2) The potential market for human food is negligible. (3) There is no internal commercial market, and no possible export market in competition with the main soya-bean growing countries. (4) For stock feed other cheaper and more certain supplies of forage and concentrates are available."

"Widespread interest has been aroused from time to time in New Zealand by reports of the amazing variety of products derived from soya beans... As long ago as 1915 the Department of Agriculture conducted successful experiments on the growing of soya beans, but the crop has not found favour with New Zealand farmers... In Western countries the chief food use of soya-oil is in the manufacture of margarine... In New Zealand some 27,000 gallons of decoloured and deodorized oil are used annually by bakers for shortening, and for greasing baking tins. For the latter purpose it is of value because it does not change colour under baking temperatures... Curiously enough, there is a soya-milk factory in Denmark, a great dairying country. Note 1. This is the earliest English-language document seen (Aug. 2013) that contains the term "soya-milk."

Industrial uses: "The chief industrial uses of soya-bean oil are in paint, varnish, soaps, linoleum and oilcloth, and printing ink. In paints the essential disadvantage of soya-oil is that it is a poor-drying oil, especially in comparison with linseed, perilla, and tung oils. This drawback can to a large extent be overcome by the use of cobalt driers, which, however, considerably increase the cost of the paint. Promising blends are being obtained with blends of perilla and soya oil..."

Tables 5 and 7 shows the average and range in the number of days to maturity, and the yields (1935-1938) for 14 soybean varieties tested in three seasons, two at Palmerston North, three at Ruakura, in New Zealand. In table 7, they are listed in ascending order of days to maturity: Manitoba Brown (128 days), Wisconsin Black (128), Cayuga (133), St. Annes (141), Mandarin, Manchu, O.A.C. 211, Black Eyebrow, Early Yellow, A.K. (Harrow), Henry Ford (a selection of A.K. grown at Ford's estate in England), Black Ontario, Laredo, Virginia (186 days). For each variety is given the days to maturity (average and range), yield in bushels per acre (average and range), and number of trials.

Appendix B lists the following 34 soya-bean varieties tested in New Zealand: A.K., Auburn, Biloxi, Bilton, Black Beauty, Black Eyebrow, Black Ontario, Cayuga, Chernie, Dixie, Early Brown, Early Yellow, Harbinsoy, Herman, Hollybrook, Illini, Ito San Laredo, Mammoth Yellow, Manchu, Mandarin, Manitoba Brown, Mikado, Morse, O.A.C. 211, Ogemaw, Otoxi, Sable, St. Annes, Tashing, Tokio, Virginia, White Non-shatter, Wisconsin Black. Of these, 13 selections were sent by Mr. N.P. Neal of Wisconsin, as being likely to suit New Zealand conditions. Also four English acclimatized varieties, known as Jap, C, J, and O, have been grown.

Note 2. This is the earliest English-language document seen (Sept. 2006) that contains the term "soya-oil." Address: Agronomy Div., Plant Research Bureau, Dep. of Scientific and Industrial Research, New Zealand.

1119. Lovell, Philip M. 1939. Care of the body. *Los Angeles Times.* Aug. 20. p. H21-23. Sunday magazine.
• ***Summary:*** The section titled "Summer drinks" (p. 22) is identical to that titled "Beverages" in his column of 4 Feb. 1934. Address: N.D. [Naturopathic Doctor].

1120. Borth, Christy L. 1939. Pioneers of plenty: The story of chemurgy. Indianapolis, Indiana and New York: Bobbs-Merrill. 303 p. Portraits. 22 cm.
• ***Summary:*** Soy is discussed at length (usually in connection with Henry Ford Sr. and Edsel A. Ruddiman) on p. 22, 40, 42, 202-06, 208-11. Henry Ford is also discussed on p. 21-22, 30, 69, 76-77, 118, 144, 246.

"A few years ago, Henry Ford was ridiculed when he said the time would come when most of an automobile would be grown on the farm. Since then, Ford chemists have perfected processes whereby soy beans are converted into plastic substitutes for automobile parts formerly made of metal. Ford Chemist Russell Hudson McCarroll estimated that the use of plastics for interior window moldings alone would increase that company's use of farm-grown metal-substitutes twenty-five million pounds annually." (p. 21-22).

"Dearborn was selected as the [first chemurgic] conference site because it was the home of Henry Ford, an industrialist who had demonstrated his understanding of the meaning of the farm problem, and because there were, in near-by Edison Institute, working exhibits of the processing equipment which Ford researchers had developed to convert soy beans into some thirty industrial products." (p. 40).

At the chemurgic conference Russell Hudson McCarroll, a Ford chemist, described how soy beans are converted into raw materials for industrial use. "From the bean oil Ford chemists make a lacquer which is claimed to be superior to the pyroxylin paints usually used in coating metals. From the residue of meal after extraction of oil, Ford chemists make plastic parts for automobiles, these farm-derived parts being substitutes either for metals formerly mined or for rubber formerly imported." (p. 42).

Chapter 10, titled "Ford links farm and factory" (p. 200-12) is about Henry Ford, chemurgy, and soy beans. "Do you recall the gibes that greeted his [Henry Ford's] prediction that man would one day find a substitute for the cow, as revolutionary as the automobile which displaced the horse? It was very funny when the cartoonists and columnists leaped upon it gleefully–but it may not be so fantastic as it once seemed.

"Let's investigate it.

"Come now to the foot of Elm Street, in Dearborn, to a rejuvenated farmhouse whose homelike exterior masks a modern laboratory."

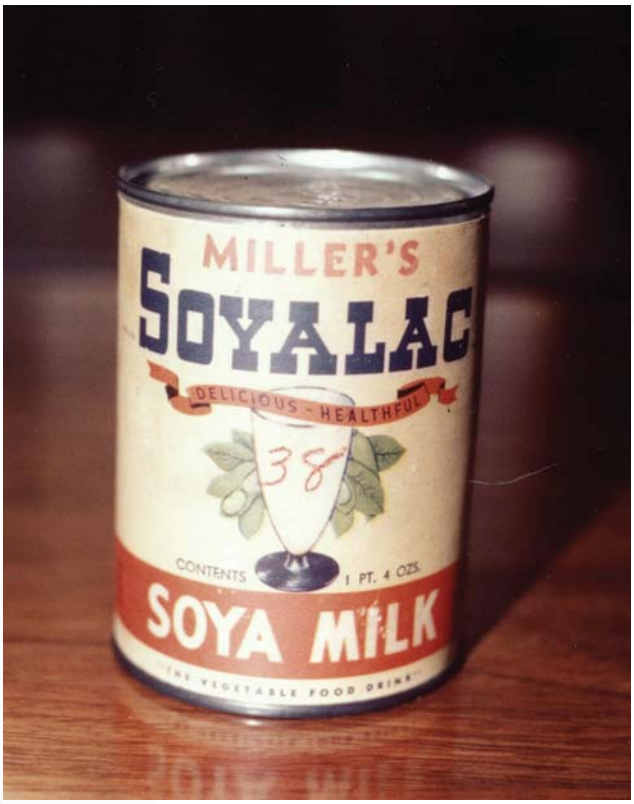
"Follow the truant chemurgists inside and meet Ford's boyhood companion, Dr. Edsel a. Ruddiman, the food-chemist whose services were enlisted by his old deskmate. In the back room, once a farm kitchen, is an electric refrigerator, filled with food made from soy beans. Milk, butter and cheese–the latter, fresh, dried, smoked and fermented–are there, soy-bean products all. In the pantry are breakfast foods, macaroni, salad oils, crackers, diabetic foods, infant foods, flour, bouillon cubes, soups, confections, coffee substitutes, sauces, gravies and beef substitutes–all produced from the soy" (p. 202-03).

A wonder bean indeed!" "During the World War [I], when Germany faced famine, German chemists extracted from the soy the glutamic acid which became the basis of the 'beef-tea' that kept patients alive in hospitals." The soy bean "gets into Heinz and Lea & Perrins' sauces and into oleomargarine" (p. 203).

A full-page photo (between pages 206 and 207) shows Irénée du Pont and Henry Ford talking and enjoying a meal together at a table.

1121. Fershan, Del. 1939. Health: Menus for September. *Nature's Path* (*New York City*). Sept. p. 334.
• ***Summary:*** Gives a menu for breakfast, lunch and dinner, each day of the week. Includes soy bean loaf, coffee substitute or soy milk, steamed soy beans.

1122. **Product Name:** Miller's Soya Lac (Canned Liquid Soymilk Fortified with Vitamins and Minerals). Renamed SoyaLac by 1941.
Manufacturer's Name: International Nutrition Laboratory.
Manufacturer's Address: 13246 Wooster Rd., Mt. Vernon, Ohio.
Date of Introduction: 1939. September.
Wt/Vol., Packaging, Price: Canned liquid.
How Stored: Shelf stable; refrigerate after opening.



New Product–Documentation: International Nutrition Laboratory. 1940? "Miller's Soy Bean Foods." Undated 12-page leaflet. 1. Miller's Soya Lac: A liquid milk packed in 13 oz. and 30 oz cans. It is available in both natural and chocolate flavors.

Ad in *Soybean Digest.* 1941. Sept. p. 17. "New items for the table: Soy products by Miller." "SOYALAC: Spray-dried Infant Food–the perfect formula for the new-born infant–especially fine for malnutrition and allergic conditions."

USDA War Food Administration, Food Distribution Administration. Grain Products Branch. 1943. Dec. "Soya products distribution." p. 5. International Nutrition Laboratory / Miller's Soya Foods makes SoyaLac, Chocolate SoyaLac. "Distribution scattered throughout the United States by Health Stores."

Ad in *Soybean Digest.* 1944. Sept. p. 61. "Meet the Vegetable Cow." International Nutrition Laboratory now makes (1) Miller's Soyalac (powdered milk), plain, malted, or chocolate; and (2) Miller's Soyalac (soya milk), liquid, natural, or chocolate.

Ad in *Soybean Digest.* 1949. Sept. p. 89. Photos shows cans of Miller's Soyalac Soya Milk (All Purpose and Malt Flavor) and Infant Food.

Soyfoods Center. 1980. Sept. Tofu shops and soy dairies in the West (2 pages, typeset). Gives the company's name

and address. Zip: 43050. Phone: 614-397-7077. Contact: Glen Blix & Charles D. Howes.

Shurtleff. 1981. Sept. Dr. Harry W. Miller: History of his work with soyfoods. Unpublished manuscript. "Dr. Miller's new plant at Mt. Vernon was completed in the fall of 1939 and the first products, canned liquid soymilk (made in a pressure cooker and fortified with vitamins and minerals) and malted soymilk (Soy-A-Malt) were available late that year. Pressure from the powerful U.S. dairy industry and the USDA convinced Miller not to call his product 'soymilk,' so he latinized the name to Soya Lac. This term was first used in late 1939 for Miller's first American soymilk; the spelling had been changed to the present one-word Soyalac by Sept. 1941. Powdered Soya Lac was first produced in 1940."

Shurtleff. 1981. Soyfoods. Winter. p. 31. "This liquid soymilk was generally considered to be better tasting and less prone to clog nipples than the various soy flour based products, although at least one series of tests showed it to have a significantly lower protein quality as measured by PER (Gyorgy 1962)."

Talk with Lillian Miller, wife of Clarence Miller, Dr. Miller's eldest son. 1994. March 28. The first soymilk Dr. Miller made in Ohio was a canned liquid soymilk for adults. He had to do additional detailed scientific experiments and get permission from the American Medical Association before he could start to make and sell an infant formula.

1123. **Product Name:** Soy Milk Compound (Renamed Soy Compound in 1981).
Manufacturer's Name: Roberts (F.G.) Health Food Products.
Manufacturer's Address: 40 Chapel St., St. Kilda (a beach-side suburb of Melbourne), Victoria, Australia.
Date of Introduction: 1939. September.
Ingredients: Incl. soybeans, lactose.
Wt/Vol., Packaging, Price: Tin-plated steel can.
New Product–Documentation: Ad in *Nature's Path to Health* (*Melbourne, Australia*). 1939. Sept. p. 27 and Oct. p. 13. "Soy Milk Compound. Contains natural lecithin and amino acids. This milk compound is a hormone building food and therefore can be used by children and adults with most beneficial results. Soy-Milk Compound is highly recommended for infant feeding. For those who cannot use cow's milk Soy-Milk Compound proves eminently satisfactory. Use Soy-Milk Compound daily either with hot or cold milk. Drink Soy-Milk Compound and strengthen the brain by Lecithin contained in this Defensive Food. Obtainable at all F.G. Roberts' Health Food Stores. Addresses, Page 47." Same ad in the following 1940 issues: Feb. p. 38, March p. 30, April p. 16.

Information brochure sent by Paul Smith of Soy Products of Australia. 1995. March 10. "Soy Products of Australia Pty. Ltd. evolved from F.G. Roberts' interest in using soy as an alternative to milk in treating allergy problems, particularly in children. The soy component of Soy Compound [soy flour] was imported between the 1930s and 1950s. Since 1954 Roberts' soy flours and grits have been manufactured in Australia from Australian grow soybeans... Soy Compound was formulated in the early 1930s as a result of F.G. Roberts' combined interest in the work of Dr. Harry Willis Miller with soy milk and children in China, during the 1920s and 1930s, and in treating cow's milk allergy problems–eczema, colic, mucus and related infection problems–particularly in children... Lactose is used in Soy Compound because it is a valuable, naturally occurring, complex carbohydrate present in the milks of all suckling mammals from human beings to whales and dolphins."

Note from Paul Smith of Soy Products of Australia (Pte.) Ltd. 1995. March 14. Paul thinks Soy Milk Compound was first introduced in about 1933-34.

1125. Bower, Frank W. 1939. Lecithin in soy bean milk. *Naturopath and Herald of Health* (*New York City*) 44(12):378, 384.
• ***Summary:*** Lecithin is a good source of phosphorus.

1126. Yang, E.F.; Dju, M.Y. 1939. The total and available iron in vegetable foods. *Chinese J. of Physiology* 14(4):479-87. Dec. [13 ref. Eng; chi]
• ***Summary:*** Fifty-six kinds of local foodstuffs are analyzed for their total and available iron contents. The name in English and in Chinese characters is given for each. Soybeans: Moisture 15.7%, total iron 8.5 mg/100 gm, ionizable iron 7.5 mg/100 gm. Percent of total iron ionizable: 88%.

Soybean curd [tofu]: Moisture 85.5%, total iron 6.9 mg/100 gm, ionizable iron 4.5 mg/100 gm. Percent of total iron ionizable: 65%.

Soybean curd cake [doufu-gan; firm tofu]: Moisture 65.5%, total iron 4.3 mg/100 gm, ionizable iron 2.85 mg/100 gm. Percent of total iron ionizable: 66%.

Soybean curd, fried [yu-doufu; fried tofu]: Moisture 55.5%, total iron 6.3 mg/100 gm, ionizable iron 4.6 mg/100 gm. Percent of total iron ionizable: 73%.

Soybean curd sheet [pai-yeh; pressed tofu sheets]: Moisture 45.2%, total iron 6.8 mg/100 gm, ionizable iron 3.6 mg/100 gm. Percent of total iron ionizable: 53%.

Soybean milk clot [yuba]: Moisture 4.9%, total iron 6.3 mg/100 gm, ionizable iron 2.5 mg/100 gm. Percent of total iron ionizable: 40%.

Soybean, sprouted [soybean sprouts]: Moisture 83.3%, total iron 8.3 mg/100 gm, ionizable iron 3.7 mg/100 gm. Percent of total iron ionizable: 45%.

Also discusses (p. 483): Cowpea pod, green. Flat bean, pod. Horse bean, dried. Horse bean, sprouted. Mung bean sprout. Mung bean starch sheet. Mung bean starch strip. Peanut. Address: Div. of Physiological Sciences, Henry Lester Inst. of Medical Research, Shanghai.

1128. Ni, T.G. 1939. Infant feeding in the Shanghai refugee camps. *J. of Clinical Medicine* (*Shanghai, China*) 4:178-82. [6 ref. Eng]
• ***Summary:*** Good results were obtained (on 3 infants) using a soybean milk powder containing egg yolk and other supplements, as developed by the late Dr. Eric Reid. Address: Div. of Physiological Sciences, Henry Lester Inst. of Medical Research, Shanghai.

1129. Univ. of Illinois, Dept. of Home Economics and Education. 1939. Ways of using soybeans as food. *HEE* No. 224. 12 p. Mimeographed. Revised in 1943 by E.C. Faulkner. 17 p.
Address: Urbana, Illinois.

1130. A handbook of Philippine agriculture. 1939. Manila, Philippines: College of Agriculture, University of the Philippines. vii + 803 p. No index. 18 cm.
• ***Summary:*** On the title page: "Issued in commemoration of the thirtieth Anniversary." The University of the Philippines was founded in 1908. The Foreword (by L.B. Uichanco, Dean, College of Agriculture) states that its College of Agriculture opened on 14 June 1909, at which time "scientific Philippine agriculture was virtually nonexistent." The idea for the book originated with the former dean of the College of Agriculture, Dr. B.M. Gonzalez, before he was appointed president of the University of the Philippines. Soybeans and soyfoods are discussed extensively.

"Coffee adulterants" (p. 104), commonly mixed with ground coffee, include roasted ground corn, soybean, peanut, mungo, cashew, and sometimes ipil-ipil (*Leucaena glauca*).

In Chapter 1, "Field crops" is a long section titled "Peanut, soybean, cowpea" (p. 132-43). Contents of "Culture of soybean" (p. 134-41): Varieties. Preparation of the land. Planting. Cultivation. Harvesting and threshing. Yield. Green and yellow seeds of Ami soybean. Soybean sprouts. How to prepare–Soybean coffee, soybean cake [dessert, with baking powder], soybean milk, "tao-si" (salted soybean [fermented black soybeans]; Method furnished by Superintendent of the Davao Penal Colony), "toyo" or soy sauce.

Note: This is the earliest document, and the earliest English-language document seen (Jan. 2012) that mentions fermented black soybeans from the Philippines, or that uses the term "tao-si" to refer to this type of salted, fermented soybean food.

The section titled "Method of preparing 'tao-si'" (p. 139-40) gives a full-page description of making tao-si on a small commercial scale–as follows: Wash dry soybean seeds and soak in clean water overnight. In the morning, remove the water. Transfer the soaked soybean seeds into a pot containing fresh clean water; boil until beans are soft. Remove boiled beans from the pot and place in shallow baskets to drain the excess water; allow them to cool. Dry beans in the shade for about one-half hour or one hour in the sun. For every 2½ petroleum cans of boiled soybeans, add 1-2 kg of wheat flour. Stir the mixture until beans are thoroughly coated with flour, then dust over about ½ kg of yellow fungus known as *Aspergillus oryzae;* thoroughly stir again. Cover open mouth of basket with a piece of abaca cloth or clean Manila paper and place in a dark room to allow the fungus to incubate. After 2-3 days the mixture will be thoroughly covered with a thick growth of yellow fungus and is now ready for salting. Transfer mixture into an earthen jar (*tapayan*), and to every 2½ petroleum cans of it, add 16 kg of native salt dissolved in two petroleum cans of water. Sun the jar for five days to facilitate curing, then move jar into a shed for further fermentation. "The 'tao-si' is ready for use after two months, but the longer it is left to cure, the better the quality becomes."

The two main kinds of insecticides in 1939 (p. 223-31) were stomach poisons (which kill when eaten; incl. lead arsenate, calcium arsenate, Paris green) and contact poisons (incl. concentrated tobacco decoction, as in Black Leaf "40").

"Diseases of beans and other legumes (p. 319+) include downy mildew of soybean and rust of soybean.

A table (p. 448) gives the content of five vitamins found in various feeds incl. soybean seeds, soybean leaves, soybean meal, peanut meal, and peanut seeds.

"Leguminous silage" includes that from cowpea, soybean, and mungo [mung bean] (*Phaseolus aureus*). Tables give: (1) The "Average digestible nutrients in feeds" incl. soybean (p. 459, 462).

(2) The "Nutritive value of foods" incl. seaweeds (ara-rosip, *Gracilaria crassa,* p. 534), mungo sprouts (p. 536), green soybeans (p. 537), seguidilla or kalamismis (*Psophocarpus tetragonolobus,* fresh and sun-dried seeds, p. 538), soy products (p. 538-39) incl. soy sauce (toyo, Superior {Senkee and Co.}, Commercial), soy milk–boiled, soy residue (sapal), soy residue after second drawing of toyo, soy curd (toqua [tofu]).

(3) "Foods as sources of minerals" (calcium, phosphorus, iron; p. 580-81), incl. miso or soybean mush, soybeans–baked flour, soybeans–baked sprouts, soy curd or toqua, soy sauce or toyo (four brands: Solo, Great Eastern, Violin, Rooster), tahuri or soybean curd preserved in strong brine solution (solid portion).

(4) "Foods as sources of vitamins" (p. 593-94) incl.

bean–asparagus or cigarillas (*Psophocarpus tetragonolobus*), bean–mungo (in pods or sprouts), bean–soy (dry, green, or leaves), peanut butter, seaweed, sesame (p. 601). Address: Manila, Philippines.

1131. Hou, Hsiang-ch'uan; Mar, P.G.; Ni, T.G.; Read, B.E. 1939. Nutritional studies in Shanghai. Chinese Medical Association. Special Report Series No. 12. 92 p. Published in 1941 by the Henry Lester Institute of Medical Research, Shanghai, China. No index. [10+ ref]

• ***Summary:*** A report upon the nutritional status of certain Shanghai groups 1937-39, dietary surveys and a study of the value of various food supplements. Two chapters, both written by H.C. Hou, discuss soymilk at length: II. "Nutritional supplements for refugee children" (p. 15-26), and IV. "Height weight measurements of refugee children given soybean milk" (p. 37-45).

Soybean milk with the addition of sugar and calcium was given to refugee children as a supplementary food. Altogether 1,028 children from 20 refugee camps had their weight and height measured monthly, up to a maximum of 8 months. Those children who received soybean milk generally had greater weight increases than those who did not receive it. Children over 1 year old who received soybean milk also showed a somewhat greater increase in height, although not so marked as the monthly increase in body weight. Address: Div. of Physiological Sciences, Henry Lester Inst. of Medical Research, Shanghai, China.

1132. Kloss, Jethro. 1939. Back to Eden: A book on herbal remedies for disease, and other natural methods of healing. 1st ed. [Washington, DC]: Published by the author. vii + 667 + [25] p. Illust. Portrait. Index. 21 cm.

• ***Summary:*** This treasury of herbal lore and vegan cookbook (it uses no dairy products or eggs, replacing them with soy products) is one of the most creative and original sources of early soyfoods recipes. Contents: Foreword. 1. Personal experiences. 2. Soil. 3. History of medicine. 4. Fresh air and exercise. 5. Fasting. 6. Effects of devitaminized, adulterated foods on the body. 7. Fruit diet. 8. Meat-eating. 9. Foods. 10. Diet. 11. Aluminum utensils. 12. Cooking under steam pressure. 13. Disease of animals. 14. History of water cure. 15. Water. 16. Water-effects and treatment. 17. Water-its effect in sickness. 18. Baths. 19. Compresses and fomentations. 20. Massage. 21. High enemas. 22. Nursing. 23. Fruits. 24. The eliminating diet. 25. Minerals found in the body. 26. Herbs. 27. Medical trees. 28. Tonics. 29. Herbs (Their description and use in treating disease). 30. Definitions of medicinal properties of herbs. 31. Herbs indicated for specific diseases. 32. Directions for use of non-poisonous herbs. 33. Treatment of disease. 34. Food preparations of various kinds. 35. Oranges. 36. Potatoes; gathering and preserving of herbs.

The Foreword states: "This book contains tried, safe, and inexpensive remedies for the prevention of disease and sickness, remedies which are the result of my own practical experience of nearly forty years." "No matter how many germs get into the body, if the blood stream is clean and the blood corpuscles are in a healthy condition, you will be safe. Everyone comes in contact with many kinds of germ, but these organisms will not harm you or cause you sickness and death unless they have a place in which to propagate themselves." Sickness and illness are "caused by violating the laws of nature and health. "If then they would resort to simple means and follow the basic laws of health that they have been neglecting–proper diet, use of pure water, fresh air, sunshine, rest, and nature's remedies, herbs, etc., nature would restore the body to its original health." "God has provided a remedy for every disease that might afflict us." "The fundamental principle of true healing consists of a return to natural habits of living."

Virtually all of the information on soybeans and soyfoods is in chapter 34, "Food Preparations of Various Kinds" (p. 582-633). First come two sections of text: "The nutritional value of the soybean" (p. 582-84; "Taken from an address delivered by Dr. J.A. LeClerc, before the annual meeting of the American Soybean Association. Sept. 15, 1936"). "Uses of the soybean for industrial purposes" (p. 585).

Then comes an introduction soy-related recipes (p. 585-87): "The knowledge of the value of the soybean here in America is one of the greatest things that was ever launched in the food line in the history of the nation, and at this time of great poverty [the Great Depression], want, and disease, it is the most important thing that could be given the people." "Soybean milk can be made from soybeans at home for less than two cents a quart." Soybean milk "is not only a good food, but a real medicine." It is easily digested and highly alkaline. "I have experimented with soybeans for fifteen years [since about 1924] and have produced a fine, acceptable soybean milk as well as many other soybean products." "I use soybeans in more than fifty dishes."

Then come recipes (p. 587+): Soybean cheese (fermented soybean milk, peanut butter, and tomato puree, p. 587). Soybean cream cheese (from fermented soybean milk, p. 588). Nut cheese no. 1 (fermented soybean milk, peanut butter, and soybean butter {see p. 613}, p. 588). Nut cheese no. 2 (raw peanut butter, ground oatmeal flour, water and salt [no soy], p. 589). Nut milk (made with raw peanut butter and cow's milk [no soy], p. 590). Canned soybeans (p. 592). Soybeans and rice (with sprouted soybeans). Baked beans with tomato sauce (incl. soybeans, p. 593; "Soybeans are, no doubt, the best of all beans, but the flavor is not as pleasant. This can be overcome by using various seasonings, such as tomato sauce, a little onion, and celery). Vegetable protein (wheat gluten seasoned with soy sauce, p. 597). Nut loaf (seasoned with soy sauce). Kloss' granola (with soybean milk and soybean mash [okara], p. 599). Baked rice (natural

brown rice baked in soybean milk, p. 600). Soybean coffee plus 2 recipes for Cereal coffee based on rye or wheat bran [real coffee with caffeine is not included]. Soybean broth (with soybean milk and oatmeal, p. 604-05). Oatmeal broth (with soybean milk). Soybean buttermilk (fermented, p. 605-06; "Buttermilk is an excellent article of diet for everyday use, but is especially beneficial in malnutrition, tuberculosis, toxic conditions, and intestinal infections. Soybean buttermilk has the advantage of producing an alkaline effect and is more nourishing than ordinary buttermilk. It is rich in minerals and very palatable. More nourishing than yogurt buttermilk used under various names."). Soybean cheese (fermented soybean milk, raw peanut butter, and tomato puree). Soybean cottage cheese (fermented soybean milk, p. 608). Soybeans and rice (with sprouted soybeans, p. 608-09). To sprout soybeans, lentils, or grains (p. 609). Soy patties (with soybean pulp [probably ground soybeans, not okara] and soy sauce). Gluten patties (seasoned with soy sauce, p. 610). Soybean loaf. Soybean cottage cheese loaf. Soybean milk. Soybean milk no. 2 (made from "soy meal, p. 611). How to curd [soybean] milk (p. 612). Soybean jelly (soybean milk jelled with agar-agar flakes and sweetened with malt sugar). Soybean butter (made with 1 cup water, 2 tablespoons soybean flour, and 2 cups soybean oil, p. 613). Soybean cream (blend rich soybean milk and soybean oil). Soybean ice cream (made with 2 quarts rich soybean milk, 2 lbs. malt sugar, ½ pint soybean butter or soybean mayonnaise, and 1 tbsp. agar-agar). The yolk of an egg (made with soybean flour, p. 614). Pancakes (with cornmeal and soybean mash [okara]). Tomato soup (with soybean flour, soybean flour, soymilk, and/or soy sauce, Savita, or Vegex, p. 618). Cream of tomato soup (with soybean milk, p. 620). Cream of celery soup. Cream of lentil soup. Vegetable oyster soup (with rich soy milk, p. 622). Eggplant soup (with soybean milk). Cream of spinach soup. Potato soup. Soybean gravy. French toast (made with soybean bread soaked in soybean milk, p. 624). Soy oil mayonnaise (with soy oil and finely ground soy flour, p. 628). Vanilla sauce (with soybean cream, p. 632). Vegetable gelatin (with agar-agar and soybean cream dressing, p. 632). Orange jelly (with soybean cream). Strawberry jelly (with soybean cream). Rice pudding (cooked in soy cream, p. 633). Cream tapioca (with soy cream and soybean milk). Soybean bread no. 1 (with whole wheat flour, soybean mash or soybean flour, p. 648). Soybean bread no. 2. Soybean buns or cinnamon rolls (with soybean meal, p. 650). Cornmeal gems (with soybean milk, p. 651). Oatmeal or soybean gems (with soybean meal). Soybean gems (with soybean mash [okara] out of which soybean milk has been washed, p. 652). Pones (with soybean milk). Beaten biscuit (with soybean milk). Unleavened pie crust (with soybean flour or mash, p. 655). Raised pie crust (p. 656). Soybean pumpkin pie (p. 656). Fig marmalade pie (with soybean milk, p. 657). Mashed potatoes (with rich soybean milk, p. 666).

This book does not call for the use of dairy milk or eggs. Concerning cow's milk, Kloss states (p. 75): "Cow's milk is not suited for human consumption. Half the invalids in the world suffer from dyspepsia, and milk should not be taken. Milk causes constipation, biliousness, coated tongue, headache, and these are the symptoms of intestinal auto-intoxication. Soybean milk and nut milks are excellent substitutes, and have practically the same analysis, and the danger of disease is removed." A recipe on page 614 uses a mixture of soybean flour and soya bean oil as a substitute for the yolk of an egg.

This book contains the same detailed information on the possible dangers of aluminum cooking utensils found in the 1935 edition.

Ads on unnumbered pages in the rear include: (1) Dominion Herbal College, Vancouver, BC, Canada. (2) "Horta" Pure Vegetable Extract. "Of strong aromatic meat flavor, though made from leguminous materials only." F. Behrend, Inc., New York, NY. Established 1886. (3) Old-fashioned Quaker mill. No. 4 Quaker City Mill. Ad: Enterprise No. 69, Hand Mill. A.W. Straub Co., Philadelphia, Pennsylvania. (4) Nature's Original Food Co., Falmouth, Virginia. "Nuts, grains, fruits and vegetables are Nature's original foods for men. Animal flesh has been substituted. If you want health, don't use it. "Try our [canned vegetarian] meats–see the difference." Meatose. Vegetose. To-Meta.

Note 1. This latter company was almost certainly founded and is owned by Jethro Kloss.

According to Doris Gardiner (Oct. 1990), the original book (of which she and her aunt each have copies) has a green hard cover. The first printing was probably done by a Mr. Brunck, who worked for the College Print Shop in Takoma Park, Maryland. She thinks Jethro self-published the book. He paid for the printing and sold the books himself. Jethro and his wife moved to Coalmont, Tennessee. There they lived with the Hiatt family, and Mr. Hyatt, owner of Longview Press (renamed The Message Press by 1964) became the book's first legitimate publisher. His wife died in 1944. Jethro died in 1946 at age 83. The page numbers from the 1939 edition are unchanged in later editions.

Note 2. This is the earliest English-language document seen (March 2007) that uses the term "Soybean cream cheese" to refer to soy cream cheese.

Note 3. This is the earliest English-language document seen (June 2013) that uses the term "soybean mash" to refer to okara. Address: Washington, DC.

1133. **Product Name:** [Vegelact (Dry Soy-Based Infant Formula)].
Foreign Name: Végélact: Lait Sec Végétal au Soja.
Manufacturer's Name: Laboratoires Boutroux (Les).
Manufacturer's Address: 30, Rue du Landy, Clichy (Seine), France.
Date of Introduction: 1939. January.

New Product–Documentation: *Bulletins de la Société de pédiatrie de Paris*, 1939, Volume 37, page 395 [published by: Société de pédiatrie de Paris, Masson].

Letter (e-mail) from Hervé Berbille of Paris, France. 2011. Oct. 25. The main problem with the soy milk as a food for infants was the absence of vitamins B-12 and D, which was probably found empirically.

"It seems that Végélact was the first commercial soy infant formula to appear in France, probably before Sojarine Natura. I found a document on Google Books attesting to its use in 1939 (enjoy this nice picture by the way, from 1954). This 1939 document (see citation above) says: "A la suite de troubles digestifs, il est mis au Végélact. A 5 mois, c'est, paraît-il, un très bel enfant."

"The first manufacturer was Les Laboratoires Boutroux, located in Clichy (or Paris, later or before?). This formula was similar to Sobee, but in my opinion, less well adapted than Sobee because with no added fats (olive oil) therefore insufficient in caloric intake for infants.

Note: The color ad for Végélact which Hervé found on the Web was dated (on the Web) as 1954, but no source was given.

1134. Matagrin, Am. 1939. Le soja et les industries du soja: Produits alimentaires, huile de soja, lécithine végétale, caséine végétale [Soya and soya industries: Food products, soy oil, vegetable lecithin, and vegetable casein]. Paris: Gauthier-Villars. x + 390 p. Illust. 18 cm. [300 ref. Fre]
• ***Summary:*** Contents: Introduction. 1. The agricultural, industrial, and commercial history of soya: Asiatic origins and propagation in Europe, soya in America (its cultivation and industries), soya in Europe, Asia, Africa, and Oceania (1936) (1. Admission of soya in the agriculture and industry of European nations (p. 35): Soya in France, soy industry and commerce in central and northern Europe {England, Germany, Holland, Denmark, Sweden, Poland, Austria and Hungary, Switzerland}, penetration of soya into southern Europe {Iberian peninsula, Italy, Balkan countries of Dalmatia, Istria, Yugoslavia, Greece (p. 47), Bulgaria, Romania, Ukraine}, the grandeur and decadence of soya in Russia. 2. Soya in modern Asia (p. 51): China and Manchuria, Japan, Korea, Formosa, French Indochina {Tonkin, Cambodia, Cochin China}, the British and Dutch Indies {Siam, Assam, Bengal, Burma, Ceylon, India, Straits Settlements [later Singapore] / Malacca}, western Asia {Turkestan, Persia (p. 57)}. 3. Soya in Africa and Australia (p. 57-58): South Africa, Rhodesia, Nigeria, Gold Coast [later Ghana], Cote d'Ivoire, Dahomey, Togo, Algeria, Tunisia, Morocco, Egypt, Australia {Queensland, New South Wales, Victoria}, Tasmania, New Zealand, not yet in British New Guinea [later Papua New Guinea], Philippines, Java).

2. The botany and agronomy of soya: The plant, its names, its botanical characteristics, its varieties (original and created by selection), the cultivation of soya.

3. The general chemistry of soya: Chemical composition of the plant, structure and chemical composition of the beans.

4. Using soya in soyfoods and soyfood products: Whole soybeans (whole green, dry, sprouted, roasted and salted {*soja á l'état vert, fève de soja sèche, fève grillée, fève salée de soja, fèves de soja salées*, p. 166-67}, soynut butter {*un mélange rappelant les beurres végétaux*}, soy coffee, soy confections {*confiture de soja*}, soy chocolate, soy sprouts {*fèves de soja germées, germes de fèves de soja*}), soymilk and tofu (*le lait et le fromage de soja;* soymilk cream, concentrated soymilk, soymilk powder / powdered soymilk, fermented soymilk {*lait fermenté, yoghurt, kéfir, koumys*, p. 189}, fermented tofu {*fromages de soja*}), okara (*pulpe résiduaire de la préparation du lait de soja*), fermented soy products (solid, paste, and liquid condiments; natto, miso, and shoyu [soy sauce]; kiu-tsee and lactic ferments), soy flour and bread.

5. The soy oil industry and products derived from it: Extraction and refining of soy oil, properties and use of soy oil.

6. The vegetable lecithin industry: Extraction of vegetable lecithin, properties and use of vegetable lecithin.

7. The vegetable casein industries and plastic materials based on soya: Soybean cakes and flours from which the oil has been removed, use of such cakes and flours, in the crude state, as a raw material for plastics, manufacture and use of vegetable protein, soybean cellulose for artificial silk, soya furfural and furfuraldehyde (phenolic resins). Conclusion: How to launch soya industries in France. Important terms. A bibliography appears at the end of each chapter.

Note 1. This is the earliest French-language document seen that uses the terms *Fève grillée, fève salée de soja,* or *fèves de soja salées,* "roasted soy beans" to refer to soynuts.

Note 2. This is the earliest French-language document seen (April 2005) that mentions soynut butter, which it calls *un mélange rappelant les beurres végétaux.*

Summary: Matagrin wrote two previous books: *Manuel du Savonnier* (Paris, no date given) and *L'Industrie des Produits chimiques et ses Travailleurs* (Paris, 1925).

Francis G. Beltzer, a practical chemist, became a major force in visualizing new industrial uses for the soybean in the West. By contrast, Li and Grandvoinnet (1912) paid little attention to soy oil in their book, devoting only 3 pages out of 150 to the subject, and only ½ page to industrial uses, while largely ignoring lecithin. These two books had a great influence on soy in France and they nicely complement each other (p. vi).

The Soybean, by Piper & Morse (1923), was published in both New York and London. Horvath was a Russo-American chemist. Italians who made important contributions to the soybean were professors Bottari, Mattei, Panatelli, and Tito Poggi (p. vii).

Leon Rouest, French the agronomist, wrote an important book titled *Le soja français et ses applications agricoles et industrielles* (Chateauroux 1936). Since 1920 he has devoted himself to the culture of soybeans and to the selection of acclimatized varieties. He was director of the Laboratory of Soja in the north Caucasus from 1930 to 1935, and in 1921 he had already published a book, *Le soja et son lait végétal.* His new (1936) book benefitted from the collaboration of Henry de Guerpel, an agricultural engineer and mayor of Percy-en-Auge, who was also an indefatigable prophet of soybeans in France, until his untimely death in Jan. 1937.

Anyone in the world can order (from the U.S. Government Printing Office in Washington, DC) the many U.S. publications about soybeans from the USDA or state agricultural experiment stations. These substantial works are based on careful research and enriched with numerous tables and photos–a fine example of the key role that governments can play in introducing and popularizing soya. Recently J.A. LeClerc (of USDA's Bureau of Chemistry and Soils) said the soybean has become a naturalized American (p. viii).

More than a century ago lord Byron wrote *Beppo,* the first Western poem on soy. It was an account of a carnival at Venice, Italy, in 1818. He advised the tourists to bring "Ketchup, Soy [sauce], Chili-vinegar."

Maurice Druel was one of the young engineers who worked with competence to launch a soy industry in France (p. x).

For an early chronology of soybeans and soyfoods in France (1856+, see pages 8-12). 1857-58: Lechaume planted soybeans at Vitry-sur-Seine and got encouraging results. A report by the National Society for Acclimatization declared: "The acclimatization of the soybean is complete."

1859–Setback for the first tests by Vilmorin with Chinese beans that were too late, but success by Dr. Turrel in le Var.

1862-69–Success of Mme. Delisse, in Gironde.

Then the Franco-Prussian war arrested these tests, so the center of interest moved to central Europe. The world exposition of Vienna in 1873 and Haberlandt. In his book one finds the first analyses of the seed by Steuf, of the cake by Woelker / Voelker, the results of texts by Berndt on oil extraction (p. 9).

Podolie is in the Ukraine.

Of Haberlandt's 148 trials in 1877, only 12 failed for lack of warmth. Much new agronomic information was accumulated.

Back in France: 1874-80–Society of Horticulture d'Etampes (Seine-et-Oise) grew a yellow Chinese variety which succeeded. This "soja d'Etampes" was studied intensively from the chemical and agronomic points of view by Lechartier and various authors. A doctor from the region prepared, for his personal use, a vegetable cheese (tofu). But the grain did not find buyers so its cultivation did not spread. There now remain only 2 or 3 innovators to cultivate soybeans and on 5-10 acres maximum. But Chinese soybeans mature in the region of Paris, as in 1879 at Marseille.

1880–While the tests of Boursier in l'Oise have succeeded. and while Olivier-Lecq, ardent propagator of soybeans, distributed 100 kg to farmers in the north, the national Society of Acclimatization organized cultural trials all over France. Results were obtained in each of the regions, some with record yields. The general objection of the farmers was the difficulty found in using the soybean as a legume (it was too hard) or to find buyers.

As Paillieux said so well: "Our point of departure has not been happy one; the soybean has been presented simply as a new legume" (p. 10).

The German successes in soybean cultivation were studied by Wein in 1881 (p. 10).

In the 1880s there was a big growth of interest in vegetarian diets in Europe. Compare this with the USA (p. 11).

Li Yu-ying: After his 1905 speech, in 1908, he created a laboratory for studies, which soon founded the factory La Caseo-Sojaine at Vallees, near Colombes (Seine), administered by a French-Chinese company. This establishment made soyfoods using imported soybeans, especially tofu (p. 12).

Dr. Bloch of France recommended thin sheets of pressed tofu as a reserve ration for troops.

Lever Bros. soap works used lots of soy oil in Britain (p. 12).

The British did some cultural trials in India, Burma, Siam (Thailand), and South Africa.

Japan, in effect, annexed Korea in 1895.

It was only after 1905 that soybean tests took place, first in Guyana, where the soybean matured easily.

Soybeans were grown for forage more in the South of USA than in the north. Continued. Address: France.

1135. Matagrin, Am. 1939. Le soja et les industries du soja: Produits alimentaires, huile de soja, lécithine végétale, caséine végétale [Soya and soya industries: Food products, soy oil, vegetable lecithin, and vegetable casein (Continued–Document part II]. Paris: Gauthier-Villars. x + 390 p. 18 cm. [300 ref. Fre]

• ***Summary:*** Continued. The agricultural experiment stations and the scientific labs have played an important role in the U.S., also the farm equipment manufacturers.

The experiment stations in many states have helped the farmers to clarify cultural questions which greatly influence yields, preparation of the soil, type and proportion of fertilizer use, dates and methods of planting, how many seeds per acre, choice of varieties according to the climate and soil, role of the soybean in mixed cultures and in crop rotation, etc.

In this book, Matagrin always says "fèves de soja."

1936 listing of soyfoods firms (p. 27): Fearn Soya Foods Co., Chicago, Illinois. Soybean Health Prods Co. Oakland, California (tofu). Soyex Co. Nutley, New Jersey. La Sierra Industries, Ontario, California (soymilk). American Lecithin Co., Atlanta, Georgia. Ten soy flour companies (p. 29).

American Lecithin Co. in 1936 was in Atlanta, Georgia. From when to when was it in Illinois?

Soy in France (p. 36): Prof. Beille of Bordeaux published a good work on soy but it is no longer available. Also the books of Prof. Jumelle of Marseille on colonial crops and vegetable oils. Prof. R. Lepine of Lyon in 1919 in *Revue Scientifique*, wrote about soy culture in Algeria and the preparation of soymilk.

Mr. Rouest perfected again the selections of yellow or green varieties that he had undertaken from 1907, with success. Using American seeds, others who experimented were Messrs. Brioux at Rouen, Carle of Carbonniere in le Tarn, and Semichon at Carcassonne; he likewise cultivated it at l'Aude from 1918. A list of 42 of Rouest's varieties (chosen from 2,000 others) were given in Rouest's book *Le Soja Francaise* showing that he was more qualified than anyone to write a book of this tile. He pursued his cultures and selections in France from 1921-30, in the Caucasus from 1930 to 1935, and thus fulfilled the efforts started by the Society for Acclimatization and its successors. He worked with another apostle, Henry de Guerpel, and agronomist and mayor of Percy-en-Auge (Calvados), who developed and perfected during 5 years the culture of the best varieties of soybeans in the regions surrounding his country house at Plainville, near Mézidon. He did not only collaborate on the book with Rouest, but also published interesting articles in several reviews in France and the colonies. Also Mr. Denaiffe of Carignan (Ardennes), author of the esteemed book *Les Haricots*, did important culture work and provided information.

Today production of soybeans in France is no more than several thousand hectoliters of beans = several 100,000 liters. For forage, the crop / culture has developed only in North Africa. It was encouraged by Rouest and de Guerpel.

Caseo Sojaine's products were excellent but expensive.

The products of Heudebert (probably diabetic products made with soyflour?), were well known in England as in France (p. 39).

Since 1913 the oil mills of Marseille, France, have started to use soy oil (mainly for hydrogenation) and those of the north (mainly for manufacture of soft soaps).

Recently the foundation (at Chateauroux) of a Society of Friends, Producers and Technicians of Soja has been announced by M. Druel.

In England the fine botanist J.L. North tested with success 13 Manchurian soybean seeds in 1913 and in the third harvest expanded these to 12,000 seeds, which he sent in 1917 to a farm at Uxbridge in Middlesex and to the Ogilvie Farm in Essex. There was a remarkable harvest in 1921, followed by good development of the enterprise. It advanced thanks to Piper and Morse's 1923 book *The Soybean* which to told of American successes. North succeeded in 1928 in getting 20-80 pods per stalk. In 1921 North's work drew the attention of the Ford establishment in Boreham which was not able to obtain good yields with American soybeans but succeeded with North's. Today England cultivates soybeans on about 15 hectares and yields are 1,400 to 2,500 liters per ha.

In England. Lever Bros. are big users of soy oil in soap. The main oil mills using soybeans are J. Bibby and Sons in Liverpool, three others in Hull, one in Erith and one refinery on the outskirts of London. Huge amounts of soy oil and meal are imported by a subsidiary of Lever Bros.

Germany: The recent agreement between Germany and Japan foreseeing an exchange of arms, explosives, etc. in exchange for soybeans which can furnish explosives (for nitroglycerine, naturally) is a barter / swap (of cannons for soybeans) analogous to that with Manchuria in 1934. What is certain is that the agents of I.G. Farbenindustrie A.G. under the patronage of the Economic Federation of Central Europe has been enforcing for 3 years soybeans culture in the Balkans which trade voluntarily with Germany.

Spain was rich in other oil sources (mainly olive oil). so not pay much attention to soy.

Italy: In 1918 a trial by Prof. Borzi, on a parcel of 2.5 acres at the Colonial Garden in Palerme / Palermo gave a yield of 20 liters/ha. In 1918-20 at the Institute Bonafous in Turin, a scientific research center, did research on yellow soybeans. Then trials were done in Liguria, Lombardia and Capo d'Istria, and Palerme about 1920s–a total of a dozen localities. Retaking in 1922 these tests of 1884 in Piedmont, Prof. Tito Poggi seeded 8 parcels in Monferrat, then helped to popularize soybeans in Italy. By the mid-1920s soy flour was widely used in baking. In March 1926 a "Bread for ammunition = pagnotto di munizione" containing 10% soy flour was heartily welcomed by the garrison in Rome. Already an official tasting by Mussolini (of the bread by him?) has been commented upon by the Italian press. The success of the campaign to promote use of wheat limited, after that, the outlets for soy in human foods, but the oil remained widely used by industry and the cake for production of milk.

Bulgaria and Rumania were influenced by the example of the Ukraine = Podolie?

The grandeur and decadence of soja in Russia: The book by L. Rouest, who was director of the Soy Laboratory in the North Caucasus from 1930 to 1935, brings together, but in a somewhat dispersed way, a very instructive documentation on soya in Russia. He described the grandeur and decadence. Soya was cultivated, it seems, since the victory of the Tcherkesses? (p. 48) and the incursions in east Turkestan, about 1860, then introduced into the Ukraine and Bessarabia, either from the Caucasus or from Hungary in the following years. Finally better known when the construction of the Transsiberian railroad connected (*conduisit*) Russia and Manchuria (1896-1900) But the soybean could not fail to interest the higher government officials. Before the universal success of the soybean after World War I, it was seen not only as an interior resource but also as an export crop. However in 1931, of the 5,970,000 ha in Russia used to grow oilseeds, less than 1,100 were used to grow soybeans versus 5.2 million used for sunflowers, 300,000 for castor oil, 140,000 for sesame, 30,000 for peanuts, and 350,000 for others such as rapeseed. But the industry began to demand soybeans. A large furniture factory in Oklanskaia made glues of vegetable proteins. The oil was studied for use in soaps and paints. The famine which menaced the working population because the moujiks [muzhiks, mujiks], resisted the exploitation of the lands into collectives, was able to be prevented or delayed by the progress in the culture of soybeans. Also the 5-year plan foresaw the extension of this crop onto 3-5 million ha with harvests of at least 1,500 kg per ha. To guide the farmers and perfect management techniques, specialists were recruited and concessions were granted to Germany in diverse regions. For how would the USSR itself have harvested the 1935 crop of about one million quintals = 100,000 MT. The number is enormous by comparison with the rest of Europe. (Did the Soviets see themselves as pioneers of a revolutionary new crop?)

Here, according to the agronomist Rouest, are the causes of the Russian setback. 1. Negligence and ignorance of the Russian peasant. 2. Disadvantages of the communist regime, 3. The general ideological method, always little reconcilable with the needs of the changes and hazards of agriculture (e.g., research to find varieties permitting the use of large harvesters). 4. Poorly chosen cultural methods. 5. Use of most of the harvest for food. The best literature concerns the moujik [muzhik, mujik] peasants, and one long study of 1911, of which we have a copy, written by a Russian doctor,... Sowed in the black earth of the Caucasus and the Ukraine, these soybeans, said Rouest, evidently saved the lives of thousands of people... We have been told that the Russians are disgusted at the compulsory use of soybeans, result of unskilled cooks...? Address: France.

1136. Matagrin, Am. 1939. Le soja et les industries du soja: Produits alimentaires, huile de soja, lécithine végétale, caséine végétale [Soya and soya industries: Food products, soy oil, vegetable lecithin, and vegetable casein (Continued–Document part III]. Paris: Gauthier-Villars. x + 390 p. 18 cm. [300 ref. Fre]

• ***Summary:*** Continued. Japan: The great oil mills of Kobe. In Japan, for cooking, sesame oil is preferred and for illumination rapeseed oil.

French Indochina: From 1931. It is estimated Tonkin cultivated about 12,000 ha of soybeans and harvested an average of 7,500 metric tons per year. The low yield of only 625 kg/ha, compared with a world average of 1,000, is explained by the fact that soybeans are generally cultivated with corn in a 1:1 mixture. Some soybeans are exported to Hong Kong. Since 1933 Paul Braemer, chief of agricultural services in Hong Kong, is exerting himself to propagate more this nutritious plant. Up till now the strong flavor of the soy protein deters colonials from using soy for food and soymilk. Made experimentally at the Maurice Museum, these have not attained but a relative success in the European colony. However the natives use many products. The village of Cu-da / Cuda 10 km from Hadong [in today's Vietnam] specializes in a type of soy sauce which cannot be made except from April to July, and which must be kept in sealed containers.

English and Dutch Indies: Today Prof. D. Kanga of Gujerat College of Ahmedabad, recommends warmly this economical and fortifying food. Soy is now used increasingly in industrial dining rooms and universities (he lists names). It is likely that India will acclimatize varieties rich in oil, develop extraction mills in its centers of industry, and deliver a large tonnage to the English soap makers.

Soybeans, propagated by the Russians, have long been grown on the plains of Turkestan [today's Afghanistan] and tests have been done in Persia [today's Iran] and the Soviet and Chinese republics of Central Asia northeast of there.

Soy in Africa: The French tried growing soybeans successfully in Dahomey and Togo. In North Africa trials have been taken more seriously since 1918 in Algeria, then in Tunisia and Morocco. In Tunisia, the tests which began in the late 19th century, are now growing. In Morocco lots of other beans are grown.

Australia is finally cultivating soybeans since the start of the century in the southeast, and today on all the east coast (Queensland, New South Wales and Victoria).

Soybean etymology: Low Countries = Sojaboon. Russia = Soia. Italy = Soia or (better) soja.

At the start of this century, when the German industry launched "Nitragine," a liquid culture of nitrogen fixing bacteria, there was much interest. The American practice, founded on the research of Norman Shaw (1910) and on the experience at the agricultural experiment stations at Michigan (1905), Wisconsin (1907, 1922). etc. consists of inoculating new soil with soil from former soybean fields.

Matagrin has a lengthy and excellent review of soybean agronomy. Also one of the best bibliographies; the most extensive of any European book to date on all aspects of soybeans and soyfoods.

The USA and the USSR were the first two countries to mechanize soybean planting and harvesting.

On the diseases and enemies of the soybean (p. 108): Earliest citation is 1919 from J. of Agricultural Research, and from the Nebraska Agricultural Experiment Station. Third is Wolf and Lehman 1920.

Most of the early studies on soybean diseases and enemies are analyzed in Morse (1927) "Soy Beans: Culture and Varieties." In the same publication is found a summary of U.S. work on insect enemies of soybeans established by H.R. Walton, Bureau of Etymology, Washington, DC.

The early research on the chemical composition of the soybean plant was to determine its value as forage. The key work in France was done by Lechartier and Joulie. The latter also studied the composition of the soybeans from Etampes, as did Giljaranski. and H.L. North.

The structure of the soybean cells was studied in France by Colin and Blondel (1888).

Matagrin has a strong historical dimension running through every chapter.

The median oil content from Asian soybeans is not more than 17%, while that of American soybeans attains 19%.

In about 1920, West and Levene developed the chemical formula and structure for animal lecithin.

The importance of soybeans as a protein source was not pointed out by researchers for 69 years, i.e., until the 1880s, and was not considered from an economic point of view until the World War I put into relief the problems of feeding populations and armies. Then interest and patents multiplied. For example, in 1910 the processes of S. Satow of Sendai, Japan for the precipitation of soymilk by a ferment or by sulfuric acid.

Most legumes contain only 1.6 to 2.9% oil, with the exception of peanuts which contain 45%. Soy contains 20%.

Concerning soy lecithin, From 1870 to 1910 W. Koch (1902), Fraenkel, (p. 152) not only verified the initial conclusions of Thudichum about this agent of nutritional assimilation. Koch showed in 1902 that this phosphatide was important.

At the start of the 20th century, soy pap was prescribed with success for diabetics in the hospitals of Algeria, as in Japan and Austria.

Page 158: Number of calories costing 15 centimes in 1938. Li Yu-ying had a similar chart but he omitted potatoes.

Potatoes: 80 grams give 224 calories
Soybeans: 40 grams give 188 calories
Rice: 50 grams give 180 calories
Bread: 45 grams give 145
Followed by 16 other foods.

Etymology: Matagrin (p. 160-61) says "fève de soja" and "soja à l'etat vert" (for green vegetable soybeans).

Miss Ellen Kingsley (p. 161) of the U.S. Bureau of Home Economics published many recipes using whole dry soybeans.

Durand (no citation) discussed cooking whole soybeans in water with sodium bicarbonate. This well-known process for all legumes leaves an unpleasant taste. So he recommended pressure cooking. Then he gives recipes for whole dry soybeans.

At whole dry soybeans, there is considerable discussion of their use in vegetarian diets. Was Matagrin a vegetarian?

Etymology: Matagrin (p. 166) says "la farine des fèves grilles" for roasted soy flour.

At the Iowa College of Agriculture, Nelson made a soynut butter as follows: Deep-fry soybeans in oil at 100-110ºC for about 5 minutes. Grind the soybeans finely. Then grill at 160ºF for about 20 minutes. Finally mixing these with some of the deep-frying oil.

Soy coffee is cafe without caffeine. Matagrin uses lots of information from Li Yu-ying; likewise information from Li appeared in countless later articles. Li was one of the two original sources; Paillieux was the second.

Is soymilk presently consumed more widely that animal milks in China? Not in Japan.

Carles (note spelling) was not a Frenchman who did work on soymilk.

Soymilk (p. 172): According to an article by Prof. R. Lepine of Lyon (1919), concerning a communication of Mlle. Castet of the Society of Horticulture of Alger (Algiers).

Rouest was director *du Laboratoire du Soja* in Russia's North Caucasus.

Castagnol (soymilk) in Bulletin of Indochina, uses a centrifuge.

Soymilk patents from France. G.D. Thevenot (1920-25), A. Serault (1931), M. Adler (1933).

Arao Itano (1918). Made soymilk from soy flour with

Bacillus inoculum. So it was fermented soymilk developed by a Japanese.

Etymology: *Fèves de soja entieres* = whole soybeans.

Li Yu-ying used cold extraction of soymilk, Chinese style.

Matagrin has an excellent review of all the various ways of making soymilk.

Muggia and Gasca (1921) made soymilk with a bland flavor in Italy.

1933 process for making soymilk in Russia by Bogatskij, Storozhuk and Morumtzev.

In raising animals, soymilk renders a great service. It is very wildly used now in USA and in Asia. but its use is limited by that fact that it is more economical to feed the animals the bean itself or the cake.

Adding lecithin to soymilk gives it a light flavor of butter.

Etymology: Matagrin unfortunately calls yuba *Crème de lait de soja* (Phu-chuc of Indochina) [dried yuba sticks]. According to an analysis by a pharmacist, Monnier, of the Pasteur Institute of Hanoi, it contains 64.62% oils, 8.98% Nitrogen. It is often prepared with fish bladders or minced meat.

Just. Hatmaker (p. 190) made powdered soymilk, as did three other processes, including a spray process of Bevenot and Neveu. This process was also widely used in English soap factories. Matagrin gives 3 analyses of powdered soymilk, the earliest from Li Yu-ying.

Pages 192-93: Discusses soy yogurt (*Yoghourt au lait de soja*), soy kefir (*Kéfir au lait de soja*), and soy koumis / koumiss (*koumys*).

Matagrin gives detailed descriptions of many methods of making tofu and 9 pages of information (p. 194-202)

Bloch said the best coagulant is magnesium chloride. Beltzer preferred acids to calcium salts.

Ellen J. Kingsley (1935) of the USDA gives a method for making tofu.

Drs. Labbé (Labbe) and Marchoisne have shown that vegetable albumines, despite current opinion, are very assimilable.

Matagrin gives a number of nice tofu recipes including French-style tofu in Petits-fours (fancy biscuits; p. 201) and Tofu meringue. Address: France.

1137. Tabanera, Juan Antonio. 1939. Estudio de un nuevo elemento alimenticio: la “soja” o “soya” [Study of a new food element: The “soja” or “soya”]. Cordoba, Argentina: Impr. de E. Spinelli. 49 p. 23 x 16 cm. [18 ref. Spa]

• ***Summary:*** Reprinted from *La Semana Médica*, no 49, 50, and 51 (1938). The soybean: Introduction and brief history (incl. Emperor Shen Nung and the *Ben Tsao Gang Mu*), uses in the human diet of the whole soybeans (*el poroto de “soya”*), soy oil, flour, grits, and soymilk. The soybean in Argentina. Soybeans and their flour: composition and energetic value (calories). Soy flour (*harina de soya*). The carbohydrates in soy flour (Von Noorden, Soyama). Other components of soy flour (protein, lecithin, vitamins, acid vs. base reaction). Various types of soy flour. Advantages of using the soybean and its derivatives (protein, lecithin, vitamins). The inclusion of soy flour in the diet / food (*alimentación*) of the healthy person.

Study of a new food element: The “soja” or “soya.” Soya and gastroenterology: The stomach (incl. gastric and duodenal ulcers).

Concerning the soybean in Argentina (p. 7): In the year 1908 studies of acclimatization and experimental cultivation were initiated in Cordoba province, Argentina. Later, some bulletins were published by the country’s Ministry of Agriculture. The zone of cultivation was extended and today the soybean has an outstanding place in the Gobernacion of Misiones and provinces such as Santa Fe and Buenos Aires. Today the crop is being developed, and the ease of harvesting the seed, so that it is as easy as wheat. Among the countries of the Americas, the United States is the leader in soybean production and commercialization. More than 70 firms are dedicated exclusively to the commercial development of the soybean. Brazil and Chile are also developing the crop.

A full-page table (p. 11) shows the nutritional composition of many basic foodstuffs and sources of protein; the superiority of soy flour is emphasized. Address: Dr. of Gastroenterology (Médico Gastroenterólogo).

1138. **Product Name:** Kevo (Soy chocolate).
Manufacturer’s Name: Kevo Co.
Manufacturer’s Address: Azusa, Calif. Later: 847 Arcade Annex., Los Angeles, California.
Date of Introduction: 1940. January.
Ingredients: Jan. 1940: Whole soy bean, germ of whole wheat, fruit, dextrose, powdered milk (with fat removed), barley malt, Special deep sea kelp, mint, spinach, carrots, celery, rhubarb, W.H.Y. blended flavoring. phosphorus, iron, copper, iodine.
How Stored: Shelf stable.
New Product–Documentation: Display ad (2¼ by 3 inches) in *Nature’s Path* (USA). 1940. Jan. p. 26. “Drink Kevo. ‘Puts pep in your step.’ Made in a jiffy! Delicious energy food-drink.” “Are you always tired? Do you feel ‘draggy’? If you need more pep and energy, start drinking Kevo... the new double energy food-drink–has a delicious *chocolate-like* flavor yet contains no chocolate. Kevo is made in a jiffy [by mixing] with either milk or water. It’s delicious hot or cold. Children and adults all like Kevo.” Ingredients are listed. “On sale at your Health Food store, or send dime for postage and packing on Large Free Sample.” Small illustrations show a cup of hot Kevo and a tall glass of cold Kevo with a straw. A similar ad also appeared in the Nov. 1940 issue (p. 431). It contains: Whole soy bean, germ of whole wheat, fruit dextrose, powdered skimmed milk, barley

malt, deep sea kelp, rhubarb, mint leaves, celery, carrots, and W.H.Y. flavoring. Also in the July 1941 issue (p. 373).

USDA Bureau of Plant Industry. Div. of Forage Crops and Diseases. 1942. Firms manufacturing or handling soybean food products. p. 1. This company is listed as making or handling soy "chocolate and other beverages."

Ad in *Let's Live.* 1945. Sept. p. 19. "Have you tasted the new formula? Kevo has amazing flavor–Gives more pep." Ingredients: Whole soy bean, germ of whole wheat, dextrose, soy bean milk, deep sea kelp, mint leaves, rhubarb plant, spinach, carrot, celery, W.H.Y. Blended flavoring, Special calcium, phosphorus, iron, copper, iodine.

1139. Lager, Mildred. 1940. Healthful philosophy. *House of Better Living* (*Newsletter, Los Angeles*) 11(49):2. Jan.
• ***Summary:*** New items include "Canned Soy Cheese. Soyburger. Full line of Madison Foods."

"We carry liquefiers at four different prices: $29.95, $19.95, $14.95 and "13.95." Contains a recipe for Carrot soy milk. Ingredients: 1 cup carrot juice, add 1 tbsp. soy flour or milk powder, 1 tsp honey or plain Joyana.

"Liquefied foods have become popular with the new electric mixers. They are fine and a boon to the person with poor assimilation and digestion..." A number of combinations are given, all starting with fruit juice. "Soy flour or soy milk powder may be added to juice or broth for soy milk drinks." A portrait photo shows Mildred Lager.

Note 1. A section titled "Soyburgers" on p. 4 explains that the Soyburger and Canned Soy Cheese mentioned above are both made by Madison Foods of Tennessee. Separately, soy chocolate is mentioned.

Note 2. A small ad on p. 3 is for waffles: Soy wheat-wheat germ. Soy corn (contains no wheat). Address: 1207 West Sixth St., Los Angeles, California. Phone: MUtual 2085.

1140. Macheboeuf, Michel; Reiss, Charlotte. 1940. Documentation sur les graines de soja et leur utilisation pour l'alimentation de l'homme et des animaux, suivie de quelques considerations sur l'importance industrielle du soja [Documentation on soybeans and their utilization as a food for humans and animals, according to some considerations of the industrial importance of soya]. Paris: Ministère de l'Education Nationale, Centre National de la Recherche Scientifique, Section de la Recherche Appliquée. 48 p. Unpublished typescript. Jan. 30 cm. [200+ ref. Fre]
• ***Summary:*** Contents: Introduction. Chemical composition of soybean seeds: Proteins, nutritional value of the proteins, lipids, phosphatides, sugars, sterols, enzymes, minerals, vitamins. Soy flour. Soybean cake. The role of soya as a food. Some physiological effects of soya. Feed for cattle. Feed for pigs. Feed for sheep. Feed for birds. Experiments on animal feeding. General considerations on the feeding value of soya for animals. The soybean as human food. Various culinary preparations based on soya: Soy sauce, fermented soy beverages, soy sprouts, tofu, soymilk, soy bread or soy and wheat bread, soy oils and hydrogenated soy oil products, soy coffee, summary. Brief survey of industrial utilization of soybeans: Oil for preserving fish, cake for fertilizer, oil for foundry use, lubricants, plastics incl. sojalithe, other uses of soy proteins, glue, paint emulsions, artificial textiles, paints and varnishes, interior enamel, soaps, petroleum substitutes, explosives. Note: The extensive bibliography is full of errors. Address: 13, Quai d'Orsay, Paris (7eme), France. Phone: Invalides: 45-95 & 45-96.

1141. **Product Name:** Soya Choc-Malt (Later Renamed Soya-Choc).
Manufacturer's Name: Roberts (F.G.) Health Food Products.
Manufacturer's Address: 40 Chapel St., St. Kilda (a beach-side suburb of Melbourne), Victoria, Australia.
Date of Introduction: 1940. January.
Ingredients: Incl. water, soybeans.
Wt/Vol., Packaging, Price: Tin-plated steel can.
New Product–Documentation: Ad in *Nature's Path to Health* (*Melbourne, Australia*). 1940. Jan. p. 46. "Fresh from the Factory Soya Choc-Malt comes to you charged with Phosphorus, Calcium, Magnesium, Potassium, Iron. No better Food Drink has yet been made. Give it to your children and use it in the sick room and on your breakfast table regularly. Made from carefully selected ingredients this new Food Drink may be used by all persons of every age and position in life. Purchase your supplies at the Roberts Health Food Shops. Branches in every state." This same ad was published during 1940 in the following issues: Feb. p. 32, May p. 40, June p. 40.

1142. **Product Name:** Joyana (Vitamin-Fortified Soymilk-Based Powder) [Plain, or Chocolate].
Manufacturer's Name: Tam Products, Inc. Later renamed American Dietaids.
Manufacturer's Address: 260 West St., New York City. Then Yonkers, New York.
Date of Introduction: 1940. January.
Wt/Vol., Packaging, Price: 10 oz can sells for $0.49, 5 oz can for $0.29.
How Stored: Shelf stable.
New Product–Documentation: Display ad (4½ by 3 inches) in *Nature's Path* (USA). 1940. Jan. p. 34. "Suffering from high blood pressure, arthritis, sinus, anemia?" "In all these conditions it is important to get enough proteins, all 5 vitamins, and iron, calcium, and other minerals. Joyana is just what you need. Abundant in vitamins and minerals. Made with soy bean, which is richer in protein than any food except white of egg." Drink Joyana in milk 3 times a day. "At all health food stores."

Talk with Jack Schwartz. 1988. Sept. 25. One product

he recalls that was soy-based is Joyana. It was made by Tam Products. Tam was a laxative. The company was founded by George Spitzer, located in Manhattan, then Yonkers, New York. Spitzer later became wealthy with the invention of the aerosol can. Jack thinks the product was introduced in about 1939. Frank Murray. 1984. Only One Slingshot. p. 32. "Joyana, plain and chocolate flavored soy milk product." p. 53. "a vitamin-fortified chocolate and vanilla powder to be added to milk."

1143. McRostie, G.P.; Laughland, J. 1940. Soybeans in Ontario. *Ontario Department of Agriculture, Bulletin* No. 407. 12 p. Feb.

• ***Summary:*** Contents: Introduction. The plant. Uses: Hay, seed, straw, soybean meal, soiling crop, ensilage, soil improvement, soybean oil, other products. Feeding value. Climatic adaptation. Place in rotation. Culture: Soil, preparation of seed bed, manure and fertilizers, seed selection, inoculation, dates of seeding, methods and rates of seeding, depth of seeding, seasonal care, harvesting for hay or seed, threshing, storing. Varieties. Description of varieties: Manitoba Brown (Brown, Ogemaw), Kabott (From Mr. R.R. Kabalkin in Manchuria), Mandarin, Cayuga, Minsoy, Hudson Heights (Hudson; a selection by T.B. Macaulay of Hudson Heights, Quebec), O.A.C. No. 211 (selected from the Habaro variety), Goldsoy, Quebec No. 92, Manchu, Illini. Soybeans in mixtures (with grains and grasses). Enemies of the soybean.

Concerning other food products (p. 3): "Soybean flour, which is made into bread, cakes and muffins, due to its very low percentage of starch, is of especial value as a diabetic food. Soybean milk, curd [tofu] and breakfast foods are products of this bean. Lecithin, a complex fatty material containing phosphorus and nitrogen, is also obtained from the soybean and is used in candy making. Green soybeans (probably green vegetable soybeans), dried beans and bean sprouts are used in many ways for the table."

Concerning varieties (p. 9): "Both Manitoba Brown and Brown are varieties which have been selected from Ogemaw which was introduced by E.E. Evans, West Branch, Michigan, 1902, as a supposed cross between Early Black and Dwarf Brown varieties. The Manitoba Brown is an early selection made at the University of Manitoba. All three are similar in appearance and may be described as follows: seed colour brown, medium to large in size, hilum chocolate; plant short, erect, bushy; flower purple. They are very early varieties suitable for seed and may be successfully grown in northern districts."

Concerning enemies (p. 12): "In Japan, according to reports, there are many destructive diseases which attack the soybean. In the United States, no pest has assumed any great economic importance, but there have been some losses due to rabbits, woodchucks, root rot, cowpea wilt and caterpillars. Forty-three years of experiments at the Ontario Agricultural College have shown little loss due to fungus and bacterial diseases, but some parts of Ontario have reported that groundhogs show a preference for this crop. This comparative freedom from plant enemies is a favourable factor in promotion of soybean culture in Ontario."

Note: This is the earliest document seen (Sept. 2004) that mentions the soybean variety Kabott. Address: 1. PhD, Prof. and Head of Dep.; 2. B.S.A., Extension specialist. Both: Dep. of Field Husbandry, Ontario Agricultural College, Guelph, Ontario, Canada.

1144. *South China Morning Post* (*Hong Kong*). 1940. Soya bean milk factory opened: War on malnutrition and T.B. March 10. [Eng]

• ***Summary:*** The article begins: "'What is wanted in the colony today is a source of supply of nutritious food which is cheap enough to be within the reach of the masses; and if we can meet a part of this urgent need, one of our main objectives will have been achieved,' said Mr. K.S. Lo, Managing Director of the newly-established Hong Kong Soya-bean Products Company, Limited, at the inaugural ceremony of the company's factory at Causeway Bay [on George Street, in Hong Kong] yesterday afternoon. Turning on a switch which set the factory in operation, the Hon. Mr. M.K. Lo officially declared the factory in open in the presence of a large gathering.

"Among those present were the Hon. Dr. P.S. Selwyn-Clarke, Director of Medical Services, and Mrs. Selwyn-Clarke, Dr. F.I. Tseung, Dr. J.E. Dovey, Dr. T.C. Li, the Hon. Mr. and Mrs. W.N. Tam. The guests were conducted over the works by Mr. K.S. Lo and Mr. Y.C. Kwan.

"Welcoming the guests, Mr. K.S. Lo said: 'To most of us, the soya bean needs no introduction. We come in contact with it every day in one form or another. It is the first thing that greets us on our breakfast table in the form of soy sauce, and to many Chinese it is also the last dish served on the dinner table in the form of a hot delicious soup. Its food value, long recognized by our fore-fathers, has been verified by chemists in modern laboratories. What is new here this afternoon is not Soya Bean, but the birth of our pet baby "Vita." And although "Vita" comes from the age-old soya bean family, she is as modern as our lass of 1940.

"'Vita is nursed and brought up in a hygienic home, scrupulously attended by its expert doctor, Mr. H.L. Hoover and a string of white-uniformed nurses. It is dressed up in modern romper with a hood as white as that of Snow White's. To make doubly sure that it will turn out to be a strong and healthy thing, we are feeding it with calcium, cod-liver oil and all the vitamins.

"'As "Vita" grows up, it will be followed by Vita butter, Vita cream, Vita biscuits, and Vita ice-cream.'" Some of the equipment from the United States for the factory has not yet arrived.

"'The present Director of Medical Services has set

a new mile-stone in social progress in the Colony by his determined campaign against malnutrition and tuberculosis. The better-off community are well supplied with the best milk obtainable. It remains for us to look after the needs of the less fortunate, among whom are thousands of school children and wage-earners.'" Mr. M.K. Lo then gave a speech about the importance of good nutrition, and of an adequate intake of the "'protective foods' containing vitamins and mineral salts... Their absence has especially deleterious effects upon children and nursing and pregnant mothers.'"

Dr. Selwyn-Clarke, as Director of Medical Services, is making an energetic attack on tuberculosis and malnutrition, especially among the poor in the Colony. "'It seems to me that any concern which could produce, under approved hygienic conditions, soya bean milk in such quantity as to be available to the poorer section of the community, and at such low prices as to be within their means, would be rendering a public service to the Colony. I understand that the Hong Kong Soya Bean Products Company seeks to fill this role. It has imported the latest machinery and will produce soya bean milk cheaply and under hygienic conditions. I wish the promoters and the Company all prosperity and success.'"

Note 1. According to Vitasoy's 50th anniversary history (1990, p. 102), the English-language name of the company's first product was "Vita Milk." The name was changed on 11 June 1940 to "Sunspot."

Note 2. This is the earliest document seen (Aug. 2013) concerning Vitasoy (named Hong Kong Soya Bean Products Co. Ltd. before 24 Sept. 1990).

1145. De Weese, C.W. 1940. The "vegetable cow." *National Food Distributors' Journal* 14(4):5-6. March. Reprinted in Madison Health Messenger (Madison, Tennessee) 2(3):1-3 (1940).

• ***Summary:*** "Suppose there were suddenly to occur a complete disappearance of all meats, milk, eggs, cheese, potatoes, wheat, and grains. Suppose further, that we were deprived of every other food known, with the exception of one vegetable. What single vegetable would you choose to live on if such an even should happen?"

The author would choose the Soy Bean. The people in the land where it originated call it the "Vegetable Cow." He discusses industrial uses of soybeans (plastics, paint, etc.), soy bean flour, "roasted soy bean nuts," and the many important nutrients found in soy beans.

Note: This is the earliest English-language document seen (Dec. 2012) that uses the term "soy bean nuts" or "roasted soy bean nuts" to refer to soynuts.

"Alkaline preparations are used daily by millions; perhaps they are necessary as we certainly are a nation of excess acid human beings. Most of the foods we eat form acid in the digestive process. Therefore, the alkalinity of the Soy Bean is good news and particularly so because when properly cooked they are delicious to eat in many different ways. Apparently they provide a diet that is adequate and well balanced."

"In Washington, DC, a milk route has been established for Soy Bean milk. Soyburgers have made their appearance. Pancake flour, cereals, cheese, substitute for egg whites, flour for baking, ground meal, coffee, baked and boiled beans, and many other foods can now be had or are in the process of going on the market."

1146. **Product Name:** [Vita Milk (Soymilk Fortified with Calcium, Cod-Liver Oil, and Vitamins. Renamed Sunspot in June 1940. Renamed Vitasoy in 1953)].
Foreign Name: Wai-ta-nai.
Manufacturer's Name: Hong Kong Soya Bean Products Co. Ltd.
Manufacturer's Address: Great George St., Causeway Bay, Hong Kong.
Date of Introduction: 1940. March.
Ingredients: Water, soybeans, water, sugar, calcium, cod-liver oil, vitamins. By 1967: Soya, oil, calcium, vitamins.
Wt/Vol., Packaging, Price: Wide-mouth half-pint glass bottles, sealed with a cap and hood. HK$0.06.
How Stored: Refrigerated.
New Product–Documentation: South China Morning Post (Hong Kong). 1940. March 10. "Soya bean milk factory opened: War on malnutrition and T.B." Mr. K.S. Lo is Managing Director of the newly-established Hong Kong Soya Bean Products Company, Ltd. [HKSBPCL], which has a factory at Causeway Bay, Hong Kong. The name of the company's soya bean milk is "Vita." It is enriched with calcium, cod-liver oil, and vitamins. Note: This is the earliest known commercial soy product (with a brand name) made in Hong Kong.

K.S. Lo. 1947. *Soybean Digest*. April. p. 8, 10. "... I am the founder of Hong Kong Soybean Products Co. Ltd., which engages in the production of fresh soybean milk for local distribution. It was established in 1940 and just before the outbreak of the Pacific war [Dec. 1941], our 'Sunspot Soya Milk' had daily sales of 13,000 to 15,000 one-half pint bottles of milk."

K.S. Lo. 1982. History of Vitasoy. p. 1, 5; Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 99-100, 130-53.

Talk with K.S. Lo. 1989. Oct. 6. The product's original name was Vitamilk, until one of the company's competitors wrote the Urban Council to complain that the term "milk" should not be used in the name of a product which was not of dairy origin. After a long debate and fight with them, they allowed HKSBPCL to retain the Chinese name Wai-ta-nai, but not the English name Vitamilk. So in 1940 Mr. Lo decided to change the product's English name from Vitamilk to Sunspot, because the company was bottling Greenspot. Sunspot was a temporary name, that was changed to Vitasoy

in 1953.

Letter from K.S. Lo. 1989. Nov. 3. Gives details on the Chinese name (registered in 1940), changes in the English name, and the use of the trademark Sunspot from 1940 to 1953. Mr. Lo never liked the term Sunspot.

Choi. 1990. *Hou sheng yü ch'uang yeh: Wei t'a nai 50 nien* (*1940 chih 1990*) [*Enriching life and creating business: Fifty years of Vitasoy* (*1940-1990*)]. See pages 18, 19, and 102 for changes in the early name of this product.

1147. DeWeese, C.W. 1940. The "vegetable cow." *Madison Health Messenger* (*Madison, Tennessee*) 2(3B):1-3. Undated.
• ***Summary:*** Reprint of an article with the same author and title published in March 1940 in the *National Food Distributors' Journal* 14(4):5-6. Note: The author's name was spelled "De Weese" in the original article.

1148. Lager, Mildred. 1940. Summer foods for health. *Madison Health Messenger* (*Madison, Tennessee*) 2(3B):1-4. Undated.
• ***Summary:*** A large photo shows Miss Lager, next to a KFAC microphone. For 6½ years she has been broadcasting over the radio four times a week on station KFAC is Los Angeles. "She is the founder of the House of Better Living, and a tireless worker for better living. Her weekly free classes draw hundreds of people for instruction in healthful cookery and healthful living."

She writes that now is a good time "to cut down on rich foods and the acid-forming foods, using instead the alkaline-forming foods and the bulk foods for the natural eliminative effects... With a liberal intake of the alkaline-forming foods, one may be assured of the natural alkalizers which neutralize body acids and in this way assist in the protection of health... Acid wastes produce fatigue; alkaline-forming foods neutralize the acid wastes to restore the normal body tone and stamina.

"The summer diet must necessarily contain adequate complete proteins, for protein foods are necessary for cell repair and growth... A lack of protein may cause retarded growth, lack of vigor, and poor appetite... The vegetable proteins are nuts, soy beans, legumes, and in general they are found in all vegetables. The proteins of nuts and soy beans are classed as complete proteins and are therefore especially desirable. The animal proteins are acid-forming, whereas the vegetable proteins are alkaline-forming. Animal proteins are also more putrefactive than vegetable proteins. The soy bean and nuts can be used in a great many tasty ways."

Among the many recipes for summer the following include soyfoods: Cocktails–Soy milk and carrot ("Soy milk is a fine, alkaline, soft food. Excellent for those with sore conditions of the digestive tube)." Protein salads–Soy bean salad. Soy cheese [tofu] tomato salad. Mock shrimp salad (with Zoyburger). Entrees–Soy cheese cutlets. Zoyburger and mushroom sauce. Mock turkey legs (with Vigorost as the main ingredient). Broiled Vigorost with ripe olive sauce. Platter of cold cuts (Vigorost and Zoyburger). Hot Zoyburger sandwich. Stake-Lets (canned) for picnic dinner. Alkaline breakfast food–Wheatasoy. Alkaline beverage–Zoy-Koff (coffee substitute). Soy bean milk (Kreme O'Soy). Complete protein foods: Zoyburger, Vigorost, Stake-Lets, Not-Meat (made with unroasted peanut meal and seasoning), Soy Cheese, and Soy Beans. A brief description, nutritional analysis, and price is given for each product. "None of the Madison Foods contain animal products." A portrait photo shows Mildred Lager next to a KFAC radio microphone. The caption states that for 6½ years Miss Lager been broadcasting over the radio in Los Angeles. "She is the founder of the House for Better Living, and a tireless worker for better living. Her weekly free classes draw hundreds of people for instruction in healthful cookery and healthful living. Miss Lager is the author of *Food Facts.*"

Note 1. This is the earliest document seen (June 2007) that mentions or gives a recipe for a soy-based meatless turkey. Vigorost, a meatless / vegetarian roast introduced by Madison Foods in 1932, used wheat gluten and tofu as its two main ingredients.

Note 2. This is the earliest English-language document seen (Jan. 2007) that contains the word "Zoyburger," an early, popular vegetarian burger in the United States.

Although this issue is not dated, it contains the reprint a current article published in March 1940.

1149. *Madison Health Messenger* (*Madison, Tennessee*). 1940. Price list [of products made by Madison Foods] (Ad). 2(3B):5. Undated.
• ***Summary:*** Breakfast cereal: Wheatasoy (9 oz).

Beverages: Zoy-Koff (No caffein [caffeine]; 12 oz.). Kreme O'Soy Milk (plain, liquid, 15 oz and 29 oz; chocolate, liquid, 29 oz). Crackers: Thin-Things ** (5 oz). Whole wheat wafers ** (5 oz). Bran wafers ** (6½ oz).

Canned protein foods (used in place of meat): Zoyburger (14 oz, 30 oz). Stake-Lets (14 oz, 30 oz). Not-Meat (5 oz, 14 oz, 30 oz). Vigorost (5 oz, 14 oz, 30 oz). Soy cheese [tofu] seasoned (5 oz, 14 oz, 30 oz). Soy Beans with Tomato (5 oz, 14 oz, 30 oz). Kreme O'Soys, plain (14 oz).

Flour: Kreme O'Soy Flour (2 lbs, 5 lbs).

Note: Asterisks in the printed list indicate that all products except Whole wheat wafers, bran wafers, and Not-Meat are "Soy Bean Foods." ** = Wheat germ added.

Although this issue is not dated, it contains the reprint of a current article published in March 1940.

1150. *Nature's Path to Health* (*Melbourne, Australia*). 1940. Soya beans. April. p. 40.
• ***Summary:*** "An ancient food with many modern uses–use as a substitute for meat, cheese, milk... made up in the form of crackers, butter, sausage, cereals, salad, loaf, coffee, cheese, etc. Soya bean products are a fine source of

protein and also have lecithin which is a brain and nerve constituent."

1151. P.J.K. 1940. La agricultura es una industria: Cultivo e industria de productos oleaginosos [Agriculture is an industry: The cultivation and processing of oleaginous products]. *Agricultor Venezolano* (*El*) (*Ministerio de Agricultura y Cria, Caracas*) 4(47-48):28-36. March/April. [Spa]
• ***Summary:*** Pages 28-31 are an introduction to oilseed processing to produce oil and meal. Peanuts, soybeans, and sunflower seeds are mentioned on p. 30. Then comes a long section on peanuts (p. 31-34), followed by a 3-page section (p. 34-36) on soybeans titled *"Plantas oleaginosas: El haba de soya y la alimentacion"* (Oilseed plants: The soybean and food).

Discusses: The major new role played by soybeans during the war in Germany. 400 million people in the Orient use soybeans daily as food. During the last 20 years soybeans have come to be widely used in Europe and the USA, but only to make certain products, such as oil and meal. The soybean is a rich source of nutrients. 10,000 Chinese infants developed robustly and normally on soymilk. The most important product of the soybean is soy flour, which has remarkable nutritional value and can easily be added to bread, cakes, etc. Lecithin is another important product and acidophilus soymilk is a new product. Address: Dr.

1152. Puget, R. 1940. La question du lait et le soja [The question of milk and the soybean]. *Les Cahiers de la santé publique. Hygiène. Hygiène publique. Hygiène et médecine sociale* 13(4):69. April. [Fre]
• ***Summary:*** Hervé Berbille, who found this article, writes: "In my opinion, this it is a very important article for two fundamental reasons:

"(1) It seems that the tariffs were increased in France in order to nip soymilk rise in the bud: 'There was, indeed, more than ten years ago, a French company, now defunct, named "Les Établissements Iris" which had begun to manufacture, at Montrouge, a plant milk plant whose nutritional value and easy digestibility threatened for a moment a disastrous competition with cow's milk.'

"'A brutal rise of the customs duties on the entrance into France of the 'pea of China,' or soya aborted'" [the development of this soymilk].

"(2) Probably shortly after the ceasing of activity of the Caseo-Sojaïne, there was a second attempt to market soy milk in France by a company ('Les Établissements Iris'), located in Montrouge (a town near Paris) which I had never heard of before (I did not find any additional information about it)."

Note: Hervé thinks that *Les Établissements Iris* probably produced soymilk during the period of roughly 1920 to 1930. Address: France.

1153. *Detroit News.* 1940. Negro exposition inspired by exploits of Dr. Carver. May 17. p. 13, cols. 3-4.
• ***Summary:*** "The inspiration of Dr. George Washington Carver... has been left with the members of his race who are celebrating at the 75 years of Negro Progress Exposition here." Dr. Austin W. Curtis, who has worked with Dr. Carver for the last 5 years, told the audience the story of Dr. Carver's life and "revealed the vistas that are open to the efforts of the American Negro." From the Spanish peanut Dr. Carver developed more than 300 uses including a "substitute butter, milk, cereals and flour, many oils, printer's ink, linoleum compounds, and rare and beautiful dyes. Under his touch the sweet potato yielded coffee, paste, 70 dyes for cotton and silk and a rubber substitute."

"Dr. Carver never took out a patent and in answer to the honors heaped upon him by the world always answers: 'It is just the work of the Lord. It is just the Lord's doing's, not mine.'"

A photo shows Dr. Austin Curtis explaining Dr. Carver's work to two boys, Walter King (age 11) and Donald Wilson (age 11). Address: Michigan.

1154. *Eat For Health* (*Rosenberg's, San Francisco*). 1940. The versatile soy bean: Food of a thousand uses. Spring. p. 6-9.
• ***Summary:*** "Man's search for the perfect food, like his search for the Fountain of Youth, has never been entirely successful. As usual, it took the Orientals to discover the qualities of the almost-perfect one–the soy bean." This bean, which is rich in high-quality protein, can be used to make soy flour for use in preparing "richer soups and in the baking of excellent breads; meat substitutes in the nut form are very appetizing; the oil is good in salad dressings, and the sprouted seed is a tasty vegetable.

"The Chinese were the one to introduce sprouted soy beans as a vegetable; practically everyone who has eaten chow mein knows the succulent shoots contained therein." Soy sauce is, of course, "the standard flavoring for chow mein, imparting a salty tang. The legume is very good cooked liked lima beans [as a green vegetable], too, and is even more alkaline than the latter.

Soy milk "is richer than cow's milk in calcium, phosphorus and iron.

"In spite of the large percentage of its fat, the soy bean does not induce obesity. Instead of being stored in the body, as are other oils and fats, soy bean oil is immediately useable by the bodily metabolistic process." Moreover, "the soy bean has practically no starch, so those keeping a careful eye on their weight can derive the full benefits of its other qualities without worrying about gaining.

"This lack of starch is a distinct advantage to the diabetic too," and many diabetic foods can be prepared from soy beans.

"Solidified [hydrogenated] soy oil is an excellent shortening for cakes and pastry;... Soy bean oil is also "capable of use as butter."

When soy beans are cooked, then put through a good grinder or coarse sieve, they become "soy bean pulp," which offers many possibilities to the venturesome cook.

"Green soy beans are a very good salad vegetable after steaming and chilling." And "the soy bean is a delightful snack when eaten as the peanut is. Toasted, it has much the same flavor and is just as energizing."

"Editor's note: We carry a large variety of soya bean foods–practically everything from soya oil and flour to those delightful toasted 'soya nuts' that make a hit wherever served. Come in soon–we'll be glad to show you.

Contain three "Delicious soy recipes": Soy mock turkey (with "½ cup soy cracks" [cracked soya nuts] and "½ cup browned soya flour"). Soy bean soup (with "1 cup soy bean pulp" [ground, cooked whole soybeans]). Soy-wheat biscuits (with "½ cup soy bean flour"). Soy bean salad (with "2 cups cooked soya beans").

A small photo shows "water-sprouting of soy beans"–four stages in the process of transforming whole dry soy beans into sprouts. Address: Rosenberg's Original Health Food Store, 1120 Market St., San Francisco, California. Phone: MArket 3033.

1155. **Product Name:** Diabetic Soya Bars [Maple, Mocca, or Dark].
Manufacturer's Name: Radcliffe Soya Products.
Manufacturer's Address: 146 Fillmore St., San Francisco, California.
Date of Introduction: 1940. June.
New Product–Documentation: Rosenberg's Original Health Food Store. 1940. Catalog of Health Foods... p. 52. "Radcliffe's Famous Soya Products." The bars are 20 cents each, or 1 lb for $1.00.

1156. **Product Name:** Soya Candy Bars.
Manufacturer's Name: Radcliffe Soya Products.
Manufacturer's Address: 146 Fillmore St., San Francisco, California.
Date of Introduction: 1940. June.
New Product–Documentation: Rosenberg's Original Health Food Store. 1940. Catalog of Health Foods... p. 52. "Radcliffe's Famous Soya Products." The bars are 5 cents each.

1157. **Product Name:** Soya Milk Powder [Regular, or Cello].
Manufacturer's Name: Radcliffe Soya Products.
Manufacturer's Address: 146 Fillmore St., San Francisco, California.
Date of Introduction: 1940. June.
New Product–Documentation: Rosenberg's Original Health Food Store. 1940. Catalog of Health Foods... p. 52. "Radcliffe's Famous Soya Products." For the regular: "1 lb. can $0.45." For the Cello, "10 oz. $0.25."

1158. **Product Name:** Cocoanut Milk Powder [Regular, or Cello]. Malvitose Beverage.
Manufacturer's Name: Radcliffe Soya Products.
Manufacturer's Address: 146 Fillmore St., San Francisco, California.
Date of Introduction: 1940. June.
New Product–Documentation: Rosenberg's Original Health Food Store. 1940. Catalog of Health Foods... p. 52. "Radcliffe's Famous Soya Products." Cocoanut Milk Powder: "10 oz. $0.40. 16 oz. $0.70." Malvitose Beverage: "18 oz. $0.55. 20 oz. $1.10." Note: It is not clear whether or not these products contain soya.

1159. **Product Name:** Soya Malt [Nut, Mocca, Banana, Plain, Chocolateen].
Manufacturer's Name: Radcliffe Soya Products.
Manufacturer's Address: 146 Fillmore St., San Francisco, California.
Date of Introduction: 1940. June.
New Product–Documentation: Rosenberg's Original Health Food Store. 1940. Catalog of Health Foods... p. 52. "Radcliffe's Famous Soya Products." "8 oz. $0.40. 16 oz. $0.70. 5 lb. $2.90."

1160. Rosenberg's Original Health Food Store and Whole Wheat Bakery. 1940. Catalog of health foods and manual of valuable health information. San Francisco, California. 76 p. Undated. Illust. 17 cm. Index
• ***Summary:*** Cover title: "Health from foods." Also on title page: "Eat to get well. Eat to keep well." "Where good health originates." "No branch stores." Contents: About your health, by Morris Rosenberg, president. Shop by mail. Parcel post scale. Eat to get well–Eat to keep well (rules and guidelines, p. 4). Vitamin chart (for each: Functions, results of deficiency, most reliable sources, p. 5-8). Biological chemistry of foods–Minerals (p. 9-10). List of products available, by product type, with weight and price. Incl. Soy bean bread, Soy toast, Soy bean wafers, Soy cookies (p. 12). Natural brown rice. Sun-dried, unsulphured California fruits. Salted nut meats (almonds, peanuts, cashews, pecans, p. 16), Nut butters (unroasted and unsalted: Almond butter, Nut cream butter {Carque}, Peanut butter, Cocoanut butter, Smucker's apple butter, Peanut oil (2 brands). Parkelp (minerals of the sea). Salt substitutes.

List of products available, by manufacturer or source, with weight and price. Incl. Battle Creek Health Products [Michigan] (p. 18-19): Beverages (SoyKee, Kaffir Tea), Gluten biscuit, Vegetable meats (Protose), Savita yeast, Psyllium seed. Cellu Dietetic Products: Canned vegetables (Soy bean oil, Soy bean spread, Soy flakes, Soy grits). Dia-

Mel (dietetic food products): Gluten crackers, Soy-Rina cereal (to be cooked). Alberty Food Products: Cero-Fig coffee substitute. Modern Diet Products [Gayelord Hauser], incl. Juicex (electric juicing machine), and Fletcherizer (juicers). Radiance Health Products (Los Angeles, p. 30-31). Tam Products (Joyana, the remarkable soybean health drink, plain or chocolate flavor). McCollum Laboratory Products (Soy-A Granules–Soy breakfast food). Penna Soya Products (soy foods): Tenderized whole soybeans, Toasted soy flakes, Toasted soy nut butter (8 or 16 oz), Soy malt–chocolate flavor, Creamee Soy Best (soy milk powder). Mrs. Hauser's Soya Products: Hot cake and waffle mix, Pancake and muffin mix, Soya cereal. Hain's Products (Hain Pure Food Co.): Nature's Best Foods: Assorted candy bars, Fruit juices (6 types), Vegetable juices (7), Hollywood Foods (Meat substitutes: Protone-Soytone-Nutone, SoyBean with Tomato Sauce, SoyBeans T.S. & Protone, Soya sandwich spread), Nut butters (raw–Almond, cashew, pecan). Nut butters (roasted–Almond, cashew), Olive oil (California virgin). Hain's vitamins. Alvita Products. Live Food Products (Paul C. Bragg). Books by Paul C. Bragg (*Paul C. Bragg's Personal Health Food Cook Book. Building Health and Youthfulness Nature's Way. Awaken Health and Happiness. The Art of Feminine Loveliness. Health Cocktails, The New Way to Health, Beauty and Youthfulness. The Chart of Scientific Diet.* Note: The first 4 books cost $1.00 each. The last two cost $0.25 and $0.10, respectively). Loma Linda Foods (Tasty, wholesome, nutritious): Cereals (5), Soy products (Soy beans–plain, Soy beans with tomato, Soy beans with Proteena, Soy milk, Soy mince sandwich spread, Soy milk, Soy mince sandwich spread, Soy weet wafers, Fruities, Fruit wafers, date sandwiches), Vegetarian meats (Proteena {plain, smoked flavor, or mushrooms}), Nuteena, Gluten steaks), Other choice foods (Garbanzos, Savory lentils, Wheat kernels, Savorex). Radcliffe's Famous Soya Products: Diabetic soya bars (flavors–maple, mocca, dark), Soya bon bons (light or dark), Soya candy bars, Soy milk powder, Soy milk powder–Cello, Cocoanut milk powder (8 or 16 oz), Soya malt (8 or 16 oz, 5 lb; Flavors–Nut, mocca, banana, plain chocolateen), Soya beverage–coffee, Malvitose beverage (8 or 20 oz), Soya paste [pasta?] (7 or 14 oz), Soya ravioli, spaghetti, macaroni (7 or 15 oz, 2 lb), Unsweetened soya bean chocolate. Cubbison's whole wheat products. Bill Baker's flour: Lima and pancake flour, Soya and wheat flour, Lima bean cookies, Soy bean cookies. Figco instead of coffee. Carque's natural foods. Carque natural brands. Books by Carque. Therapy, Ltd. (Pasadena): Theradophilus (a pure condensed acidophilus culture in soy bean milk). Health publications (22).

Health recipes (p. 68-71): Soya cup cookies. Soya loaf with rice. Soya cup custard. Soy bean goulash. Soy bean bread. Soy flour applesauce cake. Soy bean vegetable soup. Soy macaroni, noodles, or spaghetti. Baked soy bean croquettes.

Key to calories. The four types of foods: Regulatory, body-building, energizing, heating. Index.

On the rear cover is an ad for the Juicex ("makes fresh, pure, undiluted vegetable juices"–$49.50. A photo shows this modern-looking electric juicer. Fruits and vegetables as pushed–using a wooden pusher–into a small hopper on top. The juice runs out of a spigot into a glass) and Fletcherizer [electric blender] ("The new 1940 model has all the latest improvements in construction and appearance. It liquidizes, whips, mixes, and chops..." $14.95). Across bottom of ad: "See these products demonstrated at our store."

Note: This 1940 date, plus other internal evidence, gives us a good estimate for the date of this undated catalog. Address: 1120 Market St., San Francisco, California. Phone: MArket 3033.

1161. *Chicago Daily Tribune.* 1940. Soy bean feast served 35 at cost of $10.87. July 4. p. 23.

• ***Summary:*** "A full seven-course dinner–everything from 'soy' to 'bean'–was served 35 members of the Chicago chapter of the Society of Grain Elevator Superintendents. And yesterday the diners, while admitting that even a good thing can be carried too far, said they had no regrets.

The idea of a soy bean feast originated with Dean Clark, national secretary of the organization." Recipes were obtained from a California firm.

Here's the menu: "Soy-carrot juice appetizer. Hors d'oeuvre (celery stuffed with soy bean paste [soynut butter]). Soy-mince soup and soy wafers. Soy-vegelona 'meat' course (tasted like bologna). Pineapple salad made with soy bean sandwich spread. Soy bean (100 per cent) bread. Soy butter. Side dish of (you guessed it) baked soy beans with soy sauce. Ice cream made with soy milk and soy fruities wafer. Coffee with soy milk. Roasted soy beans (for variety's sake)."

The superintendents were then given "a tour of the Glidden company's new elevator at 5165 West Moffat street–a soy bean extraction plant." The retail cost of the entire banquet was just $10.87.

1162. Simmons, Roscoe Conkling. 1940. The week. *Chicago Defender.* July 13. p. 15. National ed.

• ***Summary:*** Dr. George Washington Carver may have missed a report on the stylish seven-course soy-bean dinner given recently in Chicago by the Society of Grain Elevator Superintendents. "Beans have enjoyed Dr. Carver's important attention, but goobers have increased their fame under his spell." The full soy bean menu is given: "Soy-carrot juice appetizer. Hors d'oeuvres (Celery stuffed with soybean paste [soynut butter]). Soy-mine soup and soy wafers. Soy-vegelona 'meat course' (bologna like). Pineapple salad made with soybean sandwich spread. Soy bean (100%) bread. Soy butter. Side dish of baked soy beans with soy sauce. Ice cream made with soy milk and soy fruities wafers. Coffee with soy milk. Roasted soy beans."

"The cost of the banquet came to $10.87. This writer asked one of the superintendents about the after-effects of the feast. 'Easy on the pocket, pleasant to the appetite, agreeable to health,' he replied."

1163. Fan, Ch'uan; Woo, Theresa T.; Chu, Fu-t'ang. 1940. Metabolic studies on the roasted soybean as an infant food. *Chinese Medical Journal* 58:53-67. July. [10 ref]
• ***Summary:*** Metabolic studies were made on two infants fed on various soybean mixtures. Wet ground soymilk seems to be better utilized than roasted soybean meal. The calcium of autoclaved soya-milk was as well retained as that in cow's milk, but the retention of its phosphorus was lower. Address: Div. of Pediatrics, Dep. of Medicine, Peiping Union Medical College, Peiping, China.

1164. Hayward, J.W. 1940. Soybean oil meal: Its current consumption. *Proceedings of the American Soybean Association* p. 21-23. 20th annual meeting. Held 18-20 Aug. at Dearborn, Michigan.
• ***Summary:*** The soybean arrived in America in 1804. During the past ten years the production of soybean oil meal as such has increased in the United States from about 39,000 tons to approximately 1,250,000 tons. Practically all of this production has been used as a feed for livestock and poultry.

For the past several years production of soy flour has held between 11,000 and 15,000 tons. "Before leaving this subject on food, I do wish to give credit to the increasing popularity of edible green soybeans, many specialty soybean products and special health foods, such as soy milk, etc."

Properly processed soybean oil meal is a better feed than raw uncooked soybeans. "In most cases, I think you will find that protein can be purchased cheaper in soybean oil meal than it can be supplied by feeding soybeans at market prices even though they were raised on your own farm." Several calculations are given to prove this point.

Note: This is the earliest English-language document seen (June 2009) that uses the term "edible green soybeans" to refer to green vegetable soybeans. Address: Chairman, Soybean Nutritional Research Council.

1165. Hayward, J.W.; Hayward, Mrs. J.W. 1940. Little soybean who are you? *Proceedings of the American Soybean Association* p. 6. 20th annual meeting. Held 18-20 Aug. at Dearborn, Michigan.
• ***Summary:*** This poem, written and submitted by Dr. and Mrs. J.W. Hayward reads: "Little Soybean who are you / From far off China where you grew? / I am wheels to steer your cars, / I make cups to hold cigars. / I make doggies nice and fat / And glue and feathers on your hat. / I am very good to eat, / I am cheese and milk and meat. / I am soap to wash your dishes, / I am oil to fry your fishes, / I am paint to trim your houses, / I am buttons on your blouses. / You can eat me from the pod, / I put pep back in the sod. / If by chance you're diabetic / The things I do are just prophetic. / I'm most everything you've seen / And still I'm just a little bean." Address: 1. PhD.

1166. Lloyd, J.W. 1940. The rise of edible soybeans. *Proceedings of the American Soybean Association* p. 59-62. 20th annual meeting. Held 18-20 Aug. at Dearborn, Michigan. [1 ref]
• ***Summary:*** "Although the field-type soybean was introduced into the United States from the Orient a number of years ago, the vegetable-type was unknown in America until after the exploration trip in China and Japan by Dr. [sic] W.J. Morse, which extended from February, 1929, to February, 1931. The seed samples of many varieties were sent back to Washington by Dr. Morse and were planted at the Arlington Experiment Station [Virginia] in 1930 and 1931. Seed developed from these plantings was distributed for trial to various State Experiment Stations in the spring of 1934. The Illinois station had its first contact with the vegetable-type soybeans that season, and started a series of field and palatability tests including many varieties... Other midwestern experiment stations that have been giving attention to the vegetable-type soybeans are Indiana, Ohio, and Iowa."

The results of the Illinois tests were first published in March 1939 in Illinois Bulletin No. 453. "In this bulletin and in press notices concerning it, the announcement was made that small packets of vegetable-type soybeans for trial planting would be furnished upon request, as long as the available seed supply lasted. The response was a perfect deluge of requests for seed... Special interest was manifested in the vegetable-type soybean as a food suitable for diabetics, and many stated that they wished to grow the crop for that purpose. By the end of May [1939] seed had been sent to 2,096 persons–all who had made requests up to that time. Requests were received from 46 of the 48 states, from Hawaii and the District of Columbia, from 5 provinces of Canada and from 6 other foreign countries.

"At the end of the 1939 season, reports were received from 810 persons to whom seed had been furnished that spring. Almost 80 percent of those persons reported success in the production of the crop, in spite of drouth, grasshoppers, rabbits, and other hazards. Approximately 70 percent of those who succeeded in growing the crop were enthusiastic about its table quality as a green vegetable... While tests by correspondents were limited mostly to the use of the soybeans as a fresh vegetable, a number reported successful canning of the product for winter use, while others allowed the beans to mature and reported them as highly satisfactory when used like navy beans." One company "is reported to have canned eight carloads of the finished product last year. Experimental work in canning and freezing of green soybeans is in progress on a comprehensive scale at two eastern experiment stations this season."

The Bansei variety is said to be especially well suited to the making of soybean milk. Yellow-colored varieties are said to make a superior grade of soybean flour. "The chief objection to the soybean as a home-garden or market-garden vegetable is the difficulty of shelling the beans by hand... Perhaps progress would be made in popularizing this product if the Oriental method of serving were adopted. This involves cooking the beans in the pods and letting each guest do his own shelling. Some Americans have tried this method and are well pleased with it. It involves more leisurely eating and would be especially appropriate at a banquet table."

"Previous to the spring of 1940, seed of vegetable-type soybeans was practically unobtainable by the general public. It was not offered under variety names by a single seedman so far as I am able to learn. Last spring, however, at least six seedsmen announced several varieties in their catalogs or price lists, and seeds were sold to a large number of planters."

Note: This is the earliest English-language document seen (April 2013) that uses the term "field-type soybean." Address: Univ. of Illinois, Urbana.

1167. Miller, Harry W. 1940. The role of the soybean in human nutrition. *Proceedings of the American Soybean Association* p. 64-71. 20th annual meeting. Held 18-20 Aug. at Dearborn, Michigan.

• ***Summary:*** "The interest in the soybean in America has largely centered around its industrial uses and animal feeding. Comparatively little interest has been manifest in its utilization in human nutrition. Whereas, in the Orient, where I have had opportunity to observe the various uses made of the soybean, at least 90 per cent of the local consumption is in human nutrition. The remainder is exported out of the country... I must admit that I feel that the soybean has suffered a setback by tremendously exaggerated statements made in its behalf that are misleading, and by the fact that the specimens of foods offered have so often been insipid, and poorly processed...

"There is one food that is utilized everywhere in China, and that is the soybean, for they have learned that they must have it in their diet to give them strength, and in order to promote growth. They have not understood its alkalinizing action, nor its biological value as a food, nor its mineral contents, nor its many other scientific and physiological values. However, they do know that when they are tired and need fatigue relief the soybean is the food. They realize that they soon tire on a rice, wheat or corn diet, and cannot maintain their daily round of duties unless they get a portion of soybean... The Chinese people also produce a record to the world on their great endurance during strenuous labor, as is seen in Coolie and agricultural workers...

"Paying the market prices for soya milk and also for other infant foods, in Shanghai, we made a comparative cost of food for a baby for its first five months, making an average of the cost per month. To provide the requisite amount of nutrition, if these babies were fed on fresh cow's milk bought on the Shanghai market the cost was $20.00 per month, Shanghai currency. If fed on canned milk, $16.50. If fed on the cheaper class of Shanghai dairy milk, $14.75. If fed on a milk that came from Holland, called Oster Milk, $12.00. If fed on S.M.A. or Lactogen, American prepared baby foods, the cost was $26.00 a month. Whereas these same babies could be cared for equally well on soy bean milk, at a cost of $5.00 a month." Address: M.D., International Nutrition Lab. [Mt. Vernon, Ohio].

1168. *Proceedings of the American Soybean Association.* 1940. Twentieth anniversary program. American Soybean Association. In session at Dearborn Inn, Dearborn, Michigan. August 18, 19, 20, 1940. p. 2-3. 20th annual meeting. Held 18-20 Aug. at Dearborn, Michigan.

• ***Summary:*** This meeting was held in Dearborn, Michigan, at the invitation of the Ford Motor Co., which had its headquarters in Dearborn. The company played an active role in the 3-day meeting. The first scheduled activity, after registration on Sunday, was general sight-seeing with suggested visits to Greenfield Village and Edison Museum. On Monday morning, Aug. 19, tours to those two places were scheduled from 9-12 a.m. Luncheon, at noon, was in the Alexandria Ballroom of the Dearborn Inn. Dr. E.A. Ruddiman (Engineering Laboratory, Ford Motor Co.) was in charge of the luncheon program, which included a welcome address by John L. Carey, Mayor of Dearborn. Carey praised Henry Ford's work with soy beans and referred to him as "Dearborn's first citizen." After lunch Robert A. Boyer (Engineering Laboratory, Ford Motor Co.) gave a talk on "Chemurgy and the soybean." After lunch was a tour of the Ford Rotunda and the Rouge Plant. Monday evening the dinner banquet was in the Alexandria Ballroom. Wheeler McMiller, President of the National Farm Chemurgic Council, was toastmaster. The first talk was by W.J. Cameron of the Ford Motor Co.

On Tuesday, Aug. 20, Dr. E.A. Ruddiman (Research Laboratories, Ford Motor Co.) presented an afternoon paper titled "Possibilities of soybean milk."

1169. Ruddiman, E.A. 1940. Possibilities of soybean milk. *Proceedings of the American Soybean Association* p. 62-63. 20th annual meeting. Held 18-20 Aug. at Dearborn, Michigan.

• ***Summary:*** "Infants who are not accustomed to cow's milk will take the soy milk as readily as the cow's... Soybean milk, either in the liquid or powdered form, works into baked goods to good advantage. It has about the same effect as cow's milk. Baked custard and custard pies have been made which could hardly be distinguished from that made with regular milk... The cost of ingredients which go into a gallon of soy milk is less than the cost of milk at present, but the

labor runs it up to several times that of cow's milk. Proper machinery may reduce the cost so that in case of necessity it may be a competitor of cow's milk. From a therapeutic standpoint it seems to me that soy milk is a very important product." Address: Research Laboratories, Ford Motor Co.

1170. Schmitt, R.P. 1940. The versatile soy bean: Food of a thousand uses. *Nature's Path to Health* (*Melbourne, Australia*). Aug. p. 5-6.
• ***Summary:*** "Before 1935, the soy bean was an insignificant factor in the health food store. Since then, however, its increase in popularity has been phenomenal, with the result that it is now one of the major sellers in the field. One reason for this growth is the soy bean's versatility: from it are produced flour, milk and cheese, bread, crackers, cereals, meat substitutes, candies and canned soybeans to be served as a vegetable. Almost no other item of food can claim such diversification of products. And the ways of preparing it are infinite..." It is also a good source of protein, vitamins, and minerals, and its low starch content makes it valuable in diabetic diets. It is easy to digest, "is not gas-forming, and does not encourage the growth of putrefactive bacteria in the intestinal tract, as do other high protein foods. On the contrary, it builds up acidophilus bacteria, which combat putrefaction in the digestive system.

"Then, too, it is alkaline in action: it has 20 times the alkalinity of cow's milk, and five times that of citrus fruits... Yet it one of the most economical foods." Address: Penna Soya Products [Williamsport, Pennsylvania], USA.

1171. Balzli, Jean. 1940. La culture du soja "magique" et sa contribution au redressement de la France [The cultivation of the "magical" soybean and its contribution to the recovery of France]. *L'Eclaireur de Nice et du Sud-Est.* Sept. 17. Later published Revue Internationale du Soja, March 1941, p. 41-45. [1 ref. Fre]
• ***Summary:*** Includes a discussion of uses for human foods, including defatted soy flour, soy coffee, soy chocolate, Worcestershire sauce, soymilk, tofu, and soy sprouts. Other uses include lecithin and industrial uses of soy oil and soy proteins.

1172. Bataille, René. 1940. Le soja et sa contribution à notre redressement économique [The soybean and its contribution to our economic recovery]. *Eclaireur de Nice et du Sud-Est* No. 268. Sept. 24. Partial summary in Revue Internationale de Soja 5(23-24):19, titled "Why there is no soymilk in France." [Fre]*
• ***Summary:*** The author received an excellent sample of soymilk but was told that it could not be produced without a struggle against powerful syndicates. "... I have talked in my office with entrepreneurs who had produced quite a remarkable soymilk (lait de soja) at a location that I will not mention, and managed to have it adopted by hospitals which lacked fresh cow's milk during the winter. This soymilk would have met the needs of elderly people, sick people, and children. These entrepreneurs had planned to expand their business but a short time after that, they returned to tell me that they had given up for fear of having to compete with some powerful lobbies and pressure groups." Address: Nice, France.

1173. Winter, Louis. 1940. Breuvage, engrais, tissu, peinture, farine... Voici l'incroyable "Soja!" [Beverage, fertilizer, textile, paint, flour... Here is the incredible Soya!]. *L'Ouest-Eclair.* Sept. 26. p. 1, 2. [Fre]
• ***Summary:*** In this period of restrictions, who would not think gladly of Soya? Thousands and thousands of infants have been raised on soymilk [infant formula]. Both soy flour and soymilk are useful in cooking, in making pastry, and cheeses, and confections. It can also be used to make bread (for diabetics) and pasta.

And that's not all. Soya oil is edible after it is refined. And an infusion of soya can be used to make a nutritive coffee.

The seed can be consumed green (as a vegetable), germinated (to make sprouts) or roasted. It can also be used to feed animals. To be continued. Address: Ingénieur Horticole, Directeur du Jardin de Plantes, Parcs et Promenades de la Ville de Rennes [in northwest France].

1174. Lindlahr, Victor H. 1940. You are what you eat. New York, NY: Natural Nutrition Society. 128 p. Sept. No index. 27 cm.
• ***Summary:*** Victor H. Lindlahr is the son of Dr. Henry Lindlahr, founder and head of the Lindlahr Sanitarium in Chicago, Illinois. Dr. Henry Lindlahr, "who first uttered the phrase, 'You are what you eat.'... and was one of a handful of pioneers who alone thought or knew much about diet in its relation to the prevention and cure of illness."

This book contains a wealth of interesting information on the history of nutrition. During 25 year "tenure of the Lindlahr Sanitarium, we used diet with excellent results in the treatment of more than 50,000 patients." In 1929 Victor shifted from sanitarium work to radio broadcasting. A major goal is to eat a balanced vegetarian diet. On page 43 are the "Ten Commandments of eating."

Contents of Part II: Vitamin tables. Vegetables and fruits highest in vitamins. Caloric value of vegetables and fruits. Mineral tables. Vegetables and fruits highest in minerals. Food classes. Pot liquors and fruit juices. Dry yellow soybeans are listed among the best sources of vitamins B-1, and E, and the single best source of vitamin G. They are a rich source of the minerals calcium, and an excellent source of protein. Green soybeans are an excellent source of vitamins A, B-1, and G, a good source of the minerals calcium, phosphorus, iron, and a good source of protein (p. 44-50).

In Part III, the section on vegetables contains a subsection on beans (p. 81-87), which includes "Soybeans, green-shell. Health factors: "Practically a 'life' staple in Oriental countries where meat is scarce. Protein in the diet supplied by soybeans; contain all essential amino-acid constituents of animal *proteins*, and, in some instances, have twice the quantity. Soybeans used to replace all various products of the cow: meat, milk, butter, and cheese.

"Soybean milk similar in appearance and properties to animal milk. By certain processes, some of protein may be precipitated from it, forming a gray-white curd. This protein comparable to casein (the protein of animal milk); has been commercialized in form of powder which may be used in special feeding cases.

"Soybean oil more similar to butter in Vitamin A content than any other vegetable fat. Soybean flour or meal mixed with its proper constituents not only can be made into various types of bread and confections, but is today used in invalid and infant dietetics.

"Soybeans not so well known to Americans as they justly should be. Green-shell soybeans not readily available, although their cultivation is being encouraged.

"Excellent source of Vitamin A, especially the varieties that are deepest green in color. Also excellent source of Vitamins B-1 and G. Can be relied upon as a good source of essential minerals, calcium, phosphorus and iron.

"Alkaline-ash. Should not be used on soft diets unless puréed, as high in roughage. Comparatively high in calorie content, but only 6 to 12 per cent of their carbohydrate is available to the body. Starch makes up a very small part of total carbohydrate; hence soybeans may be used occasionally by reducers. Soybean meal is used in preparing breadstuffs sufficiently reduced in starch content to be used by diabetics." Also discusses: Selection and care. Preparation. Basic method of cooking. Similar information is given under "Soybeans, dried," which are better known in the USA than green-shell soybeans.

Chapter 2, titled "Different foods do different things," contains one of the many interesting stories about the history of nutrition. "Hippocrates believed and taught that all foods served the *same purpose*, all contained a basic nourishment which he called the 'universal aliment.' Some foods, he taught, had more of the universal aliment than others, but insofar as a choice of foods was concerned, the only necessity was to eat enough foods containing the universal aliment, and all would be well.

"For almost 2300 years, physicians and laymen believed implicitly in this idea... Hippocrates' theory was accepted blindly, even by top-ranking scientists, until little more than a century ago. The few chemists who began to question it then were afraid to oppose authority and state their misgivings. Even when undeniable proof was finally presented that there was more than one kind of nourishment in foods, the great majority of physicians and scientists were unwilling to depart from the idea of Hippocrates. Those who believed that different foods have different purposes were called fools, fanatics, faddists and worse!"

As recently as 30 years ago [1910] the universal aliment idea "was so 'respectable' that 'rebels' like my father, who challenged it, felt the full weight of scientific scorn.

"The first wedge was driven in Hippocrates' theory a little over 150 years ago. In the late 1700's, a brilliant French scientists named Antoine-Laurent Lavoisier proved that the food you eat is gently burned (oxidized) in your body with the help of oxygen contained in the air you breathe into your lungs. He proved that *certain parts* of foods provide the body heat. Lavoisier, and a colleague by the name of Pierre-Simon Laplace, even developed a method by which the heat-producing value of foods could be measured.

"Later, an American by the name of Ben Thomson devised a unit of measurement for the heat which food produces in the body. This unit was called a *calorie*–the very same calorie that overweight people have been reckoning with ever since."

"Once the important role played by food in creating body heat was understood, scientific circles began to talk of a food's value only in terms of its calorie content, its heat-producing potentialities. The calorie became a tyrant; it was to rule most physicians and dietitians until the War of 1914.

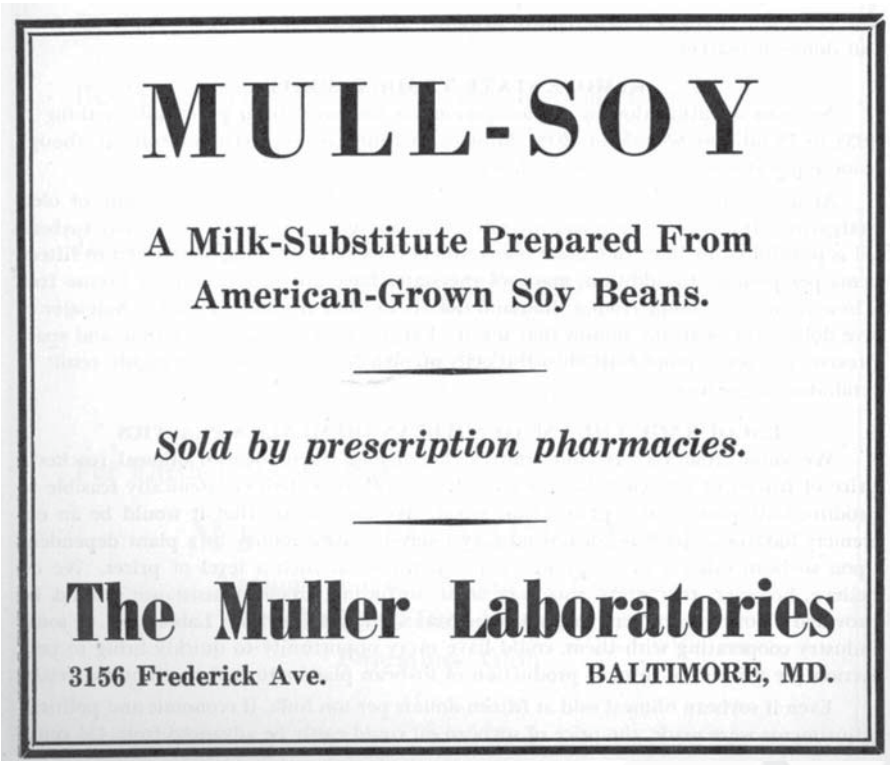
"Lard and butter, with approximately 250 calories per ounce, became premium foods. Carrots, spinach, onions and other vegetables which have a low calorie content, sank to uncharted depths in scientific esteem. Sugar (approximately 120 calories per ounce) was a 'wonderful' food; ready-to-eat cereals (120 calories per ounce) became the 'finest nourishment' anyone could partake of!"

On the inside rear cover is a description of many "Food & Health Guides" by the Lindlahrs. The rear cover shows that in March 1941 this book was the No. 3 best seller nationwide in the category "General non-fiction."

A portrait photo on the inside front cover shows Victor Lindlahr. For the past 10 years he has been a lecturer on health and nutrition, with a radio program broadcast by stations nationwide. He is also the author of: *The Guide to Balanced Health. Natural Way to Health. Eat and Reduce. Seven Day Reducing Diet. The Lindlahr Vitamin Cookbook. How to Win and Keep Health with Foods.* Address: Editor, Journal of Living, 1819 Broadway, New York City. President, National Nutrition Society, Inc., New York.

1175. Muller Laboratories (The). 1940. Mull-Soy. A milk substitute prepared from American-grown soybeans (Ad). *Proceedings of the American Soybean Association* p. 18.
• ***Summary:*** A ½-page ad (see next page) with no graphics. "Sold by prescription pharmacies." Address: 3156 Frederick Ave., Baltimore, Maryland.

1176. Fan, Ch'uan; Ch'en, Wu-min. 1940. Variations in the



composition of soybean "milk." *Chinese Medical Journal* 58(4):479-82. Oct. [7 ref]

• ***Summary:*** In China soybean milk is usually prepared as a liquid, but it has also been prepared in the powder or meal form. It has been used in the Chinese diet for centuries. The diet kitchen in the authors' hospital has been making soybean "milk" for some time for the use of public patients in the adult wards. After the soybeans are ground with water, either immediately or after standing, the emulsion is strained through a cloth then boiled for 15 minutes. Even when soybean milk is made using the same procedure under strict supervision, the composition (specific gravity, fat, and nitrogen content) "may vary independently and significantly within a wide range." This made it difficult to study the effect of other variables on the composition. The other variables were: (1) The temperature at which the soybeans were soaked (room temperature or refrigerated); (2) Whether the soybeans were soaked in plain water or salt water (0.5% solution of sodium chloride); (3) The interval between grinding and straining (immediate or 3 hours); (4) The use of different straining techniques; (5) The effect of repeated grinding of the residue [okara] so that less solid matter would be strained off. Soymilk with the highest nitrogen (protein) content resulted when the soybeans were soak overnight in plain water under refrigeration, salt water was added after grinding, and straining took place 3 hours after grinding. But the effect of uncontrollable factors made the results inconclusive. Address: Div. of Pediatrics, Dep. of Medicine, Peiping Union Medical College, Peiping, China.

1177. McBride, Gordon W. 1940. What's happening with soybeans? *Food Industries* 12(10):55-57. Oct.

• ***Summary:*** "Greatly increased production, with accompanying increase in soybean oil output and wider utilization of other soybean products, is influencing all food industries." Discusses, with many statistics, the utilization of soybeans in the USA, including the amount used for oil (crude and refined; nonfood and food), meal, industrial proteins, and foods. An interesting table on page 56 states that the following foods are made from soybean meal: bean powder, bean curd, soy sauce, soy milk, breakfast food, invalid foods, soy flour, infant foods, ice cream, baked goods, macaroni, and sausage. Whole soybeans are used to make sprouts, cooked beans, soy sauce, confections, breakfast foods, meat substitutes, and coffee substitutes. Either whole soybeans or soy flour are used to make "fresh vegetable milk," which can be further processed to make condensed milk, dried milk, confections, cheese, or casein.

"In addition to the increasing quantities of soybeans that are brought to the market as a fresh green vegetable, larger quantities of the green beans are being canned each year. One unofficial estimate placed the 1939 pack at 15,000 cases (24 one-pound cans each)."

A photo shows the soybean products plant of Archer-Daniels-Midland Co. recently erected at Decatur, Illinois. Address: Chemical Engineer, Washington, DC.

1178. *Ohio Farmer.* 1940. Now its soybean milk! This and other foods produced by new Ohio plant. 186(11):10. Nov. 30. Whole No. 4606.

• ***Summary:*** About the work of Dr. Harry W. Miller (of Ohio and China) with soymilk. Today, because of the Japanese invasion of Shanghai, there now stands in Mt. Vernon, Ohio, a plant producing soybean milk, powder, and a number of products from the edible soybean. The head of this company, International Nutrition Laboratory, is Dr. H.W. Miller, who was born in Miami County, Ohio, and educated as a surgeon. For many years he was head surgeon in an American mission hospital in China. During this time he saw the need for milk and other dairy products in China; they were unavailable to most people due to the high cost and short supply. So he and his associates started a plant in Shanghai for the production of soybean milk. In 1937, at the time of the Japanese invasion, they had 15 delivery boys going out each day on bicycles to deliver the soybean milk to thousands of

customers.

When Japanese bombs destroyed the plant in 1937, Dr. Miller decided to relocate near Mt. Vernon, in Knox County, Ohio. He and his sons built the plant, and also designed and built much of the equipment in it. According to Dr. Miller, soybean milk "is more quickly assimilated by the body than animal milk, it gives a quick recovery from exhaustion and fatigue, and is especially desirable as a food for infants and invalids. The liquid and powdered soybean milk produced in this plant is sold to doctors and hospitals all over the United States..." The steps in the process are described. They also make Mien Jing, based on wheat gluten, to which are added fresh vegetables and soya sauce to make a nutritious food with a meat-like flavor.

"During the past summer this plant also packed a quantity of edible soybeans. These were canned, both as green beans, and dried beans with tomato sauce added. Another product is a soybean flour..."

Some of the edible soybeans used in this plant were grown on the farm run by Dr. Miller near Mt. Vernon and by farmers in the neighborhood. However it has been necessary to import a large portion of the soybeans from other states.

Dr. Miller's organization is presently establishing another plant for the production of soybean milk in the Philippines. Moreover, 2,000 pounds of powdered soybean milk were recently shipped to China from Mt. Vernon.

Photos show: (1) Dr. Harry Miller, seated at a desk in a coat and tie, examining samples of edible varieties of soybeans. (2) The plant of the International Nutrition Laboratory near Mt. Vernon, Ohio. (3) A worker inspecting a can of edible soybeans, which are packed in cans and labeled, ready to ship to all parts of the USA.

1179. **Product Name:** Soya Malt, Soya Cocoa Malt, Soya Cocoanut, Soya Banana.
Manufacturer's Name: Penna Soya Products.
Manufacturer's Address: Williamsport, Pennsylvania.
Date of Introduction: 1940. November.
Wt/Vol., Packaging, Price: 8 oz can.
New Product–Documentation: House of Better Living. 1940. Nov. p. 4. 8 oz. can for $0.43, $0.23, $0.23, and $0.30 respectively; Rosenberg's Original Health Food Store. 1940. Catalog of Health Foods... p. 38. "Soy Foods (Penna Soya Products): Soy Malt, Chocolate Flavor. 16 oz. $0.35."

USDA Bureau of Plant Industry. Div. of Forage Crops and Diseases. 1942. Firms manufacturing or handling soybean food products. p. 3. This company is listed as making or handling 18 soy products, including "malted products, and soy milk."

1180. **Product Name:** Creamee Soy Best (Soy Milk Powder) [Plain, or Sweetened].
Manufacturer's Name: Penna Soya Products.
Manufacturer's Address: Williamsport, Pennsylvania.
Date of Introduction: 1940. November.
New Product–Documentation: House of Better Living. 1940. Nov. p. 4. Soya Milk Powder, plain or unsweetened. 1 lb can for $0.25; Rosenberg's Original Health Food Store. 1940. Catalog of Health Foods... p. 38. "Soy Foods (Penna Soya Products): Creamee Soy Best (soy milk powder). 1 lb. $0.40."

1181. Read, Bernard E.; Wagner, W. 1940. Shanghai vegetables. *China Journal* (*The*) 33(5):206-20. Nov.; 33(6):259-71. Dec.
• ***Summary:*** In the "Science" department, the Introduction begins: "Recent advances in the science of nutrition show the great need for more so called Protective Foods in the diet. This term refers to those things which are rich in essential vitamins and minerals."

In section 2, "The Legumes" (p. 210+), the first two entries are: (1) The soybean. Latin names. Chinese name: (Cc = Chinese characters given), Ta Dou. "The yellow, black and green varieties are common in China and marketed from Manchuria, Tsingtao and Shanghai. The young soybean in the pod is a common article of diet in Shanghai, Chinese name, Cc. Shanghai: *Mau Deu;* Peking, *Mao tou.* Followed by: season, price, nutritive value, and a recipe.

(2) Soybean sprouts. Chinese name, Cc. Shanghai: *Waung Deu Nga;* Peking, *Huang Tou Ya.* Followed by: season, price, how to make, nutritive value, and serving suggestions.

"There are very many other soybean preparations of high nutritional value well worth adding to the diet. Soybean sauce (soy) with added spices is the basis of such things as Worcester [Worcestershire] sauce. Beancurd is really a king of junket containing good digestible protein, it can be added to soups or stews. Made fresh daily... A dry cake is made [pressed tofu], also spiced, pickled, fried and fermented. The latter is just like a kind of strong cheese." Soybean milk is made by "grinding the [soy] bean with water, one part of bean to about 9 of water.

Photos (on unnumbered pages, against a black background, with a small cm ruler show): (1) Four young soybean pods with beans inside. Four soybean sprouts 8-10 cm long.

Also discusses many other edible Chinese legumes. Address: 1. Henry Lester Inst. of Medical Research; 2. Public Health Dep., Shanghai Municipal Council.

1182. *Soybean Digest.* 1940. Soybeans' traveling emissary... 1(1):5. Nov.
• ***Summary:*** A photo shows a large, three panel traveling exhibit that will be shown, by request, during November in the first floor foyer of the United States Department of Agriculture Building in Washington, DC. The exhibit was prepared for the American Soybean Association by the agricultural department of the Pennsylvania Railroad

with cooperation from the NSPA and the National Farm Chemurgic Council. The three panels are titled Farm, Industry, and Home, respectively. The display, debuted at the ASA meetings in Dearborn, Michigan on Aug. 18, 19, and 20, then went to several state fairs, and is now on the first floor foyer of the USDA building in Washington, DC. The industrial panel shows various paints, varnishes, and auto accessories. In the center of the third panel (Home) "is a Pennsylvania Railroad Dining Car finished inside and out with soybean oil and varnish, illustrating how this farm crop enters into the daily life of the traveling public"

"Flour for various uses, cooking and salad oils, nut butter, soy spread, wafers, nuts, macaroni, spaghetti, bread and cookies, together with soy milk, chocolate drink, coffee substitute, candy coated soy puffs are a few of the uses in which soybeans are prepared for human consumption."

1183. Battle Creek Food Company. 1940. Authorized dealer price list. Battle Creek, Michigan. 1 p. *
• ***Summary:*** Dr. John Harvey Kellogg was particularly interested in the nutritional use of the soybean in dietetic diets. In his 1940 price list, the following soy products are listed: Soy Beans, Cooked (10 oz cans). Soy Beans, Green (1 lb, 3 oz can). Soy Gluten Wafers (3½ oz). Soy Flour (1 lb or 4 lb). Soy Gluten Bread (in tin). Soy Kee (16 oz). Soy Milk, Condensed (10 oz tin). Soy Spread (8 oz). Address: Battle Creek, Michigan.

1184. **Product Name:** Miller's Soyalac Soya Milk [Spray-Dried, All-Purpose Flavor; Liquid, All-Purpose, or Chocolate].
Manufacturer's Name: International Nutrition Laboratory.
Manufacturer's Address: Mt. Vernon, Ohio.
Date of Introduction: 1940.
Ingredients: Water, sugar, soya oil, salt, vitamin D, calcium, soya beans.
Wt/Vol., Packaging, Price: 1 pint 4 oz can.
How Stored: Shelf stable.
Nutrition: 3.4% protein, 3% fats, 5.2% carbohydrates. 20 calories per liquid ounce.
New Product–Documentation: Label, 4.5 by 11 inches. Contents: 1 pt. 4 oz. "The Vegetable Food Drink." 3.4% protein.

USDA War Food Administration, Food Distribution Administration. Grain Products Branch. 1943. Dec. "Soya products distribution." p. 5. International Nutrition Laboratory / Miller's Soya Foods makes SoyaLac, Chocolate SoyaLac, and Soy-A-Malt. "Distribution scattered throughout the United States by Health Stores."

Ad in *Soybean Digest.* 1945. Sept. p. 40. Shows 3 large bottles of "Soyalac: A spray-dried infant food." A photo of an infant appears on the front of each bottle.

Soybean Blue Book. 1947. p. 72; 1948. p. 84. "Soyalac. Soybean milk, powdered and liquid." Also listed in 1960, 1965.

1185. **Product Name:** Miller's Soy-A-Malt [Spray Dried: Natural Malt, or Chocolate flavors].
Manufacturer's Name: International Nutrition Laboratory.
Manufacturer's Address: Mt. Vernon, Ohio.
Date of Introduction: 1940.
Wt/Vol., Packaging, Price: 1 lb can.
How Stored: Shelf stable.
New Product–Documentation: International Nutrition Laboratory. 1940? "Miller's Soy Bean Foods." Undated 12-page leaflet. 2. Miller's Soy-A-Malt: A spray-dried powder available in both natural and chocolate flavors, packed in 1-pound cans, which make 1 gallon of "vegetable milk."

Ad in *Soybean Digest.* 1941. Sept. p. 17. "New items for the table: Soy products by Miller." "Soy-A-Malt: A delicious wholesome soy-malted milk–a pure vegetable beverage containing all and more of the food qualities of milk."

Ad in Leaflet titled "Optimal Nutrition in Infant Feeding." Undated. "Soy-A-Malt is put out under registered trade mark No. 390909 U.S. Patent Offices."

USDA War Food Administration, Food Distribution Administration. Grain Products Branch. 1943. Dec. "Soya products distribution." p. 5. International Nutrition Laboratory / Miller's Soya Foods makes SoyaLac, Chocolate SoyaLac, and Soy-A-Malt. "Distribution scattered throughout the United States by Health Stores."

1186. **Product Name:** SoyaLac (Powdered Soymilk Infant Formula). Renamed Miller's Soyalac by Sept. 1944.
Manufacturer's Name: International Nutrition Laboratory.
Manufacturer's Address: 13246 Wooster Rd., Mt. Vernon, Ohio.
Date of Introduction: 1940.
Wt/Vol., Packaging, Price: Powdered.
How Stored: Shelf stable; refrigerate after opening.
New Product–Documentation: Ad in *Soybean Digest.* 1941. Sept. p. 17. "New items for the table: Soy products by Miller." "SOYALAC: Spray-dried Infant Food–the perfect formula for the new-born infant–especially fine for malnutrition and allergic conditions."

Ad in *Soybean Digest.* 1944. Sept. p. 61. "Meet the Vegetable Cow." International Nutrition Laboratory now makes (1) Miller's Soyalac (powdered milk), plain, malted, or chocolate; and (2) Miller's Soyalac (soya milk), liquid, natural, or chocolate.

Shurtleff. 1981. Sept. Dr. Harry W. Miller: History of his work with soyfoods. Unpublished manuscript. Powdered Soya Lac was first produced in 1940.

Talk with Lillian Miller, wife of Clarence Miller, Dr. Miller's eldest son. 1994. March 28. She thinks Dr. Miller's first soymilk infant formula was sold in powdered form. After introducing a liquid for adults, Dr. Miller built equipment that would spray dry the liquid.

1187. **Product Name:** Miller's Soya Lac. Renamed Soyalac by 1952.
Manufacturer's Name: International Nutrition Products, Inc.
Manufacturer's Address: 41 Nagathan St., Manila, Philippines. Phone: 6-62-71.
Date of Introduction: 1940.
New Product–Documentation: Ad in *Manila Tribune*. 1941. Aug.

Ad in *A Half Century of Philippine Agriculture.* Manila, Philippines: Liwayway Publishing. p. 433. "Soyalac. The wonder vegetable milk. Processed by International Nutrition Products, Inc., 41 Nagathan St., Manila. Tel. 6-62-71. Note: This is the earliest reference seen for the company's name, address, and phone number. They could have been different in 1941. Note also that the product is now named Soyalac.

Shurtleff & Aoyagi. Soymilk Industry & Market. p. 106-07. Made at the first soymilk plant in the Philippines, set up by Dr. Harry Miller and Mr. Paul Sycip.

Note: This is the earliest known commercial soy product made in the Philippines.

1188. Carqué, Otto. 1940. Vital facts about foods: A guide to health and longevity with 200 wholesome recipes and menus and 250 complete analyses of foods. 4th ed. Glendale, California: Natural Brands, Inc. 239 p. 23 cm. Revisions and supplements by Mrs. Lillian R. Carqué. [20+* ref]
• ***Summary:*** This manual of food reform discusses the importance of a simple vegetarian diet, fresh air, pure water, exercise, and rest. Also discusses acid and alkaline foods, the treatment of disease, and food preparation. The author lived 1867-1935.

The nutritional value of soy beans is discussed briefly on pages 113, 145, 153, 162, and 174. The section titled "The Soy Bean, a Remarkable Food" (p. 176-78) describes and discusses boiled soy beans, soy bean milk, tofu, soy sauce, and soy bean sprouts; recipes for Baked soy beans, Soy bean loaf, and Soy bean bread are given. The content of this section is slightly different from that of the 1933 edition.

A table (p. 221) gives the average chemical composition of various legumes, including soy beans.

Note: This enlarged 4th edition contains 239 pages, compared with 208 pages in the first 3 editions. The type for the entire book appears to have been reset. Address: Los Angeles.

1189. Mackay, Helen M.M. 1940. Soya bean flour with dried milk: A cheap and efficient substitute for breast milk. *Archives of Disease in Childhood* 15:1-26. Summarized in Soybean Digest, May 1941, p. 8. [45 ref]
• ***Summary:*** Research was conducted on 225 babies in London, but only 150 were available for the final statistical comparison. Of these 150, 48 were fed yolac (a mixture of dried milk and Soyolk whole soya flour), and 102 were controls, 49 of these latter getting iron-containing dried milk with cod-liver oil, and 53 the same dried milk and iron with vitamin D and no supplement of vitamin A. Over 75% of the children were under 3 months of age when first seen. All children participated for at least 5 weeks, and the average time was 9 months.

Note: This is the 3rd earliest document seen (Aug. 2013) that contains the word "soymilk," spelled as one word (see pages 2 and 8). Address: M.D., F.R.C.P., Member of the Staff of the Medical Research Council, and Physician to the Queen's Hospital for Children, London.

1190. Mariposa. 1940. Hollywood glamour cook book. Miami, Florida: Glamour Publications. Distributed by M. Barrows & Co. xviii + 427 p. Portrait. No index. 21 x 16 cm. [3 ref]
• ***Summary:*** The author presents herself as a glamour girl, who lives in Miami, Florida. She is "Your 'Mystic Pot, with herbs and spice. I charm your meals and make them nice." "Foreword: You must have wondered how the Movie Stars keep so glamorous, vivacious, young-looking and slender, they seem more like gods and goddesses than real people. No wonder they are fairly worshipped by the Movie Fans! This book will disclose to you the beauty secrets of the Movie Stars..." The key is a healthy diet and herbs.

Recommended foods: Whole wheat and soy bean spaghetti, La Choy Soy Sauce and La Choy Molasses Sauce, Soy bean crackers, goat's milk (not cow's milk), all seafoods, fish, poultry, rabbit, venison, lamb, frogs' legs. Foods to avoid: White bread, white flour, white sugar, white rice, spaghetti etc, made of white flour, beef, veal, pork, lard, suet, grease, sulphur dried fruits, table salt ("free running," iodized, but "bag salt" is OK), most soda fountain drinks, "pop" or any drink put up with carbonated water, gassed, dyed, or faked foods. Soy-related: "Legumes" include soy beans (p. xi). Soy honey bread (with soy bean flour and soy milk, p. 7). Soy honey rolls (p. 8). Soy corn sticks (with soy bean flour, p. 22). Soy vegetable flour sticks (p. 23). Soy waffles (p. 24). Soy [pie] crust (p. 35-36). Soy short cake (p. 52). To make soy bean milk and corn milk (from soy bean flour, p. 78-79). Soy milk and carrot juice (p. 79). Soy bean coffee (p. 83). Coffee substitutes (incl. soy, p. 85). Canapes d'amour (with soy bean bread, p. 102). To cook Soy Sea Shells or Soy Macaroni (p. 122). Soy kidney pie (p. 132). Soy macaroni or spaghetti (with soy or Savita Sauce, p. 200). Soy beans–highlights (p. 213-14). Soy baked beans (p. 214). Proteins (incl. soy, p. 386-87).

Also discusses: Garbanza pie crust (p. 36, 212). Electric vegetable juicer (p. 68). Importance of alkaline diet (p. 68-69, 238-39, 388-91). A table (p. 101), titled "Raw nut butters," lists 12 types: "Peanut, butternut, lychees, almond, pecans, pignolia nut, pistachio nut, paradise nut, cocoanut, hazelnut, beechnuts, cashew, walnut, chestnut, Brazil nut,

and sesame tahini. Note: These butters are sold at the fancy grocer's or Health Food Stores." Note: This is the earliest English-language document seen (May 2011) that mentions "tahini" or "sesame tahini"–a smooth paste of sesame seeds. According to *Webster's Dictionary,* the word "tahini" comes from the Turkish *tâhin* and was first used in English in about 1899.

Carrot peanut butter canape (p. 101). Mock liverwurst. Vegetarian dinner party (p. 287).

Glamour guide (p. 360-61). Planetary foods and menus (by astrological sign, p. 277-341). Tables showing the best food sources of various vitamins and minerals (p. 365-417).

In the chapter titled "Snacks and Beverages" is a recipe (p. 76-77) for a Date and goat's milk shake, which is "better than any soda treat" and which calls for use of an "electric blender." The recipe for "Orange honey nanny shake" (p. 77) states: "For a more frothy drink, whip with electric blender..." See recipe for soymilk made from soy flour. Recommends buying foods and herbs in health food stores.

In the section titled "Recognition and gratitude" (p. 392) near the end of the book, she thanks "Henry Lindlahr, M.D.," "Otto Carqué, Mausert, M.D.," and many other lesser-known people.

Talk with Akasha Richmond. 2004. June 5. Akasha has been able to find out very little about the author of this book, who she thinks self-published it. Although she lives in Florida, she talks about "glamour girls" and Hollywood. Address: 1265 S.W. 11th St., Miami, Florida.

1191. Matagrin, Am. 1940. La culture du soja: Avec des notions sur l'histoire, l'intérêt économique, la composition, les emplois agricoles, alimentaires et industriels de la fève asiatique [Cultivation of soya: With notes on the history, economic interest, composition, and agricultural, food, and industrial uses of the Asiatic bean]. Chindrieux (Savoie dept.), France: Published by the author. 125 p. 22 cm. [17 ref. Fre]

• ***Summary:*** Contents: Introduction: The soybean and its seed, historical summary of the culture and use of soybeans, economic questions–the soybean worldwide and in France. I. The climatic and agrological preferences of the soybean and its needs for fertilizers (organic, chemical, or microbiological). II. Methods and cultural styles for soybeans: the seed, the plant, and its evolution. III. The soybean harvest: Methods, yields, storage, how to select the seeds. Conclusion: Agricultural, food, medicinal, and industrial uses of soybeans: 1. Agricultural uses: Fertilizer and livestock feed. 2. Food uses (p. 108-18): As a vegetable, sprouts, flour, milk (incl. tofu, condensed milk, and fermented milk), fermented products, roasted (as a coffee substitute), oil (incl. margarine and vegetable butter), lecithin, and edible casein (purified soy protein). 3. Medicinal uses (p. 118). 4. Industrial uses: the oil, soaps, industrial proteins.

Note: Matagrin has written previous books: The industry of chemical products and its workers (1925), In the country of the sun (1927, a novel with Felix Vial), The soap-maker's manual (1938), and The soybean and its industries (1939). Address: Anc. Professeur et Bibliothecaire Scientifique, Conseil en Chimie appliquee, Savoie, France.

1192. Piedallu, André. 1940. Produisons du soja [Let's produce soybeans]. *Gouvernement General de l'Algerie. Direction de la Production Agricole. Documents et Renseignements Agricoles. Bulletin* No. 19. 4 p. [Fre]

• ***Summary:*** Describes the basics of cultivation: Soil, culture, fertilization, sowing for forage or seeds, time of planting, harvest, threshing, yield (forage and seeds), composition of the seeds compared with wheat and beef. Products made from soybeans: Flour for diabetics, oil, lecithin, paints and varnishes, soymilk, tofu, artificial wool, soybean cake for feeds, soy sprouts, roasted soy coffee that is popular in Switzerland and Italy, soy oil mixed with hydrogenated fish oils is used in Germany to make margarines. Address: Pharmacien Lieutenant-Colonel, Docteur es-Sciences, Ingenieur Chimiste.

1193. Sampaio, Sebastiao C. 1940. Soja [Soybeans]. Sao Paulo, Brazil: Tipografia Brasil, Rothschild Loureiro & Cia, Ltda. 43 p. Secretaria da Agricultura, Industria e Comercio do Estado de Sao Paulo. [20 ref. Por]

• ***Summary:*** Contents: Introduction: Soya. Botanical description. Varieties. Composition of the plant. Culture/cultivation. Enemies and pests. Improvement of the seeds: Improving the oil (*óleo dos graos de soja*), improving the cake and flour, other improvements. Commerce and trade.

This general book draws heavily on U.S. publications, including Piper and Morse, 1923. The section titled "other improvements" (p. 38-39) briefly mentions many food uses of soybeans, including vegetable-type soybeans (Easycook and Hahto), green vegetable soybeans (*Quando verdes... elas constituem ótimo legume verde = when green... they constitute an excellent green vegetable*), sprouted seeds (*sementes germinadas*), soy flour, soymilk (*leite de soja*), soy casein, soy cheese (*queijos e requeijoes*) [tofu], shoyu, and miso. The Japanese colony in Sao Paulo makes shoyu in commercial quantities.

Note 1. This is the earliest Portuguese-language document seen (June 2009) that mentions green vegetable soybeans, which it describes as shown above.

Note 2. This is the earliest Portuguese-language document seen (Sept. 2006) that uses the term *óleo dos graos de soja* to refer to soybean oil.

Note 3. This is the earliest Portuguese-language document seen (Jan. 2013) that mentions sprouted soybeans, which it calls *sementes germinadas.*

Note 4. This is the earliest Portuguese-language document seen (April 2013) that uses the term *queijos e*

requeijoes to refer to tofu. Address: 3a Seccao Tecnica do Departamento do Fomento da Producao Vegetal, Sao Paulo, Brazil.

1194. White, Julius Gilbert. 1940. Abundant health: A digest of the "Learn-how-to-be-well" lectures. Madison College, Tennessee: Published by the author. ix + 317 p. Illust. 28 cm. [soy ref]

• ***Summary:*** Advocates vegetarian diet. Note that Madison College is a Seventh-day Adventist college and sanitarium. One section, titled "The Soy Bean–The Wonder Food," introduces the many benefits of soybeans, discusses their low cost, and describes (in fairly specific terms, but without recipes), how to use soybeans in baking, as cooked or canned beans, in commercial "meat substitutes," as soybean milk (good for those with allergies to cow's milk), as cheese (tofu), as greens (soybean sprouts), or in commercial "coffee substitutes." Note: The author lived 1878-1955. Address: Madison, Tennessee.

1195. Chéron, E.P. 1940? Le Soja: Culture et récoltes. Ses applications alimentaires, industrielles et thérapeutiques. Son avenir. Recettes gastronomiques et culinaires. 5e édition. Provendes au Soja [The soybean: Cultivation and harvest. Its food, industrial and therapeutic applications. Its future. Gastronomic and culinary recipes. Uses as fodder]. Sanguilles, Indre département, France: Comptoir Agricole de Centre. 48 p. Undated. Illust. (many photos). No index. 21 cm. [10 ref. Fre]

• ***Summary:*** Contents: Introduction. 1. Study of the botany and composition of the plant: its cultivation and vegetation.

2. Study of the seed; food and industrial applications. Soymilk, condensed and powdered soymilk, fermented soymilk (kefir, yogurt), okara (*résidus de laiterie de Soja*), Ajimoto [sic, Ajinomoto], soy cheeses / tofu (*fromages de soja*), applications of soy legumine in industry: vegetable wool and rayon, soy oil, sterol, soy flour, soy germ flour (farine de germe de Soja), soy coffee (Soféрur / Sofepur, Grillsoy), feed for animals, soymilk for animals, soybeans as feed for adult animals, conclusion. Appendix to the first edition: the soybean, a complete food, a medicinal food, a food for infants. Recipes for soy cuisine. Soy industries: making soy oil, lecithin, plastic materials, soybean cake: refining, neutralization, deodorization, decoloration, properties of soy oil, use of soy oil in France. The by-products of soy oil: lecithin, its properties, food uses, industrial uses. Soy casein, substitute textiles and plastic materials based on soy. Use of soy for raising young animals.

Note 1. A previous edition may have been titled: *Le Soja: Son histoire, sa culture, ses applications industrielles et alimentaires.*

Note 2. On page 1 the author's enlarged title is given as *Président du Syndicat National des Producteurs, des Amis et des Techniciens du Soja por la propagation du Soja en France et en Afrique du Nord.* Address: Président du Syndicat National des Producteurs de Soja en France et aux Colonies, France.

1196. International Nutrition Laboratory. 1940? Miller's soy bean foods (Brochure). Mt. Vernon, Ohio: International Nutrition Laboratory. 12 panels. Each panel: 19 x 10 cm. Undated.

• ***Summary:*** A description (probably written by Dr. Harry W. Miller) of each of the following foods is given: 1. Miller's Soya Lac: A liquid milk packed in 13 oz. and 30 oz cans. It is available in both natural and chocolate flavors. 2. Miller's Soy-A-Malt: A spray-dried powder available in both natural and chocolate flavors, packed in 1-pound cans, which make 1 gallon of "vegetable milk." 3. Miller's Soya Curd: "This delicate protein food is made by coagulating Miller's Soya Lac with lactic acid and then blending this soft curd with tomato puree, pimento and Soya Sauce. It is a pleasing protein addition to salads, or for spreading crackers and sandwiches."

4. Miller's Mien Jing: Wheat "gluten, or cereal protein, is the basic food element in Miller's Mien Jing. Mien Jing is the Oriental name meaning processed gluten. A high protein wheat flour is washed free of starch, and small slices of the remaining gluten are processed with fresh vegetables and soya sauce, making a highly nutritious food, quite meat-like in taste. This gluten food was first introduced into this country by us, and our Mien Jing, or gluten cutlets, has the genuine flavors that have popularized this food in the Orient... It requires only a little cooking to make Mien Jing into many savory dishes, such as stews, croquettes, entrees, and also Oriental dishes such as Chow Mien and Chop Suey."

5. Miller's Soya Sauce: "Produced in South China where the finest soya sauce is made, insuring a pure and highly concentrated product. It should be used in flavoring all protein dishes where a meat-like flavor is desired." 6. Miller's Soya Loaf: "Made from especially selected high protein edible soya beans, low in fat and carbohydrates. This food will be found to be a very pleasing entree that can be served as it comes from the can, or made into appetizing roasts, pot-pies, sandwiches, and other meat substitute dishes."

7. Miller's Soya Spread: This canned product can facilitate the making of tasty and nutritious sandwiches. 8. Miller's Whole Soya Bean Flour: This flour "is not made from oil extracted 'bean cake,' but fresh selected edible soya beans are ground to produce this rich golden flour. Wheat flour is classed among the acid foods while soya bean flour is strongly alkaline... One part of Soya Flour will neutralize the acidity of four parts of wheat flour." 9. Miller's Green Soya Beans: These delicious canned green beans "are an abundant source of Vitamins A, B, and G, and a splendid source of calcium, phosphorus and iron... rich in protein, they can be

served just as they come from the can. They make a splendid addition to a vegetable salad. They combine well with many of the vegetables in cooking. Surprise your family and friends by serving this new food.

10. Miller's Giant Soya Beans: These soy beans are high in protein (43.18%) and low in fat (18.7%). "Miller's soy beans are processed so that the nutlike flavor is brought out and they are rendered entirely digestible. The eating of the soy bean creates an alkaline reserve so necessary for the healthful functioning of the body." 11. Miller's Soya Beans with Tomato Sauce: Edible soy beans are canned with tomato puree and malt. "This is truly a treat for the picnic lunch."

This brochure contains 8 recipes using Miller's products. Three panels discuss the "Dietetic advantages of the soy bean;" across the bottom is written in large letters "Alkalinize with Miller's Soy Bean Foods." These panels note of the soya bean: "So highly does it stand in the list of foods from the vegetable kingdom that the International Nutrition Laboratory is devoting 95% of its effort to the output of foods made from the soya bean." Edible Soy Beans are a remarkable food, a complete protein with adequate calcium for optimum metabolism, a ready alkalinizer, rich in Lecithin and Cephalin–the nerve foods, and "The only vegetable protein that is biologically able to substitute for animal protein... It is indeed unfortunate that so little interest has been aroused here in America in the culture of the so-called vegetable or edible type of soy beans... The International Nutrition Laboratory uses only these edible beans for canning and food manufacture.

"This institution now located at Mount Vernon, Ohio, first began its work in Shanghai, China, where extensive nutrition experiments were carried out in the feeding of infants, children and adults on soya milk. It operated a Soya Bean Dairy, providing daily milk distribution of plain and chocolate soya milk to thousands of persons. But as this plant was practically demolished during the recent war in the Orient, it was organized again in 1939 in Mount Vernon, Ohio as the International Nutrition Laboratory, and is producing from the edible soya bean all the valuable foods described in this folder."

Another panel describes the "Advantages of vegetable milk." Large letters across the bottom state: "Alkalinize with Miller's soy bean foods."

Note 1. This is the earliest document seen (April 2002) with the term "soy bean foods" in the title.

Note 2. This is the earliest document seen (Aug. 2013) that uses the term "Soy Lac" to refer to a soymilk. Address: Mt. Vernon, Ohio.

1197. **Product Name:** Soyagen (Soymilk for General Use) [Powdered, or Spray Dried].
Manufacturer's Name: International Nutrition Laboratory.
Manufacturer's Address: 13246 Wooster Rd., Mt. Vernon, Ohio.
Date of Introduction: 1941. January.
New Product–Documentation: Raymond S. Moore. 1961. *China Doctor.* p. 185. After developing Soyalac, Dr. Miller developed a different product for adults, which he called Soyagen.

Talk with Raymond C. Kraft. 1989. Oct. 24. He worked for Dr. Miller from Jan. to Sept. 1941. When he started, he thinks he recalls that the company was making Soyagen in both liquid and powdered forms. Note: The year that this product was introduced and the manufacturer's name at that time are not certain.

1198. Holman, Ross L. 1941. Soybeans and college degrees. *Forward magazine* 60(5):5. Feb. 1.
• ***Summary:*** About Madison College, located near Nashville, Tennessee, and their work with soybeans and soyfoods. Reprinted in the *Madison Survey* of March 1983, p. 8.

Madison College has developed a large number of soybean food products and is selling them all over the United States "in such a volume as to net that institution a large amount of the revenue it needs to operate.

"In fact, Madison College is getting almost its entire support from its own 800-acre farm... Nearly all of its 400 students earn their tuition, board, clothes, and all personal expenses by growing these crops and preparing them for use.

"The most interesting of these processing plants is the soybean factory where these beans are manufactured into thirty different food products which, in addition to what are consumed at the college, bring the institution a revenue of $60,000 a year. Among these foods are meat, bread, cheese, breakfast foods, pork and bean products, sweet milk, buttermilk, and coffee... They say that such foods are more nourishing than the meat or vegetable products for which they are substituted.

"Take soybean milk, for instance. You can't tell it from any cow's milk you ever saw, except when you taste it. You may not like the taste, but many consumers prefer it to that drawn from a cow...

"The bread made from soys is baked in loaves of the same size and shape as bread from regular bakeries. This bread is sold in nearly all the grocery stores of Nashville and in other cities. All these soy foods are sold to grocery chains and are consumed from coast to coast...

"Madison College was started 37 years ago by Dr. E.A. Sutherland, who is still its president... The students have not only been working their way through college but have actually built, with their own hands, the 120 buildings in which the institution and its industries are operating. They not only process the soy foods and serve them to the patients of the sanitarium, but they also constructed the factory and sanitarium buildings in which these foods are made and consumed."

Note: Forward magazine is published weekly by the Board of Christian Education of the Presbyterian church,

USA.

1204. Morgan, Helen. 1941. Jack in the beanstalk. *Scribner's Commentator* 9:82-84. April.
• ***Summary:*** The subtitle reads: "Salad dressing, milk for the baby, varnish, fertilizer, steering wheels for Fords–and profits- all come from the soybean, agriculture's miracle crop."

"Few plants have been subjected to such a thorough dissection in such a short space of time. Recently it's been found that the same protein of soybean, which, when mixed with water, chemicals, and coloring, makes the steering wheels and horn buttons for Henry Ford's cars, can also be whipped into a lofty meringue. Commercial bakers may use it instead of expensive egg-white."

Note 2. This is the 2nd earliest document seen (Aug. 2002) that uses the term "miracle crop" in connection with soybeans.

1205. *Calcutta Municipal Gazette.* 1941. ABC of soya bean. 34(2):49. May 31. *
• ***Summary:*** This article is reprinted in Dr. K.M. Nadkarni's book *Indian Materia Medica* (Vol. 1, p. 1145-48). The title of each paragraph starts with a different letter of the alphabet. The many benefits of soya beans are discussed. Soybean milk, flour, oil, and lecithin are mentioned.

1206. Concepcion, Isabelo. 1941. Significance of soy bean in the dietary of Filipinos. *Acta Medica Philippina* 2(4):479-95. April/June. Read before the Sixth Pacific Science Congress, San Francisco, California, July 24 to Aug. 12, 1939. [28 ref]
• ***Summary:*** Contents: Introduction. Composition and nutritive value. Supplementary value of soy bean (to a rice-based diet). Forms of soy bean used in Philippines: Soy

bean curd or "tokua," fermented bean curd or "tahuri," soy bean curd brain or "tojo" (served with a little thick brown sugar syrup), soybean with shaved ice or "mongo con hielo," soy bean flour, soy bean milk. Deficiencies of Filipino diet. Effects of improper food. The need for a campaign to popularize soy bean products. Conclusions.

"Soy bean is grown in many parts of the Philippines where it is known as 'utao' and also as Chinese 'Balatong.' It is grown in large quantities in Batangas Province. The green pods are harvested in October and November and the dried seeds may be had in bulk in December and January. Just when soy bean was first cultivated in the Philippines is not known. For years casual plantings have been made but it is only in comparatively recent years that the cultivation has been seriously considered as an agricultural industry. Statistics indicate that consumption of soy bean in the Philippines has grown faster than production. They also show a growing appreciation of soy bean in the Philippines."

Soy bean with shaved ice "is a very popular soy bean mixture introduced by the Japanese but now sold in nearly all refreshment parlors all over the Philippines. The preparation consists of a mixture of boiled red mongo and soy bean mixed with cream, brown sugar and ice shavings. This form of soy bean mixture is more nourishing than any other preparation just described on account of its cream and sugar content."

The consumption of soy bean products in the Philippines "does not amount to very much. The reason for this apparent neglect is the general lack of sufficient information. It is desirable that the government should initiate the necessary campaign to inform the people regarding the valuable nutritive properties of soy bean. Although the Bureau of Science since 1931 has been carrying a demonstration campaign to teach the public the different methods of cooking soy bean with the aim of popularizing its use among the masses, its efforts so far have not yielded the expected results. Another reason is the lack of a central body in the Philippines that can coordinate all the nutrition work to be carried out in that country. Furthermore, there is lacking a definite long range policy for the betterment of nutrition...

"The popularization among the masses of soy bean and soy bean products like soy bean curd, soy bean flour, and soy bean milk should be undertaken along with a more intensive campaign about its nutritive value carried on in the different schools all over the Philippines."

Note 1. In section titled "Fermented bean curd or 'Tahuri'" (4 paragraphs and 1 table), the text is a combination of that first presented by Gibbs and Agcaoili (1912) and Orosa (1932). Although the word "fermented" is used here to describe *tahuri* for the first time, no information about a fermentation microorganism or process is given.

Note 2. This is one of the earliest English-language documents seen (Sept. 2006) that uses the term "Soy bean" in a new way–as a singular noun, like corn or wheat, not preceded by "the." Examples: "Soy bean is grown in many parts of the Philippines..." "... campaign to teach the public the different methods of cooking soy bean with the aim of popularizing its use among the masses,..." Address: Dep. of Physiology and Biochemistry, College of Medicine, Univ. of the Philippines.

1207. Morse, W.J. 1941. Shanghaied... a super food. *Soybean Digest.* July. p. 4-5, 10. [10 ref]

• ***Summary:*** The super food is green vegetable soybeans from edible soybeans. "Attempts to secure seed of these food varieties from oriental countries through correspondence met with little success, due to the fact that the edible types were classified under another name than the soybean. During agricultural exploration work in the Orient from 1929 to 1931, many varieties of soybeans were found in Japan and Chosen [Korea] which were used solely as green vegetables or dry edible beans." These varieties have been under test for the past 8-9 years at various agricultural experiment stations throughout the United States.

A table shows 42 "edible varieties of soybeans classified according to maturity." Very early (100 days or less): Agate, Sioux. Early (101-110 days): Bansei, Chusei, Etum, Giant Green, Goku, Kanro, Kanum, Sac, Tastee, Waseda, Yellow Marvel. Medium Early (111-120 days): Fuji, Hakote, Hiro, Hokkaido, Jogun, Kura, Osaya, Sato, Shiro, Sousei, Suru, Toku, Willomi, Wolverine. Medium (121-130 days): Chame, Emperor, Funk Delicious, Illington, Imperial. Medium late (131-140 days): Aoda, Easycook, Hahto, Higan, Rokusun. Late (141 or more days): Green, and Black, Jackson, Jefferson, Nanda, Seminole.

"Most of these edible types have been found to be much superior to the commercial varieties in flavor, texture, and ease of cooking. Moreover, tests have indicated that the flour made from edible types has a better flavor than that made from commercial varieties. Some of the edible types have also been judged to be superior to commercial types in the manufacture of bean milk, roasted beans and other food products...

"One of the most promising uses of edible varieties of soybeans is as a green shelled bean and for this purpose the pods should be picked when the beans have reached the full size but are still green and succulent. The green beans resemble young, tender Lima beans and have a rich, distinctive and delicious flavor... The usual oriental way of cooking green soybeans is to boil the pods in water flavored with soy sauce or salt and serve them to be eaten from the pod."

In America, "Several commercial concerns have canned large packs of green soybeans, which have become quite popular."

Photos show: 1. Soybeans sprouts pushing up out of spherical earthenware pots at a market in East Asia. 2. A woman selling "soybean curd" ("the 'boneless meat' of

millions of Oriental people") in a Korean market. 3. "In place of candy between meals, Japanese children often carry about a small bag of cooked [green] vegetable soybeans, break open the pods and lick the salty beans out with their tongues." 4. Roasted soybeans, which are used extensively in candies in Japan. 5. Portrait of William Morse. 6. Green vegetable soybeans (in the pods on plants, or shelled) being sold in a Korean farmers market. 7. "This Japanese farm girl has just pulled an armful of green vegetable soybean plants to prepare for market." 8. A Korean peddler with a large pack of green vegetable soybeans on his back.

Note: This is the earliest document seen (Aug. 2013) that mentions the soybean varieties Etum, Green and Black, Jackson, Jefferson, Kanum, Sac, Seminole, Tastee, Wolverine, or Yellow Marvel. Address: USDA Bureau of Plant Industry, Washington, DC.

1208. Ukil, A.C. 1941. Soya bean as a component of balanced diet. *Science and Culture* (*Calcutta*) 7(1):49-53. July; 7(2):111-16. Aug. [3 ref]

• ***Summary:*** This article is largely a summary of: Orosa, Maria Y. 1932. "Soybeans as a component of a balanced diet and how to prepare them." *Manila* (*Philippines*) *Bureau of Science, Popular Bulletin* No. 13. 53 p.

It begins: "In view of the interest recently created in the value of the soya bean to make up for the deficiency of protein in the diet of starch-consuming agricultural populations of countries lacking a sufficient supply of high quality proteins like milk, fish, meat and eggs in their diet and in view of its extensive use in China, Japan, the Philippines, U.S.A. and more recently the German army, the following..."

"Although isolated attempts [have been made and] are being made in India to cultivate the bean, no systematic efforts have yet been made to encourage its use on a sufficiently large scale for commercial purposes and to supplement the food resources of the country... Soya bean is not only much more nourishing but has many more uses than *dal."*

Foods discussed (in July) include: Soya-bean flour, soya-bean milk (regular or condensed), coffee made from roasted soya beans, soya bean sprouts (a table shows they are much more nutritious than mung bean sprouts), soya bean oil, soya bean casein, soya bean curd [tofu].

August issue: "Some common foods and their methods of preparation:" Soya sauce (using koji, based on Groff 1919). Soya-bean flour. The cooking of soya beans (immature [green vegetable soybeans] and mature). Some food recipes with soya beans: Of the 22 recipes given, 17 call for boiled whole soya-beans, 2 for roasted soya-beans [dry roasted, soy nuts], one for soya-bean flour (Angel cake), and 3 for soya-bean milk (two puddings and a custard). Address: Member, Sanitary Board, Bengal [India].

1209. *Science News Letter.* 1941. Soybean protein to replace milk casein. 40:89. Aug. 9.

• ***Summary:*** "Soybean protein is scheduled to replace milk casein as paper sizing, as an adhesive in making plywood, as an ingredient in water paint, and in many other industrial uses, chemists of the U.S. Department of Agriculture state. Freeing milk casein from industrial demands will aid national defense as well as the aid-to-Britain program, for casein is the raw material from which cheese is made, and more cheese is one of the prime needs of the food-export program...

"It is estimated that 10,000 tons of soybean protein will be required annually, on the basis of present needs, to make up for casein shortage."

Note. This is the earliest English-language document seen (Aug. 2013) that contains the term "replace milk" or the term "replace milk casein."

1210. *Manila Tribune* (*Philippines*). 1941. Soya-Lac Supplement (Ad). Aug. 16. *

• ***Summary:*** This full-page supplement, including a 5-column ad for Miller's Soya Lac, is devoted to the story of soya milk and the soya bean. The lead article states: "By unbiased laboratory analysis, soya milk has been found to be virtually identical to cow's milk in nutritional elements, and higher, in fact, in protein content." Paul Sycip, a soya milk chemist and a graduate of the University of the Philippines, recently returned from a tour of U.S. soya milk factories. He stayed most of the time with Dr. Harry W. Miller, owner of the patent on soya milk processing.

Another article quotes Rafael Alunan, Philippines Secretary of the Interior, as saying that "The National Land Settlement Administration is already committed to the growing of the soybean on a large scale in the Koronadal Valley and to making soybeans one of the major producing crops."

1211. *Times* (*Morning ed.*) (*Chattanooga, Tennessee*). 1941. The lowly soybean rises. Aug. 29.

• ***Summary:*** "Most people don't know what soybean are. They associate them, rather loosely and vaguely, with cover crops on farm hillsides. Something cows eat, maybe. But the lowly soybean may hold the future of the world health in its little husk.

"Henry Ford has been experimenting with soybeans down on his Ways (Georgia) plantation for many years. He has grown a lot of soybeans and has turned them into plastic things. Mr Ford, it is said, drinks soybean milk. It is healthful.

"Over at the Madison (Tennessee) sanitarium they grow a lot of soybeans, too. The doctors at Madison have found out how to make the soybean look like beefsteak. It not only resembles steak, but it tastes like steak. The soybean is a fine source of protein. So is steak, but the soybean is said to

have steak beaten for the most proteins. The Germans have been using the soybean in their blitzkrieg tactics. The Nazi soldiers have been partly on a soybean diet since the war began."

1212. Liebenthal, Frank; Adolph, William H. 1941. The determination of soybean milk used as an adulteration in cow's milk. *Chinese Medical Journal* 60:174-77. Aug. [4 ref]
• ***Summary:*** Because soybean milk has properties resembling cow's milk, it can be used as an adulterant. Therefore a simple method is needed for measuring if adulteration has occurred, and how much. The basis for this method is the fact that glycinin, the principal protein of the soybean, is a globulin, which under certain conditions is more readily coagulated by sodium chloride than is the casein in cow's milk. The weight of soybean nitrogen in the mixture is directly proportional to the weight of nitrogen found in the coagulum. This rapid method is found to be accurate to ± 2 percent when calculating the percentage of soybean milk used as a coagulant. Address: Dep. of Chemistry, Yenching Univ., Peiping.

1213. LeClerc, J.A. 1941. Re: Cablegram from Dr. C.J. Ferree inquiring about soy milk. Letter to Dr. Charles E. Fearn, Fearn Soy Products Co., 355 West Ontario St., Chicago, Illinois, Sept. 26. 1 p. Typed, with signature on letterhead.
• ***Summary:*** "Dear Dr. Fearn: I am enclosing a copy of a cablegram which was received from Dr. C.J. Ferree inquiring about soy milk... I am also asking the R.E.A. to send you a copy of their recent bulletin on whole wheat flour.

"I want to say right here that I enjoyed meeting you again, and I hope that it may be my pleasure to greet you here in Washington [DC]. Very truly yours... Enclosure." Address: Senior Chemist, Agricultural Chemical Research Div., Bureau of Agricultural Chemistry and Engineering, USDA.

1214. International Nutrition Laboratory. 1941. New items for the table: Soy products by Miller (Ad). *Soybean Digest.* Sept. p. 17.
• ***Summary:*** The three new soy products are: "Soy-A-Malt–A delicious wholesome soy-malted milk–a pure vegetable beverage containing all and more of the food qualities of milk."

"Canned Green Soybeans–Delicious creamed, buttered, or in soups and salads.

"Soyalac–Spray-dried Infant Food–the perfect formula for the newborn infant–especially fine for malnutrition and allergic conditions.

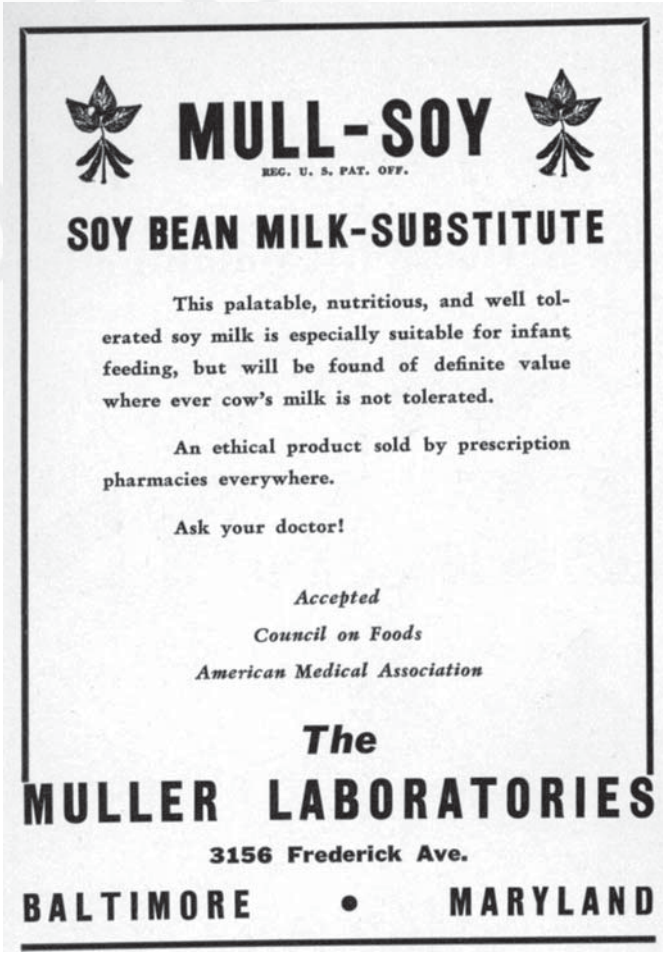
"Available in Health Food Stores everywhere or for further particulars regarding these Miller Soya Foods write International Nutrition Laboratory, Mount Vernon, Ohio."

Note: The meaning of the term "Canned Green Soybeans" is unclear. They were probably canned mature soybeans with green seed coats rather than canned green vegetable soybeans. Address: Mt. Vernon, Ohio.

1215. **Product Name:** Miller's Soyalac Infant Food [Spray-Dried Powder, or Liquid].
Manufacturer's Name: International Nutrition Laboratory.
Manufacturer's Address: Mt. Vernon, Ohio.
Date of Introduction: 1941. September.
Wt/Vol., Packaging, Price: 1 lb can.
New Product–Documentation: Ad in Leaflet titled "Optimal Nutrition in Infant Feeding." Undated. The spray-dried product is packaged in 1-lb cans, "sealed in nitrogen gas to insure shelf wear, 24 cans to the case. It is sold from coast to coast, mainly through health food stores and druggists."

Ad in *Soybean Digest.* 1949. Sep. p. 89. "Soyalac: A Spray Dried Infant Food." A photo shows a can of the Infant Food

1216. Muller Laboratories. 1941. Mull-Soy: Soy bean milk-substitute (Ad). *Soybean Digest.* Sept. p. 28.



• ***Summary:*** This ¼-page, black-and-white ad states: "This palatable, nutritious, and well-tolerated soy milk is especially

suitable for infant feeding, but will be found of definite value where ever cow's milk is not tolerated. An ethical product sold by prescription pharmacies everywhere. Ask your doctor! Accepted: Council on Foods, American Medical Association." Address: 3156 Frederick Ave., Baltimore, Maryland.

1217. Re: Experimental work with plastics, soybean protein fiber, vegetable milk, etc. 1941. Dearborn, Michigan. 2 p. Dec. 4. Unpublished typescript. Courtesy of Henry Ford Museum & Greenfield Village Archives (Dearborn, Michigan). Acc. 285, Henry Ford Office (Correspondence), Box 2453.

• ***Summary:*** "Plastics: Plastics for use in structural applications has occupied much of our attention in the laboratory during the last few years." Formulas for these plastics are generally based on the use of cellulose fibers held together and waterproofed with phenolic resin. Mass product methods have been developed; forming the slurry with a "vacuum mold has shown the most promise. A complete automobile body was made by this method this summer.

"Soybean protein fiber: Our work with the soybean led us a few years ago into the development of a synthetic fiber from the soybean protein. This development has now reached the point where the fiber is suitable for many commercial uses such as the manufacture of felt for mens [sic, men's] hats and for the blending with wool and mohair [goat's hair] for the manufacture of automobile upholstery." The steps for making this fiber are described briefly. "The resulting fibers have will like characteristics and at the present time have about 80% the strength of upholstery grade wool. This procedure has been used on other vegetable proteins such as peanuts and wheat. The peanut protein has given very promising results to date."

"Vegetable milk: Recently a project to develop a vegetable milk to replace cows milk was undertaken. Tests conducted with the Henry Ford Hospital show that rats can live and reproduce for five generations on nothing but a soybean milk. The problem today is to produce a milk that will taste equally as good as cows milk."

"Miscellaneous protein uses: Our work with the soybean protein in the fiber job has led us into other possible uses for the vegetable protein such as a base for water paint, a paper sizing material to substitute for milk casein and as a material for making transparent films. Because of the defense program milk casein is becoming very scarce and expensive and it is imperative that some substitute be found. To date the soybean protein is showing increasing promise of being an excellent substitute. Likewise if the protein is spread in a film under certain conditions a transparent film similar to cellophane can be produced. We are at present experimenting with a small laboratory machine for preparing transparent films from soybean and other vegetable proteins."

Also discusses: Recovery of iron from low grade ores, new sources of magnesium, possible industrial uses of wheat, preservation of fruits and flowers, artificial parts for the human body [prosthesis].

Ford R. Bryan (Jan. 1993) is quite certain that R.H. McCarroll was the author of this document; he "was instructed to keep Carver apprised of Ford research programs. McCarroll was 'Chief Chemist' of the Ford Motor Co., and spokesman for Ford research in general." Address: Dearborn, Michigan.

1218. Savon S., Julio. 1941. La soya: Un vegetal marvilloso [The soybean: A marvelous vegetable]. *Agricultor Venezolano* (*El*) (*Ministerio de Agricultura y Cria, Caracas*) 6(67-68):5-9. Nov/Dec. [Spa]

• ***Summary:*** What is the soybean? It is a legume which was cultivated for more than 5,000 years in the Celestial Empire, which has the important characteristic of being a food of major value as a source of protein, and which can provide a large quantity of derivative foods, forage, and industrial products.

In the Soviet Union there is a Soy Institute (*el Instituto de la Soya*), which is continually experimenting with new soybean varieties.

A table gives the chemical composition of whole soy flour–which contains 38% protein and 22.5% vegetable oil. The soybean is also a source of many other nutrients, including vitamins and minerals. It is also a source of milk, called soymilk (*leche de soya*), which can be made at home from soybeans. There is no danger of tuberculosis in soymilk as there is in cow's milk. Discusses various published experiments feeding soymilk to infants, and gives the chemical composition of Soybee and Sobee, two soy-based infant formulas. There follows one paragraph on each of the following foods: Soy cheese or tofu (*el queso de soya or teo-fu*). Soy sauce or shoyu (*la salsa de soya o shoyu*). Soybean puree (*el puré de soya;* made from dehulled, ground soybeans, boiled for a long time). Soy cottage cheese and butter. Soy oil and lecithin. Soy coffee and chocolate. Soy bread (bread enriched with 10-20% soy flour; good in diabetic diets). Soymilk: A table compares the chemical composition of mother's milk, cow's milk, and soymilk. Address: Dr.

1219. Smith, Robert A. 1941. Re: Experimental work with soy bean milk, etc. Moore [sic, Moir] House Lab., Dearborn, Michigan. 2 p. Courtesy of Henry Ford Museum & Greenfield Village Archives (Dearborn, Michigan). Acc. 285, Henry Ford Office (Correspondence), Box 2453.

• ***Summary:*** "Soy bean milk: A method was developed for the preparation of soy milk that differs from other soy milks on the market. The milk is prepared from purified soy protein, hydrogenated soy oil and corn sugar. It is more like cows milk in appearance, taste and chemical composition than other soy milk products which are made from the whole

bean. It has been tested in the nutrition laboratory of the Ford Hospital in rat feeding tests and when supplemented with the proper vitamins, has produced normal growth when fed exclusively to rats for four generations.

"pH instrument: To aid in the production of soy bean milk and for general laboratory work, a glass electrode pH instrument was designed and constructed. The circuit, which uses for the most part standard radio parts has proven to be accurate, rugged, dependable and easily used."

Also discusses research on water sterilization, fertilizers (synthetic manure vs. composted grass cuttings, and using waste materials), soil analysis, furnace, weeds (fibrous weeds were tested for their fiber strength and retting qualities for use in cellulose plastic). Note: To "ret" is to soak (as flax) to loosen the fiber from the woody tissue. Address: Dearborn, Michigan.

1220. *Soybean Digest.* 1941. German Army Soya Cook Book: Translated by competent authority. Dec. p. 2-6.
• ***Summary:*** This is a summary of the translation of an important book titled *Speisenzusammenstellung unter Mitverwendung von Edelsoja mit Kochanweisungen* (*Formulation of menus using Edelsoja, with recipes*), by Oberkommando der Wehrmacht (German Army High Command), Berlin, 1938.

Contents: Introduction: Problems and possibilities of using full [whole] soya flour, "working" vital elements, carbohydrates lacking, high protein essential, calorie count, excellent for health, economical use of Edelsoja in cooking, the use of Edelsoja in army kitchens (uses of soy flour {a means of making meat go further, a means of economizing on fats, egg substitute, milk substitute for use in cooking, spread for bread, panada}, methods of saving essential foods {savings of meat in minced-meat dishes, savings in fat}), not to be fried.

Resume of recipes as shown in translation: Soups (soups from army canned soups, sweet soups), roasts, roast sliced meat, minced meat dishes, fish dishes, egg dishes, potato and other vegetable dishes, alimentary pastes (macaroni, noodles, etc.), one-dish meals, sauces and gravies, salads and fruit dishes, desserts. Note: No actual recipes are included in this article.

The article begins with a translator's note: "Scientists have devised a method of milling and extracting [removing] the bitter substance from soybeans without removing any of the oil. This produces a yellow flour containing 40 percent protein, 20 percent fat, 27 percent carbohydrates, 5 percent ash, and 8 percent water. This is called full soya flour ('Vollsojamehl') or pure soya ('Edelsoja'). Its composition and use differ widely from cereal flours."

The text states: "A reduction in the use of animal products in the German diet is desirable for economic reasons, as these products must be manufactured from plant materials in a roundabout way by the bodies of the animals themselves. In the process the animals use up the major part of the plant material consumed–about 80 percent–in preserving their own lives."

Full-fat soya flour (*Vollsojamehl*) is also called *Edelsoja.* "This flour is made from the soybean, the cultivation of which in the Reich, and particularly in Austria, is becoming yearly more important... Edelsoja is made from shelled [dehulled] soybeans without the use of chemicals." It has very little taste of its own. The flour itself should not be fried, since it its high lecithin content causes it to burn easily. "In making up the menus, the dishes are to be chosen so that at least 30 gram of Edelsoja (28 gm = 1 ounce) shall be used per person per week."

The recipes: "This extensive complete collection of recipes for use in German Army kitchens contains 270 separate varied recipes, more than 100 of which include small amounts of soya flour and a few contain larger percentages." In general among the recipes 5 grams (roughly one teaspoonful) of Edelsoja are to be mixed into the portion for each person served. A list of the names of all recipes containing soya flour is given.

1221. Blanchard, Marcel. 1941. Le soja en France: Ses possibilités culturales. Ses débouchés industriels. Son intérêt économique [The soybean in France: Its cultural possibilities. Its industrial outlets. Its economic interest]. Paris. Societe d'Editions Geographique, Maritimes et Coloniales, 17 rue Jacob, 6eme. ii + 200 p. Illust. 22 cm. [158 ref. Fre]
• ***Summary:*** Contents: Introduction. Part 1: Cultivation of soya. 1. The soybean. 2. Soybean cultivation worldwide. 3. The varieties of soybeans. 4. The requirements of the soybean crop. 5. Sowing soybeans. 6. The soybean during its vegetative stage. 7. Harvesting soybeans. 8. Mixed cropping and intercropping of soybeans. 9. The enemies and diseases of the soybean.

10. History of soybean cultivation in France (introduction in 1739 at Jardin des Plantes under direction of Buffon, 1850–National Society for Acclimatization, around 1880 MM Vilmorin-Andrieux, M. Pailleux, M.P. Olivier-Lecq, Messrs. Lechartier, Denaiffe, Dr. Le Goff, Boulanger & Dausse, Brioux, Semichon, Carle de Carbonnières, Rouest, de Guerpel).

11. The vegetative cycle of the soybean in France. 12. The soybean at the various French agricultural research centers (*les Centres de Recherches agronomiques français*) including Centre de Versailles, Station de Dijon, de Colmar, de Clermont-Ferrand, d'Antibes. 13. The possibilities of soya in France in terms of its cultivation.

Part 2: The nutritional value of the soybean. 1. The nutritional value of the soybean.

Part 3: Utilization of soya. 1. Soybeans in the farm economy. 3. The soybean in human nutrition and in industry.

Part 4: The soybean from an economic viewpoint. 1.

Commerce and trade in soybeans and soybean products up to Sept. 1939. 2. The present economic possibilities of the soybean in France. Conclusion. Bibliography. 16 illustrations. 8 maps.

The introduction begins: "In a letter written on 15 Jan. 1935, on board the *Chenonceaux* which was sailing toward Shanghai, Li Lu-Ying [sic, Li Yu-ying], president of the National Academy of Peiping (l'Académie Nationale de Péping) offered to furnish us with the translation of important documents in the Chinese, Japanese, and Russian languages concerning all aspects of soya. Let him find here the expression of our gratitude, because he introduced us to a plant, in which there is more interest abroad than in the country of its origin."

The publisher was formerly named Maison Challamel, founded in 1839.

Illustrations show: (1) The branch of a soybean plant, with the flowers and young pods, enlarged 3x. (2) The flower of a soybean plant as it is about to open, enlarged 5x. (3) A soybean branch with mature pods and leaves, enlarged 2x. (4) Two views of a soybean seed with parts labeled. C = chalza (*chalze*). H = hilum (*hile*). M = micropyle (*micropyle*). R = radicle (*radicule*). A-H = hypocotyl axis (germ) (*axe hypocotylé*). G = raphe, bud, leaf-bud (*gemmule*). Enlarged 3x. Note: The raphe is a small grove extending to the chalza, where the integuments were attached to the ovule proper.

(5) Microscopic view of a transverse section of the seedcoat: C.P. = palisade layer of cells (*cellules en palisade*). C.S. = hourglass cells (*cellules en sablier*). P.E. = spongy parenchyma (*parenchyme externe*). C.A. = aleurone layer (*cellules à aleurone*). P.I. = remains of parenchyma cells of endosperm or internal parenchyma (*parenchyme interne*). Enlarged 247x. (6) Cells of the epidermis facing the microscope. Enlarged 460x. (7) Microscopic view of a transverse section of a cotyledon, two views, showing starch grains (*grain d'amidon*), oil droplets (*oléolaste*), and aleurone grains (*grain d'aleurone;* high in protein). (7a) Six large maps of soy in Asia and in Oceania, in North America and in South America, in Europe and in Africa in 1939 (p. 12-36). (8) Nodules containing nitrogen-fixing bacteria on the roots of a soybean plant (p. 66). (9) Planting soybeans; a man walks behind a planter pulled by two horses (p. 84). (10) Cultivating soybeans; a man sits on a cultivator pulled by two horses (p. 89). (11) A field of long, straight, weed-free rows of soybeans in the United States. (12) Drying of soybean hay in shocks. (13) Harvesting soybeans; a man sits on a harvester pulled by two horses. (14) Threshing soybeans using a machine (p. 99). (15) Intercropping of soya and maize. (16) The soybean variety Lisbonne growing at the Central Station for Seed Trials (*Station Central d'Essais d Semences*) (p. 122). (17) Map of France with isotherm lines of July and a line showing the northern limit of maize cultivation (p. 134).

Tables: 1. Asiatic varieties: Chinese and Manchurian varieties, varieties from the British Indies, from the Dutch Indies, Japanese varieties. 2. American varieties: Canadian varieties, U.S. varieties (for each is given: Days to maturity, flower color, seed color, color of the oil, oil content, protein content, weight of 1,000 seeds in grams, seed yield (in kg/ha), yield of hay containing 15% moisture (in kg/ha)). 3. European varieties: German, Austrian, English, Italian, Polish, Czech, Soviet Russian. Mineral needs of the soybean. Yield of two soybean varieties, with and without inoculation. Yield of three soybean varieties with and without inoculation. Germination percentages of 8 French soybean varieties at the Station Centrale d-Essais de Semences in 1938-39 (ranges from 91% to 100%). Variation in the composition of soybean hay at 4 stages of maturity. Weight of seeds vs. straw for 10 U.S. soybean varieties (the straw weighs 1.5 to 2.7 times as much as the seeds). Average yield of soybeans in four countries in 1933 (in kg/ha): Manchuria 1,200. Japan 1,000. Korea 650. China 950. Length of the vegetative cycle at four stations with 10 varieties in France (ranges from 98 to 157 days). Length of the vegetative cycle at four more stations with 16 varieties in France (ranges from 95 to 172 days). 18 varieties that completely matured their seeds at 2 stations in 1921 and in 1922. Oil and protein content of 7 French soybean varieties at Station de Clermont-Ferrand. The seed yield of 10 soybean varieties at the same station. The seed yield of 6 soybean varieties at Station d'Antibes. Six tables (p. 138-42) on the nutritional value of soybeans. Six tables (p. 148-61) on the utilization of soybeans in the farm economy and for feeding animals 2 tables (p. 162-42) on the soybean in the human diet and in industry. 5 tables (p. 175-42) in trade in soybeans and its by-products. 7 tables (p. 181-86) on the present economic possibilities of the soybean in France.

Chinese and Manchurian varieties soybean varieties (p. 48): Chu Yen Tou Erh, Kung-Chu-ling pai Mei, Pai Hoa Tso Tse, Su Li Huang, Ta Li Huang, Tieh Chia, Tou Tse.

Soybean varieties from the British Indies (*des Indes britanniques*) (p. 48): Behrum, Hto-nao, Hto-nang, Mirjanhat, Pekyat-pyin, Pe-Ngypi [pè-ngapi], and Santonauk. Note: According Thompstone & Sawyer (1914), some of the above names are the names of the yellow soybean in different parts of Burma.

Soybean varieties from the Dutch Indies (*des Indes néerlandaises*) (p. 48): Djepoen, Idjo, Ireng, Krawe, Mentik, Poetik, No. 16 sélectionné, No. 17 sélectionné, No. 27 sélectionné, No. 28 sélectionné, No. 29 sélectionné.

One variety from Indochina (p. 48) is Langson.

Soybean varieties from Japan (p. 50): Akasaya, Banseihikarikuro [Bansei hikari kuro], Chinseihikarikuro [Chinsei hikari kuro], Gindaizu [Gin daizu], Ishikarishiro [Ishi kari shiro], Kanro, Kurosaya, Mitsuishidaizu [Mitsuishi daizu], Naktchadaka, Oyachi no. 2, Rankoshi no. 1, Shimoshirazu no. 1 [Shimo shirazu no. 1], Shirokotsubu,

Shirotsurunoko, Tsurunoko, Wasehodaka / Waschodaka, Yoshiokatairin [Yoshio katairin].

Soybean varieties from Canada (p. 50): A.K. (Harrow), Brun du Manitoba, Soja jaune de Montréal / Montreal, Soja jaune de Québec / Quebec 92, Manchu (Hudson), Mandarin (Ottawa), O.A.C. No. 211. Address: Directeur interimaire, Station d'Essais de Semences (Ministere de l'Agriculture), France; In 1946 Chef de Travaux at this station.

1222. Diehl, Harold S. 1941. Healthful living. New rev. ed. New York and London: Whittlesey House, a div. of McGraw-Hill Book Co. x + 449 p. Foreword by Morris Fishbein, M.D. Illust. Index. 21 cm. Series: Whittlesey House; Morris Fishbein, editor. [150+* ref]

• ***Summary:*** This is a basic, interesting mainstream book on health, written in a language that any intelligent person can understand. For many years the author was associated with the care of student health at the Univ. of Minnesota. "As dean of the Medical School of the University of Minnesota and as a teacher of preventive medicine, he has devoted many years to presenting the problems of hygiene and health." "Our nation is about to engage in a vast campaign [World War II] of preparedness... Only those who are physically fit can consider themselves prepared" (p. vii-viii, by Morris Fishbein, M.D.).

The tuberculosis death rate as dropped steadily and rapidly since 1900. The death rate from pneumonia, measles, and whooping cough are also dropping. A few years ago heart disease became the leading cause of death for Americans of all ages. The cancer death rate is also rising.

In the two chapters on food, milk is considered "the perfect food." Eggs and meat are "expensive but necessary."

In chapter 7, titled "Dietary dangers," is a section titled "Dietary fads and fallacies," which begins: "The food faddist, with his missionary spirit and his pet prescription for health, is always with us." The subsection on "Vegetarianism" states: "The disciples of this fad usually follow it either because they consider animal foods deleterious to health or because they object to the destruction of animals to supply food for man. This latter reason is purely sentimental; but the former merits consideration.

"Professor E.V. McCollum, leading authority on nutrition, has written that 'a vegetarian diet, supplemented by fairly liberal amounts of milk is the most satisfactory type of diet that man can take.' But this is not true vegetarianism [sic]. In fact milk, butter, eggs, cheese, and other dairy and animal products are rarely left out of the diets of vegetarians. Hence, most 'vegetarians' are not really vegetarians but only abstainers from meat."

Note: The author fails to understand that a vegetarian diet has been defined for 100 years as one that avoids consumption of meat, poultry, and fish.

Also in this subsection on dietary fads are the use of enemas, a raw foods diet, alkaline foods, food combining, and dieting.

Chapter 21, "Choosing a health adviser," has the following contents: Introduction, scientific medicine, cost of medical care, choosing a physician, what to expect from a physician, healing cults (osteopathy, chiropractic, faith healing), why cults flourish, medical quacks, self-medication. Address: Prof. of Preventive Medicine and Public Health, and Dean of the Medical Sciences, Univ. of Minnesota.

1223. Fallon, F. (Baron). 1941. Le soja [The soybean]. *Belgique. Ministere des Colonies. Direction Generale de l'Agriculture et de l'Elevage. Propagande et Vulgarisation Agricoles* No. 21. 39 p. Bruxelles: Impr. Industrielle et Financiere. [17 ref. Fre]

• ***Summary:*** Contents: Botanical description: Introduction, the plant's needs, varieties. Soybean cultivation in Europe: Introduction (for some countries preferred early, medium, and late varieties are listed), France, Great Britain, Hungary, Poland (selection has been done at the Wilna experiment station using varieties imported from Hungary and Czechoslovakia), Romania (About 30,000 ha are devoted to soybeans, primarily in Bessarabia [Besarabia], Dobrouja [Dobrudja, Dobrogea], Bukovina [Bucovina], Walachia or Wallachia or Valachia [now called Muntenia, a fertile belt across southern Romania], and Moldavia. Most of these varieties came from Austria), Switzerland, USSR (the main soybean regions are all warm ones–the Caucasus, Ukraine, and Transcaucasia). Soybean cultivation in America. Soybean cultivation in Africa (especially in South Africa, mainly for forage in the Natal and Transvaal). Soybean cultivation in Asia: China and Manchuria, Malaysia, British Indies, Dutch Indies, Indochina, Japan. Soybean cultivation in Oceania (mainly Philippines).

Cultivation: Crop rotation, inoculation, planting and propagation, maintenance and manuring the land, harvest, seed storage, yield, selection of varieties. Soybean utilization: As human food (dry soybeans, soy sauce, soy flour, soymilk, tofu, soy oil), industrial uses (soy oil, refining and use, soymilk casein). Soya as a fertilizer: Green manure, or soybean cakes. Soya as a feed for domestic animals: Green forage, hay, silage, pasture, seeds, cakes. Soybean cultivation in the Belgian Congo. Soybean trade.

In the Congo various soybean trials have been undertaken since 1936 at the stations of the National Institute for Agronomic Study of the Belgian Congo (l'Institut National pour l'Etude agronomique du Congo Belge). Numerous varieties from the USA and Manchuria have been tested. Address: Directeur au Ministere des Colonies, Professeur a l'Institut Agronomique de Gembloux [Belgium].

• ***Summary:*** Stephen Greenberg, of NLM, replies to Ask a

Librarian request for a full citation: "I'm sorry, but I do not see that title in the NLM collection, or anywhere else for that matter."

1225. Silva, Benedito Bruno da. 1941. A soja: Sua importancia na alimentacao. Seu emprego no pao [The soybean: Its importance in food and nutrition. Its use in bread]. Sao Paulo, Brazil: Revista dos Tribunais. 188 p. No index. 24 cm. Secretaria da Agricultura, Industria e Comercio do Estado de Sao Paulo. [19 ref. Por]

• ***Summary:*** Contents: Introduction. Part I. Introduction–general considerations on the problem of food and nutrition. General concepts and principles relating to food and nutrition. Criteria employed in appreciating the nutritional value of foods. Classification of foods. Metabolism of proteins, fats, and carbohydrates. Daily requirements of basic nutrients.

Part II. The importance of bread in human nutrition. The problem of wheat in Brazil. Nutritional analysis of wheat. Nutritional value and types of bread. Substitutes for wheat flour–Bread made of mixed flours.

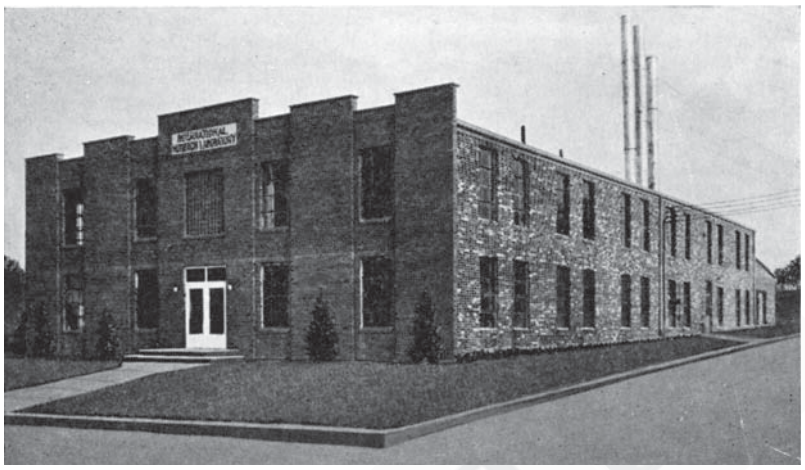
Part III: The importance of soya in human nutrition–breads based on wheat, soy and bran. Protein deficiency in regular or mixed breads in Brazil. The role of soya in nutrition: Nomenclature and history, world centers of soybean production, imports and exports, ways of using soybeans: Green or dry plants, green seeds (*graos verdes;* green vegetable soybeans–Store cooked or refrigerated; use as a green vegetable or in salads), dry seeds (*graos secos*), soymilk (*leite vegetal*), whole soy flour (*farinhas de graos secos*), flour from soybean cake (defatted) (*farina de torta de soja*), soy oil (*óleo de soja*), soy lecithin (*Lecitina de soja*, p. 118). Varieties of soybeans. Microscopic structure of the soybean seed. Chemical composition of the soybean seed. Nutritional value of soya. The introduction of soy flour into bread–soy bread. Mixed breads based on wheat, soy, and bran. Digestibility of bread based on wheat and soy. Conclusions. Bibliography.

Note 1. This is the earliest Portuguese-language document seen (June 2009) that mentions green vegetable soybeans, which it calls *graos verdes.*

Note 2. This is the earliest Portuguese-language document seen (March 2001) that uses the word "Lecitina" to refer to lecithin or the term "Lecitina de soja" to refer to soy lecithin.

Note 2. This is the earliest Portuguese-language document seen (Aug. 2013) that uses the term *leite vegetal* to refer to soymilk. Address: School of Veterinary Medicine (Escola de Medicina Veterinaria de) Sao Paulo, Brazil.

1226. Miller, Harry W. 1942. Answering America's protein problem! *Soybean Digest*. Jan. p. 6.



• ***Summary:*** "Editor's Note: Dr. Miller, whom we here introduce to the readers of The Soybean Digest, is a leader of the soybean food industry. President of the International Nutrition Laboratory, Mt. Vernon, Ohio, manufacturers of Miller's Soya Foods, he has had a most interesting career.

"Graduating in medicine in Chicago in 1902, he went to China the next year as a medical missionary under the Seventh-day Adventist board. He spent 8 years in the interior of China, and then was transferred to the superintendency of the Washington Sanitarium and Hospital, Tacoma Park, D.C., where he remained from 1913 to 1925.

"Returning to China in 1925, he established several medical centers in that country and in Japan, Korea, the Philippines and the Malay Peninsula.

"Becoming interested in dietary problems, because his specialty, goiter surgery, was directly concerned with a dietary deficiency condition, and because of the high Oriental mortality rate due to malnutrition, he began studying the food products which might ease the situation.

"This led him to the soybean, because, he observed, malnutrition was not nearly so acute in those sections in which the soybean was an article of diet.

"In 1936 Dr. Miller established a food plant in Shanghai from which he manufactured milk from the soybean. As he puts it: 'This work was nicely underway when the Japanese invasion of Shanghai resulted in the complete destruction of the plant, and after a year of waiting I again returned to America and established in Mt. Vernon the International Nutrition Laboratory where we have specialized on the processing of the soybean, not only studying varieties best suited for human food, but methods of preparing the bean and also developing processing equipment, that will give us a more satisfactory product."

"Dr. Miller has an interesting statement regarding the use of Soya Milk in infant feeding: 'In this country nearly a score of babies that we are in touch with have either been started on Soya Milk or have been transferred to it very shortly after birth, and the number of users of Soya Milk for infants are increasing very rapidly. Our results of feeding

large numbers of babies and children are to be found in the National Medical Journal of China.'"

"Soybean foods for human consumption have to date been scarcely available in America, and the question arises: Why bother to supplement a dietary which is already so abundant?

"Still, it would seem strange it the raw material which has been a mainstay in the Oriental diet for so many centuries could not be utilized in the American diet. It can be!

"That part of the American diet most often lacking is protein. Most animal proteins are cumbered with toxins, and most vegetable proteins are inadequate for nutrition.

"Soybeans the Answer: The soybean provides the answer to the protein problem. With a protein content of more than 40 per cent, it is the best source of protein which we have. Its protein is biologically equal to that of meats and animal foods, and it has the advantage of being free from toxins.

"The effectiveness of the soybean is strikingly demonstrated in China. Where vegetable protein is abundantly supplied in the diet as in Manchuria, and in North China, we have a stalwart race of people. However, in South China where the major products are oil and sugar we see dwarfed bodies and it is a rare exception to find in the warm climate among oil and carbohydrate feeders a single well-developed individual." A photo shows "The International Nutrition Laboratories, Mt. Vernon, Ohio, home of 'Miller's Soya Foods.'" The building is large, and appears to be constructed from bricks. Address: M.D., International Nutrition Lab., Mt. Vernon, Ohio.

1227. Prehn's Health Food Store. 1942. Build morale for defense: Eat soybean products (Ad). *Soybean Digest.* Jan. Inside front cover.

• ***Summary:*** A 1/8 page ad. "We have all kinds of soy foods from macaroni to chocolate clusters. Special 2 lbs. Soy Milk Powder 55¢. Write for price list." Address: 700½ S. Goodwin, Urbana, Illinois. Phone: 6-1691.

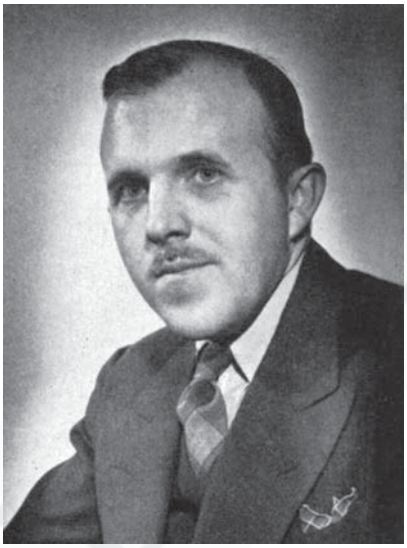
1228. *Soybean Digest.* 1942. Dr. Julius F. Muller, sells to Borden. Jan. p. 10-11.

• ***Summary:*** "The Muller Laboratories, Baltimore, Maryland, producers of Mull-Soy, soybean milk, have been purchased by The Borden Company, manufacturers and distributors of dairy products.

"The laboratories will be operated under the direction of the Prescription Products Department of the Borden Company and will continue under the management of Dr. Julius F. Muller.

"Mull-Soy, which is sold in drug stores on the recommendation of physicians, is in liquid form in tins of 15½ fluid ounces. It is prepared from soybean flour, soybean oil, dextrose, sucrose, calcium and sodium salts. It has been in production since 1936 [as an infant formula].

"Dr. Muller obtained his B.S. degree at Rutgers University [New Jersey] in 1922, his M.S. at the same institution in 1928, and his Ph.D. also at Rutgers, in 1930, following a Walker-Gordon Fellowship."



A portrait photo shows Dr. Muller.

Note: This is the earliest document seen (Dec. 2012) concerning The Borden Company's work with soy.

1229. **Product Name:** Mull-Soy Liquid (Soy-Based Non-Dairy Infant Formula).
Manufacturer's Name: Borden Company.
Manufacturer's Address: Headquarters: 350 Madison Ave., New York, New York. Product made temporarily in Baltimore, Maryland. Then by May 1943 at the National Milk Sugar Div. of The Borden Co., Bainbridge, NY.
Date of Introduction: 1942. February.
Ingredients: Water, soybean flour, soybean oil, dextrose, sucrose, calcium phosphate, calcium carbonate, salt, soybean lecithin.
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable; refrigerate after opening.
New Product–Documentation: *Soybean Digest.* 1942. Jan. p. 10-11. "Dr. Julius F. Muller sells to Borden." J.F. Muller. 1943. *Soybean Digest.* May. p. 5, 16. "The use of soy milk in allergy diets."

Schroeder and Cahill. 1946. Journal of Nutrition. Oct. p. 417. "Mull-soy, provided by the Borden Company, is an emulsified concentrate of water, soybean flour, soybean oil, dextrose, sucrose, calcium phosphate, calcium carbonate, salt, and soybean lecithin; homogenized and sterilized. Its soybean proteins are practically the nutritional equivalent of egg proteins (Cahill, Schroeder and Smith, 1944)."

H.F. Meyer. 1952. *Essentials of infant feeding for physicians.* p. 106, 197. Mull-Soy, a liquid, retails for $0.38 per 15½ oz can.

H.F. Meyer. 1960. Infant foods and feeding practices. A photo (p. 82) shows this canned product. A photo of a baby's face appears on the front panel. See also p. 88 and 90. Page 121 gives a detailed analysis of the product. The liquid, after being reconstituted, contains: Fat 4.0%, protein 3.1%, carbohydrates 4.5%. Calories per ounce: 20. Added vitamins and minerals: minerals 1.0, calcium 0.13, phosphorus 0.11. Curd tension (grams): zero. Affected by terminal sterilization: No. How formulated or reconstituted: dilute with equal volume of water and formulate as with evaporated milk–adding a carbohydrate modifier if desired. Chemical definition and essential clinical uses: "Hypo-allergenic soy food for infants and children who are milk sensitive. Palatable and well-tolerated." Meyer gives the manufacturer as The Borden Company, Pharmaceutical Division, 350 Madison Ave., New York 17, N.Y.

Harkins & Sarett. 1967. Journal of Nutrition. 91(2):213-18; Bates et al. 1968. Annals of Allergy. 26(11):577-83; Shurtleff & Aoyagi. 1984. Soymilk Industry and Market. p. 26. "In early 1942 Muller's company was purchased by The Borden Company, which continued to promote the product well. A powdered version became available in the late 1940s." Taylor. 1944. The Soy Cook Book. p. 200. Gives address as 350 Madison Ave.

1230. **Product Name:** Mull-Soy Powder (Soy-Based Non-Dairy Infant Formula).
Manufacturer's Name: Borden Company.
Manufacturer's Address: 350 Madison Ave., New York, New York.
Date of Introduction: 1942. February.
Ingredients: Incl. soy flour, water.
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable.
New Product–Documentation: H.F. Meyer. 1960. Infant foods and feeding practices. A photo (p. 82) shows this canned product. A photo of a baby's face appears on the front panel. See also p. 88 and 90. Page 121 gives a detailed analysis of the product. The liquid, after being reconstituted, contains: Fat 4.0%, protein 3.1%, carbohydrates 4.5%. Calories per ounce: 20. Tablespoons per ounce: 3 3/8. Added vitamins and minerals: minerals 1.0, calcium 0.13, phosphorus 0.11. Curd tension (grams): zero. Affected by terminal sterilization: No. How formulated or reconstituted: 1 level tablespoon to 2 oz. water. Chemical definition and essential clinical uses: "Hypo-allergenic soy food for infants and children who are milk sensitive. Palatable and well-tolerated." Meyer gives the manufacturer as The Borden Company, Pharmaceutical Division, 350 Madison Ave., New York 17, N.Y.

Harkins & Sarett. 1967. Journal of Nutrition. 91(2):213-18; Bates et al. 1968. Annals of Allergy. 26(11):577-83; Shurtleff & Aoyagi. 1984. Soymilk Industry and Market. p. 26. "In early 1942 Muller's company was purchased by The Borden Company, which continued to promote the product well. A powdered version became available in the late 1940s." Taylor. 1944. The Soy Cook Book. p. 200. Gives address as 350 Madison Ave.

1231. Davidson, Marion T. 1942. Milk–A human poison. *Southern Medical Journal.* Feb. *
• ***Summary:*** Dr. Davidson uses this strong expression because he has found cow's milk to be to blame in more cases of perennial allergy than any other food. In tabulating the cause of allergy in 100 patients, he found that house dust was apparently involved in 51% of the cases, milk 40%, eggs 27%, and wheat grains 8%. In a group of children ranging in age up to 4 years, the percentages were: milk 55%, eggs 40%, and wheat grains 40%. Address: M.D.

1232. Gullickson, T.W.; Fountaine, F.C.; Fitch, J.B. 1942. Various oils and fats as substitutes for butterfat in the ration of young calves. *J. of Dairy Science* 25(2):117-28. Feb. [11 ref]
• ***Summary:*** "Soybean oil" is mentioned repeatedly throughout this study. When either corn oil, cottonseed oil, or soybean oil were substituted for the fat of whole milk, the result was poor growth. Address: Div. of Dairy Husbandry, Univ. of Minnesota.

1233. Rouest, Antoine. 1942. Le soja français [Soya in France]. Argenton, France: Langlois. 48 p. Preface by J. Bordas. Illust. No index. 24 cm. [9 ref. Fre]
• ***Summary:*** Contents: Dedication Introduction. Part I. 1. What is the soybean? Composition properties of the soybean. 2. Cultivation of the soybean in France: Climatic zones in France for the cultivation of soybeans, A–Atlantic Zone, B–Continental Zone, C–Mediterranean Zone and climate, influence of latitude on the soybean, soils best suited for soybeans. fertilizer / manure, bacteria, soybean varieties, crop rotation, intercropping.

Part II. 3. Technical advice (*Conseils techniques*) for the cultivation of soybeans in France: Labor and preparation of the soil, seeds, soybean vegetation, germination, ways of cultivations (*façons culturales*), irrigation of soybeans, flowering and fruiting, diseases and enemies of the soybean, harvesting soybeans, harvest soybeans as forage, threshing and storage, yield.

Part III. 4. Use of soybeans on the farm: As green manure, green forage, hay, silage–which uses the stems and leaves of the plant. 5. Soybean seed and cake in the feeding of animals: Soybean cake in the feeding of dairy cows, conclusions, soybean cake in the fattening of animals, soybean cake in the feeding of pigs, conclusions, the value of soybean cake, soymilk, how to make soybean milk (on the farm).

6. Use of the soybean as a human food: Soybean coffee, dry roasted soybeans, Sojenta (made from cooked potatoes

and whole soybeans), soybean pâté (a meat alternative), soybean sprouts, salad of soybean sprouts, soybean sprout casserole with vegetables, sweet soya preserves (*Confiture de soja*), soy flour and its use by Germany during World War II, Comparative production of nutritive elements by the various legumes (haricot beans and peas), calorie content of various foods (table), soy flour (again), soy sauce. 7. Industrial uses of soybeans. Conclusion.

The Dedication reads: In homage to my father, the man who acclimatized the soybean to France. Léon Rouest. Born in Paris on 11 Nov. 1872. Died at Chartres on 27 Feb. 1938. A small portrait photo shows Léon Rouest. Address: Son of Léon Rouest, France.

1234. *Soybean Digest.* 1942. Manila paper praised milk from soybean. Feb. p. 7.
• ***Summary:*** On 16 Aug. 1941 the *Manila Tribune,* in the Philippines capital, published a "Soya-Lac Supplement" The full page, including a five-column advertisement for Miller's Soya Lac, is devoted to the story of soya milk and the soya bean. A nice photo shows Dr. Harry W. Miller.

1235. Quail, Betty. 1942. Vary your menus with Chinese foods: While their cooking techniques are different from ours, we can adapt some of their vegetables to our advantage. *Los Angeles Times.* March 29. p. F5.
• ***Summary:*** The Chinese, our old friends and new allies [in World War II] have long used soybeans as a staple in their diet. But in America, until recently, they were grown solely as a forage crop. "Fresh green soybeans rank higher in food value than any of our common table beans..." Dried soybeans contain about 12 times as much fat as other beans. Today soybean flour and bread are widely available in American food stores.

"The Chinese, however, were not content with just beans. They set to work with the skill of alchemists and accomplished some surprising results. They sprouted the dried beans..." to yield bean sprouts, now starting to be sold in American markets. Then they made a milk out of crushed soybeans and turned it into bean curd. Cut it into squares and try adding it to an omelet, to hard-cooked eggs, or meat loaf. It may also be seasoned and be used as a stuffing for tomatoes, celery, or green pepper rings for salad. Soybean milk can be substituted for cow's milk. And of course there is "soy sauce, or mandarin sauce." Unfortunately most Americans limit its use to those "half-caste dishes, chop suey and chow mein. As a matter for fact, this dark brown seasoning should have a place of honor on every American pantry shelf..." Like all good seasonings, it brings out the best in other foods, remaining in the background, "completing a dish while claiming no recognition for itself." A photo shows bean curd.

1236. Jester, W.B. 1942. What you can do with a pound of peanuts. *Peanut J. and Nut World* 21(6):13-14. April 7.
• ***Summary:*** Contents: Introduction. Food value of peanuts. Vitamin content. Many uses for peanuts. Peanut butter (Approximately 35% of all peanuts go into peanut butter). Peanut flour. Peanut oil. Peanut hulls. Peanuts go to sea (Six million pounds of raw, shelled peanuts have been exported to England for emergency rations).

Miss Dora Armstrong, a missionary in the Belgian Congo, developed a milk from peanuts as a substitute for cow's milk. She reported that the lives of many babies were saved with peanut milk. She raised, on peanut milk, two premature babies, each weighing approximately three pounds at birth. Address: Executive Secretary, National Peanut Council.

1237. Dies, Edward J. 1942. Soybeans: Gold from the soil. New York, NY: The Macmillan Co. 122 p. April. Index. 21 cm. Revised ed. March 1943. 122 p. Includes index, Illust., 22 cm. [205 ref]
• ***Summary:*** A landmark popular book and a good description of the pioneering period of soybean production and processing in the United States. Contents: 1. A certain man of science (William Morse and Dr. C.V. Piper). 2. Vignette from antiquity (how the soybean vine saved a caravan in China besieged by bandits). 3. Birth of an industry (U.S. soybean crushing). 4. The big drive starts (A.E. Staley, Glidden, Central Soya, Buckeye Cotton Oil Co., Drackett Co., ADM, Allied Mills, Ralston Purina, Spencer Kellogg and Sons, Swift & Co., Shellabarger Grain Products Co. Standard Soybean Mills, Iowa Milling Co.). 5. Breeding new types (Burlison, Hackleman). 6. Scientists commend product (oil and meal). 7. Lakes of oil. 8. In the field of industry (U.S. Regional Soybean Industrial Products Laboratory, and Henry Ford). 9. Listening post for soy (NRRL at Peoria). 10. Whims and price turmoil. 11. Milk for the tots of China (Dr. Harry Miller). 12. Soys in the home garden ("the vegetable soybean for table use," "garden varieties of soybeans," "green soybeans," "green vegetable soys," "vegetable type soybeans," "edible varieties"). 12. Americanizing soy foods (mainly about soy flour and improving its taste for use during World War II). 14. Little bean, what now? Appendix: Chronology of the soybean (27 entries). Bibliography. Dies was born in 1891.

Illustrations and diagrams show: (1) Principal centers of U.S. soybean production (p. 19, map). "Almost 90 per cent of all soybeans are harvested in Illinois, Iowa, Indiana, and Ohio. If three other states are included as shown on the map–Missouri, Michigan, and Virginia–the total is 97 per cent. (2) Principal centers of U.S. soybean processing (p. 20, map). Discs of different size show the various centers. Since Illinois produces 52% of the harvested soybeans, central Illinois is the center of soybean processing [crushing] in the USA. "Total processing capacity in late 1942 exceeded 100 million bushels for the regularly established soybean

processing plants." (3) Diagram of uses of the soybean (p. 68).

Chapter 2, "Vignette from antiquity" begins: "Even when the Pyramids were being built, three hundred years before the Tower of Babel, and twelve centuries before Solomon fashioned his temple, the soybean was hoary with age. The earliest writings on the subject go back to the period of the Pyramids.

"But of the science of soybean growing you will find no recorded beginnings in the musty tones [sic, tomes] of oriental history. No book reveals the name of the inquisitive oriental who in the misty long ago began sowing the seeds, harvesting the beans, pounding them into a mash for cooking and eating, and probably boring his friends no end with tales of their merit. There is no record depicting this unsung hero's foresight in saving the seed of the magic plant against next year's hunger. Likely as not he was a crude dreamer who fumbled his hunches and accomplished little in a lifetime of wrestling with the problem of proper cultivation.

"Oriental literature of a later date contains much about the plant but of its origin as a food product again there are only legends.

"A choice vignette from antiquity on the initial use of soybeans runs something in this fashion. Long, long ago, far back in the dim past, a caravan pulled out of an eastern China town. It consisted of a number of merchants and their servants... The caravan was bound for a distant inland settlement intent upon disposing of its valuable wares." After trading in the north, the caravan headed home, "now laden with gold, silver, and choice furs received in payment for the merchandise. Suddenly at dusk on a day when the caravan was still far from home it was surrounded by bandits who had learned of the rich prize at hand. Merchants and servants took quick refuge in a rocky defile easy of defense. Here they were besieged day on day until their scanty provisions ran low and starvation seemed inevitable. At length a servant whispered to his master and pointed to a vinelike plant bearing some sort of legume. No one could recall having seen such a plant before but all were touched with the pinch of hunger. So with grave doubts the men pounded the beans into a thick flour, mixed it with water, and made coarse cakes. Upon these cakes the caravan survived, and with renewed strength fought off the foe until help arrived. And, so the legend goes, from that day forth the miracle bean became the staff of life in China." Note 1. This story of the caravan besieged by bandits in China is a longer and embellished version of the tale first dreamed up and told by H.W. Galley in *Soybean Digest* (Dec. 1940).

"True or false, the story has lived through the ages.

"For the first written record of the soybean one must turn to 'Materia Medica,' written by Emperor Shen-nung in 2838 B.C. It describes many plants of China including that of the soybean, but even the name is clouded with antiquity. In the early Chinese history the name 'Shi-yu' [sic] and the 'Ta-tou' were applied to the soybean. These names probably antedate the first authoritative records of the plant."

Dies then discusses Engelbert Kaempfer, Linnaeus, and Moench.

"Then in 1804 a Yankee Clipper ship in full sail glided down the coast of China searching for ports for a return cargo. Not sure of the length of the return journey, the captain ordered several bags of soybeans tossed into the hold as a reserve food supply. And thus did the first soybeans enter America. Little was done about the soybeans then. Note 2. This is the earliest document seen (June 2003) that further embellishes the myth of the "clipper ship" with phrases like "glided down the coast of China" or "ordered several bags of soybeans tossed into the hold"–all supposedly in connection with the introduction of the soybean to the United States. This is also the earliest document seen (Aug. 2000) that compares the age of the soybean with that of the pyramids (in Egypt; the oldest and largest was built for Khufu at Giza in the 26th century B.C.), the Tower of Babel (in Babylon [today's Iraq]), or Solomon's Temple (in today's Israel), arguing that the soybean was much older than all of them.

"James Mease of Pennsylvania first mentioned in American literature shortly after this importation that the soybean was adaptable to Pennsylvania and should be cultivated" (p. 9).

In Chapter 3 (p. 14) Dies notes: "The first soybeans processed in this country were imported from Manchuria in 1911 and sold to Herman Meyer who had a small crushing plant in Seattle, later called the Pacific Oil Mills. From the raw material he produced the two chief products–soybean oil meal for livestock feed and soybean oil, selling the latter locally for industrial use. The meal was advertised and sold as 'Proteina,' a high-protein feed. The venture did not last for any considerable period; a few years later Meyer passed away." Note 3. This is the earliest document seen (May 2010) that mentions Herman Meyer.

"Soybeans grown in this country were first processed by the Elizabeth City Oil and Fertilizer Company at Elizabeth City, North Carolina. W.T. Culpepper, now postmaster at Elizabeth City, was manager of the new mill, started in 1912. The first domestic soybeans were crushed for commercial purposes there in the late fall of 1915. It was a small operation." Note 4. This is the earliest document seen (May 2010) that mentions W.T. Culpepper.

"At that time, most of the soybeans were grown in North Carolina, and the Winterville Cotton Oil Company at Winterville, North Carolina, purchased expellers for processing purposes, and these operated on soybeans for a limited period. Still another mill, operated by Havens Oil Company at Washington, North Carolina, crushed thirty thousand bushels of beans as an experiment in 1916." Note 5. This is the earliest document seen (May 2010) that mentions the Winterville Cotton Oil Company.

"'My uncle, Jonathan Havens,' says J. Havens Moss,

'was the first to plant soybeans in this section, devoting considerable acreage to the mammoth yellow [Mammoth Yellow] type which grew and matured splendidly from the very start. Its value to the land was obvious'" (p. 14-15).

Note 6. On the first page of the copy owned by Soyfoods Center is a signed inscription, in dark blue ink, which reads: "With kind regards to Russell East, who has done much on behalf of the soybean–Edward Jerome Dies."

Note 7. Only minor changes were made on about 13 pages of the revised edition published in March 1943. None of the statistics in the many tables were been updated, and the bibliography was not changed. Address: USA.

1238. Feingold, Benjamin F. 1942. Calsoy: A soybean substitute for milk. *J. of Pediatrics* 20(4):484-85. April.
• ***Summary:*** This article gives a recipe but does not describe a commercial product. The ingredients are 160 gm soybean flour, 4 gm clear gelatin, 840 ml (3.5 cups) water, 1 gm calcium gluconate, and 1 teaspoon salt. The nutritional composition of 960 ml Calsoy/cow's milk: Carbohydrates 19/48 gm, protein 64/29 gm, fat 32/38 gm, calories 620/650, calcium 1.30/1.38 gm, phosphorus 896/835 mg. Address: 3875 Wilshire Blvd., Los Angeles, California. From the Allergy Service of Dr. George Pines, Children's Hospital, Los Angeles.

1239. *Good Health* (*Battle Creek, Michigan*). 1942. Cow's milk a common cause of allergy. 77(4):52-53. April.
• ***Summary:*** In a group of children ranging in age up to 4 years, the causes of allergy were: milk 55%, eggs 40%, and wheat grains 40%.

"An effective remedy for milk allergy is to exchange cow's mild for an excellent milk prepared from the soybean which is now available under the commercial name of Soygal. This plant milk is the result of many years' research conducted in the food laboratories of The Battle Creek Food Company,..."

"Soygal, when examined by a government expert some months ago, was pronounced the first wholly satisfactory preparation of soy milk that he had ever examined, being wholly free from the unpleasant taste of the soybean."

• ***Summary:*** Contents: Introduction. Food uses: Whole soybeans, soy sprouts, soy coffee, soy milk, tofu, shoyu, miso, natto, soy flour. Industrial uses: Soy oil, Henry Ford and hexane solvent extraction, lecithin, soybean cake, animal feeds, plastics, green forage. Address: Professor, Univ. of Strasbourg.

1241. **Product Name:** Dr. Hollie's Soya Malt [Plain, or Chocolate].
Manufacturer's Name: Dr. Hollie's Products.
Manufacturer's Address: Los Angeles, California.
Date of Introduction: 1942. May.
Wt/Vol., Packaging, Price: 1 lb can.
New Product–Documentation: Natural Brands. 1942. Spring Wholesale Catalog. p. 1. 12 x 1 lb cans for $3.75 or 12 x 8 oz cans for $2.25. Talk with Ben Kahan of Kahan & Lessin. 1988. Sept. 24. This company was located in suburban Los Angeles. They also made slabs of soy chocolate, a combination of soy and carob.

1242. **Product Name:** Dr. Hollie's Soyalate (Soy Chocolate).
Manufacturer's Name: Dr. Hollie's Products.
Manufacturer's Address: Los Angeles, California.
Date of Introduction: 1942. May.
New Product–Documentation: Natural Brands. 1942. Spring Wholesale Catalog. 10 lb slab for $3.30. "A delicious health product, tastes like fine chocolate, sold in bulk." Talk with Ben Kahan of Kahan & Lessin. 1988. Sept. 24. The product was pronounced "So-ya-LAYT."

1243. Hill, Lewis Webb. 1942. The production of nonetiological skin hypersensitivity to foods by natural means in atopic persons. *J. of Allergy* 13(4):366-70. May. [2 ref]
• ***Summary:*** For the last 10 years the author has fed a milk-free food made of soybeans [soybean milk] to many eczematous infants who had positive scratch or intracutaneous tests to milk protein. In some of these patients, their dermatitis was removed by removing dairy milk from their diet. In others, removal of milk does no good and drinking milk does no harm. The author then selected 13 infants whose eczema was either greatly improved or cured when dairy milk was removed from their diet. The soybean food was substituted for dairy milk and all infants were "tested intracutaneously with soybean protein the day the soybean food was started. All were negative. They were then re-tested at one- or two-week intervals. Seven developed positive tests–1 at the second week, 2 at the third, and 4 at the fourth week. There was no aggravation or return of dermatitis coincident with the development of the positive skin tests or at any time while the soybean food was being taken, in most cases over a period of months. Some of these patients were again fed milk after a few weeks, and the dermatitis immediately recurred. The soybean food was again resumed, and the dermatitis disappeared... These observations do not seem reasonable and are not easy to explain... Whatever the explanation may be, the genesis of entirely nonetiological skin sensitivity to foods in atopic persons is demonstrated."

Webster's Dictionary defines atopy (derived from the

Greek *atopia* = uncommonness, and first used in 1923) as "a probably hereditary allergy characterized by symptoms (as asthma, hay fever, or hives) produced upon exposure to the exciting allergen without inoculation." Address: M.D., Eczema Clinic, Children's Hospital, Boston, Massachusetts, and Dep. of Pediatrics, Harvard Medical School.

1244. *Science and Culture* (*Calcutta*). 1942. Soya bean in infant feeding. 7(11):563-66. May. [19 ref]
• ***Summary:*** Contents: Metabolism of infants. Indian conditions (pediatric advances, shortage of cow's milk, promise of soya bean milk). Clinical experience with soya bean milk (brief review of the literature). Methods of making soya bean milk: Raw bean flour, wet grinding, roasted bean flour, steam processed flour (Berczeller process for Soyolk), soya bean flour with dried milk (Helen Mckay and Yolac), ground soya bean milk (made with groundnuts and soya beans). Composition of soya bean milk. Conclusion. Address: From the Section of Physiological Hygiene, All-India Inst. of Hygiene and Public Health, Calcutta.

1245. Rouest, Antoine. 1942. Le Soja dans l'alimentation humaine [The soybean in human nutrition]. *Revue Horticole: Journal d'Horticulture Pratique* (*Paris*) 114(2089):112-14. June 1. (New Series, Vol. 28, No. 5). [Fre]
• ***Summary:*** Discusses the reasons that soya has a poor image as a food. Discusses individually: Soymilk, soy oil, lecithin, soybean cake, whole soy flour, soya coffee, and soy sauce (which forms the base of Worcestershire sauce from England). Address: In 1946: Professeur d'Agriculture, Conservatoire National des Arts et Metiers, France.

1246. Carver, G.W. 1942. Re: Soy bean milk and peanut milk. Letter to Mrs. Ruth Sheldon Knowles, Petroleum Specialist, U.S. Department of Interior, Washington, DC, June 6. 1 p. Typed, without signature (carbon copy). [1 ref]
• ***Summary:*** In a letter dated June 3, Mrs. Knowles said she had read that "peanut milk was being used in the Belgian Congo with great success." Dr. Edward A. Perk, Pediatrician in Chief at Johns-Hopkins Hospital wrote her, in reply to letter of inquiry, saying that he knew of no one there who was working to develop a peanut milk. "He said he thought the chances with soy bean would be much better and that soy bean milk had been used in China as a food for infants and is the basis for nonmilk formula for babies, like Sobee."

Mr. Carver replied: "My work with peanut milk, soy bean milk, and other vegetable emulsions have been tried out by me, and the two that interested me most are soy bean milk and peanut milk. Where ever peanuts can be raised, I recommend the use of peanut milk, and where soy beans can be successfully raised soy bean milk, as soy bean milk has reached a much higher commercial stage than peanut milk, of course, as it is much older in development.

"Madison College, Madison, Tennessee, can give you much information with reference to the soy bean milk, as they have quite a number of commercial products made from soy beans.

"There is much yet to be learned about peanut milk and its uses. Missionaries from Africa, besides individuals working in foreign fields have used peanut milk most successfully in their work, according to the letters that I have received from them." Address: [Tuskegee, Alabama].

1247. **Product Name:** Sandwich Spreads.
Manufacturer's Name: Soy-Malt Co.
Manufacturer's Address: 234-A Marion St., Brooklyn, New York.
Date of Introduction: 1942. July.
New Product–Documentation: USDA Bureau of Plant Industry. Div. of Forage Crops and Diseases. 1942. Firms manufacturing or handling soybean food products. p. 3. Soy-Malt Co. company is listed as making or handling the product listed above.

1248. **Product Name:** Malted Milk (Soymilk).
Manufacturer's Name: Tastee Soy Foods.
Manufacturer's Address: 354 E. Girard Ave., Philadelphia, Pennsylvania.
Date of Introduction: 1942. July.
New Product–Documentation: *Soybean Digest.* 1941. Feb. p. 12. This company sells "edible soybeans." USDA Bureau of Plant Industry. Div. of Forage Crops and Diseases. 1942. Firms manufacturing or handling soybean food products. p. 3. This company is listed as making or handling 15 soy products, including "malted products." It is not clear whether this company is a manufacturer or a handler.

Soybean Blue Book. 1947. p. 72.

1249. USDA Bureau of Plant Industry. Div. of Forage Crops and Diseases. 1942. Firms manufacturing or handling soybean food products. 3 p. July. Mimeographed unpublished manuscript.
• ***Summary:*** The companies are listed alphabetically by state, and within state by city. Numbered codes after each company, keyed to a list of 35 soyfood types in the back, explain which foods are made by each company. Unfortunately, it is not clear from this list which companies are manufacturers and which are "handlers" (retailers or distributors).

California: Arlington (Loma Linda Foods), Berkeley (Golden Gate Food Products Co.), Glendale (Hygenic [Hygienic?] Food Co.), Los Angeles (El Molino Mills, Mrs. Hauser's Soya Foods Co. {4617 Melrose Ave.}, Kevo Co., Klein Soup Co.), San Francisco (Radcliffe Soya Products {146 Fillmore St.}), Santa Cruz (Daglish Health Food Service). Delaware: Milton (Draper Canning Co.). Illinois: Bloomington (Funk Bros. Seed Co.), Chicago (Allied Mills, Armour & Co., Dewey Food Products Inc., Dietetic Supply

House, Durkee Famous Foods, Fearn Soya Foods Co. {355 W. Ontario St.}, Glidden Co., Great China Foods Co., Griffith Laboratories {1415 W. 37th St.; handles soy flour and grits}, John F. Jelke Co., Soybean Products Co. {210 N. Carpenter St.}, Swift & Co.), Decatur (Spencer Kellogg and Sons, A.E. Staley Manufacturing Co.), Elgin (B.S. Pearsall Butter Co.), Urbana (Prehn's Health Food Store). Indiana: Columbia City (Oriental Show-You Co.), Decatur (Central Soya Co.), Indianapolis (Standard Margarine Co.). Iowa: Des Moines (Soy Products Co.). Maryland: Baltimore (J.H. Filbert, Inc., The Wm. Schluderberg–T.J. Kurdle Co.), Takoma Park (Hillcrest Health Products Co.). Massachusetts: Boston (Prince Macaroni Co.), Newton Centre (W.L. Cummings & Co.). Michigan: Battle Creek (Battle Creek Food Co.), Detroit (Shedd Products Co.). Minnesota: Minneapolis (Archer-Daniels-Midland Co.). Missouri: Kansas City (Harrow-Taylor Butter Co.), St. Louis (Blanton Co.). New Jersey: Vineland (George A. Mitchell). New York: Brooklyn (Agash Refining Corp., Cosmo Packing Co., Soy-Malt Co. {234-A Marion St.}), Elmhurst, Long Island (American Lecithin Co.), Glandale, Long Island (Beskor, Inc. Note: As of May 1997 there is no place named "Glandale"–or "Glendale"–on Long Island), New York City (Barrett & Eastwood, Borden Company, Enco Chemical Corporation, Franklin Mills Co., National Biscuit Co., Soya Corporation of America {Rockefeller Plaza}, Stein, Hall & Co.), Rochester (Vegetable Products Co.). North Carolina: Asheville (Judd's Health Foods), Lexington (Vitro Nu Foods Corp.). Ohio: Cincinnati (The Churngold Corp., Miami Butterine Co.), Circleville (Winoor Canning Co.), Cleveland (Barton Nut & Candy Co., Pfaffman Egg & Noodle Co.), Columbus (Capital City Products Co.), Greenville (O'Brien Milling Co.), Mount Vernon (International Nutrition Laboratory [Dr. Harry Miller]), Worthington (Special Foods, Inc.). Pennsylvania: Paoli (Great Valley Mills), Philadelphia (J.S. Ivins' Son, Inc., C.F. Simonin & Sons, Tastee Soy Foods), Williamsport (Penna Soya Products Co.). Tennessee: Madison College (Madison Foods). Wisconsin: Hortonville (Fox Valley Canning Co.), Oostburg (Oostburg Canning Co.), Owen (Owen Canning Co.).

The soy food types are: "1. Albumin or protein. 2. Beans–baked. 3. Beans–canned green. 4. Beans–roasted. 5. Breakfast foods. 6. Butter–soy. 7. Candies. 8. Chips or meats. 9. Chocolate. 10. Chocolate and other beverages. 11. Coffee substitute. 12. Crackers, wafers, cookies, puddings, etc. 13. Curd or cheese. 14. Diabetic foods. 15. Flakes. 16. Flavorings. 17. Flour. 18. Flour–prepared. 19. Grits. 20. Health foods. 21. Ice cream powder. 22. Infant foods. 23. Lecithin. 24. Macaroni products. 25. Malted products. 26. Meat-like products. 27. Milk. 28. Molasses–bean. 29. Oil. 30. Puffs. 31. Sauce. 32. Shortening. 33. Soups. 34. Soybeans. 35. Spreads–sandwich. 36. Toast."

Note: This is the earliest document seen (Nov. 2002) that mentions Griffith Laboratories. Address: Washington, DC.

1250. *Soybean Digest.* 1942. Soybeans and people... Aug. p. 9.
• ***Summary:*** The Iowa Experiment Station is working on better ways to shell "green soys." "No need for bossy: If you wish to make your own butter, milk, and cheese, here are some recipes to help you, from the Edison Institute, Dearborn, Michigan." Contains 3 short recipes: Soy bean milk. Soy bean cheese (tofu, coagulated with dilute acetic acid or vinegar). Soy bean butter (like peanut butter). A photo shows a woman cooking green soybeans in a glass pot on an electric stove. The beans should be precooked before freezing.

1251. **Product Name:** Miller's Soya Milk [Liquid, or Powdered].
Manufacturer's Name: International Nutrition Laboratory.
Manufacturer's Address: Mt. Vernon, Ohio.
Date of Introduction: 1942. September.
New Product–Documentation: Ad in *Soybean Digest.* 1942. Sept. p. 16. "Miller's Soya Products." Soybean Blue Book. 1947. p. 72. Also listed in 1960, 1965.

1252. International Nutrition Laboratory. 1942. Miller's Soya Products (Ad). *Soybean Digest.* Sept. p. 16.
• ***Summary:*** This quarter-page black-and-white ad states: "The International Nutrition Laboratory are pioneers in soya bean processing of the choice edible varieties and of soya protein utilization in the human dietary. Our distinctive achievements are: 1. Flavor improvement. 2. Ready digestibility. 3. High protein yield. 4. Lower cost of man's protein dietary requirements.

"Send for catalogue of Miller's tasty soya foods including soya milk, liquid and powdered, delicious green soya beans, soya meat substitutes, such as Miller's savory vegetable cutlets, soya loaf, sandwich spread and soya cheese. Processed and packed by the International Nutrition Laboratory." Address: Mt. Vernon, Ohio.

1253. *Madison Health Messenger* (*Madison, Tennessee*). 1942. Soy bean exhibit at National Health Foods Convention. 4(4):3. Undated.
• ***Summary:*** "'The World of Tomorrow in Soybeans' was the theme of the Madison Foods exhibit at the National Health Foods Convention in New York City. A picture of this very beautiful exhibit is shown at the bottom of this page.

"Many new varieties of soybeans were shown to health food dealers from all over the United States, who saw for the first time at the National Health Foods Convention a comprehensive exhibit of various soybean products. There were small black soybeans, brown soybeans, green soybeans, yellow soybeans, of various sizes, shapes, and varieties. There were breakfast foods ready-to-eat and cooked. Other items in the exhibit consisted of soy flour, various kinds of

soy oil, soy hydrogenated shortening, soy lecithin, stock feed, poultry feed, dog and cat foods; canned soybeans plain, canned soybeans in tomato sauce, meat substitutes, soy cheese, soy milk, soy albumin, soy bread, soy muffins, soy toast, soy coffee substitute, soy macaroni, soy noodles, soy sauce, linoleum, and plastics.

The exhibit was finished in an automobile lacquer with a photographic smear of soybeans covering the entire front of the exhibit around the display of sample bottles of various soybean products on the right wing of the exhibit, and the Madison Foods products on the left wing of the exhibit, the soybean smear was finished in a sepia tone to approximate the natural color of the soybean, and the lettering on the top of the exhibit was cut-out wood, raised letters, finished in automobile lacquer. It was one ot the most outstanding exhibits ever shown at a National Health Foods Convention from the standpoint of its educational value as well as its artistic layout and beautiful finish. Visitors to the exhibit were profuse in their commendatory comments of the exhibit, and E.M. Bisalski, Manager of Madison Foods, and Ulma Doyle Register, Chemist, were busy receiving visitors to the exhibit, who came from all parts of the forty-eight states to attend the National Health Foods Association Convention, Hotel McAlpin, New York City, August 26-29.

"Next year the convention will be held in Los Angeles, California, at approximately the same time."

1254. Vergnaud, Henri. 1942. Ressources apportées par le haricot d'Asie à l'alimentation humaine [Resources supplied by the Asiatic bean (soybean) to the human diet]. *Chimie et Industrie* (*Paris*) 48(3):126-33. Sept. (Chem. Abst. 37:6049). [9 ref. Fre]
• ***Summary:*** Repeats, with minor modifications, the history of the arrival of the soybean in various countries, given in Letzgus and Vergnaud 1941. Address: Ingénieur E.C.A.T. Secrétaire général de l'Institut Agricole et Industriel du Soja (Paris).

1255. Carver, George Washington. 1942. Re: Miniature food wafers made from soybean flour. Letter to Frank Campsall at Ford Motor Co., Dearborn, Michigan, Oct. 21. 1 p. Typed, with signature on letterhead.
• ***Summary:*** "Under separate cover I am sending you a few miniature wafers made from the soy bean flour from the Engineering Laboratory [at the Ford Motor Co. in Dearborn, Michigan]. These miniature wafers are simply the soy bean flour combined with ordinary cream cheese in proportion of about one-third cheese to two-thirds soy flour. You can see what a very high protein ration that would make.

"Think also how nice it would be to use the Bulgarian soy milk made into cheese, instead of cow's milk.

"The reason that this is rather skimpy is the fact that I haven't but very little of the soy flour, and therefore, have to use it very sparingly.

"Please see that Mr. Ford, yourself (naturally), and others who may be interested get a taste. Be sure that the Engineering Laboratory gets a sample. I should like to know just how they like it. Any modification as to quantity of flour or cheese can be used."

Courtesy of Henry Ford Museum & Greenfield Village Archives (Dearborn, Michigan). Acc. 285, Henry Ford Office (Correspondence), Box 2453. Address: The George Washington Carver Foundation, Tuskegee Inst., Alabama.

1256. Cartwright, William. 1942. The miracle of soybean milk: Equalling cow's or goat's milk in general nutriment, Soy Milk bids fair to become a popular favorite in baby diet, where it is now undergoing extensive experimentation. *American J. of Health.* Oct. p. 16.
• ***Summary:*** In Ohio, 30 babies in average homes are living exclusively on soy bean milk–and they are thriving. A recipe for home-made soymilk is given. A photo shows a healthy baby, little Joan Martony, "incubator baby who responded promptly to a dietary of soy bean milk." She is 6 months old and weighs 23 lbs.

1257. Sonnedecker, Glenn. 1942. Soybean boom: Armed forces and Lend-Lease buy soy products in great quantities. *Science News Letter* 42:362-63. Dec. 5.
• ***Summary:*** From soybeans we can make rubber substitutes, cloth, high-protein foods, plastics, and vegetable oils. Over 600 million pounds of soya flour and grits have been purchased by the Agricultural Marketing Administration for shipment to our allies and for school lunches. "Overseas, soy is used in meat products, baked goods, soups, ice cream and milk substitutes."

"In Army rations: The U.S. government is also adopting soybean products as part of the rations for the armed forces. So far, Army purchases have been confined to flour. The Marines are also using it in this form. Wider usage has been hampered, asserted Colonel Rohland A. Isker of the Quartermaster Corps Subsistence Research Laboratory, because manufacturers threw soy products on the market that had not been scientifically prepared. This situation is being remedied."

Breakfast foods containing up to 20% soya flour and flakes "are being shipped by lend-lease to Russia and other allied countries." The British are also buying large quantities of soybean flour sausages and grits.

Note: This is the earliest document seen (Oct. 2001) concerning the use of soy in school lunches or a school lunch program.

1258. Lust's Health Food Bakery. 1942. BakerLust–Sends you a hearty Christmas greeting, and a popular priced Christmas special offer (Ad). *Nature's Path* (*New York City*). Dec.
• ***Summary:*** This ad (two-thirds page) lists various foods and

their prices. Soyfoods include: ½ lb. Soynuts (Crisp-coated) $0.20. 2 pkgs. Soya cookies (a real alkaline sweet). $0.24. One 14 oz. box Soya milk powder $0.35. Address: 309-311 E. 56th St., New York, NY.

1259. Reid, Marion. 1942. Soya beans help solve food problem. *Health Culture.* Dec. p. 28-30, 55.
• ***Summary:*** Describes Mahatma Gandhi's work to improve living conditions in India, a country with a population of 350 million, all but 6 million of whom live in 700,000 villages. "Gandhi himself is a vegetarian and he is introducing a sane vegetarian diet into the villages. His medium of instruction is his little weekly paper called Harijan (i.e., 'Child of God'). The people have acquired the pernicious habit of buying polished rice, white sugar, white flour and commercial oil, instead of growing these things themselves and using them in their natural condition as they used to do...

"Gandhi is a great believer in the soya bean. He thinks that soya milk will eventually replace the dairy product. In a recent number of Harijan he published the following extract from pamphlet No. 7 issued by the 'Bombay Presidency Baby and Health Week Association.'" The extract is reprinted in full. For details see Bombay Presidency... 1935.

Note: *Health Culture* magazine was published from 1894 to 1964 in New York City. In 1910 Elmer Lee, M.D., was the editor.

1260. Stanley, Louise. 1942. Studies of Bureau of Home Economics (on soybeans). *Soybean Digest.* Dec. p. 4, 10.
• ***Summary:*** "During the last war an effort to promote the wider use of soybeans was unsuccessful because the vegetable varieties were not generally grown and processed products from the other varieties were on the market to a limited extent. Soys were grown then largely as a forage crop and used in animal feeding.

"The earlier work of the Bureau on soybeans was undertaken in cooperation with the Bureau of Plant Industry. We tested the vegetable varieties–those most satisfactory as a green vegetable–those that were easily cooked as dried beans and did not have the beany flavor characteristic of many varieties.

"The green vegetable soys are too little known and used. They have good flavor and food value, being good sources of efficient protein, calcium, vitamins A, C, thiamine, riboflavin and probably a fair source of other members of the B complex.

"Satisfactory methods of preparing and using soybean milk, the curd, and the mash were worked out and the varieties most satisfactory for this use determined. Home methods were worked out for sprouting the dried beans." A photo shows Dr. Louise Stanley. Address: Chief, Bureau of Homes Economics, Washington, DC.

1261. **Product Name:** ViM-ilk (Soymilk).
Manufacturer's Name: Butler Food Co.
Manufacturer's Address: P.O. Box 4, Cedar Lake, Michigan.
Date of Introduction: 1942.
Wt/Vol., Packaging, Price: 8 oz or 16 oz can.
New Product–Documentation: Manufacturer's catalog. 1942. 8 oz. can for $0.06 or 16 oz. can for $0.10. "Resembles cow's milk. May be used in same manner, and is preferred by many to an animal milk. ViM-ilk, as it comes from the can, is of the consistency of cream, therefore should be diluted about half with sold water for drinking. ViM-ilk is purely vegetable, therefore it is pure and wholesome. This product should be kept in a cool place, if possible, in a refrigerator, as the lecithin, which is in abundance in the soybean, may cause ViM-ilk to solidify if stored in normal temperature. After ViM-ilk has become solid or sour, a fine cheese can be made from it, the same as cottage cheese is made from cow's milk."

1262. Dau, M. 1942. Quelques modifications apportées à la technique de préparation du lait de Soja [A few modifications employed in the technique for the preparation of soymilk]. *Revue médicale française d'Extrême-Orient* 20(1):219. [Fre]
• ***Summary:*** The leguminous taste of raw soymilk makes its consumption sometimes difficult, in particular for the persons not accustomed to this vegetable milk.

To mask this unique and peculiar (*suis generis*) odor of the soymilk (*du lait de soja*), we first thought about roasting the soybeans to a certain degree. But the roasting the beans creates a total destruction of the vitamins and a partial destruction of the fundamental active principle of the milk: its proteins and lipids. Indeed, milk prepared with roasted beans has the pleasant smell of toasted bread and keeps much better (at least a whole month in the ice box). But its consistency is thinner than the one of raw soymilk. In order to keep intact its vitamins and its active principles, and to hide the legume taste, we supplemented the soya milk with the principal food item of the country: rice. We begin by toasting the rice, until its grains acquire the dark yellow color of the heel of a loaf of bread. Toasting too much would cause the starch in the rice to be completely carbonized. We then prepare a decoction of roasted rice grains with 200 grams of rice per 100 grams of water (the decoction lasts for 15 minutes). We are finally called to prepare a real coffee with soya milk adding to the milk 100 grams of the toasted rice soaking liquid and 100 grams of simple syrup. And indeed, the color and the smell do recall closely the look and the taste of coffee prepared with cow's milk. We should note that the decocted rice is stringy and slightly viscous, as it still retains a large part of the starch that will transform into body holding gel at the time of decoction and will make the milk thicker while enriching it with carbohydrates.

To further improve its pleasant flavor and enhance the milk consistency, we add 10 grams of caramelized sugar for

each liter of milk. To increase its lipid content and make it more unctuous, we supplemented it with 5 grams of peanut oil per liter. This oil has an added benefit when preparing soymilk: it eases the filtering by causing the abundant foam of the bean emulsion to settle. Address: Pharmacist from Indochina [Pharmacien Indochinois].

1263. Anderson, Hans Steele. 1942. Food therapy: Diet and the healing art. Fort Meade, Florida: The Anderson Publishing Company. 152 p. 23 cm.
• ***Summary:*** The author was born in 1877.

1264. Butler Food Co. 1942. Order blank. P.O. Box 4, Cedar Lake, Michigan. 1 p. Catalog. Undated (but date is written on by hand).
• ***Summary:*** The following soy products are listed: Cereals: Soy-fruit & nut cereal (ready to eat). Vegetarian Meats: ViM-eat soy-nut loaf, ViM-eat soy-nut cheese. Beverages: Soy-kawfee. Flour: Entire soybean (very fine) bulk, entire soybean wheat mix 30-70 bulk, soy beans with tomato sauce, ViM-ilk, and Soy-Nuts.

Note: This is the earliest document seen (March 2001) concerning Butler Food Co., Cedar Lake, Michigan. Address: Cedar Lake, Michigan. Phone: 128-F-21.

1265. Butler Food Products of Cedar Lake Academy. 1942. [Product descriptions and recipes]. P.O. Box 4, Cedar Lake, Michigan. 4 p. Catalog. Undated (but date is written on by hand).
• ***Summary:*** The company's products are listed, a brief description is given of each, and with many a recipe is also given, as follows: Cereals: Soy-fruit & nut cereal (ready to eat.). Soy-Wheat Cereal. Vim-eat Soy-Nut-Loaf. Soy-Nut-Cheese. Vim-Ex (a savory extract of dry yeast and vegetables). Soy Kawfee. Flour. Soybeans with tomato sauce. ViM-ilk. Soy Nuts. Address: Cedar Lake, Michigan. Phone: 128-F-21.

1266. Giraud-Gilliet, J. 1942. Le soja, aliment d'avenir: manière de le cultiver; 2 à 300 façons de le consommer [Soya, food of the future: How to cultivate it; 200-300 ways to consume it]. Saigon: Imprimerie de C. Ardin. 285 p. Index. [Fre]
• ***Summary:*** Contents: Dedication. Introduction. Part I: Summary study of soya (the soybean): Its cultivation. 1. The nature of soya: Its area of expansion. 2. Cultivation of soya: Soil, manure & fertilizer, seeds. 3. Interest in soya: Its richness in nutritive elements and comparison with other foods. Various possibilities for utilization: therapeutic uses for hygiene and diseases (vegetarian diet, diabetes, beriberi, diseases of the nervous system, anemia, slimming, milk diet), agricultural uses for fixation of nitrogen in the soil and as a fertilizer, use in the feeding of animals (green forage, dry forage, soybean cake, flour, seeds, germinated seeds, straw and pods, soymilk, milk), industrial utilization (soybean oil and its derivatives, glycerine, soy casein), use as human food (whole dry soybeans, soy sprouts, soybeans mashed or ground after they are cooked, soybeans cracked or crushed before they are cooked, fermented soybeans, soymilk, soymilk derivatives / foods made from soymilk {tofu / *dâu-phu,* yuba / *tao hu ky,* dry yuba rolls / *phu chuc,* beverages}, edible oil), utilization for social work (drops of milk, bowls of soya, inexpensive restaurants, battle against malnutrition and degeneration, for school gardens, pagodas, waste lands).

Part II: The main soyfood products and how to prepare them at home. 1. Soymilk, soymilk curds (*tau hu hoa*), small white cheeses (*petits fromages blancs* {*dâu-hu miêng*}), folded sheets of yellow yuba (*feuille jaune plissée de crème de soja* {*dâu-hu ky vang*}), white sheets of yuba (*feuille blanche unie* {*dâu-hu ky trang*}), dried or smoked yuba (*plaquettes séchées ou fumées* {*dâu-hu ky ngot*}), fermented tofu–like cream cheese (*fromages fermentées: cancoillotte comtoise au soja*). 2. Soy flour: Roasted soy flour, soy bread, sojenta (soy polenta), pasta (soy vermicelli and vermicelli of mung beans {*dâu xanh*} or *song than*). 3. Soy condiments. Solid condiments: natto and douchi (*taotché*), condiments that are pastes: miso and doujiang (*tao tjiung*) and koji [sic, not a paste but used to make miso, doujiang, shoyu, and jiang-you], liquid condiments: shoyu, jiang-you (*tsiang yeou*), (*tao yu*), ketjap (Indonesian soy sauce), Vietnamese soy sauce (*tuong*).

Part III: Recipes. 1. Introduction: Essential recommendations, the cookery of the poor, comparative cuisine, general recipes. 2. Soups and paps. 3. Hors d'oeuvres and salads. 4. Vegetables. 5. Meat, fish and egg dishes. 6. Breakfasts, sweets, and desserts.

Conclusion. Appendix. Errata. Address: Administrateur des S.C. de l'Indochine; Vietnam.

1267. Glotzhober, Clem. 1942. Annual report (August–December). Dearborn, Michigan: Food Laboratory (Ford Motor Co.). 14 p.
• ***Summary:*** Research was conducted on a coffee substitute made from roasted soybeans mixed with other plants, patties made from pre-cooked soybeans, and the effects of hydrochloric acid and sodium hydroxide on the pH of solutions of "soy protein."

The last section, titled "Hard soy cheese," describes the author's attempt "to make a similar cheese from soy milk. Several batches of soy milk were curdled by several methods including acetic acid plus heat, and lactic acid plus pepsin, and then the curds were pressed." The cheese was then cured for 3 months or more.

Note: This is the earliest English-language document seen (Feb. 2007) that uses the term "Hard soy cheese" to refer to a Western-style soy cheese. Address: Food Lab.

1268. Lager, Mildred. 1942. Soy bean recipes: 150 ways to

use soy beans as meat, milk, cheese, & bread. Los Angeles, California: House of Better Living. 43 p. Index. 21 cm.
• ***Summary:*** Contents: History of the soy bean. Food value. Analysis. Comparison with other legumes. Ash analysis. Soy beans in low starch diet. Alkaline in ash. Recipes: Green beans. Dry beans. Meat substitutes. Soy milk. Soy cheese. Soy butter [soynut butter]. Salads. Salad dressings. Soy spreads. Soy cereal. Soy macaroni, spaghetti and noodles. Soy bread and muffins. Waffles and pancakes. Cakes and cookies. Candies. Beverages. Toasted soy beans. Bean sprouts.

"Alkaline in ash: Soy beans have one great advantage over many proteins especially the meat proteins, in that they are alkaline in their chemical reaction or ash. This applies to the soy bean itself and to the other 100% soy bean products. The alkalinity will naturally be less in products where soy beans are mixed with acid ash foods."

A small portrait photo (p. 1) shows Ms. Lager and notes: "I want to acknowledge the aid received from Madison College, Tennessee; Loma Linda Food Company, El Molino Mills, Penna Soya Products Company, and from the many friends who gave me suggestions and recipes." Address: 3477 West 6th St., Los Angeles, California.

1269. Lager, Mildred. 1942. Soy bean recipes: 150 ways to use soy beans as meat, milk, cheese, & bread. 2nd ed. Los Angeles, California: House of Better Living. 43 p. Index. 20 cm. Reprinted in 1943. *
• ***Summary:*** Contents: History of the soy bean. Food value. Analysis. Comparison with other legumes. Ash analysis. Soy beans in low starch diet. Alkaline ash. Recipes: Green beans. Dry beans. Meat substitutes. Soy milk. Soy cheese. Soy butter [soynut butter]. Salads. Salad dressings. Soy spreads. Soy cereal. Soy macaroni, spaghetti and noodles. Soy bread and muffins. Waffles and pancakes. Cakes and cookies. Candies. Beverages. Toasted soy beans. Bean sprouts.

A photo (p. 1) shows Ms. Lager and notes: "I want to acknowledge the aid received from Madison College, Tennessee; Loma Linda Food Company, El Molino Mills, Penna Soya Products Company, and from the many friends who gave me suggestions and recipes." Address: 3477 West 6th St., Los Angeles, California.

1270. Löbbe, Henrique. 1942. Cultura da soja no Brasil. 6a ed. [Culture of soybeans in Brazil. 6th ed.]. Rio de Janeiro, Brazil: Serviço de Informaçao Agrícola, Ministerio da Agricultura. 35 p. 23 cm. 4th edition, 1939, 33 p.; 7th ed., 1945, 74 p. [Por]
• ***Summary:*** Contents: History (in East Asia, Europe, and the USA). Markets. Soybean trials in Brazil (from March 1921 at Campo de Sementes de Sao Simao). Letter dated 28 Sept. 1926 from W.J. Morse of the USDA to Dr. Henrique Lobbe (after Lobbe's visit with Morse to Arlington Farm [Virginia], Morse sent Lobbe one ounce each of 51 varieties of named American soybeans, plus 17 varieties of cowpeas). Table showing the 48 varieties of soybeans tested at Sao Simao in 1927, with the dates of planting, germination, flowering, maturation, and harvest, days to maturity, resistance to pests (*vagens*), height of the plant, and yield (in grams). Botanical description. Nomenclature (in Brazil the soybean is called "soja," "feijao China," "ervilha oleaginosa do Japao," "feijao Japones," and "fava da Mandchúria"). Varieties (divided into 5 groups from very early [80-90 days] to late [130-150 days]). Green manure. Climate and soil. Chart showing products of the soybean (from Piper & Morse, *The Soybean* 1923). Preparation of the soil. Inoculation with bacteria. Sowing. Chemical fertilizer. Things to be careful of during cultivation. Diseases and pests. Harvest and yield. Cost of cultivation. Use as forage. Chemical composition of the seeds. Oil. Cake. Use as a food for humans: Hahto and Easycook, soy sauce, soymilk and tofu (*leite e queijo de soja*), use in diabetic diets, soy flour. Address: Brazil.

1271. Mouriquand, Georges. 1942. Vitamins et carences alimentaires [Vitamins and food deficiencies]. Paris, France: Albin Michel. 462 p. Illust. Index. 20 cm. Series: Sciences for Today (*Sciences d'Ajourd'hui.* [Fre]
• ***Summary:*** This book was published during World War II. Because the Germans looted France of food and other valuables, the French were suffering from malnutrition. Efforts were made on many fronts to grow soybeans in France; long experience had shown that certain varieties grew and yielded well in the southern and eastern parts of the country. Moreover, soybeans were not subject to requisition by Germany, which did requisition meat dairy products, wheat, potatoes, wines, etc. It had long been well known that the soybean contained exceptional nutritional value, especially as a source of high-quality, low-cost protein. Yet Prof. Mouriquand regrets that habitual ways of eating and thinking are making the French slow to adopt soyfoods into their diet, where they could do immense service to the population. Even though he is a distinguished professor of medicine, Prof. Mourisand he does not hesitate to give his all and to cultivate soybeans (either he or someone in his family) as an experimental home crop–as shown in photographs.

The section on Flours for infants and young children (from 6 months to 6 years; p. 325-28) notes that France's Minister of Health and the Family demanded that the Commission on Food, under the Consultative Committee of Hygiene for France set aside flour, to be sold a low prices, for infants and young children. A table shows that these flours include both soy flour (*Farine de soja*) and defatted soybean cake. The introduction of soy into the diet raises the content of protein and oil in the diet. Our trials show–contrary to what some may believe–that soy does not give any "bad taste" to the flour and that that the infants accept and digest perfectly any of the flours shown in the table if

they are presented in the form of a pap with milk. Our study also shows that toasting the flours renders them even more savory and more digestible.

The section on Soy and nutritional balance (p. 407-10) states that there are now major deficiencies of protein and fat in the French diet. Yet men such as Bordas and Matagrin have written extensively about the soybean. Now is the time we must heed their words. The soybean contains about 40% protein and 18-20% vegetable oil; this oil is one of the main oils used by the Germans. One kg of soybeans has about the sane nutritional value as 6 liters of milk or 500 gm of meat. And soy contains vitamins A, B, and D. The people of southern France should be growing their own soybeans. The soybean can also be made into chocolate, or roasted soy flour can be added to cocoa powder to enrich it with protein, calories and vitamins–and to lower its price. Soybeans can also be use to make soymilk, tofu (fromage de soja), etc. Various authors have recommended a mixture such as the following for infants and young children: Soy flour 5-8 gm. Rice cream 10 gm. Malt 2 gm. Sugar 5 gm. Water 80 gm; it is well accepted and well digested.

Facing page 368 is a photo of soybean plants in a field at Saint-Rambert l'Ile-Barbe in the department of Rhone near Lyon. Photo by Ed. Mouriquand, Sept. 1941.

Facing page 369 is a photo of a single mature, dry soybean plant, planted in May, pods reached maturity on 15-30 Sept. 1941. Photo by Ed. Mouriquand, Sept. 1941. Address: Professeur à la faculté de Médecine de Lyon. Membre correspondant de l'Académie de Médecine, France.

1272. Rotondi, Pietro. 1942. Vegetarian cookery. Los Angeles, California: Willing Publishing Co. 151 p. Recipe index. 23 cm. 2nd edition 1948 (150 p.).

• ***Summary:*** This book, dedicated "To Humanity," is basically a vegan cookbook–except for the use of a little honey. It uses no dairy products or eggs, and views a raw food diet as the ideal–although many recipes call for cooking. Following the dedication is this quote: "The human body is the temple of God and as real as God himself, because He dwells in it..."

Under "Substitutions" (p. 21) the author notes that "Soy milk may be substituted for cow's milk..." Under "For the infant" we read: "Advice to the mother–Almond milk is the most perfect and ideal food for the infant both in nutritional value and digestibility." Soy sauce (p. 70-71, etc.), Savita, and Vegex are widely called for a seasonings. The soy-related recipes in this book seem extremely original and innovative; they include: Baked lima beans (with soy bean milk, p. 58). French-fried onions (with soy bean milk, p. 61). Peas cooked with potatoes and soy bean milk (p. 67). Whole wheat or barley chowder (with soy bean milk, p. 68). Ripe olive croquettes (with soy milk, p. 71). Vegetable hamburgers (with soy bean milk, p. 72). Carrot loaf I (with soy milk, p. 73). Tofu (fried in flour breading, p. 74). Tofu loaf (baked, p. 74). Tofu omelet (p. 74). Tofu and garbanza [garbanzo] beans (p. 75). Gluten steak (with 1 cup soy sauce, p. 75). Chop suey (with [mung] bean sprouts and soy sauce, p. 78). Savory lima patties (with soy bean bread, p. 85). Soy bean loaf (with cooked and ground soybeans, p. 85). Soy gravy (with soy milk and soy sauce, p. 87-88). Wholewheat bread and rolls (p. 89-92; many call for the use of soy milk). Tofu cake I (like a baked cheesecake with shredded coconut, lemon, and agar, but no crust, p. 99). Tofu cake II (like a cheesecake with a wholewheat or graham cracker crust, p. 99). Note: This is the earliest document seen (Oct. 2003) that mentions a tofu cheesecake, and the earliest recipe seen (Oct. 2003) for a tofu cheesecake.

"All Bran" muffins (with bran and soy milk, p. 112). Soy wheat germ muffins (with soy pastry flour, p. 113). Corn meal muffins (with soy milk, p. 113-14). Soy bean chocolate frosting (with "2 squares soy bean chocolate," p. 116). Soy bean chocolate date pudding (with 5 oz "soy bean chocolate" and 1 tablespoon soy bean milk, p. 120). Rice pudding deluxe (with 1 quart soy milk, p. 121). Soy bean chocolate ice cream (with 1/3 pound soy bean chocolate and a pint coconut milk, p. 127). Fruit ice cream, Maple sugar candy, Maple fudge (each with soy milk, p. 129). Soy bean chocolate fudge (with 1 cup "grated soy bean chocolate" and 3 tablespoons soy milk). Peanut butter fudge (with soy milk, p. 130). Soy bean chocolate caramels (with 3 squares soy bean chocolate and ½ cup "soy milk," p. 131).

On pages 141-43 are two charts: (1) Alkaline, acid and neutral foods (soy beans [dried or fresh], soy bean bread, and soy bean milk are listed as having an alkaline ash, whereas flesh foods, eggs, cheese, and most nuts are listed as having an alkaline ash). (2) Vegetable protein vs. animal protein. Divides various foods that are high in protein content into vegetable and animal, then ranks them in descending order of protein content. Included in the vegetable protein are: 1. (highest) Soy bean flour 39.5%, 4. soy beans 34.0%. The highest ranked animal product is dried beef 39.2%. The average protein content of 26 vegetable foods is 25.89%, compared with 21.79% for 26 animal foods.

The author, a chiropractor, died in about 1986 in a fire at about age 92. A videotape of him has been produced by the Rotondi foundation in Los Angeles.

Note: This is the earliest English-language document seen (Jan. 2007) that contains the term "Vegetable hamburgers" (or "Vegetable hamburger"). Address: Los Angeles, California.

1273. International Nutrition Laboratory. 1942? Soyalac: Optimal nutrition in infant feeding. Mt. Vernon, Ohio. 12 p. Each page 22 x 10 cm. Undated.

• ***Summary:*** Contents: Mothers milk simulated in Soyalac. Solves feeding problems ("While Soyalac is an ideal food for non-problem infants, it becomes tremendously important in cases of milk allergy"). Composition of Soyalac (two

forms: Soyalac dry powder {22.31% protein}, and reliquified Soyalac {2.79% protein}). Preparation of baby's feedings (always add the powder to water, not water to powder). 24 hour feeding formulas. Canned liquid Soyalac. Soyalac hypoallergenic. Laxative correction. Supplementary feeding (starting 3rd month). Soyalac benefits mothers. Quick, nourishing for children and adults. Medical supervision. The home of Soyalac (photo of large brick building at Mt. Vernon, Ohio). You can get Soyalac ("mainly through health food stores"). Miller's high protein soya foods: 1. Soyalac All Purpose spray dried soya milk. 2. Soyalac Malt Flavor. 3. Soyalac Liquid. Soyalac Chocolate. Soyalac Infant Food–Powder (1 lb cans). Soyalac Infant Food–Liquid (20 oz cans). Miller's Cutlets. Cutletburger. Giant Green Soya Beans. Soya Beans in Tomato Sauce. Soyaspread ("Delicious sandwich filler"). Vegetable Chili Con Carne (with soya beans and wheat gluten). Vegetable Chop Suey (with soya beans and wheat gluten). Address: Mt. Vernon, Ohio.

1274. Holt, Jane. 1943. News of food: Soy beans, the source of oil, flour, milk and cereals, winning 'terrific' popularity. *New York Times.* Jan. 27. p. 16.6.
• ***Summary:*** "The wallflower became the belle of the ball. That, figuratively, is the American history of the soy bean." Several decades ago the soybean was considered fit only for fodder, but now it is found, in one form or another, "on the best of dinner tables."

Soy flour is creamy yellow in color and lighter in texture than wheat flour. It may be used for baking muffins, soft cookies, or bread. In one Manhattan department store, soy flour is sold in 1-pound tins for $0.30 each. Dried soybeans (or "dried soys") are sold in New York City shops for about $0.10 per pound.

Although the canning of soy beans has been ruled out for the duration of the war, some tins are still available. "Giant green beans, those not fully ripe, are sold in six-ounce containers for 18 cents, and a one-pound four-ounce tin of the mature soys costs a quarter [$0.25]. The fresh green variety does not seem to be available at the moment.

Soybean milk is sold in a Manhattan store–$0.20 for a 14 oz tin. The curd is also sold in tins–$0.30 for 13 ounces.

Soybeans are also converted to breakfast cereals. One that recently arrived on the market, made solely from soy beans, "looks and tastes very much like chopped nuts. It is ready to serve with milk or cream, or to use in place of nuts as garnish for cakes and cookies. An eight-ounce package, which holds more cereal than you may suspect, costs a quarter [$0.25]... Various soy cereals have been compounded and set forth as coffee substitutes."

1275. *Soybean Digest.* 1943. Soys on hotel menu: Hotel Wellington, 55th Street and 7th Avenue. Jan. p. 8.
• ***Summary:*** A luncheon menu from this downtown New York City hotel restaurant dated Tuesday, October 13, 1942, is reproduced, with the soy-based items boldfaced. They include: VV-Feature of the Day; Baked soy bean loaf with mushroom sauce. Wellington rolls with ground soya beans. Ice cream with soya fudge sauce. Millers Soya Milk. Soya wheat rolls. Chocolate soya milk shake. Golden brown waterground corn and soy scrapple. Whole wheat soy bread. Soy bean milk.

Director Christine McKeever says that "on many days our leading sales item has been a soybean product."

Note 1. This is the earliest article seen in *Soybean Digest* with the word "Soys" in the title. "Soys" was used in the title of articles in *Soybean Digest* at least 19 times between Jan. 1943 and Nov. 1952. Note 2. This is the earliest English-language document seen (Dec. 2003) that contains the term "soya milk shake."

1276. Carver, George. W.; Curtis, Austin W., Jr. 1943. The peanut. *Tuskegee Institute Experiment Station, Bulletin* No. 44. 14 p. Feb.
• ***Summary:*** Note: Page 1 states: "This bulletin was in the process of being prepared before Dr. George W. Carver's death on January 5, 1943."

Contents: Introduction. Fertilizing. Selecting seed. Planting. Protecting the seed, Cultivating. Harvesting. Marketing. Grading. Cleaning. Shelling. Roasting in the shell. Salted peanuts. Blanching. Peanut butter. Peanut butter mills. Food value. In candy. Peanut oil. Oil extracting (hydraulic press vs. expeller press). Refining of oil. Analysis and physical constants of peanut oil. Iodine number–89 to 96. Saponification value–186.6–188.4. Titer test 30., 5-32.0º. Smoke point 450-470º Fahrenheit. Diesel fuel. Peanut meal. Peanut flour (incl. nutritional analysis). Peanut hulls. Uses for peanut oil. Additional uses [of the peanut], including peanut "milk," peanut cheese–made "by keeping the 'milk' in a warm place until the curd is formed, which would require overnight, or by the addition of vinegar to the 'milk.' After the curd has been formed it is placed in cheese cloth and allowed to drain. After the liquid has been removed the curd is seasoned with salt and stored in a cool place or cooked immediately.

"The residue [okara] resulting from the preparation of the 'milk' or curd can be used in the making of meat substitutes, and in flavoring paste.

"Peanut sprouts are also a very wholesome adjunct to the diet." Address: 1. Director of the Station (1896-1943), Tuskegee Institute, Alabama; 2. Director.

1277. Stidger, William L. 1943. Henry Ford on plastics. *Rotarian* (*The*). Feb. p. 15-18, 58. [1 ref]
• ***Summary:*** In a metal-short world, soybeans are being used in a surprising number of new ways. Henry Ford has a suit made of spun soybean fibers, drinks soybean milk, and has an experimental plastic car, many parts of which are made from soybeans (only the tubular frame is made of steel; the

car weighs only 2/3 as much as a steel car). A chronology of major plastic products–from celluloid in 1875 to vinylidene chloride in 1941–is given.

1278. U.S. Office of Price Administration. 1943. Official table of point values for processed foods: No. 1–Effective March 1, 1943. *New York Times.* March 1. p. 13.
• ***Summary:*** This large table is a reprint of "Now that point rationing is here." Down the left column are the names of various foods that are rationed. Across the top are the point values for different weights of each food. At the bottom, a section titled: "The following items are not included," includes "By-products of fruits or vegetables such as soya bean oil, soya bean milk,..."

1279. Shippey, Lee. 1943. Lee side o' L.A. *Los Angeles Times.* March 31. p. A4.
• ***Summary:*** Frank W. Bower writes that you can buy a dime's worth of soybean flour at a food store, add water, and make 8 quarts of soybean milk. "It doesn't taste so good, but it has all the health-giving qualities of milk," he says.

1280. Dies, Edward J. 1943. Soybeans: Gold from the soil. Rev. ed. New York, NY: The Macmillan Co. 122 p. March. Index. 21 cm. First published in April 1942. [205 ref]
• ***Summary:*** This revised edition is very similar to the first edition published in April 1942. Minor changes have been made on the following pages: 20, 28, 70-73, 84-85, 90-94, 121-22. None of the statistics in the many tables have been updated, and the bibliography is unchanged. Address: USA.

1281. Yoder, Robert M.; Thiem, George. 1943. Soya can do! *Rotarian* (*The*) 62:26-27, 54-55. March. [2 ref]
• ***Summary:*** Scientists are transforming soybeans into glue, clothing, doorknobs, paint oils, and a thousand other needed items. A sausage (containing 22% soybean meal and 66% meat), "undoubtedly doomed to be called 'soysage,'" is helping to feed a hungry world (p. 27).

"The Germans, it is known, have fortified practically all their Army rations with soybean flour. As far back as 1939, they added the protein-rich powder to the ten basic foods of the German Army–barley, noodles, wheat flour, conserves, peas, potatoes, rice, lentils, cabbage, and turnips" (p. 54).

"A year or so ago, Henry Ford, wearing a suit made of soybean 'wool,' treated a visitor to a glass of soybean milk and took him for a ride in a soybean Ford, in which soybean plastics had replaced everything replaceable. Mr. Ford predicted that this bean will in time replace both the cow and the hog on Midwestern farms, and the corn belt will inevitably become known as the soybean belt" (p. 54).

"A clipper ship brought the first soybeans to the United States in 1804... Soybeans growing in a garden plot were a curiosity in the Oriental exhibit at the Chicago [Illinois] World's Fair [Columbian Exposition] in 1893" (p. 54).

"Two years ago, at Kutsing, a refugee center deep in the interior of China, an American-educated Chinese girl opened a soybean dairy. China Child Welfare, Inc., of New York, sponsored her project" (p. 54).

Three somewhat racist cartoons from the *Chicago Tribune* shown how the soybean, in the form of a Chinese man, has become Americanized. A photo shows a man driving a tractor, whose wheels straddle two rows of soybeans; he appears to be cultivating.

Note 1. This is the earliest document seen (May 2013) that contains the word "soysage." This same year, the word was picked up and used by three other widely-read periodicals: *The Atlanta Constitution*, *The New York Times*, and *Time* magazine.

Note 2. This is the earliest English-language document seen (Oct. 2003) that contains the term "soybean dairy" (or "soy bean dairy" or "soy-bean dairy").

1282. Gounelle, H.; Marche, J. 1943. La farine de soja dans le traitement des amaigrissements et des oedèmes par sous-alimentation [Soy flour in the treatment of emaciation and oedema from under-nutrition]. *Paris Medical* 125:109-11. April 30. [1 ref. Fre]
• ***Summary:*** Contents: Introduction and history. Composition of the soybean: Proteins, lipids, glucides [carbohydrates], minerals, and vitamins. Soy flour in the treatment of emaciation. Soy flour in the treatment of edema and undernutrition. Interpretation.

"In France, although Armand Gautier recommends use of soya as a food, soy bread, 'prescribed' by Lecerf and Dujardin-Beaumetz, and made by Mr. Labbé, remained a food for diabetics. Despite the work of Germans and Americans, who as early as the turn of the century assigned a prominent role to the use of soya milk in the treatment of infantile diarrhea, we had to wait for the remarkable studies of Mr. Ribadeau-Dumas and his students (Mathieu, and Willemin) before the use of soymilk became widely used among French pediatricians...

"The good research of Mr. Terroine and of Miss Valla have shown the exceptional quality of this albumin [protein]."

Note: This article was published by Corbeil in Crete in 1943 as a 4-page monograph. Address: Centre de recherches de l'hôpital Foch [Suresnes, a separate city near Paris].

1283. Gay, H. 1943. La culture du soya en Tunisie [Soybean cultivation in Tunisia]. *Revue Internationale du Soja* 3(17):31-41. March/April. Also in: Bulletin de la Direction des Affaires Economiques, 2nd trimester, 1936. [Fre]
• ***Summary:*** Contents: The environment. Climatic factors affecting soybean trials during 1932-34 near Tunis. Varieties tested during these years: white seeded and colored, early and late, those suited for grain vs. forage. Design and implementation of the trials. Results of the trials: Influence

of the date of planting, of spacing, of the soil type, of the fertilizer used, of the bacteria used for inoculation, combined action of the fertilizer and bacteria, of irrigation, crop management, harvest and yield (of seed and forage; the highest seed yields came from Mansoy, Virginia, Illini, and Mandarin; the highest forage yields came from Virginia, Laredo, and Tarheel Black), the influence of soybean culture on the following wheat crop. Enquiry and investigation of farmers who grew soybeans in other parts of the country (1932-34). Notice and advice concerning soybean varieties and cultivation addressed to farmers in 1934.

Trials of the utilization of soybean products: Soymilk, tofu (*le fromage de soya*), soy coffee, whole dry soybeans and soy nuts (*Soya Légume, soya salés et grillés*), soybean forage. Conclusions. The results are inconclusive. Special thanks goes to Mr. Serge Livoff, Mr. Chabrolin, and Mr. Parisot. The latter is *directeur du Domaine des Fermes Françaises de l'Oued Tessa*. Address: Conseiller a la Direction des Affaires Economiques de Tunis.

1284. Muller, Julius F. 1943. The use of soy milk in allergy diets. *Soybean Digest*. May. p. 5, 16.
• ***Summary:*** Dr. Muller developed Mull-Soy in 1936 for his own child, who was highly allergic to cow's milk. "The detailed development of the formula and manufacturing process required more than 2 years of study and experimentation. When the finished product finally emerged from the laboratory stage, it had to go through extensive clinical investigation in leading hospitals in various parts of the country, to prove its worth." He then promoted it by his personal efforts. Most people are surprised to learn that an estimated 2% of all babies are allergic to cow's milk. Proteins are the usual factor causing allergy.

"Mull-Soy is now being manufactured by a large scale continuous batch system in a wing of the fine modern factory of the National Milk Sugar Division of The Borden Company in Bainbridge, New York, in the heart of a rich farming region. The process consists of mixing the various ingredients (soybean flour, soybean oil, sugars, and salts) in water in great steam jacketed vats. From these it flows into a homogenizer where under a pressure of 2500 pounds the particles are disintegrated and the oil finely dispersed, the mixture emerging as a creamy white emulsion. The Mull-Soy is then filled into sanitary-type tin cans, sealed, and sterilized under steam pressure...

"Since almost the entire output is used for allergic cases, the promotion is done entirely on an ethical basis through the medical profession. Mull-Soy bears the seal of acceptance of the American Medical Association, and frequent references in medical text books and journals show the physicians' interest in this soybean product... Inventory stocks are maintained in warehouses in several key cities in various parts of the country from where it is distributed to the larger drug wholesalers. These in turn distribute to the local retail drug stores who are the source of supply for the ultimate consumer." Address: Director of Allergy Research, The Borden Co.

1285. Swingle, Walter T. 1943. Trees and plants we owe to China. *Asia and the Americas* 43:295-99. May.
• ***Summary:*** See Swingle 1942, "Our Agricultural Debt to Asia." Address: Div. of Plant Exploration and Introduction, USDA.

1286. Otto, Harold L. 1943. Re: Dr. Charles Fearn and soya flour. Letter to Dr. Charles E. Fearn, 355 West Ontario St., Chicago, Illinois, June 10. 1 p. Typed, with signature on letterhead.
• ***Summary:*** Dr. Otto begins by thanking Dr. Fearn for his gift of Glen Livet (apparently a type of rum). "Soya Products Co. submitted 3 soups–a total of 9 million pounds–for which we hope to have the acceptance of a portion so that our actual business is begun. Bert Adair had a long talk with Harry Surface [in St. Joseph] a few days ago. Harry has checked the building in St. Joseph and has all his equipment lined up with the exception of the dryer." Dr. Otto asks if he can visit Dr. Fearn in Chicago and then if Dr. Fearn can accompany him to St. Joseph. There they can talk "before the real action begins."

"I have submitted on preliminary sample your pan cake [pancake] flour and cereal. We will see what happens. I would like also to discuss in great detail the line-up for production of soya milk. I can dump it off by the carload if we can line up its production.

"I had a conference with Drs. Wilder and Sherwood of the FDC and they can't [sic, can] see no edge for high fat flour. From all indications it looks clearly to me that we ought to have a production division for low fat... Harry I think will have no difficulty in picking up an expeller or two. Dr. Payne told me that Glidden [The Glidden Co.] will come out in the fall with something new in the way of a high fat product by a new processing technique which is to create a revolution in the industry... We will be seeing you soon. As ever, Harold Otto." Address: M.D., Soya products Company, 667 Madison Ave., New York, N.Y.

1287. Holt, Rackham. 1943. George Washington Carver: An American biography. New York, NY: Doubleday Doran & Co. 342 p. 2nd ed. 1963, 360 p. [18* ref]
• ***Summary:*** This is considered by some to be the best biography of Carver. The author is a woman. There are ten entries on soy in the index of the 1963 second edition.

Dr. Carver was born a slave in Missouri, around 1864. After working his way through school by washing clothes, Carver applied for registration at the University of Iowa and received a letter of acceptance. However, when he arrived, and officials learned that he was a Negro, he was rejected. Later he attended Simpson College at Indianola, Iowa, and

then Iowa State College, where he was appointed to the faculty after graduation. In 1896 Carver accepted Booker T. Washington's invitation to come to Tuskegee Institute in Alabama, where he stayed until he died. The Iowa State College of Agriculture and Mechanic Arts was already an eminent institution in 1891. "It was the seed bed from which sprouted 3 men who were to rule the agricultural destinies of the United States for 28 years.

"James G. Wilson, director of the Agricultural Station, was soon to become Secretary of Agriculture in the cabinets of McKinley, Theodore Roosevelt, and Taft; Henry Cantwell Wallace was Assistant Professor of Agriculture, later to become Secretary of Agriculture in the cabinets of Harding and Coolidge until he died in 1924. His son, Henry Agard Wallace, was to fill the same post during the first 2 administrations of Franklin D. Roosevelt." The school term had already started when George Washington Carver arrived in May.

Before the turn of the century, Carver was preaching that the South should balance its agriculture by growing peanuts and sweet potatoes. He later developed more than 300 uses for the peanut.

Shortly after arriving at Tuskegee in Oct. 1896, Prof. Carver started experimentation on various relatively new members of the legume family, which he felt could enrich the soil and serve as valuable additions to the diets of livestock. "In 1896 there was no crimson clover anywhere in the county, nor for many counties roundabout. He planted this and the cowpea and hairy vetch. In '97 [1897] he secured a pint of velvet-bean seed which yielded fully three pecks. He experimented with the peanut, which was no more considered a farm crop than was parsley; the children liked to eat peanuts, so a few families had a few vines.

"Developing agriculture means keeping an eye out for new things. The soja pea, now known as the soybean (*Glycine soya*), the little honorable plant and the main dependence of China for its food supply, was said to have been brought back by Commodore Matthew C. Perry, but nothing had been done about it in this country. This, too, Professor Carver planted" (p. 168). He would make every effort to educate away from the one-crop system. A photo (p. 169) shows young Carver at Tuskegee.

In 1901 Carver noted the occurrence of a fungus, which he designated as *Cercospora canescens* E. & M., on soybean and several other unrelated hosts. This appears to be the earliest reported occurrence of a Cercospora on soybean in America." It was not recorded in the U.S. again until 1924. In 1903 Professor Carver's exhibit in the capitol drew crowds to see his dried foods and soja peas and demonstrated the value of sweet potatoes and cowpeas.

With the notable exception of Professor Carver, few people in the U.S. had heard of the soybean until 1907 when the Department of Agriculture instituted experimentation on imported plants and tried adapting it to American soils and climatic conditions. Professor Carver had already successfully tried his own hand at experimentation. He was lecturing on the soybean and the derivatives he had found–flour, meal, coffee, breakfast food, oil, milk–long before it had been picked up by Midwestern growers. He could not emphasize the soybean for industrial purposes, however, because of Southern unfamiliarity. He concentrated his efforts, therefore, on the peanut.

Concerning peanuts, page 237 notes that "Professor Carver had started publishing recipes for cooking peanuts for the table before 1913, but these were constantly being augmented, and the bulletin was in its sixth edition by 1916, carrying directions for growing and 105 ways of preparing it for human consumption." During this time he was teaching senior girls at Tuskegee Institute how to cook with peanuts. The girls served a 5-course luncheon to Booker T. Washington and nine guests–"soup, mock chicken, creamed as a vegetable, salad, bread, candy, cookies, ice cream, coffee–all from peanuts."

Pages 239-40 describes a conversation, in "God's Little Workshop," between Prof. Carver and God in which Carver asks God about the meaning of the universe, of human life, and of the peanut. Responding only to his third question, God replied that "my mind was too small to know *all* about the peanut, but He said He would give me a handful of peanuts. And God said, 'Behold I have given you every herb bearing seed, which is upon the face of the earth... to you it shall be for meat..." Then God instructs Carver what to do with peanuts in order to unravel their mysteries and uses. Page 242 describes Carver's preparation of peanut milk. "Cream would rise upon it which could be turned into butter without souring. The cream could be removed to produce buttermilk, and from either an inexpensive, palatable, and long-lasting cheese could be manufactured; where a hundred pounds of cows' milk made ten pounds of cheese, the same amount of peanut milk made thirty-five pounds. This milk proved to be truly a lifesaver in the Belgian Congo. Cows could not be kept there because of leopards and flies, so if a mother died her baby was buried with her; there was nothing to nourish it. Missionaries fed the infants peanut milk, and they flourished."

On 22 Jan. 1921 Carver spoke at the hearings of the General Tariff Revision before the Committee of Ways and Means of the House of Representatives. Given 10 minutes to speak, he was found to be so interesting and persuasive that his time was extended to 105 minutes. He showed the Committee a bottle of peanut milk on which the cream had risen, a bottle of rich peanut milk for ice cream, plus samples of buttermilk and evaporated milk. He explained that Secretary of Agriculture Wilson had been his instructor at Iowa State College for 6 years.

William Jay Hale, a chemist, coined the term "chemurgy," which first appeared in print in 1934 in his book *The Farm Chemurgic*. "Chemi," the root from which

"chemistry" was derived, originally meant the black earth of Egypt; "ergon" was the Greek word for work. Hence "chemurgy" could be defined as "chemistry at work," an implied the application of this work to the soil.

In his book *Pioneers of Plenty,* author Christy Borth called Carver the first and greatest chemurgist. Carver later became close friends with Henry Ford.

1288. House of Better Living. 1943. Beat the meat shortage: *150 Ways to Use Soybeans as Meat, Milk, Cheese and Bread,* by Mildred Lager (Ad). *Nature's Path* (*New York City*). June. p. 237.
• ***Summary:*** This book sells for $0.55 by mail. Address: 3477 West 6th St., Los Angeles, California.

1289. **Product Name:** Soya-Choc. Introduced in Jan. 1940 as Soya Choc-Malt.
Manufacturer's Name: Roberts (F.G.) Health Food Products.
Manufacturer's Address: 40 Chapel St., St. Kilda (a beach-side suburb of Melbourne), Victoria, Australia.
Date of Introduction: 1943. June.
Ingredients: Incl. water, soybeans.
Wt/Vol., Packaging, Price: Tin-plated steel can.
New Product–Documentation: Ad in *Nature's Path to Health* (*Melbourne, Australia*). 1943. May/June, p. 15. "Your best moment. When the drink is Soy-Bev or Soya-Choc. These are the nicest drinks. Freshly made from the choicest soya beans in our modern factory, St. Kilda, Melbourne. In Hygienic ½ lb. and 1 lb. Tins at all Health Centres Throughout Australia." An illustration shows a man and woman seated in chairs by their fireplace each enjoying a cup of Soy-Bev or Soya-Choc. Below this is a steaming cup of the hot beverage. This ad also appeared in the Feb/March 1946 issue (p. 25), the Aug/Sept. 1946 issue (p. 23), and the April/May 1949 issue (p. 8) of this magazine.

Note from Paul Smith of Soy Products of Australia (Pte.) Ltd. 1995. March 14. Soya-Choc = Soy Compound with added cocoa. Soya-Choc = Soya Choc-Malt of 1940. Paul thinks Soya-Choc was first introduced in about 1933 or 1934.

1290. Faulkner, Evelyn Chambers. 1943. Ways of using soybeans as food. Department of Home Economics, University of Illinois. 17 p. Mimeographed unpublished manuscript. July 17. HEE-224. 28 cm.
• ***Summary:*** Contents: Ways of using soybeans as food. How to use green soybeans. Ways of using dry soybeans (with 17 recipes). Ways of using soybean flour with wheat flour (16 recipes). Soybean recipes for special diets (8 recipes). Ways of using soybean milk (11 recipes, including homemade soybean milk, homemade soybean curd, and sauted soybean curd). Miscellaneous soybean products. Revised 1943 by Evelyn Chambers Faulkner, Instructor in Home Economics. Address: Univ. of Illinois.

1291. *New Yorker.* 1943. Meat without bones. 19(24):14-15. July 31.
• ***Summary:*** A humorous article. "Governor Dewey's announcement that only the soy bean stands between New Yorkers and starvation made the soy as timely as Badoglio" [Pietro Badoglio, and Italian soldier and politician. As Prime Minister of Italy, replacing fascist dictator Mussolini, he signed an Armistice with the Allies].

"We immediately sent out our man with instructions to get the soy story and spare no expense doing it, and he has submitted the following facts. In the first place, it is true that a diet of soy beans and water will sustain life indefinitely; Governor Dewey could live on soy beans and water until he becomes president." This year the acreage will probably double or triple as "the result of the soy's publicized ability to take the place of meat and other protein foods that are now hard to get. In this country the soy is considered chiefly an article of civilian diet, but it is also included in military rations as an ingredient of such things as soups, gravies, and pie crusts."

"In China as well as Japan, soy bean curds are called 'meat without bones.'"

Soy bean oil can be used for pretty much any purpose, including a butter substitute and artificial rubber (which won't stretch but works fine as a doormat). The beans may be served as a "green vegetable. Put in a warm, steamy place, they shoot out sprouts, which make a nice salad. Soy-bean flour makes good muffins. Mixed with ten parts water, it turns into a palatable milky drink. From this milk several kinds of cheese and something like buttermilk may be produced. The dried bean can be used as a breakfast cereal, or, roasted and ground, as a coffee substitute.

"Soy meal with the oil removed has dozens of uses in industry... Soy-bean glue is now the preferred adhesive for pine and fir plywood, from which the Mosquito bomber is made. Soy beans can also, of course, be put in beanbags."

Note 1. This is the earliest document seen (June 2012) with the phrase "Meat without bones" (or a similar phrase) in the title; it is used to refer to tofu.

Note 2. This is the earliest document seen (Aug. 2013) that uses the term "milky drink" to refer to soymilk.

Note 3. Notice the interesting use of the terms "the soy's publicized ability..." and "the soy is considered..."

1292. Paddleford, Clementine. 1943. Meet the soy! Try the new tasty products of this versatile, nutritious bean. *Los Angeles Times.* Sept. 5. p. G18.
• ***Summary:*** "This mighty little bean, the soy, is on its way to changing the food habits of the nation. The grocery store of the future will be crammed with soy foods. Soy items are moving out of the food-fad class, out of the health stores into regular grocery channels to play an important role in

everyday dining."

The soybean "is a near-perfect food" which for 5,000 years has been the "staff of life" in the Orient."

"Dry soys can be made to sprout into a new 'miracle' food containing large quantities of nutritious proteins plus Vitamin C." Anyone can grow soy sprouts at home in a kitchen flower pot. They will be ready to harvest in 4 days. It's a Victory so rich in Vitamin C and protein that nutritionists at Cornell University say the sprouts can substitute for meat, fresh vegetables, and even citrus juice.

A sprout garden requires neither sunshine nor soil; sprouts need water and prefer darkness. When the "soy sprout" is 2 inches long, much of the bean itself still remains. Both the sprout and the bean are cooked and eaten together. Cook for 10-20 minutes, just long enough to remove the raw taste. They are nice sautéed or when steamed and served with a sour sauce or with chow mein.

Note: Clementine Paddleford was a very important and influential food writer, who wrote syndicated articles. She was the food editor of the *New York Herald Tribune* and *This Week* magazine. Born and raised in Kansas, she lived most of her professional life in New York City.

This article also appeared on Sept. 5 in the Atlanta Constitution (p. 18).

1293. *New York Times.* 1943. Vegetable 'steak' declared at hand: And many Americans will get soybean milk shakes, says Dr. Burkholder at Yale. Meat shortage stressed. It will force us to rely on plants with high protein content, he says in radio talk. Sept. 6. p. 12.

• ***Summary:*** New Haven, Connecticut: The remarks of Paul R. Burkholder, Associate Professor of Plant Physiology at Yale University, were broadcast on radio station WTIC. Edible strains of soybeans can be grown in home gardens and served like baby lima beans. He also recommended bean sprouts, which the Chinese have eaten for centuries; they have a fine flavor and high nutritive value. Other "substitutes for meat" include "potent yeasts harvested from brewery vats."

1294. Voellmig, Gertrude. 1943. Soy bean luncheon served to Detroiters: Soy milk introduced to public. *Detroit Free Press.* Sept. 25.

• ***Summary:*** "A world premier of soy bean milk was part of a complete soy bean luncheon served by the Ford Motor Co. to a selected group of Detroit newspaper women, Friday noon, Sept. 24.

"While they had looked forward eagerly to the first all soy bean meal that has ever been served, they were amazed at the variety of fascinating dishes produced from this miracle bean... Henry Ford II, enjoying with the rest of his guests the foods prepared in special kitchens at the Administration Building, commented favorably about the soy bean butter...

"Planned especially to introduce practical soy bean dishes to the world's housewives, the luncheon menu was as follows:

Celery stuffed with soy pimento cheese. Canapes of soya crackers with soy butter. Soy bean soup. Soya melba toast. Soy cutlets. Soy sprouts creole. Buttered green soya beans. Baked soy beans. Parsley potatoes. Soy bean coffee. Soy bean milk. Soy sprout salad. Soy bean bread, butter and crackers. Soya ice cream. Soy custard. Soya cookies." The ice cream, described as "rich" and "delicious," was one of the highlights of this "World Neighbor Luncheon."

Note. This is the 4th earliest English-language document seen (Jan. 2013) that contains the modern term "soy sprouts."

"Robert Smith, soy bean chemist of the Carver Experimental Laboratory at Dearborn, Michigan, explained that the luncheon was held to demonstrate how the soy bean can help to rehabilitate the war-devastated countries where dairy herds and food sources have been destroyed."

Note 1. Ford served a similar (but not identical) all-soy luncheon to reporters nine years earlier, in Aug. 1934, at the Chicago World's Fair. Soy bean milk was also served at the 1934 luncheon, but not soy ice cream.

Note 2. This is the earliest English-language document seen (March 2007) that uses the term "Soya ice cream" to refer to soy ice cream.

1295. *Time.* 1943. Down with meat. Sept. 27. p. 70, 72.

• ***Summary:*** "The U.S. Department of Agriculture warned the U.S. people to prepare for big changes in their diet in 1945. Example: they will get a lot less meat, a lot more beans.

"Harvard doctors, after a two-month feeding test, announced that an active adult can get along perfectly well with no more than an ounce of meat a day."

Food scientists are working to develop supplementary and substitute foods. "For almost two years a notably thorough analysis of possible meat substitutes has been conducted by Yale Botanist Paul Rufus Burkholder. He and others have found a number which on almost every food count (protein, vitamins, calcium, carbohydrates) are as good as or better than beefsteak; even whole wheat compares well with meat."

The researchers state that soybeans rival meat in protein, cost only about one-fourth as much, and that from soybeans one may secure a great variety of foods–from milk shakes to steaks. Soybean sprouts can be grown at home "indoors in a pot or jar, they can be raised the year round from dried field soybeans, sprout in five days or less, can be cooked as quickly as a pork chop, have several times as much vitamin B complex as the bean itself, rival tomatoes in vitamin C. A crisp, tasty dish, they have been a staple of the Chinese diet for centuries."

Other good sources of protein are cottonseed, peanuts, vegetable steaks [meatless] (Already on the market are

"Soysage, Stakelets, Proteena, Victory Chops"), yeast, and germs [bacteria].

1296. Hauser, Gayelord. 1943. Delicious and nutritious food for the duration. *Diet Digest* (*Beverly Hills, California*) No. 17. p. 40-41, 62.
• ***Summary:*** Recipes include: Delicious baked soya beans. Soya bean loaf. Soya butter (toast whole soya beans then grind very fine. Add soya oil and a pinch of salt until the consistency of peanut butter). Soya and peanut butter patties. Soya sprouts. Soya bean milk. Soya wheat germ waffles (with soya flour). Wheat germ soya muffins (with soya flour).

The article ends: "Note: For the duration it will be wise for you to go to your health food store and secure several pounds of wholewheat germ, wholewheat pastry flour, and soya flour (preferably toasted)." Plus several supplements sold by Hauser's Modern Products in Milwaukee, Wisconsin.

Note 1. This is the earliest English-language document seen (April 2012) that clearly uses the term "soya butter" to refer to soynut butter.

Note 2. This is the earliest English-language document seen (Jan. 2013) that uses the term "soya sprouts" (or "soya sprout") to refer to these sprouts. Address: 9889 Santa Monica Blvd., Beverly Hills, California.

1297. International Nutrition Laboratory. 1943. Miller's soya foods (Ad). *Soybean Digest.* Sept. p. 35.
• ***Summary:*** "Miller's International Nutrition Laboratory are among the largest growers of the Edible Soya bean, as also processors of high protein yielding foods from the Soya Bean. They possess both Eye and Flavor Appeal. Miller's Laboratory is a demonstration that Soya Beans are a delicious food for humans.

"Miller's Soya Foods Include:

"1. Canned liquid Soya Milk.

"2. Spray dried Soya Milk Powder (natural, malted and chocolate flavors).

"3. Superb canned Giant Green Soya Beans.

"4. Delicious meat substitutes and extenders in appearance, and taste, like bologna, veal cutlets, etc.

"Price and detailed information supplied to interested individuals, address,..."

Note: This is the earliest English-language document seen (March 2003), published in the USA by a manufacturer of soybean foods, with the term "soya foods" in the title. Address: Box 326, Mt. Vernon, Ohio.

1298. Miller, Harry W. 1943. Soybeans and the Orient. *Soybean Digest.* Sept. p. 18, 44.
• ***Summary:*** "It was my privilege during 23 years of residence in the Orient to travel very extensively through the provinces of China, and to acquaint myself with all eastern Asia relative to soybean production. I found that while the central and northern provinces of China including Manchuria are the principal soybean producing areas of the Orient, that soybeans are widely used by all the groups of Orientals, save the Filipinos, and the Malays, and are universally used by the Chinese, and that wherever they emigrate in any part of the world, the one universal food of the Chinese is soybeans, and not rice, as so often claimed.

"There are millions of the Chinese who do not live in the rice producing territories. The Chinese and many of the Oriental people have come to understand by common experience rather than scientific deduction that soy protein is an essential to livelihood and cannot with safety he dispensed with from their diet. Wherever in Chinese occupied territories soil and climatic conditions are at all favorable to the production of soybeans, they will be found as one of the stable crops. However the yield in the tropical portions of China is rather small. They have depended on importing beans from Manchuria and northern China. The same is true of the South Sea Islands.

"Foundation: Much that we have learned concerning handling soybeans and preparing them into food materials we must credit to the knowledge gained through studies made and travels in the Orient, chiefly in China, Korea, and Japan. Like their handling of many other things, they have developed the soybean culture and processing up to a certain point and there they stand. We have built upon their foundation, and have carried research in the agricultural field, as also processing methods several steps farther, and have made soya food products not only better but far more digestible, and therefore nutritionally more available, and found out that the bean can be made tasty as well.

"You may ask how are the Oriental people using the soybean. There are many ways. If you were to visit the Chinese markets during the late summer and early autumn months you would be able to purchase shelled green soybeans. You would also be able to purchase the unshelled beans, that is in the pods just like you buy peas in the pod. Some people prefer to purchase them in the pods, cook them in the pods in salt water, and then squeeze out the beans and eat them from the pod. There have been no canning facilities available to the Chinese for any of their products in years past, and so the use of the green soybean is only seasonable. You might expect that since the Chinese have stone mills everywhere to grind their wheat and their corn into flour and meal that they would be grinding their soybeans into a flour. But soy flour is largely an Occidental product. It would be very difficult for you to pick up in any of the markets of China a pound of soy flour.

"Curd: The Chinese have learned through long experience that the greatest value nutritionally from the soybean is obtained through a water extraction of its protein. This milky liquid after it is strained is coagulated into a cheese [tofu]. Ninety percent and possibly even higher of the nutrition the Oriental obtains from the soybean is taken in the form of this cheese. Of course they have many ways of

dealing with this soft gelatinous curd, which has a very high water content. They press it into cakes, about the thickness of a large slice of bread. This then is placed in a brine solution or other flavored liquid, and later sliced up like we at times dice cheese. Again it is pressed into thin sheets that are about a sixteenth of an inch in thickness. These are also diced up and eaten like a relish or a salad.

"Another common product is a thin semi-transparent sheet of protein [yuba] made by a slow heating vat filled with this soya milk. A heavy scum will come to the surface, which they lift off at intervals and suspend to dry. These sheets are later on used as food wrappers. They can use these sheets which are pure protein, like we can use cellophane sheets, but instead of wrapping parcels with them they stuff them with certain vegetables, imitating the body and legs of a fowl, or the form of a fish, or they can represent almost anything in the way of an animal, and by submitting them to a little baking, give the same nice brownish hue by the use of a little oil, so you could hardly tell whether you were eating actual turkey or an artificial one.

"When you go to the market where the soybean producer delivers his finished products, you will see a great variety of foods made from soybeans. As I say, you can buy the bean curd in squares, or you can buy the patties, or you can buy the thin sheets of soya cheese, or you can buy these large semi-transparent sheets of soya protein. These in turn can be incorporated into many tasty and highly nutritious dishes, by the skill and ingenuity of the cook, and has also the likeness of meat in flavor and appearance. Naturally nutritionally we know of the high value of these proteins for a proper substitute for meat, fish, fowl, eggs, and the protein of animal milk.

"Of course the Chinese have as one of their big industries the making of oil from the soybean, and that is true of the Koreans and the Japanese. They heat the bean, grind it, and put it into wooden presses and extract the oil by driving wedges into their oil presses, bringing a tremendous pressure to bear upon the roasted beans. This oil is all used for edible purposes.

"The residue of the bean cake contains about 6 percent of oil, and has been exported in recent years to great extent. But the Chinese have in certain localities ground it up and used the bean cake meal for food, although much has been used in China and exported for fertilizer.

"The soybean is also extensively sprouted, and these sprouts are used in their vegetable food mixtures and eaten as bean sprouts.

"I shall not attempt at all to discuss the varieties of soybeans found in the Orient. I have seen almost every color, every shape and size, running from a small shot sized bean to the large jumbo sizes, such as we have in our edible list. All the beans that I have seen that come from India have been of a very small size. When we buy beans in China we go to the market and ask for soya beans. If we are not satisfied with what they have we go to another shop, and see if we can find a bean of superior size and quality. We never purchase soybeans in China by name of any variety.

"As is well known, China and most parts of the Orient grow from two to three crops per annum on the same ground. In some areas when they harvest a rice crop they plant a soybean crop on the same soil. In other areas when they harvest a wheat crop they put in a crop of soybeans. We believe in many of our central states, and certainly this would be true of the southern portions of our central states, that it would be quite practical to harvest a crop of peas, and disk the land, and plant and harvest a crop of soybeans" (Continued).

1299. *Poston Chronicle* (*Poston Internment Center, Arizona*). 1943. Poston may get soybean milk. 16(8):3. Oct. 22.
• ***Summary:*** "Poston will soon have ersatz milk made from soybeans to alleviate the lack caused by the nation-wide milk shortage, if all goes well with the equipment which the Steward's department has obtained from Phoenix.

"At present it is planned to experiment with the milk substitute in Unit III only, in conjunction with the tofu industry which will supply the soybeans. If the milk agrees with Poston palates, arrangements will be made to have the milk made available to the other units.

"Soy bean milk has a higher protein content than cow's milk and is said to be richer in minerals."

1300. Kollmorgen, Walter M. 1943. The soybean goes to college. *Tennessee Planner* 4(1):15-20. Sept/Oct.
• ***Summary:*** The author was invited to lunch at Madison by E.M. Bisalksi, who is in charge of the food research and production program. The menu, typical of the meatless meals served on the campus, included: Meatless meat balls (Yum), fresh soymilk, Zoy-Koff (coffee substitute), margarine (75% soybean oil), and bread (made in part from soybean flour). "It should be noted that in the above menu animal foods and animal products are completely absent, with the exception of a small portion of cream used in the Zoy-Koff... Cans of Madison Foods substitutes for milk and meat carry the words "Contains no animal products." These food were not developed to stretch meat ration points during the war; some of them are nearly 20 years old.

Large photos on a 2-page spread show the following Madison products: Wheatasoy, Kreme O'Soy (sliced bread), Kreme O'Soy (canned soymilk), bottled soymilk, Yum, Zoyburger, Soy Cheese, Kreme O'Soy Butter Muffins, Stake-Lets, Not-Meat, Vigorost, and Zoy-Koff.

"Dr. Floyd Bralliar, Vice President of Madison College, has for years conducted experiments with soybean varieties. In this work he is closely associated with experts in the United States Department of Agriculture. Dr. Bralliar believes that Tennessee farmers can profitably devote more acreage to the soybean. He holds that canneries will do well

to can more fresh soybeans...” Address: Research Director, Tennessee State Planning Commission.

1301. Morse, W.J.; Stuart, W.M., Jr. 1943. Vegetable varieties of soybeans. Washington, DC: Div. of Forage Crops and Diseases, Bureau of Plant Industry, USDA. 6 p. Nov. [12 ref]

• ***Summary:*** Contents: Introduction. Nutritive value of the soybean. Classification of varieties as to use and maturity (very early is 100 days or less; very late is 161 days or more. The two types by use are “green vegetable” and “dry edible”). Soil and climatic adaptations. Preparation of the seedbed. Fertilizers and lime. Inoculation. Time of seeding. Method, rate, and depth of seeding. Cultivation. Harvesting and shelling green vegetable beans. Harvesting and threshing mature beans. Utilization: Shelled green soybeans, mature soybeans. Enemies of soybeans. Seed supplies of vegetable varieties. Publications.

“About 10 years ago agricultural explorers in the Orient collected more than 100 varieties of soybeans that were used solely as green vegetable or dry edible beans. The term ‘vegetable varieties’ has been applied to such edible types to distinguish them from varieties grown for other purposes. These varieties, differing in size, shape, and color of seed and ranging in maturity from 85 to 165 days, have been under test for the past 8 or 9 years at various experiment stations throughout the United States and its insular possessions.

“In extensive tests of the cooking quality and composition of the green and dry soy beans made by the Federal Bureau of Home Economics and by the Departments of Home Economics of various agricultural colleges and experiment stations, the vegetable varieties have proved to be much superior to the field varieties in flavor, texture, and ease of cooking. Some varieties have also been judged superior for the manufacture of bean milk, flour, and other food products.”

“Classification of varieties as to use and maturity.” “The recommended uses and classification as to the length of growing season of the following vegetable varieties are based on observations made at Arlington Farm: [Arlington, Virginia]: A table shows:

Very early (100 days or less): Green vegetable: Agate, Giant Green, Hidatsa, Sac, Sioux. Dry edible: Giant Green, Sac.

Early (101-110 days): Green vegetable: Bansei, Chusei, Etum, Goku, Kanro, Kanum, Waseda. Dry edible: Bansei, Chusei, Etum, Goku, Kanro, Kanum, Waseda.

Medium Early (111-120 days): Green vegetable: Emperor, Fuji, Hakote, Hiro, Hokkaido, Jogun, Kura, Osaya, Sato, Shiro, Sousei, Suru, Tastee, Toku, Willomi, Wolverine. Dry edible: Emperor, Fuji, Hokkaido, Jogun, Osaya, Sousei, Suru, Toku, Willomi, Wolverine.

Medium (121-130 days): Green vegetable: Funk Delicious, Hahto, Illington, Imperial. Dry edible: Funk Delicious, Illington, Imperial.

Medium late (131-140 days): Green vegetable: Aoda, Chame, Higan, Rokusun. Dry edible: Easycook, Higan, Rokusun.

Late (141 to 160 days): Green vegetable: Edsoy, Green and Black, Jackson, Jefferson, Nanda. Dry edible: Edsoy, Jefferson, Nanda.

Very late (161 days or more): Green vegetable: Cherokee, Seminole. Dry edible: Seminole.

“In general, the method of planting vegetable soybeans is practically the same as that of field varieties except that they are always planted in rows far enough apart to permit cultivation. Three feet has been found a satisfactory distance between rows, although the very early varieties may be planted in 2-foot rows.”

Note: To see refinement in Morse’s thinking, compare this with a similar article written about two years earlier: Morse, W.J. 1941. “Shanghaied... a super food.” *Soybean Digest.* July. p. 4-5, 10. Address: 1. Senior Agronomist; 2. Asst. Agronomist. Both: Div. of Forage Crops and Diseases, USDA, Washington, DC.

1302. *Gila News-Courier* (*Gila River Internment Center, Phoenix, Arizona*). 1943. Keadle gets facts on tofu delivery. 3(44):4. Dec. 2.

• ***Summary:*** “Project Steward H.E. Keadle returned Tuesday night from a trip to Poston [Arizona] where he went to get necessary data on tofu consumption and distribution.

“Poston has a smooth mess operation, according to Keadle. They are making soy bean milk as well as tofu, and Rivers will soon be making them too, he said.”

1303. *Science News Letter.* 1943. Soybean curd makes good cottage cheese substitute. 44:360. Dec. 4.

• ***Summary:*** “Now that cottage cheese production has been curtailed, soybean curd can be used as a good substitute.” This curd, made from soybean milk, can be “added like cheese to omelets, Welsh rabbit and creamed hard-boiled eggs, or served with other vegetables in hot dishes. Its mild, somewhat cheese-like flavor and soft texture” makes it a good as a stuffing for celery, pepper rings, or tomatoes, a garnish on salads, or mixed with salad dressing. It can also be rolled into balls and served on crisp lettuce.

There follows a description of how to make soybean milk and soybean curd on a home kitchen scale.

1304. Brewster, Clara M. 1943. The soya bean–A four star food. *Diet Digest* (*Beverly Hills, California*) No. 18. p. 32-34. [1 ref]

• ***Summary:*** This is a reprint of an article with the same author and title first published in Aug. 1936 another Hauser magazine: *Horizon* (Tempo Books, New York City) 1(3):9, 26-27.

1305. Drown, Marion Julia. 1943. Soybeans and soybean products as food. *USDA Miscellaneous Publication* No. 534. 14 p. Dec. [1 ref]

• ***Summary:*** Contents: Introduction. Nutritive value of soybeans: Why soybean protein is important, minerals and vitamins of soybeans, the fat of soybeans–soybean oil. Recent increase in soybean production [in the USA]. Soybean products: Soya flour, soya grits, flakes and meats, soya with sausage and in soup. Soybeans as a green or dried vegetable: Varieties, growing and harvesting, preparation and cooking. Soybean "milk." Soybean curd. Soybean sprouts. (Note: A description is given of how to make the three previous foods at home.) Other edible soybean products (Soy sauce, Worcestershire sauce, soya crackers and breakfast foods, a coffee substitute, and salted soys [soynuts]).

"In 1942 nearly 210 million bushels of soybeans were produced on about 11 million acres [yield = 19.1 bushels/acre]. If the 4.6 million acres on which soybean plants were grown for forage and other purposes are added to this figure, only five other crops–corn wheat, hay, oats, and cotton–occupied more land in the United States in that year. These figures contrast strikingly with those of 1924, when less than 5 million bushels of soybeans were harvested from 448,000 acres" [yield = 11.16 bushels/acre]. Figure 1 shows soybean production in the USA (in million bushels) from 1924 to 1942. The rapid increase in production began in 1934. In 1942 production doubled as a result of wartime needs.

"Soybean meats are split or coarsely ground soybeans, dehulled and debittered. They are chiefly used in place of roasted peanuts in confectionery and baked goods, but they can also be cooked and eaten like navy beans.

Vegetable soybeans make an excellent Victory Garden crop. "The most suitable varieties for green shelled or dried beans have straw-yellow or olive-yellow seeds that cook easily and have a mild flavor." A table (p. 8) shows: "Some of the desirable garden varieties for green and dried beans, classified as to their length of growing season" (from Morse & Stuart, Nov. 1943). State experiment stations can usually supply information about the "seeds of vegetable varieties of soybeans... Many State experiment stations furnish pure cultures of soybean bacteria at cost, and commercial seed firms also sell them" (p. 9).

"When soybeans follow corn on fertile land, they should produce a good crop without direct application of fertilizers. The use of fertilizers, however, is recommended on sandy soils or soils of low fertility, the best results being obtained with stable manure or superphosphate and muriate of potash. Wood ashes may be used if the potash is not available."

Note: This is the earliest English-language document seen (May 2005) that uses the word "debittered" (or "debitter," "debitters," or "debittering") in connection with flavor problems in soybeans. Most early documents that used the term were written in German. Address: Associate editor, Bureau of Plant Industry, Soils, and Agricultural Engineering.

1306. Morse, W.J. 1943. Introducing the soybean. In: U.S. Food Distribution Administration, War Food Administration, ed. 1943. Soybeans and Soya Products. Program for Meeting of Interdepartmental Nutrition Coordinating Committee. 25 p. See p. 1-2. Dec. 7. [1 ref]

• ***Summary:*** The soybean has many uses. Fermented, it yields different sauces; "pressed, it gives oil for cooking; sprouted, it gives a fresh vegetable rich in vitamins; picked when green, it makes an excellent green vegetable; ground dry, it makes flour; soaked, ground, and with water added, it provides milk; and the curdled milk furnishes the famous bean curd–the boneless meat of the Orient–used in the form of various cheeses and as a meat substitute."

Note. This is the earliest English-language document seen (April 2013) that uses the term "boneless meat of the Orient" refer to tofu.

"Strange to say, the first published use of the soybean in the United States, other than for forage purposes, was as a coffee substitute by the Indiana Experiment Station in 1892 [sic, 1894]. It was revealed that an Indiana farmer and his neighbors had been using the roasted beans for coffee for about 8 years. During the past two years, as many of you know, the soybean has been sold as 'Coffee Berry", and 'Coffee Plant', and used extensively to blend with coffee."

"The soybean was first used for food in America, beginning about 1910, as a flour prepared chiefly for infant foods and for persons requiring a food of low starch content" [diabetics].

"In 1925 the American Soybean Association held its annual meeting in Washington [DC] and in the exhibit of products, the only articles of food shown were canned baked soybeans, diabetic and infant foods, soy sauce, and health soy flour. At the present time more than 50 different foods made wholly or in part from soybeans by about 200 manufacturers are on the market."

"Vegetable soybeans led the list of new vegetables planted in the rural gardens in 1942 in South Carolina. Approximately 2000 home demonstration club women in 44 of the 46 counties in South Carolina planted them in the vegetable garden for the first time. In the winter and spring of 1943, 10,000 one-pound packages of dry vegetable soybeans were sold throughout South Carolina." Address: Bureau of Plant Industry, Soils, and Agricultural Engineering, Agricultural Research Administration, USDA, Washington, DC.

1307. USDA War Food Administration, Food Distribution Administration. Grain Products Branch. comp. 1943. Soya products distribution. Washington 25, DC. 5 p. Dec.

• ***Summary:*** Gives a partial list of companies that retail products containing soya, the names of the products

distributed, and their areas of distribution. Address: Washington, DC.

Address: Yugoslavia.

1309. Huebscher, Adolf. 1943. Die Soja: Ihre Kultur, Verwendung, Zukunft! [Soya: Its culture, use, and future!]. Grenchen, Switzerland: A. Niederhaeuser. Published by the author. 52 p. Undated. Illust. with 18 line drawings. [Ger]
• ***Summary:*** Contents: Foreword. Soya–The dispenser of work and bread. Botanical description of the soybean. Cultivation and manuring of the fields. Seeds and sowing. Nutritional composition and food value. Harvest, storage and use as silage. Enemies of the soybean. Economic significance of the soybean. Preparation of the soybean for use as food. Soya minestra (an Italian dish, also consumed in Switzerland). Soya beefsteak. Soya cutlets. Tomatoes stuffed with soya. Soy sauces–Japanese shoya [sic, shoyu] and Shimosa. Vegetable cheese [tofu]. Miso-cheese. Natto cheese. Soy coffee. Soy flour (Soja-Mehle, made by Morga S.A. or Ennat-Kappel, Switzerland). Soya cakes. Soya salad. Green vegetable soybeans (*Soja-Gruengemuese*). Soya Muesli. Soya Kasha (*Soja-Kascha*, the newest food for soldiers, athletes, and heavy laborers. It consists of a mixture of soy flakes, rolled oats, corn flakes, sugar, salt, and powdered milk). Soymilk (The first soymilk in Europe was made in Paris in 1882). Soy yogurt (*Soja-Yoghurt*). Soy cream for the tropics (*Soja-Crème-Tropenmilch*). Address: Dr. and veterinarian, villa Bel-Air, Corseaux (Vaud), Switzerland.

1310. Mathews, R.H. comp. 1943. A Chinese-English dictionary. Revised. American ed. Cambridge, Massachusetts: Harvard Univ. Press. Published for the Harvard-Yenching Institute. xxiv + 1226 p. Index. 26 cm. [3 ref]
• ***Summary:*** This excellent dictionary, which romanizes Chinese words using the Wade-Giles system and arranged them in alphabetical order by sound, is a condensed version of the multi-volume dictionary by Giles, and a revised version of Matthews' 1931 dictionary. Soy-related characters include:

Chiang (No. 661, p. 90)–Soy [sauce], pickled vegetables, pickled bean curd (*chiang toufu*) [fermented tofu].

Fu (No. 1930, p. 285)–Tofu.

Ju (No. 3144, p. 473)–Milk. The breasts; a teat, a nipple. To suckle. *Fuju* ("rotten milk")–A milky preparation from beans. [Note: Probably fermented tofu].

Shih (No. 5805, p. 813)–Cantonese soy [sauce], salted beans [fermented black soybeans] eaten with rice, gruel, etc.

Note: This is the earliest English-language document seen (April 2012) that contains the term "Cantonese Soy," which apparently refers to soy sauce made in Canton, China.

Tou (No. 6478, p. 939-40)–See No. 6481.

Tou (No. 6481, p. 940)–Beans, oil expressed from beans, young bean plants, bean stalks, bean flour, bean curd, dried cakes of bean curd usually flavored with soy, underlings = bean curd officials, soft hearted, bean sprouts [mung]–used as a vegetable, bean pods, soy [sauce], bean-cake, four kinds of soya beans (ta-tou, hei-tofu, huang-tou), (*Glycine hispida*).

Note: At Mao (No. 4357, p. 614, meaning "hair") there is no entry for *Mao tou* = "green vegetable soybeans."
Address: China Inland Mission, Shanghai.

1311. Rebelo Hespanha, Jaime. 1943. A soja: Cultura e utilizacao dos seus produtos [The soybean: Cultivation and use of its products]. Lisboa, Portugal: Livraria Rodrigues. 42 p. No index. [Por]
• ***Summary:*** Contents: Part I: Soybean culture. 1. Introduction: History and origin, botanical description, advantages of its cultivation for farmers. 2. Soybean culture: Climate, terrain, types of culture, seed and sowing, varieties and sub-varieties, seed characteristics, time of planting, manuring and fertilizing, precautions during cultivation, harvest. 3. Yields.

Part II: The products of soya and its utilization. 1. As human food: As a green vegetable (*como legume*), flour (*farinha*), milk (*leite*), cheese (*queijo-caseina* [tofu]), oil (*oleo*), the hulls (*bagaço*). 2. Feed for cattle. 3. Industrial products.

In Spanish the soybean is called "Soja, Soya, Haba, or Guisante de Japan."

In the section on soybean culture, pages 10-11 state: "For 20 years [i.e. since 1923], the soybean has been cultivated in Ribatejo, with the only goal of providing feed for cattle. The soybean is now being cultivated technically in Alentejo, in Baixo-Minho, and in parts of Estremadura. [Note 1. Ribatejo, Alentejo, Estremadura, Baixa, and Minho are all provinces of Portugal, according to the U.S. Board of Geographic Names for Portugal, 1961.] The land in these areas is well suited for growing soybeans. The most admirable initiative for the cultivation of soybeans in Portugal was undertaken by the Malange [Malanje] Agricultural Station (in Angola), which obtained a yellow variety that had been given an excellent classification in Germany.

"Soybean cultivation in Angola could be extensively spread, even among European farmers. The growing period does not exceed 145 days, and the yield averages 700 kg of seeds [per hectare], bringing a price of $25 (0.25 angolares) per kilogram. It would be good if the example given by the Malange Agricultural Station would spread to the [area around the] cities."

Note 2 This is the second earliest document seen

concerning soybeans in Portugal, or the cultivation of soybeans in Portugal. This document contains the second earliest date seen for soybeans in Portugal, or the cultivation of soybeans in Portugal (1923 in Ribatejo). The source of these soybeans is unknown. The author was born in 1891.

Note 3. This is the earliest Portuguese-language document seen (April 2013) that uses the term *queijo caseina* to refer to tofu. Address: Major do S.A.M., Portugal.

1312. Ricino, soja y sesamo: Siembra, cultivo, cosecha e industrializacion de estas tres plantas oleaginosas. 2nd ed. [Castor-oil plant, soybeans and sesame: Sowing, cultivation, harvesting, and industrialization of these three oleaginous plants. 2nd ed.]. 1943. Buenos Aires, Argentina: Editorial Atlantida, S.A. 148 p. See p. 41-150. Illust. 17 cm. (Biblioteca de "La Chacra" Dirigida por Waldemar Martínez Pintos). [Spa]

• ***Summary:*** Contents: Introduction. Products obtained from the soybean (chart). As a human food. The seeds (*los porotos;* the soybean is called *poroto soja*). Green vegetable soybeans (*porotos verdes*). Soy flour. Soy oil. Soy sauce. Soy sprouts (*vastagos*). Soy milk (*leche vegetal*). Tofu (*queso*). Curd (*cuajada*). For livestock or cattle destined for slaughter. For sheep and poultry. Preparation of the seeds for obtaining oil. Utilization of the oil. Defatted soybean flour (*harina de torta*). Soybean cake for animals. Soybean cake for fertilizer. Other uses of the cake. The soybean for hay. For pasture. For silage. Address: Buenos Aires, Argentina.

• ***Summary:*** Contents: Introduction. The production of soya beans, by A.R. Saunders. The economic aspect, by S.J. de Swart. Use as livestock feed, by W.F. Bergh and L.L. Roux. Nutritional value and domestic use, by D.J.R. van Wyk and Miss T. Hoek (Mrs. P.J. Serfontein) (Composition, mineral content of selected foods, comparative analyses of selected foodstuffs, soya bean bread. Soya beans on the menu: 41 recipes). The industrial preparation and uses of soya bean products, by P.W.G. Groene woud (Edible soya-bean flour, oil, plastics). Address: South Africa.

1314. Ford News Bureau. 1943? [Ford soy milk: Background–not for release]. Administration Building, Dearborn, Michigan. 3 p. Typed. Double-spaced. Undated. Courtesy of Henry Ford Museum & Greenfield Village Archives (Dearborn, Michigan).

• ***Summary:*** This undated, untitled background document, probably written between 1943 and 1945, describes the production of soymilk based on isolated soy protein. "The undernourished of a war-devastated world will receive abundant protein as a result of a mass production process for making soybean milk now being perfected in the laboratories of the Ford Motor Company. Note: This is the earliest English-language document seen (Nov. 2002) that uses the word "undernourished."

"Since soy milk is laboratory and not animal produced, it is possible to scientifically control bacteria and procure–quickly and cheaply–sufficient quantities of protein-giving liquid at a cost equal to, or less than milk.

"The implications of mass production of life-sustaining milk are of terrific import. Herds in occupied countries have been slaughtered. During the four to five years that must pass before cow's milk can be available to malnutrition-threatened millions, synthetic milk may supplement the world's diminishing supply of proteins. Ford soy milk may enable the people of regions like the tropics, where the breeding of cattle is difficult and unsatisfactory, to receive the necessary benefits of dairy products...

"Nine bushels of soybeans will produce one ton of milk, 232 gallons or 928 quarts of milk.

"Soy milk has been used for hundreds of years by the Chinese and of recent years has been manufactured in considerable quantities to supply the dietary needs of children allergic to cow's milk. However, soy milk made by the Chinese method is often inferior to cow's milk in both composition and flavor and those produced by many of the newer formulae, while comparing with cow's milk in composition, are expensive and to many tests have an objectionable flavor. The Ford chemists, under Mr. Ford's personal direction, have developed a soy milk having similar appearance and composition to cow's milk and which can be produced by mass production methods at a cost equal to, or less than, cow's milk.

"The process of manufacture of soy milk from the bean may be considered in three steps: first, the separation of the oil from the bean and its subsequent hydrogenation and de-flavoring; second, the extraction of the protein from the oil-free meal and its purification; third, the mineralization and the mixing of the protein and the addition of the ingredients necessary to complete the product.

"The oil is removed from the soybean at Saline, Michigan–an attractive, white frame, reconditioned mill–located like 17 other Ford village industries near power-producing streams and small country towns which furnish the labor.

"As soybeans arrive from neighboring farms, the beans are cleaned, cracked, and conveyed from the Saline mill to another spotless building. From then on, gigantic telescope-shaped equipment separates oil from the meal in one continuous cycle of solvent extraction. The soybeans are pressed into yellowish bits similar to corn flakes. These flakes are carried countercurrent through a 32-foot tube where Hexane, a petroleum solvent, separates the oil and meal. After flakes are freed from solvent and dried in the

middle and lower tube, the solvent is fed into a long tube, or percolator, near the upper end. Flowing through a filter and into a still, the oil is freed from the solvent. The solvent from both sources is now collected and recovered in the decanter from which it is taken and used again. The extracted soybean oil flows into a container at one end of the unit; flakes emerge in the finished form, ready for the next step.

"The dry, protein-containing meal is taken to the George Washington Carver Laboratory, a neat sunlight-filled brick building near the little Michigan town of Dearborn. There, inside towering glass tubes, protein is extracted from the yellowish meal. Piped into a settling tank, most of the once pithy, flaky meal separates from the yellow-greenish solution of water and protein. Any meal remaining in the mixture is removed by whirling centrifuges, their 6,000 revolutions per minute revolving like a cream separator. The combined water and protein goes to a de-airating [de-aerating] tank where any excess air is removed.

"Looming over the shiny tanks and maze of giant tubes, controller-recorder dials chart a graphic red ink progress of precipitation of the proteins into bits of whipped-creamy white. Swirling water in huge tanks complete the purification of the protein. At present, the George Washington Carver Laboratory produces enough protein in 24 hours for 300 gallons of milk.

"Since Ford soy milk is approximately the same composition as cow's milk–3.5 per cent protein, 4.8 per cent carbohydrates, 3.5 per cent fats, and 0.7 per cent minerals–the final operation is simple mixing and addition of minerals, the proper amount of potassium phosphate, calcium chloride and citric acid. The glucose, maltose and dextrin found in corn syrup provide sufficient carbohydrates without making the milk too sweet to be palatable. Refined, hydrogenated soybean oil forced through viscolizers at high pressure supplies fat with such reduced globules that they stay in suspension like those of homogenized milk. Vitamins are added to make the soy milk equal to the best grades of cow's milk in this respect. The result is a tasty, more digestive beverage, Ford soy milk.

"Daily, more and more soybean milk is being produced to meet the demands of experiments taking place at the Henry Ford Hospital in Detroit–dietary experiments conducted among children and infants to determine how completely vegetable protein may replace animal protein so vital to life. Synthetic dairies pouring forth soybean milk in mass production quantities may be on of the most important contributions of America to a war vitiated world." Address: Dearborn, Michigan.

1315. **Product Name:** Soymalade (Soy Malt Drink & Spread. Powdered Base for Beverages or Sandwich Spreads).
Manufacturer's Name: Hodson's Pantry Products. Imperial Brands Co.
Manufacturer's Address: 537 S. Dearborn St., Chicago, Illinois.
Date of Introduction: 1944. January.
New Product–Documentation: Ad in *Nature's Path* (New York City). 1944. Jan. p. 16. "Try this new modern product from Hodson's Pantry." "Soymalade: Soy malt drink & spread–65¢."

Taylor. 1944. The Soy Cook Book. p. 199.

1316. Chapman, Paul W. 1944. Cowless milk. *Atlantic Journal.* April. p. 3-. *
• ***Summary:*** The author believes that Americans will not accept (as Henry Ford suggested) a vegetable drink as a substitute for a glass of cold cow's milk, nor a plate of sprouting soybeans in place of a thick, juicy steak. Address: Dean, College of Agriculture, Univ. of Georgia.

1317. *Southern Dairy Products Journal.* 1944. Can the soybean say moo? April. p. 2. *
• ***Summary:*** This editorial wondered if Henry Ford had estimated all his costs when he announced that soybean milk could be produced for 3 cents a quart.

• ***Summary:*** Good review of soyfoods and human nutrition. Address: Bureau of Human Nutrition and Home Economics, Agricultural Research Administration, USDA, Washington, DC.

1322. Stoesser, A.V. 1944. Chemical evaluation of soybean milk and oil in allergic infants and children. Lecture presented at annual meeting of American College of Allergists. June. *

1323. *Business Week.* 1944. Soya Butter. July 22. p. 85-86.
• ***Summary:*** "'Soya Butter' is a new food spread formulated by Butler Food Products, Cedar Lake, Michigan, which is said to resemble dairy butter in 'taste and appearance... but which will not turn rancid.'... The process by which it is made consists of churning hardened soybean oil in soya milk and adding certain unspecified ingredients. The product is shipped in pint-sized cardboard containers or in 38-lb. fiberboard tubs."

1324. Anderson, George K. 1944. Make way for soy in your diet. *Hygeia* 22:525-26, 528, 530. July.
• ***Summary:*** Subtitle: "The little bean with the big reputation is here to stay–so you should know its many good nutritional qualities."

The article begins: "It is only recently that the soybean has been introduced in this country as a food of any widespread use; yet already this little fellow has been variously hailed as a 'wonder food,' a 'miracle food' and a 'magic plant.' It would be difficult for any food to live up to a description such as this,..."

In the Orient, soybeans are known as the "poor man's meat." "Others have called them the 'cow of China,' because the fluid milk or curd made from these beans has served as the only source of milk ever known to most Chinese babies aside from their mother's milk."

In 1943 the soybean was America's "fourth largest pay crop, with a total of 290 million bushels."

"More recently the cultivation of edible varieties or 'vegetable types' is gaining in popularity... They can be eaten either as a fresh vegetable, in the form of dried baked beans, or as any of the prepared products such as soy flour... Perhaps the easiest way to become acquainted with the soybean is to raise it right in your own garden... The shelled beans serve as a fresh green vegetable for table use and taste much like fresh lima beans."

Also discusses [whole dry] soybeans, soy sprouts, soy milk and curd, soy oil, margarine made from soy oil, soy flour, industrial uses of soybeans, and the nutritional value of the soybean and soyfoods. Soybeans now sell for approximately 12 cents per pound in most sections of the country and the flour is priced at 12 cents per pound. Soy flour is used in military rations and in Lend-Lease food supplies.

Concerning [whole dry] soybeans (p. 530): "The American palate is not sufficiently familiar with the full, unmodified taste of soybeans to have developed a real appreciation of them as yet. This taste differs from that of our more commonly used dried beans in that it has a heavier, stronger quality. The processing methods which are now used to make the soy flour and grits serve to mellow this taste so that it is much more bland. It is often said to have a 'nutty' character which is delightful in preparations made of the proper proportions of soya and other foods."

1325. **Product Name:** Butler's Soya Butter (Non-Dairy Margarine made with Soybean Oil and Soy Milk).
Manufacturer's Name: Butler Food Products.
Manufacturer's Address: P.O. Box 4, Cedar Lake, Michigan.
Date of Introduction: 1944. August.
New Product–Documentation: *Business Week.* 1944. July 22. p. 85-86. "Soya Butter." *Soybean Digest.* 1944. Aug. p. 16. "What is Status of Soya Butter?" Ad in *Soybean Digest.* Sept. 1944. p. 11. "New foods from the wonder bean: Butler's Soya Butter."

Short in *Soybean Digest.* 1945. Feb. p. 22. "The *Detroit News* puns in headlines: 'Uses his bean to make butter: Spread it soya can forget about points,' which doubtless refers to the soya butter of Butler Food Products." Note: "Soya" is a pun on "so you." During World War II dairy butter was rationed and one needed points to buy it. *Soybean Digest.* 1945. May. p. 14. "Ohio Ruling on Soya Butter."

Note: This was the first all-soy margarine and the first non-dairy (vegan) margarine made in the USA. It appears to be related somehow to Shedd's Willow Run Margarine. There were conflicting state and federal regulations to whether the product was margarine or not. Finally in December 1945, at which time the company was manufacturing 100,000 units of soya butter a month, a federal judge in Detroit ruled that the product was oleomargarine as defined by the internal revenue code, and therefore subject to back taxes of 10 cents a pound on

every pound made to date. The three-year battle and the ruling assessing an estimated $150,000 in back taxes drove the company out of business in 1946. In about 1950, while typing out an appeal to the government to reconsider his case, Butler suffered a fatal heart attack. Shortly after his death, the margarine law was changed and the tax (on other companies) removed.

1326. **Product Name:** Delsoy (All-Vegetable Soymilk-Based Non-Dairy Whip Topping).
Manufacturer's Name: Russell-Taylor Inc. Renamed Delsoy Products, Inc. by July 1945.
Manufacturer's Address: Livonia Dairy, 2001 S. Telegraph Rd. at Harvard, Dearborn, Michigan.
Date of Introduction: 1944. August.
Ingredients: Incl. soymilk, vegetable oil, sugar.
Wt/Vol., Packaging, Price: ½ pint wax paper carton in the shape of a truncated cone.
How Stored: Refrigerated.
New Product–Documentation: This is the world's earliest known commercial non-dairy whip topping. Letter from Herb Kusche to Bob Rich, both of Rich Products Corp. in Buffalo, New York. 1945. March 22. "Glad to hear you are progressing favorably with your topping with the exception of the Washington delay. It sounds as if you might be on the market very soon. Let's hope so anyway. The government restricted Taylor [Herbert Marshall Taylor] for selling 'topping' for about a month due to the fact that he was overselling his quota. Now I understand he has come out with a complete soy product containing no butterfat. I am going to get a carton of it and send it to you."

Detroit News. 1945. April 16. "Who's who and why." [About Herbert Marshall Taylor and Delsoy]. A photo shows Taylor. In Nov. 1942 the War Food Administration issued an order prohibiting the sale of whipping cream in America. After dairy interests forced Taylor to leave Chicago, he picked up a partner, Eric R. Swanson, who is still with him, and in Dec. 1943 started a business in Detroit. Though dairy people continued to oppose him, his "business soared. In 1944 it jumped from 1,400 to 20,000 gallons a month. He sold at wholesale, then added half pints for the home trade. Now he claims 1,500 independent distributors here [in Detroit]. But along came a War Food Administration order placing a 19 per cent limit on all fats–animal or vegetable–used in his product [which combined a milk base with vegetable fat]. WFA also cut his milk quota. So he started using soy milk as a base, producing an all-vegetable product.

An ad (below this article in Rex Diamond's binder; original source and date unknown) is titled "What is Delsoy? It's the dessert topping that's winning the enthusiastic approval of housewives by the hundreds of thousands. Delsoy is the original topping made of natural vegetable products." The ad shows illustrations of two non-dairy whip toppings: (1) In the foreground, "Delsoy Super Whip: Instant Dessert Topping" which is sold in a pressurized can. The ad states: "Introduced in August 1944, the first product of its kind, Delsoy dessert topping has gained tremendous popularity. Continuing to grow by leaps and bounds..." (2) In the background, "Delsoy: A delicious whip," a refrigerated perishable product which is sold in a half-pint paper container shaped like a truncated cone.

Letter from H. Marshall Taylor to Mr. Holton W. Diamond, c/o Russell-Taylor, Inc., 2001 S. Telegraph Rd., Dearborn, Michigan. 1945. July 6. "Dear Diamond: At the suggestion of Mr. [Bob] Smith, and with my consent, we take pleasure in handing you... ten shares of the common stock of Delsoy Products, Inc. We feel that since you have taken such a great interest in our operations, and that you would like to continue working with us, that we can possibly cement our relations by inviting you to join the small family." At the top of the letter is "Devonshire Topping, Inc." Just above Marshall's signature is typed "Delsoy Products, Inc."

Soybean Digest. 1945. Aug. p. 24. "Delsoy topping: An all-vegetable cream." Note 1. This early non-dairy whipped topping was NOT made with enzyme-modified soy protein.

Note 2. This is the earliest known commercial soy product made by Delsoy Products, Inc.

A W-2 form shows that during 1945 Holton W. Diamond (who lived at 1648 May Ave., Dearborn, Michigan) was employed by "Russell-Taylor Inc., 1951 E. Ferry Ave., Detroit 11, Michigan." [Note the spelling of the company's name; Diamond was working on their whip topping]. His wages totaled $552.13 in 1945. A 1946 form shows he was paid wages $68.25 by Russell-Taylor in the first quarter of 1946.

Shurtleff & Aoyagi. 1979. Feb. Tofutti & Other Soy Ice Creams. p. 22-23. Shurtleff & Aoyagi. 1985. History of Rich Products' work with soy proteins. "In 1944 or 1945 Bob Smith (a former Ford researcher) and Herbert Marshall Taylor introduced Delsoy, a soymilk-based non-dairy whip topping. Launched in the Detroit area, it was sold mostly to the restaurant trade. In the spring of 1945 it was introduced through retail stores in New York. Delsoy was America's earliest known commercial non-dairy whip topping. But it never became a very successful product. In part because it was not a frozen food, its distribution was limited to the Detroit area."

Robert A. Smith. 1979. "The Ford Experimental Laboratory and the 'Square House.'" Interview conducted by Donald V. Baut of Dearborn Historical Museum, May 31. Pages 44-48. This is one of the best sources seen on the origin and history of this product and of Presto Whip, its counterpart in a pressurized can. Starting in the spring of 1943, Smith worked in his spare time, designed the equipment (based on the design of the equipment in the Carver Laboratory but on a larger scale), and built a plant in the old Livonia Dairy on Telegraph Road at Harvard in Dearborn; its initial capacity was about 1,000 gallons

per day (one shift). The equipment in Ford's Carver Lab was designed to produce 150 gallons of soymilk per day in a small non-stop stream. The funds needed to equip and establish the plant in Dearborn came from profits made by selling Devonshire Topping in Detroit. They began production [of Delsoy] in the Livonia Dairy "in the latter part of 1943" (p. 45). [Note 3. This introduction date of late 1943, recalled by Smith in 1979, does not fit with the date given in several earlier documents. 1. Olmsted (April 1945) says that H.M. Taylor started making a filled dairy milk in Detroit in Dec. 1943. He did not start using soy milk until WFA cut his milk quota, apparently in 1944. 2. An undated Delsoy ad from about 1945 states that the Delsoy was "introduced in August 1944, the first product of its kind"]. For the first year or so the company's name in Dearborn was the Russell Taylor Co. Harvey Whitehouse, a Detroit dairyman who was qualified to operate both refrigeration and steam equipment, was hired to operate the plant. Smith left the Ford Motor Co. in Aug. 1945 to work full time with Delsoy Products.

Talk with Herb Kusche, executive vice president of Rich Products Corp. 1993. July 14. He thinks that Delsoy was on the market only several months before Whip Topping, made by Rich Products Corp.

1327. Taylor, Demetria M. comp. 1944. The soy cook book. New York, NY: Greenberg. 215 p. Index. 21 cm. [2 ref]
• ***Summary:*** Emphasis on recipes using soy flour, sprouts, and dried soybeans. Contains one of the most complete early listings of commercial soyfoods products, with product name, and manufacturer name and address.

Contents: 1. Soy–The wonder bean. 2. Growing soybeans in Victory Gardens. 3. How to sprout soybeans. 4. How to cook soybeans: Green soybeans preservation, canning, dehydration, quick freezing, dried soybeans, soybean pulp or "mash" (cooked, crushed or finely chopped soybeans), soybean milk and soybean curd or "cheese," recipes for dried soybeans, recipes for canned soybeans, recipes for soybean pulp, roasted soybeans or soynuts (p. 45), soynut butter (p. 47), recipes for soybean milk and mash [okara]; "It makes a good base for macaroon-type cookies" (p. 50), recipes for soybean curd or "cheese" (tofu). 5. How to use soy flour. 6. Using soy grits and flakes. 7. Stretching meat with soybeans. 8. Using other soy products. List of [commercial] soybean products (p. 199-202). Key to recipe sources.

Chapter 2, "Growing soybeans in Victory Gardens," states (p. 4): "In general, all varieties may be classified under two main types: the field type and the edible or vegetable type. The latter type is the one which is of interest to the Victory Gardener, although a few field varieties, such as Illini or Manchu, are satisfactory for eating purposes." Varietal trials (p. 5-8) with four type-A vegetable varieties (suited for cooler, northern climates) show: In mountainous Colorado, all four varieties matured seed at altitudes of 5,000 to 7,000 feet. In Idaho, all four varieties matured seed at altitudes of 1,700 to 3,745 feet. In Montana, Giant Green soybeans matured seed at altitudes of 3,000 to 4,900 feet. In Wyoming, Giant Green was the only variety to mature seed in Campbell county (4,600 feet) and in Park county (4,600 feet). But all four varieties matured seed in Johnson county at an altitude of 3,750 feet. Giant Green also did well in Utah and New Mexico at altitudes of 7,000 to 8,000 feet. In California, 11 counties reported success with vegetable-type soybeans. In Tucson, Arizona, 8 varieties were grown under irrigation at an altitude of 2,400 feet, all with satisfactory yields. Some varieties also did well in Canada. In St. George, Ontario, Giant Green, Bansei, Fuji, and Willomi all matured seed before killing frost. Bansei was the best producer. In Barrington Passage, Nova Scotia, Fuji was the only variety that produced pods before frost. At Bogot, Manitoba, only Giant Green matured seed before frost, but Fuji reached edible condition. At Swift Current, Saskatchewan, the season was evidently too cool for soybeans. Page 142 states: "Soy grits and soy flakes are made from soybeans in much the same way that soy flour is made. However, they contain almost no fat, and are ground more coarsely. Grits are like corn meal in texture, while flakes resemble rolled oats. Grits and flakes both contain less than 45 per cent protein."

Note 1. This is the earliest English-language document seen (Dec. 2012) that contains the word "soynuts." On pages 45-49 the book gives recipes for: Cream of soynut soup (using 1 cup Co-Op soynuts), Soynut rice loaf. Soynut honey buns. Soynut brownies. Soynut butter. Economical soynut brownies. Soybean brittle (using 1 cup chopped roasted soybeans).

Note 2. This is the earliest English-language document seen (Dec. 2012) that contains the term "soynut butter," used to refer to a product resembling peanut butter that is made from roasted soybeans. The recipe for "Soynut butter" (p. 47) states: "Grind 2½ cups of roasted Vee-Bee soybeans and mix with 2 tablespoons of salad oil. Use in place of butter or as a sandwich spread." On p. 197 is a recipe for Mull-Soy "ice cream."

1328. Cahill, William M.; Schroeder, L.J.; Smith, A.H. 1944. Digestibility and biological value of soybean protein in whole soybeans, soybean flour, and soybean milk. *J. of Nutrition* 28(3):209-18. Sept. [13 ref]
• ***Summary:*** The authors studied the digestibility and biological value (BV) of the soybean protein in cooked whole soybeans (with 10 human subjects, the digestibility averaged 90.5 and the BV 94.5), cooked soybean flour (with 6 subjects, the digestibility averaged 94.0 and the BV 91.7), and "soymilk" (with 9 subjects, the digestibility averaged 89.6 and the BV 95.3). The biological value of egg protein, taken as the standard, is 100. The soybean milk [actually a soy-based infant formula] was Mull-Soy, a brand made by The Borden Co. They concluded that the soybean proteins

in Mull-soy are practically the nutritional equivalent of egg proteins. The soy flour they used was Staley's Soy Flour #2. Address: Wayne University College of Medicine, Detroit, Michigan.

1329. International Nutrition Laboratory. 1944. Meet the vegetable cow (Ad). *Soybean Digest.* Sept. p. 61.
• ***Summary:*** A creative illustration (see next page) shows the head of a cow made entirely from soya. The main part of the face is made from whole dry soybeans. The ears are made of soybean leaves. The horns, forelock, parts surrounding the eyes, nostrils, and mouth are made of soybeans in their pods.

The company now makes 8 commercial soy products: 1. Miller's Giant Green Shelled Soya Beans. 2. Miller's Soyalac (powdered milk), plain, malted, or chocolate. 3. Miller's Soyalac (soya milk), liquid, natural, or chocolate. 4. Miller's Vegetarian Cutlets in uniform slices or diced [made from wheat gluten]. 5. Miller's Soya Loaf. 6. Miller's Soya Spread. 7. Miller's Edible Soya Flour. 8. Miller's Edible Soya Beans.

A photo shows a 14 oz glass jar of Miller's Soya Spread, with some of it being spread, using a knife, on two slices of bread. It is a butter substitute and sandwich filling. Standing next to the jar is a small cartoon figure of man dressed like a chef or baker. The caption reads: "The Soybean Man says: 'There's nothing like it!'"

Note: This is the earliest document seen (June 2009) concerning the marketing of green vegetable soybeans. Address: Mt. Vernon, Ohio.

1330. Associated Press (AP). 1944. Try crushing soybeans for your milk supply. *Wall Street Journal*. Oct. 2. p. 1.
• ***Summary:*** *Domestic Commerce,* a publication of the U.S. Department of Commerce, suggests that if you run out of milk, why not try making soybean milk. It states that "Chinese children are raised on soybean milk and that small amounts of the liquid are being produced in the United States."

According to Dorothy P. Bales of the Bureau of Foreign and Domestic Commerce and author of the article, one method is to soak dried soybeans for several hours, crush them, boil 3 parts water with 1 part bean mash for half an hour, then strain. The resulting liquid "resembles animal milk both in appearance and properties."

1331. Loma Linda Food Company. 1944. Re: Loma Linda Soy Milk. Letter to Mrs. Marie G. Thompson of Milwaukee, Wisconsin, Oct. 17. 2 p. Typed, without signature on letterhead.
• ***Summary:*** This letter is written on the company letterhead which contains an illustration (line drawing) of the new Arlington headquarters, and gives the address and phone number. Across the bottom is written: "Tasty. Wholesome. Nutritious." The author writes: "We are surely interested to know that you have had such good success in raising your baby entirely on Soy Milk and we trust that this good progress will continue. It encourages us to know that there are those who believe in the vegetarian regime and... are willing to demonstrate that babies can be raised on Soy Bean Milk. We are sending you with this letter a copy of our folder featuring Loma Linda Soy Milk. The Kreme O'Soy put up by Madison [Foods] is also a good product. They do not add Carotene [which Loma Linda does, to provide essential vitamin A].

"One of the largest children's hospitals in Los Angeles where they have many allergy cases is using our Soy Milk very extensively and has done so for a number of years." Address: Arlington, California. Phone: Riverside 9217.

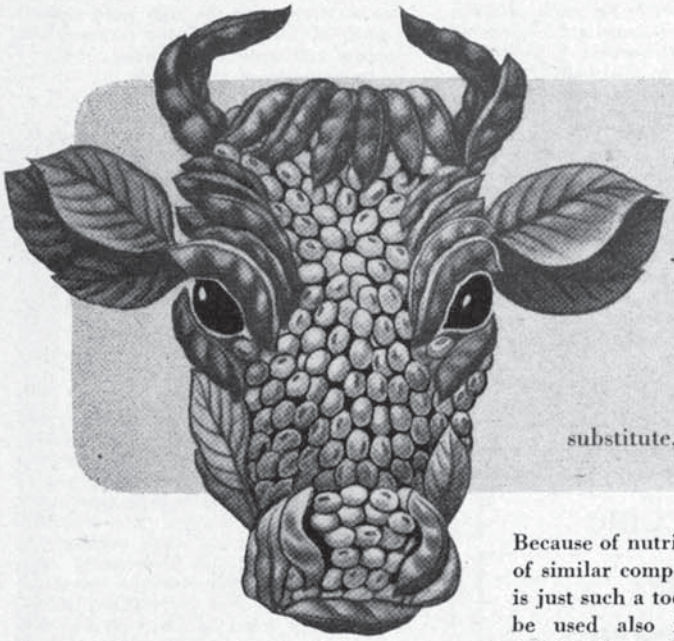
1332. Stoesser, Albert V. 1944. Clinical evaluation of soy bean food in eczema of the child. *Annals of Allergy* 2(5):404-12. Sept/Oct. [1 ref. Eng; spa]
• ***Summary:*** Thirty-seven children were offered a soy bean formula. "Eight could not take it and soy bean sensitivity was only suspected in 3 of these patients. Twenty-nine cases ranging in age from 2 months to 2 years ingested the food very well, but 14 developed a diarrhea which was controlled. Four normal non-allergic controls receiving the soy bean formula did not have diarrhea.

"All of the children progressed remarkably well, with 18 revealing good, and 11 fairly good, results in a relatively short period of time. The improvement continued long enough to make this observation quite significant." Address: Minneapolis, Minnesota.

1333. Moulinier, André. 1944. Essai d'utilisation de la graine de soja dans la fabrication des milieux de culture [Attempt to use soybean seeds in making culture media]. Lyon and Villeurbanne, France: Printed by Association Typographique. 59 p. 25 cm. [19 ref. Fre]
• ***Summary:*** The title pages states that this is the published version of the author's PhD thesis at the University of Lyon, Faculty of Medicine and Pharmacy–No. 357. The work was done at the university's Laboratory of Hygiene. The thesis was presented and defended before the Faculty of Medicine and Pharmacy (section of pharmacy) on 13 Dec. 1944 to obtain the degree of Doctor of Pharmacy. The author was born on 23 April 1920, at Firminy (Loire).

Contents: Preface. Part I. 1. Principal vegetable media used in bacteriology. 2. Overview of the soybean: Botanical origin, geographical origin and distribution, cultivation, chemical composition.

Part I: Experiments. 3. Attempts to use the soybean in bacteriology: Soy bouillon, solid media, bouillon of soy peptone, attempt to use all of the albumins, soymilk–its preparation and utilization, tofu (*petit lait de soja* = little soymilk). Interpretation of results. Conclusions. Address: Pharmacy intern at the Hospital of Lyon (France), certified in



Meet the VEGETABLE COW

The Soybean produces a milk substitute, *Soyalac*,* and a butter substitute, *Soya Spread*.

Because of nutritional needs we should use butter or a tasty spread of similar composition on our bread. MILLER'S SOYA SPREAD is just such a toothsome spread for plain or toasted bread. It may be used also in various combinations for salads, sandwiches, entrees, omelets, croquettes, etc.

Miller's SOYA SPREAD comes in 14-ounce glass jars, and a trial purchase will convince you how little you miss butter when *Miller's* SOYA SPREAD is put on a cracker or slice of toast. Besides a high oil content, *Miller's* SOYA SPREAD, like *Miller's* popular VEGETARIAN CUTLETS, has a high protein value.

* Miller's milk substitute in powdered or liquid form.

THE SOYBEAN MAN SAYS:
"There's Nothing Like It!"

All Miller's products are distinctive and FIRST in quality. Here they are:

1. Miller's Giant Green Shelled Soya Beans.
2. Miller's Soyalac (powdered milk), plain, malted, or chocolate.
3. Miller's Soyalac (soya milk), liquid, natural, or chocolate.
4. Miller's Vegetarian Cutlets in uniform slices or diced.
5. Miller's Soya Loaf.
6. Miller's Soya Spread.
7. Miller's Edible Soya Flour.
8. Miller's Edible Soya Beans.

If your dealer does not stock *Miller's* foods—

INTERNATIONAL NUTRITION LABORATORY » Mt. VERNON, OHIO

microbiology and hygiene, ex-monitor of practical hygiene works.

1334. **Product Name:** Mel-K-Soy (Soy Flour).
Manufacturer's Name: Central Soya Co.
Manufacturer's Address: 300 Old First Bank Building, Fort Wayne 2, Indiana.
Date of Introduction: 1944.
New Product–Documentation: Taylor. 1944. Soy Cook Book. p. 202. "Sold wholesale to bakers." Letter from E.B. Oberg. 1985. May 4. Central Soya tried to get the confectionery trade to use its Mel-K-Soy soy flour in place of non-fat milk powder. The soy flour had a higher protein content and probably lower cost.

1335. Kingsley, Ellen J. 1944. Soybean and soybean products for table use. Washington, DC: Bureau of Home Economics, USDA. 17 p. Mimeographed unpublished typescript.
• ***Summary:*** Contents: Introduction. Green soybeans [green vegetable; "Of the garden varieties tested, the Hahto, Easy Cook [Easycook], and Rokusun are most desirable]. Dried soybeans. Soybeans sprouts. Soybean flour. Soybean milk. Soybean curd. Soybean mash ("The ground bean pulp or mash which remains after the milk has been extracted...).

For each type of soybean or soybean product an introduction followed by several recipes is given. For example: Dried soybeans:

"Dried soybeans may be used in much the same way as navy beans and other dried beans, except that some varieties of soybeans require longer soaking and longer cooking, The Easy Cook and Rokusun require least cooking but Mammoth Yellow, Dixie, and Hahto, are other varieties which may be used successfully as cooked dried beans. All of them need to be soaked overnight and simmered in fresh water for 2 hours or less, according to the dryness of the beans and the variety.

"A pressure cooker may be used to advantage in cooking dried soybeans. Soak the beans before cooking. Easy Cook and Rokusun varieties will cook in 15 minutes in a pressure cooker at 15 pounds pressure. Dixie, Hahto, and Mammoth Yellow require 25 to 30 minutes at 15 pounds pressure.

"Although soybeans are very rich in fat, in cooking, a little meat fat or butter may be added for flavor. To bake them, use cooked dried beans, season, and cook in a slow oven for 3 or 4 hours.

"A number of appetizing dishes may be made of soybean pulp, which is obtained by mashing, grinding, or pressing the soaked dried soybeans through a coarse sieve." Ten recipes for dried soybeans are given. Address: Under Scientific Aid, Foods and Nutrition Div., USDA, Washington, DC.

1336. **Product Name:** Soy-B Prep Soy M Powder (for Making Soymilk).
Manufacturer's Name: Natural Health Products.
Manufacturer's Address: 143 W. 41st St., New York 18, New York.
Date of Introduction: 1944.
New Product–Documentation: Taylor. 1944. The Soy Cook Book. p. 201.

1337. Soya Foods Ltd. 1944. Soya flour: Make your dishes more nutritious (Leaflet). Elstree, England. 2 panels each side. Each panel: 20 x 12 cm. Undated.
• ***Summary:*** Contents: Introduction. How you should use it. Recipes for household use [of soy flour]. Child and infant feeding.

At the bottom of panel 3 we read: "A section on soya flour, including further recipes, can be found in 'Food Without Fuss' [1944], by Josephine Terry, the well-known *Daily Mirror* cookery expert (Publishers, Faber & Faber, price 4/6)." Address: Boreham Holt, Elstree, England. Phone: 2421.

1338. Anderson, Hans Steele. 1944. The new food therapy: Diet and the healing art. Maitland, Florida: Printed by The Academy Press. 165 p. See p. 37-38, 64-66, 85-86, 89, 118-19. 23 cm.
• ***Summary:*** This is a rewritten and enlarged edition of the author's *Food Therapy: Diet and the Healing Art*, published in 1942. The author, apparently a Seventh-day Adventist, was born in 1877.

Pages 37-38 contain a discussion of soya bean products (including Soya Lac, which is alkaline in reaction, and is made by the International [Nutrition] Laboratory, Mt. Vernon, Ohio). There are home-scale recipes for: Soybean milk no. I (made from soybean flour). Soybean milk No. II (made from powdered soybean milk–Soya-Lac). Soy butter substitute No. I (made by blending soybean flour, soybean oil, and a few drops of dandelion butter color with a Dover beater). Soya bean butter substitute No. II (made by blending Soya-Lac powdered soybean milk with soybean oil; refrigerate). Soybean cheese, made by curding hot soybean milk with a little citric acid. "Season with rich soybean milk and salt as you would flavor ordinary cottage cheese and serve."

Pages 64-66 give nutritional information on soybeans and soy-products, and compare soybean milk with cow's milk. "As a source of wholesome food constituents, the soybean probably has no peer... Soya bean milk contains more food mineral and vitamins than cow's milk; is alkaline in reaction; has a greater proportion of calcium; and forms into smaller curds in the stomach. Soya milk, moreover, is far cheaper than cow's milk and may be prepared fresh as required, and can be seasoned to suit anyone's taste."

Other soy-related recipes include: Soybean-wheat muffins (p. 85-86). Use of soy bean flour in wholewheat bread (p. 89; it can be substituted for up to 25% of the wheat flour).

In the chapter titled "Diet and the healing art," under "Lecithin," pages 118-19 note that "there is a new food factor called lecithin which promises to become a factor of importance on account of its being essential for reconstruction and for the maintenance of vital organs, including the brain, nerve forces, heart and liver. Oil that is contained in the soybean is comparatively rich in lecithin and vitamin A and in this respect it is said to resemble butter. Cow's milk proves rather deficient in lecithin whereas soya milk is fairly rich in this essential constituent. Nutritional anemia which has been brought about through an exclusive use of cow's milk may be quickly eradicated by a liberal use of soybean milk."

1339. Bordas, Jean. 1944. Le Soja: Agronomie du soja, utilisations agricoles et alimentaires, usages industriels, économie du soja, état actuel de la question en France. Dieuxème ed. [The soybean: Agronomy, agricultural and food uses, industrial uses, economics, and present status in France. 2nd ed.]. Montpellier, France: Dubois et Poulain. 32 p. The 1st edition (36 p.) was published in 1937. [39 ref. Fre]
• ***Summary:*** Contents: 1. Introduction (he notes that World War II is "the war we have just lost"). 2. Soybean agronomy: Botanical characteristics, varieties (in Japan, China, Manchuria, USA), acclimatization trials in Europe, soybean cultivation (incl. inoculation), 3. Food and agricultural uses of soya: Chemistry of the soybean, alimentary physiology, as a feed for animals (soybean cake, forage, soybean seed and flour, soymilk mixed with 25% animal milk), other agricultural uses, as a human food (soy sprouts, tofu, fermented tofu, smoked tofu, how to make tofu), condiments–sauces (soy sauce, miso, tuong of the Annamites, soy coffee, provisions / rations), human therapy (incl. infant foods).

4. Industrial uses: Soybean oil, casein, plastic materials (Sojalithe), vegetable lecithin, cellulose, sterol.

5. Soy in the economy: Production, imports and exports.

6. The present state of the soybean question in France–Conclusion.

A full-page table (p. 7) shows varieties developed and acclimatized to various countries. France: Rouest 29. Rouest 250. Rouest 104. Rouest 14. Rouest 71. Rouest 60. Rouest 178. Rouest 16. Rouest 36. Rouest 85. Rouest 6. Rouest 67. Rouest 40. Rouest 500 M. Rouest 13. Vilnensis.

Russia: Schribaux (Rouest). Lawes et Gilbert (Rouest). Miège (Rouest). Staroukrainskaya. Halton 502/2. Kouben 0.354. Kouben 0.375. Kharbinskaya 190.

Germany: Früheste Mittelhôhe gelbe. Mittel Frühe. Mitteleurope. Diekmanns frühgelbe. Diekmanns hel'gelbe. Diekmanns grungelbe. Platter silo. 236 Pappelsdorf. 238 Pappelsdorf.

England: Green Jap. Brown C. Yellow J.

United States: Cayuga. Manchu. Illini. Tokio noir [Tokyo Black]. Mandell. Black Eyebrow. Wisconsin. Chestnut. Mandarin. Lisbonne.

On page 8 is an interesting map of France which shows: (1) Twelve centers of agronomic research. (2) A shaded zone which is the area of optimal production of soybean seeds. It is in the southeast of France and along the eastern side of France all the way to the northern border. This zone includes (from southwest to northeast) the following centers: Toulouse, Montpellier, Avignon, Antibes, Clermont, Dijon, and Colmar (in Alsace).

Pages 5-6: The first trials made by the agronomic stations in France date from 1901. Mr. Lechartier, director of the station at Rennes, concluded at the end of his observations, that the production of soybean seeds would be more advantageous in a climate that was drier and warmer than that of Brittany (Bretagne).

These were the same conclusions that Mr. Brioux, director of the agronomic station at Rouen, arrived at some years later.

Starting in 1924 the agronomic station at Avignon, the central station for plant improvement at Versailles, in 1935 the stations at Colmar, Clermont-Ferrand and Dijon, and in 1940 the School of Merle (Bouches-du-Rhône), established soybean [germplasm] collections which originated in many different places, in order to test the earliest and most productive varieties that were adapted to each region.

Rouest and Rondet in the south of France, Dr. Balzli in Alsace and de Guerpel in Normandy were the main agronomists and selectionists who were passionately interested in the cultivation of Soya in France.

Note: Rouen is the historic capital city of Normandy, in northern France on the River Seine. Address: Ingénieur Agronome, Directeur de la Station Régionale de Recherches Agronomiques d'Avignon, France.

1340. Hauser, Bengamin Gayelord. 1944. Diet does it. New York, NY: Coward-McCann, Inc. 248 p. Index. 20 cm. Rev. ed. 1951 (117 p., 28 cm), and 1952.
• ***Summary:*** In the preface, the author states that for 20 years he has been a pioneer in the field of scientific eating. The author does not advocate a vegetarian diet, but he does recommend use of soya beans, and consumption of plenty of vitamins and whole (unrefined) grains. For example, at the start of chapter 3 titled "Normal Nutritional Regime" is a section on "Proteins Come First." It says: "Protein foods are of two kinds, spoken of as first class and second class proteins. The first class proteins keep the body in excellent repair. Such proteins are found in egg yolk, cheese, milk, yogurt, and glandular meats such as liver, kidney, brain, and sweetbreads. The muscle meats which we eat as roasts, chops, and steaks are also first class proteins but are less valuable to the body than glandular meats. A few vegetable foods contain first class protein: soya beans, nuts, wheat, especially wheat germ..." An active man should eat 75 gm of protein daily to maintain buoyant health. Half of the amount

should be supplied from animal protein. "Recent studies have revealed that about 60% of the people in America obtain too little protein to build full health. With the higher costs of eggs, fish, and meat, protein deficiencies of a more severe nature may be expected. For that reason you should acquaint yourself with 'the honorable soya bean' or the 'meat without bones' as it is called in the Orient. Prepared correctly as directed in the 'New Health Cookery,' Chapter 20 [sic, 21, of this book], soya beans can be delicious and fortunately contain first class protein."

Cooked soya beans are a good source of vitamin B-1 (p. 32). "Buy only whole wheat or soya bean macaroni, spaghetti, and noodles which are sold at stores specializing on health-building foods. Use brown rice rather than the white variety. Eat soya beans, baked, in "meat" loaves and patties" (p. 34).

Soy-related recipes include: Cream of soya soup (with cooked soya beans, p. 217). Soya nut croquettes (with baked soya beans mashed, p. 224). Soya bean loaf (p. 224). Soya and peanut butter patties (with cooked soya beans, p. 224). Delicious soya muffins (with soya flour, p. 228). Soya cream waffles (with soya flour, p. 229). Soya nut waffles (p. 229). Delicious soya cake (with soya flour, p. 229). Soya cookies (with soya flour, p. 230). Whole soya flour pie crust (p. 232; with "½ cup whole wheat flour and 1½ cups soya flour" etc.). Soya bean sprouts (homemade, p. 234; "They are also often used with soya bean curd and vegetables in chop suey."). Soya bean milk (homemade, p. 235). Address: Beverly Hills, California.

1341. La soya: Excellente alimento para el hombre como para el ganado y valiosa materia prima de numerosos usos industriales: Indicaciones para su cultivo y aprovechamiento [The soybean: Excellent food for people and for livestock and valuable raw material with numerous industrial uses. Remarks on its cultivation and utilization]. 1944. New York, NY: Reader's Digest. 32 p. [Spa]*
Address: New York City, New York.

1342. Matagrin, Am. 1944. Le soja: Culture et utilisations [Soya: Cultivation and utilization]. Paris: Gauthier-Villars. 72 p. Illust. No index. 28 cm. [Fre]
• ***Summary:*** Contents: Introduction: Why does soybean culture remain little known in France? 1. What is the soybean (*le Soya*)*?* Why should it be cultivated?: The plant and its varieties, the soybean (*la fève de soya*) and its general characteristics, alimentary interest in soya, agricultural interest in soya, industrial [non-food] interest in soya.

2. Soybean cultivation: The question of climate, choice of the variety to cultivate, choice and preparation of the land/soil, fertilizers for soya, soya in crop rotations, seeds, sowing, and seedlings, mixed cultures or intercropping, soybean vegetation and crop management, maturation, harvest, yield, and storage.

3. Use of the soya plant and its seeds: Soya in agriculture and livestock feeding, soya in human foods, recipes, industrial uses of soya, people and organizations connected with soya, contracts for growing soybeans in 1944. Table of contents.

The section on soya in human foods, based on the author's 5-6 years of personal experience, discusses, with recipes: green vegetable soybeans (*soya en légume vert*), whole dry soybeans (*soya en légume sec*), soy sprouts (*germes de soya*), fermented soy condiments (shoyu, miso, natto), soy flour (bread containing soy flour was made at Paris and even at Vichy in 1939), soymilk and tofu (*lait de soya et fromage végétal*), roasted soybeans and a coffee substitute (*soya grillé, substitut de café*), soy oil (*huile de soya*). Address: France; In 1946: Technical Consultant to Bureau Francais du Soja.

1343. Miller, Harry W. 1944. The story of milk from the soya bean. Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 1-6.
• ***Summary:*** This rare and very interesting booklet was sent to Soyfoods Center by Charles D. Howes of Mt. Vernon, Ohio, in Feb. 1979.

Contents: Full page photo of the "International Nutrition Laboratory established for processing soya bean foods, located at Mt. Vernon, Ohio. Foreword, by J.A. LeClerc, PhD, Formerly Senior Chemist of the USDA (Retired). March 5, 1944. The story of vegetable milk (Soyalac), by Harry W. Miller, M.D. Early trend, observations in China, back in America, the milk question, encouraged to produce a vegetable milk, further studies in China, the role of the International Nutrition Laboratory in America. Other products of the International Nutrition Laboratory.

"Foreword: The preparation of a palatable and appetite-appealing soya milk is proving a great boon to people allergic to cow's milk. It has been estimated that 20 to 25 per cent of our population are allergic to ordinary milk and many thousands of babies suffer from infantile eczema and other violent symptoms, whose condition clears up when transferred to soya milk feeding.

"Soya milk as prepared has approximately the same composition as cow's milk, except when soya milk is especially prepared for infants its formula simulates mother's milk. Soya milk contains more Vitamin B than cow's milk, and an equal quantity of Vitamin B-2. The valuable proteins found in soya milk contain all the Amino-acids known to be essential for growth. Preparations made from the soya bean are relatively rich in iron and copper, so that soya milk compares very favorably with animal milk as to its nutritional and biologic values.

"Soya milk has this further advantage that it does not endanger the user to disease producing germs.

"In view of the fact that there is not enough animal milk available in this country for the optimum nutrition of our

population, also that it takes three years of care and feeding before a cow gives milk, that only a small percentage of the food consumed by the cow is returned in the form of milk, and further that the use of only ten million bushels or one twenty-fifth of our annual soy bean crop for conversion into soy bean milk, would supply a pint of milk every day to 8,000,000 people, at a cost less than that for cow's milk, and that soya milk is palatable, and especially acceptable by children, it would seem the sensible thing to encourage the preparation and consumption of soya milk on a large scale.

"The 'Story of Vegetable Milk' is most interesting to read. The successful preparation of an appetite-appealing soya milk, after years of experimentation by Dr. Harry W. Miller, now bids fair to become one of the most practical of modern food discoveries. Its use will not only be the means of saving thousands of children from unnecessary suffering and sickness but soya milk should prove a good substitute for cow's milk for those who are allergic to animal milk.

"It is my sincere wish that all who are fortunate enough to obtain a copy of Dr. Miller's "Story of Vegetable Milk," will study its contents and then pass it on to others, in order that in due time, millions of our people will have recognized the full nutritive value of this most excellent food product."–Signed, Joseph A. LeClerc, PhD.

"Early trend: Being the oldest of a family of five children, it fell to my lot to help Mother about the kitchen. She was well known for her sumptuous meals, and we always had many visitors at our house. Later as a part of the curriculum of the college which I attended was a course in cookery, and this stimulated my interest in knowing how good things were made as well as their food values. Then when I became a student of medicine we were introduced into a study of food preparation which in those days (1898) was rather unusual in the program of a medical school. This course only seemed to further whet up my interest in the study of foods and their preparation.

"Having to earn the resources for pursuing my medical education. I secured the position of guiding visiting groups through a food factory. As I explained the processes of manufacture, many questions were directed to me on all phases of nutrition as it relates to health and disease, and I took great interest as a guide to inform myself in every way available. I hungrily devoured literature on the subject and was fortunate in being under the tutorage [sic, tutelage] of the father of nutrition work in America, namely the late Dr. John Harvey Kellogg, to whom more credit belongs for furthering the selection, processing and sanitary packaging of breakfast foods than any other man. He was forty years ahead of the times in advocating the value of proper diet in relation to the cure of the sick, and so I have been able to grow up with the advance of nutrition work from its beginning and see the birth of the science of dietetics.

"Observations in China: In the autumn of 1903 my wife and I sailed as medical missionaries for interior China. After a stormy voyage, in which seasickness had deprived us of rations that were included in the price of our ticket, as well as several pounds of flesh, we arrived at the port of Kobe, Japan, where our colleagues, Dr. and Mrs. Lockwood, who preceded us one year, had a small sanitarium and had prepared a sumptuous meal for us. Half starved, we ate with great relish. One dish that was new to us especially attracted attention. It was a protein loaf made from the soy bean curd which was marketed under the name 'To Fu.'

"Arriving at the port of Shanghai, China, we went inland and took up our abode in the central part of the province of Honan, where we not only wore the Chinese costumes, including the queue, but our diet was from foods bought from the local markets, and consisted of only those edibles indigenous to China. Here again we were introduced to the soy bean, whose home is China, and which has been the great source of protein of the Chinese people for millenniums.

"The bean was grown abundantly in Honan, and in fact in all parts of North and Central China. Wherever the Chinese emigrate, they utilize this bean in many marvelous and tasty ways, mostly, however, in the form of cheese made by coagulating the milk with calcium sulphate. This curd is eaten in its soft state, or else pressed into little square cakes. The curd may be formed in sheets by pressing cloths. They also gather sheets of almost pure albumen [yuba] from a scum arising to the top of the soy milk on heating same. Accustomed to people chiefly drinking cow's milk, rather than making products from it, I questioned the Chinese why they did not use the soy milk. They said some of the aged with weak digestions do, but that the cheese was more popular, as they could combine it with other cooked foods. Still more did I wonder why, for the much undernourished infants of the Orient, they did not give them soy milk, containing as it does such important food entities as salts, vitamins, protein and oil in richer amounts than the bean curd and without the undesirable gypsum.

"Being engaged in language study and other mission responsibilities for several years I could do but little more than ponder over what I felt were great possibilities in soy milk for the people of China as well as other lands, were it scientifically studied.

"Another observation I made was that the people of North and Central China who were vegetable-protein eaters, getting especially soy bean rations, were a large and muscular people in comparison with those of the South, where rice was the food, and who used more meat in their diet. These results were later confirmed by experiments to show that the protein of the soy bean is one of the greatest body building foods known.

"Back in America: After eight years' service in China, I was compelled to return to America on account of illness contracted in interior China. When sufficiently recuperated, I was called to the position of medical superintendent and

surgeon of the Washington Sanitarium and Hospital at the nation's capital. This again brought me in touch with important nutrition studies carried on at the government bureaus in Washington and also the work at Johns Hopkins University. We also had our own laboratory where we prepared several soy products and introduced many original dishes into our hospital dietary. The Washington Sanitarium was an institution whose dietary was of the lacto-vegetarian type" (Continued). Address: M.D., Mt. Vernon, Ohio.

1344. Miller, Harry W. 1944. The story of milk from the soya bean (Continued–Document part II). Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 6-11.
• ***Summary:*** Continued. "In order to get our protein supply, we went heavy on cow's milk and dairy products. In 1917 we received notice from the dairy which supplied us milk, that the government had requisitioned their entire milk supply to the Walter Reed Military Hospital, and we would have to look to other sources. We secured a large farm nearby and expended several thousand dollars buying the best registered cows we could secure. Our heavy investment necessitated that I should give some study to the dairy business. And, although I grew up on the farm and as a boy it fell to me to do the milking, which was usually accomplished in the barnyard or in the cow stable, my boyhood anxiety while milking was how best to save the milk from dirt contamination, in which we had many narrow escapes, and when none to successful we had to add an extra thickness to the strainer cloth. We knew nothing then of infected milk through disease of animals, or of milk as a carrier of infections and spreader of epidemics, of cow allergy, or that the milk contained toxins that came from certain feeds and pastures. My father being a school teacher, taught us, however, to try to keep flies out of the butter, and lids on the milk crocks while the cream was rising. From the day I began to milk cows I lost interest in drinking milk.

"The acquisition of this dairy by the Washington Sanitarium not only convinced me of the need of a substitute for animal milk, but my investigations into all phases of the care of a herd and its product, milk, served as a preparation for building up just such a product with nutritious properties equal to those of animal milk.

"The Milk Question: Among the several dairy publications studied, I was especially impressed with Dr. M.J. Rosenau's book on "The Milk Question," especially since he was recognized as America's foremost hygienist, being surgeon-general of the U.S. Public Health Service. Dr. Rosenau aimed in his book to inform the public of dangers in animal milk and the need of improved methods for caring for same. To start with, he calls attention to the following: The milk-giving animal may be suffering from serious disease or there may be contamination while milking, both from filth on the animal or from exhalations from diseased cows, from milkmen's unclean hands, dirty milk pails or strainer cloths, unclean holding receptacles, the fly menace, putrefactive changes in milk while standing in the sun or being hauled to the market, contamination from often repeated handling of milk, failure of pasteurization to make infected milk good and safe, and also the contamination of the infant nursing bottle. In his amazing statement of the high infant mortality through contamination of milk, he also enumerated numerous epidemics transmitted by milk infection, typhoid, scarlet fever, and other disease scourges. However. Dr. Rosenau's book was written too early to list undulant fever now known to be wholly contracted from infected animals.

"The results of these investigations led me to check our herd of carefully selected cows for tuberculosis, with the result that five of the finest milk cows reacted as tuberculosis infected animals, and the results were confirmed by specimens of infected glands taken from each animal. During these years of investigation and practical experience I became convinced of the following facts:

"1. That the cow's milk is a perfect food for the calf during its early period of development. The grown calf turns to other food later and the mammary secretion of the cow is for a short period. The calf has four stomachs and possesses enormous powers to digest the heavy curd of cow's milk. It should be kept in mind that each animal gives a milk most suitable for the nourishment of its own kind. A calf's growing conditions are different from the human, so that cow's milk is not suited by nature as a perfect food for man.

"2. Out of a mixture of milk from several cows you are almost certain to get strains of pathogenic germs, which are not always certain of destruction by Pasteurization temperatures. Only when Pasteurization temperatures are held at 154 degrees Fahr. for 30 minutes can its germicidal action be depended on.

"3. Tests made on 500 well people showed that 27 per cent gave evidence of allergy to cow's milk, of whom about one-fourth were severe reactors.

"4. Certain foods in the animal diet affect the character of the cow's milk.

"5. Cow's milk has six times the amount of calcium of human milk, but such salts are not so available to the human infant as the calcium of woman's milk.

"6. The casein or protein of cow's milk forms a tough curd in the infant's stomach, and since the infant's digestive organs are poorly developed, the casein is only partially available.

"7. Cow's milk is frequently constipating to both infants and adults and has a tendency to gas formation.

"8. Both vitamins and minerals are a variable item in cow's milk, depending on her diet. The cow borrows all she contributes in food values from vegetation. If what she eats does not have vitamins, her milk cannot contain same.

"9. Animal milk certainly has proven of value in the feeding of infants and children, still, because of certain lacks and dangers to be found in cow's milk, an effort to find a

safer and more suitable substitute is justifiable.

"10. Deriving nourishment from cow's milk is an extravagant waste of food materials, since the cow returns but 12 per cent of her feed in milk and only 8 per cent of what she eats is stored as muscle tissue for beef.

"After all, the only perfect food for humans is woman's milk, and that only during the lactation period, as every animal gives a perfect milk to start off the nourishment of its kind. The reason goat's milk is better for infants, is that its offspring's growing needs more nearly parallel those of the human infant, whereas the milk of the large animals whose offspring make a very rapid growth are not so suitable for the human species without considerable modification. Thus extensive modification of cow's milk is required to make it suitable for infants, so that baby food manufacturers discard some of the fat, others modify the salts, still others soften the curd, and some replace the entire sugars; and to be sure of vitamins, they always have to be supplemented.

"So, we ask why not build up just the milk we want to start with, and this we have now accomplished. Nevertheless, cow's milk will still continue to occupy an important place in the American dietary, but let us not conclude it is indispensable, by any means. However, we are convinced that every process the cow uses to make milk could be duplicated in the laboratory as regards the transformation of food materials to become a part of our growth and energy needs. We have sugars even superior to animal lactose, vegetable oils with a less tendency to rancidity. Minerals, as also vitamins, are today added to food with greater certainty than depending on their existence in animal milk, and thus far there is no protein superior to that found in the soy bean, as it contains all the indispensable amidoacids [sic, amino acids] that constitute complete protein nutrition" Continued. Address: Mt. Vernon, Ohio.

1345. Miller, Harry W. 1944. The story of milk from the soya bean (Continued–Document part III). Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 12-18.
• ***Summary:*** Continued. "Encouraged to Produce a Vegetable Milk: Having arrived at these conclusions which were based on extensive feeding experiments, we set about to get milk from a vegetable cow. However, my colleagues shook their heads saying, 'You might make something that looks like milk, but will it have those living properties that fit the requirements of a growing life in the form of a human individual?' But I have only to remind them that in the early days we thought of vitamins as living principles that evaded analysis, causing reactions but perishing with attempts at investigation, subsequent years have erased this argument and we can now analyze vitamins as well as manufacture them, as they have a chemical formula.

"I could easily have become discouraged in trying to bring out a substitute for animal milk because of the well established dairy business in America where sixteen per cent of United States industry flourishes, except that all the while I had in mind the people of the Orient in behalf of whom I had dedicated my life for service as a young man. Millions die annually for the lack of a suitable balanced food beverage to take the place that animal milk occupies in the American dietary, and as many more suffer lifelong weakness and ills because of faulty nutrition, especially in the early years of life. I was also well aware that in America we have many who cannot take animal milk, either dislike it, are fearful of it, or are allergic to it, who are ill nourished for lack of a milk substitute. And even yet cow's milk is not available to all the inhabitants of the Americas.

"As I pondered over what a suitable milk food would mean to the Oriental races, where there was such a lack of that kind of food, I felt that humanity was throttled at its start. I was also aware of the dangers to health and life that lurk in the lacteal secretions of animals and the way milk is handled in dairy yielding countries. Consider also the economic food waste, in view of the enormous amount fed to animals and the little protein return. Think of what this well-processed vegetable protein would mean were it fed to the starving millions of this world. I determined to work out the problem of a vegetable milk. It occurred to me that if wool could be made direct from vegetable protein instead of feeding protein to the sheep, we could make milk without the digestive laboratory of the cow.

"I first investigated to see what had been accomplished, and discovered that two groups of child specialists, one in Baltimore, the other in Cleveland, had fed infants a gruel made from soy bean meal, and the reported results were very satisfactory. In America, all experimental feeding work was done with mixtures made from milling the soy bean into flour, although the fiber of the meal was a drawback. Yet because of the high nutritive value of soya protein and its alkalinizing properties, it possessed remarkable values as reported in infant feeding by these authorities.

"We made the acquaintance of two men prominent in soy bean work of the U.S. Department of Agriculture, Dr. W.J. Morse, Chief of the Soy Bean Division of the Department of Agriculture, and Dr. J.A. LeC1erc. Chief Senior Chemist of the Bureau. These men filled me with inspiration, enthusiasm and information. Throughout the succeeding years, we have had several interviews, and both of these men have made frequent visits to our Nutrition Laboratory at Mt. Vernon, Ohio.

"My preliminary studies made me aware that I would be confronted with many problems in producing from the soy bean an easily digested, tasty, wholesome milk that would meet a popular demand.

"My thirteen years spent at the nation's capital as surgeon and Medical Superintendent of the Washington Sanitarium and Hospital gave me a preliminary foundation in research methods for the years to follow in China. These years, from 1913 to 1925 were synchronous with the time

of the beginning of modern dietetics. McCullom at Johns Hopkins University in Baltimore was neighbor to us, and he was actively pursuing the study of vitamins and their dietetic value. I was intimately acquainted with this pioneer worker and in fact at the Government Bureaus in Washington there was a great arousement on the importance of dietetics and cooking advances, to which work I had ready access, as well as utilizing the marvelous Surgeon General's and the Congressional Library facilities, seeking the latest publications on food, processing and nutritional work.

"It was during this year I published my first book entitled, *The Way to Health*, which has enjoyed a wide circulation.

"During all these studies, my thoughts were focused on the Soy Bean, the world's great protein yielder, and how to best utilize it, and incorporate it into the American dietary as a substitute for meat, fish, milk, eggs and cheese. Early and late we were running experiments at the little food plant we erected in connection with the Washington Sanitarium and Hospital We realized that the large things in soy bean utilization in America, as also in the Orient, remained to be worked out in the future, and that our work was the first real effort to be recorded relative to a soy bean milk suitable for infant feeding and as a complete beverage milk.

"Further Studies in China: Finally in 1925 the opportunity came for me to return to China. My employing organization, the Seventh-day Adventist Church, sent me to establish a sanitarium at Shanghai. During the early years after my return to China, my time was fully occupied with medical and surgical work and the building of the Shanghai Sanitarium and Clinic, and assisting in the establishment of numerous other medical units in different parts of the Orient. However, simultaneous with this work, my son and I began to carry forward the assembly of a soy bean plant at the Shanghai Sanitarium. My work necessitated my return to America for a brief period about every two or three years and this gave me the chance to discuss my problems with chemists as well as investigate suitable processing machinery.

"In my contacts, while traveling in China. Korea and Japan, I discovered that a milky looking solution, a water extraction of soya protein, oil and its contained vitamins and minerals, had been tried out in infant feeding in some hospitals, in some instances with satisfactory results, but for the most part with quite disappointing results.

"The method used in its manufacture in most cases was to soak the beans, grind them in a stone mill with a stream of running water and this milky solution was filtered through a cotton cloth and then boiled, sugar added, and various flavors tried out to cover the beany taste, but flavor control was not possible by the strongest essences. As I examined this milk, it was apparent that something must be done to overcome the beany taste, and I concluded the reason the people were using bean curd rather than drinking the milk from which the curd was made, was that it tasted better after it was coagulated than before. Further, it needed to be farther processed to make it more digestible, and until we could add sugar and additional oil to it, we could not have a balanced milk as is found in human milk.

"Being familiar with the process of constituting cow's milk from skim milk powder, and sweet butter, through melting the butter, mixing it with the dissolved milk powder, and then homogenizing it, I concluded that we could do the same with this water-extracted solution from the hydrated soy bean.

"Since I knew that soy milk was a colloid liquid just the same as animal milk, and would hold a suspension of emulsified oil, I lost no time in getting a colloid mill that would do this same work, and could now constitute a liquid of any formula of protein, fat and sugar, so the resulting solution would be a colloid liquid as animal milk. Yet, I was far from having a milk that gave satisfactory results as to digestibility and could be borne by infants without too great looseness of the stools; and while you could sweeten it up so babies would take it, the older group would take a sip and turn it aside because of its bitter taste. To get rid of that beanish taste seemed far off, but to process it so that it could be more digestible, I thought was surely possible. Much work had been done at Ames, Iowa, in experimental animal feeding. Not only did these experiments show that thorough cooking under pressure of soy beans raised the availability of soy protein to 95 per cent absorption, but that weight and growth records in feeding of pigs and fowls were far superior to those of animals fed ordinary cooked beans, and thorough processing caused a disappearance of digestive disturbances" (Continued). Address: Mt. Vernon, Ohio.

1346. Miller, Harry W. 1944. The story of milk from the soya bean (Continued–Document part IV). Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 18-23.
• ***Summary:*** Continued. "This coincided with work that I had done in which I discovered the fact that the more you process vegetable protein, the more digestible and available the protein becomes, while the contrary holds for animal proteins, which are less digestible when overcooked. Having proven that soy beans were improved in both taste and availability through thorough processing, we conducted extensive cooking tests to determine optimum temperatures and length of cooking required to give us the best flavor and to render the several soya products, including soya milk, most readily digestible and assimilable. In the feeding of infants, whereas simply boiling milk causes great looseness of the bowels, as soon as we processed at the correct temperature and determined the exact period of time in most cases even the premature and weakest infant could take the soya milk without this laxative effect. Occasionally an infant would still have too loose movements and the soya milk would have to be modified by adding the acidophilus

organisms or a little boiled cow's milk. With the solving of many nutritional problems regarding soya rations, we began feeding it to the infants and children at the Shanghai Clinic, keeping careful records in each case. We had no difficulty in getting children to accept soya milk, even though it was not so tasty in those days as the soy milk we have now.

"I knew there were yet many factors that must be solved to accomplish in this vegetable milk all that is claimed for animal milk. For instance, we must correct the beany taste, then the milk must be capable of being made to formula, containing definite quantities of fat, sugar, protein, minerals and vitamins. It must remain a colloid liquid and be capable of spray-drying into a powder that completely reliquefies, also made as inexpensive as animal milk.

"All these I believed must and could be accomplished, just as we had already made the milk more digestible than animal milk. The first problem was that of flavor control. I had endeavored to educate my American friends to learn to like the natural bean taste, just as people have learned to like yeast, as later the soya taste will be as pleasant to them as to the Oriental people who do not care for the taste to be changed. But the result was that they would pick up a glass that looks like animal milk, smell of it and sip it and say, 'It does not taste like cow's milk.' To this I replied, 'No, it does not taste like cow's milk, nor goat's milk, nor horse's milk, nor human milk," but I assured them that an infant would as readily change from its mother's milk to soya milk flavor as to cow's milk flavor. When I insisted on their drinking a glass of it instead of smelling of it or sipping at it before they passed judgment on its taste, the results were much better. Still I concluded that it takes much more than mere proof that a thing is scientifically correct to put a food across. The food must have a taste appeal and I believed that this could be accomplished with soya milk. It is a fact that food we relish is the food that gets the most bountiful supply of our digestive secretions, for good flavors and odors are a stimulant to the organs of digestion.

"Returning to America, I addressed myself again to this problem of removing the beanish taste. I had previously filed application to the U.S. Patent Office for a patent for constituting a vegetable soy milk of any given formula. Through our research we had now found that which was responsible for the beanish taste and also what to do to debitter it. We were able to make a milk from the soy been that could not be detected as from the bean. I therefore appeared at Washington with my samples of debittered soy milk powder and canned liquid soy milk and accompanied by my attorney we went before the commissioner of patents. Never before was I put through such a grilling. One man had spent several months looking through all available literature to see if my claims were entirely original and others checked over to see that they were true, and then my finished products were examined by expert tasters. The commissioner assured me that there were already patents on making a vegetable milk out of the soy bean and that as far as he knew none had ever netted their originator very large returns. This was my opportunity, and I remarked, 'Yes, but you have no patent that gives a method for debittering the soy bean nor of constituting a milk from it of any given formula, and not one of those products is palatable.' He and his taster admitted having tasted many soy products, and this was the first time there had ever come to them a truly debittered soy milk.

"My lawyer assured me my case was won and in a short time I received word that the patent had been awarded me No. 2078962. This patent covered several processes original with us, as debittering, and thus making a usable milk; the special methods of cooking so as to make soy products readily digestible; the method of preserving the protein from spoiling whereby it could be bottled as liquid milk, tinned as condensed milk, or dried as powdered milk; also the method of incorporating through homogenization the food principle to any given formula, reinforced by both vitamins and minerals. It but remained for us to find suitable machinery and equipment for practically carrying out extensive production by means of the above patented processes, and since much of this was not available, we had to have some specially built. For many years we had made soya milk only for our Shanghai Sanitarium and Clinic, using a few small machines and cookers sufficient for our needs. Through this small unit we were able to carry on extensive feeding of infants and children as well as the sick patients, also expectant and nursing mothers. Remarkable results were obtained in feeding post-operative cases, as they could start nourishment with soya milk much earlier than with other foods without the usual gas complaints. Ulcer of the stomach people did exceptionally well, also sprue patients, those suffering from colitis, the several types of dysentery, and those with constipation. For diabetics and arthritis eases the results were most satisfactory. In meeting up with allergy, soy milk proved to be the one food we could always turn to in our dilemma of finding something to agree with those suffering from skin rashes, vomiting. diarrhea, nervous attacks, dyspepsia. etc.

"In order to meet a growing demand for soya milk, we shipped to China the essential machinery for the first soy bean milk factory. It was the first soy bean creamery ever established and equipped with laboratory and machinery to make canned milk, condensed milk and spray dried powered milk and vacuum packed bottled milk, with regular deliveries. Milk routes were established in all parts of Shanghai, and the production doubled each succeeding month. Three types of liquid milk were produced: natural soya milk, chocolate soya milk and acidophilus milk, packaged in pint and quart bottles. The price to the consumer was less than that of cow's milk in Shanghai, which thus made available a milk rich in food value for all members of families whose circumstances did not permit them to buy the more expensive animal milk. It was here demonstrated that

soya milk in every way filled the average family requirement for a milk, and that in countries where the economic conditions make impracticable dairies, where stock feed is scarce and costly, the people may still have an equally suitable milk. We were able to bottle soya milk so that it would keep indefinitely without the need of refrigeration, and could be kept for a week or a month if necessary without spoiling. Thus we had a bottled milk and also a powdered milk that did not require refrigerators, and the expense of delivery was eliminated. Also, people were assured of a pure bacteria-free milk, one that would not give rise to intestinal disturbances in hot weather.

"Soyadophilus, a delicious sour milk made by growing the lactic acid organism in sterilized soya milk, had a remarkably large sale. In fact, cheese and numerous other preparations were made from our soya milk, while the powder afforded a convenient form in which to ship soya milk to western and northwestern China, where transportation rates were high. One pound of powder will make eight pounds, or four quarts of liquid soya milk" (Continued). Address: Mt. Vernon, Ohio.

1347. Miller, Harry W. 1944. The story of milk from the soya bean (Continued–Document part IV). Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 23-30.
• ***Summary:*** Continued. "Unfortunately, the war that broke out in Shanghai on August 13, 1937, put an end to this illustrious beginning of making a soya milk with the vegetable cow. The sales returns were just beginning to equal the cost of operation. As a consequence of the war, the fire and bombing destroyed more than a hundred thousand dollars, national currency, worth of property and equipment. However much valuable experience had been gained during this time through the feeding of infants and children and the dieting of special disease conditions. The results of this experience were published in the *China Medical Journal*, 1937. These results showed that soy bean milk was second only to mothers milk in the feeding of infants and children and has no equal in dieting cases of stomach acidity and other intestinal complaints. The high biologic value of its protein, the ease of its digestion and ready absorption, when combined with dextrose and maltose, yielded a food of tremendous value to the people of the Orient where the soy bean is indigenous. This brief experiment in conducting a soy bean dairy left a contribution far exceeding the losses sustained by fire and the bombs. For two years we had to turn largely aside from food manufacture. We were busy establishing and organizing a sanitarium at Hankow, China, known as the Wuhan Sanitarium and Hospital. This large institution was extensively used for the care of sick refugees and disabled and wounded soldiers up till October 25, 1938, when the Japanese army forces entered the Wuhan area. Three months later I, with a group of four other Americans, being among the first to evacuate from Central China, were granted transportation on a Japanese transport to Shanghai.

"The Role of the International Nutrition Laboratory in America: Back in America, my first thoughts were how most advantageously to follow up our food research work and lay hold upon the wealth of nutritional advance and the knowledge of food processing in the U.S.A. in perfecting processes developed in China. The need of the peoples of the Orient was uppermost in our mind and protein direct from vegetation seemed their only way out for adequate nutrition, the soy bean naturally being that source. We, therefore, secured land and erected a suitable building on a farm at the suburbs of Mt. Vernon, Ohio, as this was in the soy bean growing belt.

"No sooner did we start the foundation of the building than we began also to fabricate the equipment for carrying forward the processes already worked out for the manufacture of soya milk and subsidiary food products from the soy bean according to our more recent research. The farm gave me opportunity to grow several types of the edible soy beans. The edible soy beans differ widely from the field type beans grown so extensively in the United States. The field varieties are raised for hay or for ripened beans to be used by the oil refiners, the residual bean cake is sold for stock feed. A small part of the bean crop is used for flour. The edible beans are those varieties that are better flavored, easier to cook, make better flour and are such as can be shelled in the immature state for green pack tinned beans. There is as much difference in foods made from the edible beans and those made from the field soy beans as in the taste and quality of sweet corn and that of field corn. There are two belts in America for producing soy beans. Some varieties of soy beans mature in from 90 to 120 days and are suitable for planting in the northern belt which includes the states of Ohio, Indiana, Illinois, Michigan, Wisconsin and Iowa, and the beans requiring over 120 days to mature are grown in the southern belt including the states of North and South Carolina, Georgia, Arkansas, Texas and Missouri.

"Out of fourteen varieties of the edible beans planted on our farm, four outstanding varieties were selected, namely, Bansei, Aoda, Funk's Delicious and Hokkaido. These four mentioned in the order of their value were found best for green pack canning, also made the best quality flour and milk, and were found best for processing for other foods. From our southern soy bean station located in North Carolina, there were three varieties, namely, Rokusun, Tokyo and Woods Yellow, named in the order of their value for food processing, A very unique feature of our farm experiment work was the shelling of green soy beans, with the use of a Viner obtained from the Scott Viner Company of Columbus [Ohio]. Some 40,000 cases of these delicious beans were put up this season (1943). A single unit of these Viners is capable of shelling five tons of green beans in one day.

"Because of the limited production in America of these fine vegetable types of soy beans, we readily saw that we

would have to run, as an important adjunct of the laboratory, a seed department, and an extensive agricultural program in raising this type of beans, and our methods in these lines have been perfected to overcome shattering, uneven ripening and other heretofore drawbacks to the raising of these splendid beans. We now have under cultivation annually several hundred acres of these large delicious edible soyas for green bean canning and for milk processing.

"Our factory, a newly built brick structure, lined with enameled tile, was completed in the autumn of 1939 and contains laboratory space, test kitchen space where soy milk and soy products are under continual tests for their combining properties in tasty recipes. This modern food factory has three large boilers for supplying steam pressure for processing, and contains specially constructed stainless steel cookers, vacuum pans, spray dryer, iron cow (homogenizer), grinder, centrifuges, sterilizers and other processing machinery. This is our first model plant where we have arranged the machinery in series so that the hydrated beans start at one end of the factory and come out a dehydrated complete milk powder at the other end, all ready for tinning in sanitary cans, and shipping.

"Nothing is perhaps more spectacular than to watch this milky bean juice being converted into a palatable, readily digestible milk, containing all the food essentials, with minerals and vitamins added and flowing from the iron cow in quantities as much as is often secured from the aggregate milkings of several hundreds of cows. It is truly a wonder, a colloid milk, bacteria free, being made in a sanitary laboratory.

"The splendid tasting and readily soluble powdered milk as it is now produced at the International Nutrition Laboratory came about only as a result of much effort and time in making many improvements and alterations of equipment from week to week. Dr. Weisner, of Ohio State University, did much valuable research work on the bacteriology of soy milk, and we are indebted to Dr. W.J. Morse for supplying seeds and much valuable information, and to Dr. LeClerc, senior chemist of the Government Department of Agriculture, for check-ups that assisted us in the standardization of our products.

"We were fortunate in being able to develop this milk in the Orient with a background of the Chinese experience with soy bean foods for ages and also have the benefit of scientific and technical expert help in the United States through the frequent visits I made to this country, and I feel profoundly grateful for the services of many of the leading nutrition experts as also the laboratory and engineer help to be found in Government Bureaus at Washington and at the Ohio State University. For vitamin assays, I am indebted to Dr. Howard J. Cannon, Director of the Laboratory of Vitamin Technology at Chicago. In the Orient we also had able laboratory help, and the feeding work was under our own supervision in Shanghai Sanitarium Clinic, a 200-bed hospital conducting a very large maternity and children's department.

"Soy beans can be grown in almost any country of the world and are capable of many methods of preparation. In Oriental countries we need to improve the preparation of soy bean foods to make them more digestible. In the Occident we have readily at hand the processing vats to thoroughly cook the beans, but to go over big, they must be made readily available and also palatable. The International Nutrition Laboratory, as its name indicates has been established to thoroughly process the bean and at the same time make it palatable so that its use can be universal. In warm climates or frigid areas nothing is more easy of digestion than the colloid liquid, soya milk.

"On several occasions we have gone out to lecture and give demonstration to clubs and to the annual meetings of the American Soy Bean Association. We have observed the textiles, fabrics and plastics made from soy bean protein with great admiration. At one meeting, wool was shown made from the soy bean and at another a cap, necktie, and many other articles we use" (Continued). Address: Mt. Vernon, Ohio.

1348. Miller, Harry W. 1944. The story of milk from the soya bean (Continued–Document part VI). Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 30-34.
• ***Summary:*** Continued. "After all, protein is an important component of our clothing and many articles we commonly use. The soy bean is nature's greatest protein yielder. From 35 to 52 per cent, or almost one-half the weight of the dried soy bean, is protein. Next in value is the oil. By way of comparison with navy beans, peas, lentils and lima beans, the soy bean has 300 per cent more protein and ten times as much oil content.

"In making up our dietary requirements, we pay eight times as much for our protein as we do for carbohydrates and three times as much for protein as we do for oil. This may impress the reader with the great economic wealth in the soy bean. Nitrogen or protein is of first importance to the growth and maintenance of the human race, as well as the entire animal kingdom. While mankind has often depended on the flesh and products of animals, such as milk and eggs, for this protein supply, the animals had to basically depend on vegetables for their nitrogen. It is only vegetation. that can utilize the nitrogen of the air and inorganic sources of nitrogen and place it in accessible form for animal life. For instance, we exhale every atom of nitrogen of the air that we inhale. None is utilized or stored in our tissues. Therefore, whether we drink animal milk, eat animal flesh, or take only vegetation, we get our edible protein solely from plant life, and there is no superiority in the animal stored protein, to that eaten by the animal and which is primarily available to the human from vegetation. So, as the sheep makes wool from the protein it eats, so the cow makes casein from the protein she eats. Unless the animal gets protein, there would

be no wool or casein. But it is not necessary to use the animal digestive laboratories to make either wool or milk, for we can take the products the animal eats to make wool or milk by means of laboratory technique, and that under sanitary conditions.

"The chief and outstanding product of the International Nutrition Laboratory is soy milk, put out under the names of Soyalac and Soy-A-Malt, names having originated in the early days of our experimental work while pioneering in this field. Soy-A-Malt is put out under the registered trade mark No. 390909 U.S. Patent Offices and Soyalac registered trade mark is 389131 U.S. Patent Office.

"However, the Laboratory is concerned in making a large variety of foods from the soy bean and already has a score of such products on the market utilizing the entire bean, which is all valuable in human nutrition. Since milk has a wide variety of uses, we are making a beverage liquid Soyalac put up in tin cans, of 13 ozs. and 30 ozs. respectively. A chocolate flavored Soyalac is also put up in 13 oz. tins. A modified infant food powder, called Soyalac, is put up in one pound glass containers, which meets all the requirements of the growing infant from birth onward to the end of the nursing period, after which it is used to supplement the child's diet. This infant food has as its chief constituent vegetable oils homogenized, a combination of sugars including dextrose, maltose and dextrin, and supplemented by vitamin A and D with calcium, phosphorus and iron added. Hundreds of babies in America and other countries with allergy, weak digestion and intestinal disturbances, are now being most satisfactorily nourished by Soyalac, a complete infant food including all known requirements for infant nutrition.

"Miller's Soy-A-Malt is now a country-wide known beverage milk sold in either natural malt flavor or chocolate flavor and packed in one-pound, four-pound and twenty-pound containers, possessing all values of the soy bean nutritionally but without the bean flavor. Many who want a milk more nearly the animal milk flavor call for All Purpose Soyalac. This is packed in containers same as Soy-A-Malt, and can he used for cooking purposes as well as beverage the same as animal milk. Until we brought out these vegetable milks which are rapidly taking their place in the market beside cow's milk, soya milk was chiefly demanded for certain specific diseases such as correcting acid states, intestinal upsets, and for diabetics. The composition of all soya milk powders will be found on the labels as well as directions for using them.

"Frozen soya milk desserts and soya ice cream are now quite popular. Recipes are given for the home refrigerator.

"This little pamphlet concerns itself with the history of soya milk development rather than trying to cover the field of the International Nutrition Laboratory, for this soy food processing institution is the largest plant in the world devoting its entire efforts to human nutrition from the soy bean and for making meat substitutes. Foods that look like and taste like meat are made with high protein values. Our canned soya beans are among the most delightful and tasty vegetables. The soy bean is nature's highest protein yielder and the International Nutrition Laboratory engages in the manufacture of these fine protein foods from the edible varieties only.

"No claims are made that soya milk has yet been developed by us to its final possibilities, but at least these twenty-five years of painstaking study and experimentation has resulted in a food second to none as an essential to strong body building and health. So much progress has been made in changing the extracted milk liquid of the soy bean used for millenniums by the people of China for making cheese [tofu] into a complete food of inviting appearance and delicious taste, with food values the equivalent of either human or animal milk that we feel rewarded for the effort and expense. Our soy milk can be made into a sour milk resembling buttermilk, it can be made into a cheese, and this cheese can be treated so as to have the appearance and flavor of meat. We have not tried to enter into the comparative values of soya milk and cow's milk. There is much to be said regarding the value of soya milk and the story of Soya Milk would not be complete without a summary of the many virtues and nutritional values of soy food products. The soy bean, often called these days the 'wonder bean,' is just as wonderful as a food supplier as in the oil industry, or when used for plastics.

"The protein of the soy bean possesses all of the indispensable amidoacids [sic] and therefore is a complete dietary substitute for milk, eggs and meat, and stands as the only vegetable protein that is biologically equal to meat proteins. By our extraction process we are able to obtain 85 per cent of this edible protein in a soluble form that means that it is very readily digested. Truly, it is a wonder bean, for it does wonders in the nourishment of the well as also the sick. It is good for growth and excellent for body maintenance" (Continued). Address: Mt. Vernon, Ohio.

1349. Miller, Harry W. 1944. The story of milk from the soya bean (Continued–Document part VII). Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 34-37.
• ***Summary:*** Continued. "Let us notice the high points in favor of soya milk as manufactured by the Miller process at the International Nutrition Laboratory:

"1. The edible soy bean, which is the protein base of soy milk, is the richest source and unquestionably the highest type of protein known.

"2. Soyalac made by our modern equipment takes from the soy bean about 85 per cent of its protein content, 50 per cent of the oil and the major portion of the mineral and vitamin content, all of which is extracted in true colloid liquid form.

"3. Soya protein contains all the indispensable amido-

acids that are of known value in human nutrition, and is biologically comparable to animal protein.

"4. Soyalac, as made by the International Nutrition Laboratory, supplies every purpose of animal milk for the new born, the growing child, for the adult, the pregnant or nursing mother, and in the dieting of special diseases.

"5. Soya milk, being first thoroughly debittered, is capable of affording all varieties of flavors by their addition, and its sweetness will depend on the amount of dilution added.

"6. It is hypoallergic and serves as a substitute protein diet to those of allergic tendencies.

"7. It has a definite standard formula which can always be maintained, for it is laboratory checked.

"8. It is free from pathogenic germs and other types of harmful bacteria.

"9. It is a definitely alkalinizing food of great value in treating arthritis or dieting acid or ulcer states, and serves as an ideal nonresidue diet of high nutrition value in intestinal disorders, particularly amoebic dysentery, sprue and colitis.

"10. Mixed with lactic acid bacillus or acidophilus cultures it makes a delicious sour milk drink and one of known therapeutic value in intestinal disturbances.

"11. Eight pounds of soy beans fed to a cow will produce a gallon of cow's milk, whereas the same eight pounds of beans by our process yields eight gallons of soya milk equivalent in value to cow's milk. In other words there is a great economic saving, not to consider perhaps other advantages in a vegetable milk.

"12. It is the only vegetable protein that is biologically equal to and may be substituted for animal milk, cheese, eggs, fish and meat in the human diet with safety, and mixes well with fruits and vegetables.

"13. All Miller's milks are richer in calcium than cow's milk and are vitamin D fortified.

"This little pamphlet on the Story of Soya Milk is issued by the International Nutrition Laboratory, Mt. Vernon, Ohio.

"Other Products of the International Nutrition Laboratory: The Vegetarian Cutlet is another of Miller's distinctive high protein foods. These are marketed as choice, uniform sliced cutlets for frying or broiling; or diced for use in roasts, chop suey, patties, croquettes, hash, or as meat extenders. Sold in small family size, or in large containers for hotels, restaurants and institutions.

"Miller's Canned Green Shelled Soya Beans are a treat. They contain the nutritious values of meat, fowl, eggs and milk. They are grown as choice edible beans, and canned just before ripening.

"Miller's Soya Spread not only takes the place of butter as a spread, being rich in fat as well as protein, and very pliable; but is also combined in many table recipes. It comes packed in 14-oz glass sealed jars.

"Miller's Soya Milk is packed in various formulas and different sized containers.

"Soya Malt, as a spray dried powder, either with a malt or chocolate flavor.

"Soyalac all purpose milk, for either a beverage or in cooking and baking.

"Soyalac Infant Food, a soluble milk powder, hypo-allergic, fortified as a complete vegetable milk.

"Soyalac Liquid Milk, in either natural or chocolate flavor.

"For descriptive material regarding other Miller Foods, such as Soya Loaf, Vegetable Cheese, Soya Flour, write to the manufacturers at Mt. Vernon, Ohio." Address: Mt. Vernon, Ohio.

1350. Saillenfest, Jean. 1944. Le Soya: Sa culture et ses utilisations [The soybean: Its culture and uses]. Paris: Editions de Montsouris, 1 rue Gazan, Paris XIV. 96 p. 19 cm. Series: Collection Rustica. Preface by Pierre Chouard. [10 ref. Fre]

• ***Summary:*** Contents: Preface. Foreword. 1. The soybean worldwide and in France. 2. The plant: Botanical description, varieties, vegetative cycle, climate, area of cultivation. 3. Soybean culture: In fields (fertilizer and soil amendments, symbiotic bacteria, sowing, soya forage), in the garden. 4. Diseases and enemies of the soybean. 5. Soybean utilization: Table of uses, main industrial uses, uses on the farm, the soybean in the family cuisine (green vegetable soybeans [*graines de soya vertes*], soy sprouts [*germes de soya*], soaking soybeans, cooked ground soybeans [*pâté de soya*], soya desserts (dry roasted soynuts [*Soya grillé*], soy cakes and confections with roasted soy flour), soy coffee, how to make soy flour at home, soymilk, tofu [*fromage de soya*]). 6. Regulation of soybean varieties: Table of varieties: The role of G.I.O.M. (*Groupement interprofessionnel des oléagineux métropolitains*), growing contracts, classification and catalog of varieties, prices of seeds, how to obtain seeds. Address: France.

1351. Union Nacional de Cooperativas del Campo. 1944. Instrucciones sobre el cultivo de la soja y sus aplicaciones. 2nd ed. [Instructions on the cultivation of the soybean and its applications. 2nd ed.]. Madrid. 16 p. [Spa]

• ***Summary:*** Pages 12-14 list industrial uses of soybeans, give a nutritional analysis of white and black soybeans (Soja blanca, Soja negra) done by the Central Agricultural Station (*Estación Agronómica Central*) using samples from Granada, and briefly describe several soyfoods, including soy flour, soymilk, and tofu (*queso de soja*). Thus section concludes: "Outdoing the known anecdote of Permantier, who offered Louis XVI a succulent feast in which all the dishes were made of potatoes, today one could make a menu that was more varied, rich and select in which the delicacies as well as the serving utensils would all be derived from soya." Address: Madric, Spain.

1352. White, Julius Gilbert. 1944. Abundant health: Expounding the Learn-how-to-be-well system of daily living. 4th ed. Madison College, Tennessee: Published by the author. xix + 437 p. Illust. 24 cm. [21+ ref]

• ***Summary:*** The maintenance of physical and mental health can be achieved through a vegetarian diet and wholesome living. Interesting sections include: Meat not necessary (p. 150-52; 13 quotes from authorities). Denmark's food experiment under Dr. Hindhede during World War I (p. 152-53). Sixteen reasons for vegetarianism (p. 153-). The animal kingdom a reservoir for disease (p. 165-). Note that Madison College is a Seventh-day Adventist college and sanitarium.

Soya is discussed on the following pages: Soybeans and soybean products as a replacement for meat (p. 151-52). One section titled "The Soybean: The Wonder Food" (p. 345-59) discusses many aspects of soybeans and how to use soybeans: In baking. In general cooking. As beans. As beans ready-cooked. As meat. As milk (gives 3 recipes for making soybean milk and ways for using "the pulp left after making milk"). As cream. As cheese ("A very satisfactory soybean cheese is now available in the health food stores. It has a texture something like cottage cheese..."). As butter. As oil. As home-made soy butter (made from 4 tablespoons each soy flour and water, 1 cup of oil, a little salt and butter color if desired). As home-made soy mayonnaise (based on the above home-made soy butter). As soy acidophilus milk (also often called soy buttermilk). As greens (soy sprouts). As soy sauce. As coffee. As substitute for egg white.

On page 389 begins a long treatise on the safety of aluminum in connection with cooking and foods, a subject which is causing much debate. Address: Madison, Tennessee.

1353. Williams-Heller, Annie; McCarthy, Josephine. 1944. Soybeans from soup to nuts. New York, NY: The Vanguard Press. 119 p. Foreword by Walter H. Eddy, Ph.D., Professor Emeritus of Physiological Chemistry, Columbia University. Index. 20 cm.

• ***Summary:*** Dedication: "To the soybean pioneers, American and Chinese."

Contents: Introduction. Part 1. The soybean: Vegetable of tradition and high nutritional value, "fresh green soybeans," dried soybeans, sprouted soybeans, soybean oil, soybean flour, soy grits and soy flakes, soybean milk and curd, soy sauce, soy nuts. Part 2. How to prepare soybeans: General directions; fresh green soybeans, dried soybeans, and sprouted soybeans; soybean milk, curd, pulp or mash; soy grits and flakes.

Part 3. Recipes: Appetizers, soups, meat stretchers, meat substitutes, croquettes and fritters, side dishes, salads, salad dressings, sauces, sandwich spreads, breads and quick breads, desserts, soybean-milk drinks, soybean nuts. Part 4. "One soybean dish a day" (Menu suggestions).

The section titled "Soybean-milk drinks" (p. 107-08) contains 5 interesting recipes: Banana soybean-milk shake (with 4 cups soybean milk, 1 ripe banana, 1 tablespoon honey, and 1 teaspoon lemon juice or vanilla or almond flavoring, to taste; it used no ice cream). Eggnog (with 4 cups soybean milk, 3 eggs, 3 tablespoons honey, nutmeg and cinnamon to taste, and flavoring to taste). Hot cocoa with soybean milk. Spiced soybean milk (with 4 cups soybean milk, 2 tablespoons honey, ½ teaspoon cinnamon, and a pinch of nutmeg, or mace [somewhat like chai]). Vanilla soybean-milk shake (with 4 cups soymilk, 2 tablespoons honey, vanilla flavoring to taste).

About the authors: "Annie Williams-Heller, a former Austrian and now an American citizen, has had international experience as a consultant and author in the field of nutrition and food. She holds diplomas from several European schools and has undertaken graduate academic studies in this country. She is an active member of both the New York Dietetic Association and the Soroptimist Club of New York and an associate member of the International Federation of Business and Professional Women.

"Broadcasts and many publications in leading newspapers and magazines here and abroad are indicative of Mrs. Williams-Heller's desire to create a bridge between scientific knowledge and its practical application for the public and housewife.

"In this connection she became interested in the soybean. She studied this miracle food from the soil to the kitchen at a time when its qualities were known only to pioneers in the field.

"Josephine McCarthy, a graduate of San Francisco State Teachers' College, has had twenty years experience as an executive in various of the country' largest restaurant and bakery chains. In hotel work she has supervised the training of food workers from chefs on down.

"For the past five years she has been broadcasting on food preparations and news of the home. At present, as Home Economist for the American Institute of Food Products, she is known as 'Ella Mason' to millions of devoted fans, and is heard daily with Doctor Walter H. Eddy on the 'Food and Home Forum' over Radio Station WOR, emanating from New York City" (inside rear dust jacket).

Note: This is the earliest document seen (Dec. 2003) that contains a recipe (in standard format with the amount of each ingredient) for a non-dairy soybean-milk shake, or for soy eggnog. It is also the earliest English-language document seen (Dec. 2003) that contains the term "soybean-milk shake." Address: 1. Nutritionist and Food Consultant; 2. Home Economics Director, American Inst. of Food Products ("Ella Mason" on the Dr. Eddy Food and Home Forum). Both: USA.

1354. Ecuador Ministerio de Economia, Subsecretaria de Agricultura. 1944? El Ecuador produce Soya, el alimento ideal, nutritivo y barato. Cultive y consuma soya [Ecuador produces soya, the ideal food, nutritious and inexpensive.

Grow and eat soya (Poster)]. Quito, Ecuador. 1 p. 2 x 3 feet. Undated. [Spa]
• ***Summary:*** A remarkable poster. Request seeds for your planting from the Undersecretary of Agriculture, Quito, Ecuador. But soya from the national distributor. "It yields well in sheltered places." With soya, you can make tortillas, empanadas, tostado, bread, soup, soymilk (*leche vegetal*), tofu (*quesos*), fideos, etc.

An illustration shows an Ecuadorian man, woman and child, in traditional dress, on a hill overlooking their fields, with a basket of whole soybeans beside them, and snow-caped mountains in the background. Address: Ecuador.

1355. Ecuador Ministerio de Economia, Subsecretaria de Agricultura. 1944? Soya: El fréjol maravilloso que mejorará la dieta de la América de post-guerra [Soya: The marvelous bean that will improve the post-war diet of the Americas (Poster)]. Quito, Ecuador. 1 p. 2 x 3 feet. Undated. [Spa]
• ***Summary:*** A striking poster. Soya has nutritive value in the form of proteins, oils, carbohydrates, and vitamins. A substitute for milk, eggs, meat, fruits, and pulse / vegetables (*legumbres*).

An illustration in a square, with a caption, in each of the four corners of this poster shows: (1) 1 lb. of soya flour and 3 liters of water = 3 liters of soymilk (*leche vegetal*). (2) Student outside of a schoolhouse. Toasted soybeans taste like peanuts. (3) Competent authorities consider soya the most complete food. 1 kg of soya = 88 eggs or 12 liters of milk. (4) Woman facing a stove. To cook soya with ease, put it in cold water. Address: Ecuador.

1356. Ecuador Ministerio de Economia, Subsecretaria de Agricultura. 1944? Algunos aspectos importantes del frejol "soya": Alimentacion, vestidos, hogar, industrias, haciendas, perfumeria, medicina [Some important aspects of soya: Food, clothing, the home (paint), industry, the farm, perfumes, medicine (Poster)]. Quito, Ecuador. 1 p. 2 x 3 feet. Undated. [Spa]
• ***Summary:*** A large and detailed poster, showing the versatility of soya. Soya: A low cost food with good nutritional value. Seven illustrations, each in a vertical rectangle, has a one-word caption then details in smaller letters. The caption words are: Food. Garments. Home. Farm. Industry. Perfume. Medicine. Under food (for example): Substitutes of butter, lard, meat, coffee, egg albumin, flour, edible oil, cereals, food for babies and children, tostadas, bread, cocoa, sweets, eggs from chickens, soymilk / vegetal milk (*leche vejetal*), green beans and dry beans, sauces, etc. Address: Ecuador.

1357. Ecuador Ministerio de Economia, Subsecretaria de Agricultura. 1944? El alimento ideal para los niños: "Soya." Nutre mas y cuesta menos [The ideal food for children: Soya nourishes more and costs less (Poster)]. Quito, Ecuador. 1 p. 2 x 3 feet. Undated. [Spa]
• ***Summary:*** A charming poster. Soya: Its nutritive value in proteins, oils, carbohydrates, and vitamins can substitute for milk, eggs, meat, fruits, and pulses / vegetables (*legumbres*).

An illustration shows a wide-eyed woman next to a bowl of fruit, cup of beverage, and a plate holding a cooked chicken and a whole egg. Address: Ecuador.

1358. Ecuador Ministerio de Economia, Subsecretaria de Agricultura. 1944? Soya: El alimento del pueblo [Soya: The food of the people (Poster)]. Quito, Ecuador. 1 p. 2 x 3 feet. Undated. [Spa]
• ***Summary:*** A remarkable poster. If you cannot buy milk, eggs, meat, fruits, etc., get soya, which contains the nutritive principles of those foods. Raise robust children with Soya. With it you can make empanadas, fideos, galletas, soups, tortillas, frozen desserts, soymilk (*leche vegetal*), cream (*crema*), etc.

An illustration shows a very strong Ecuadorian working man, with his right hand raised over his head, standing next to his wife and child, in modern urban dress. Address: Ecuador.

1359. Gotham, Lucille J. 1944? Allergy to certain foods. *Madison Health Messenger* (*Madison, Tennessee*) 6(1):1-2. Undated.
• ***Summary:*** A reader writes to ask: "I am on a diet eliminating wheat, milk, and eggs. What products and foods can I substitute for them while I am experimenting?" The author answers: "Milk is the hardest problem. Through the years nut milks and soy milks have been developed, and they may be used in cooking in place of cow's milk, with satisfying results for almost everyone. They are also very nutritious. The soy milks are liquid or dry... If you make your own nut or soy milk you had better ask your physician about the advisability of adding some dicalcium phosphate with viosterol and some vitamin A. These additions will not change the flavor noticeably, and they will safeguard your health.

"You will like soy cheese in place of real cheese. Health food stores have these special foods." The following recipes are then given: Nut milk (almonds make the best milk). Soy milk (made from soy flour). Plantation cocktail (with soy milk). Creamy soup (with soy milk and Savita [a product made from brewer's yeast]). Soybean apple crisp (with soy flour). Soy cookies (with soy flour). Creamy rice pudding (with soybean milk). Soy piecrust (with soy flour). Corn soy mush (with soy flour). Mayonnaise (with soy flour). Address: Dietitian.

1360. Loma Linda Food Company, Inc. 1944? The Loma Linda line: 35 selected recipes. Arlington, Riverside, California. 16 p. Undated. 16 cm.
• ***Summary:*** This little undated booklet, bound with 2

staples, is printed with brown ink on tan paper. Front cover: "They're tasty. Wholesome, Nutritious." On the inside from cover is a quotation by Ellen G. White: "Those who understand the laws of health and who are governed by principle, will shun the extremes, both of indulgence and of restriction. Their diet is chosen not for the mere gratification of appetite, but for the upbuilding of the body. They seek to preserve every power in the best condition for the highest service to God and man" (Source: *Ministry of Healing,* p. 319).

Contents: Soy beans (canned; introduction + 4 recipes). Soy Mince sandwich spread (Specially ground soy bean with nuts, olives, tomatoes, and choice vegetable flavoring; 9 recipes). Garbanzos (canned, 4 recipes). Proteena (Plain or with smoke flavor) (A nut- and cereal combination with a meat-like texture, "yet contains no animal product"; 8 recipes). Nuteena (Makes tasty cutlets; 7 recipes). Savory lentils ("One of the latest additions to the Loma Linda line." Grown in Chile. Cooked, seasoned to impart a meat-like flavor, and canned. 2 recipes). Syl-Dex breakfast wheat (with dates and powdered psyllium, dextrinized). Oven-cooked wheat (dextrinized, 1 recipe). Fruit cereal. Breakfast cup (Made with soy beans, plus grains and figs. Alkaline beverage served like coffee). Fruities (bite-sized raisin-filled wafers). Fruit wafers. Date sandwich. Soy-Weet Wafers (with soy flour). Ruskets (Whole wheat with malt, sugar, and salt; dextrinized). Soy milk (canned). Savorex (yeast extract). Savory Bits (Wafers made from wheat and soy flours plus Savorex). Address: Arlington, Riverside, California.

1361. **Product Name:** Milnot (Filled Dairy Milk Containing Soy Oil).
Manufacturer's Name: Milnot Co.
Manufacturer's Address: 120 W. St. John, Litchfield, Illinois. Phone: 217-324-2146.
Date of Introduction: 1944?
Wt/Vol., Packaging, Price: Can.
New Product–Documentation: American Soybean Assoc. 1974? "Soybeans: From America's fertile soils the world's versatile protein resource." A photo shows a can of Milnot. Product line seen at Adventist Book Center in Pleasant Hills, California. 1990. July 9. The company is now located in Litchfield, Illinois (Phone 217-324-2146).

Talk with Tenny Hutchcraft at Milnot Co. 1990. July 11. She assistant to the president, Mike Osborne at the company's headquarters (100 South 4th, St. Louis, Missouri 63102). The company was started by the Howser (spell?) family. Milnot was originally called Milnut. It was introduced during the 1940s and widely used during World War II. The product has always been made in Litchfield. Recently they started another plant in Seneca, Missouri. The company was recently sold and a company history was written on that occasion. The company also makes a vegetarian chili, and tamales.

1362. *J. of the American Medical Association.* 1945. Biological value of soy protein. 127(5):279-80. Feb. 3. [1 ref]
• ***Summary:*** A summary with comments of Cahill, Schroeder & Smith. 1944. Compares the digestibility and biological value of three sources of soybean protein with that of egg protein. The results are: soybeans (90.5 / 94.5%), soy flour (94 / 91.7%), and soybean milk (89.6 / 89.6%).

Note: This is the earliest English-language document seen (Oct. 2003) with the term "soy protein" in the title.

1363. Diamond, Holton W. 1945. Laboratory notebook. Dearborn, Michigan: George Washington Carver Laboratory. Unpublished manuscript. 23 cm. Courtesy of Henry Ford Museum & Greenfield Village Archives (Dearborn, Michigan). Microform negative, Acc. 89.432.
• ***Summary:*** During January and February 1945, Diamond was doing research on a "soy cheese" made by culturing soymilk curds at the Ford Motor Company's Carver Laboratory. On Jan. 8 he wrote the words "Soy cheese" at the top of his notebook page. Note: This is the earliest English-language document seen (March 2007) that uses the term "Soy cheese" to refer to a Western-style soy cheese.

During March and April he worked on whipped toppings. On 24 March 1945 Diamond noted in his notebook that the previous day he had made two batches of "Exptl. topping" (experimental whipped topping). Concerning the first batch, he wrote: "Flavor excellent; definite improvement [perhaps compared with a sample Florence Diamond says was brought to the lab by Herbert Marshall Taylor]. Did not whip." The ingredients were: 125 gm hydrogenated soy oil ("accident–intended to be 62.5 gm), 62.5 gm liquid soy oil, 125 gm skim soy milk, 250 gm water, 4 gm Span 20 emulsifier. 1 gm NaCl (table salt), 12 drops butter color, 2 gm B.V. meat flavor, 2 gm butter flavor, SM."

During April, Diamond's toppings vary from "thin" to "thick," with some "dark" and others "soapy." None of the 4 experimental toppings he made on 10 April 1945 whipped, but two of the three batches he made the next day did whip but were very thin. On April 13 the first batch finally whipped although it was somewhat thin. It contained 170 gm soy milk, 170 gm water, and 170 gm fat (composed of 92% hydrogenated soy oil, 5% glycerin, 2% glyceryl monostearate, and 1% Soyemuls); increasing the glycerin was the key to success. On April 19, the first topping whipped satisfactorily–in 4½ minutes; the basic ingredients were the same but the pH was adjusted after preparation (probably by adding citric acid) to 6.60 or 6.68. By April 30 the first sample was "usable."

In May and June Diamond concentrated his research on soymilk, then started to work on ice cream in early June 1945. On June 28 (p. 80) he gave the formula for his soy ice cream then noted: "This batch was exceptionally good. The

flavor was mild, not at all 'beany,' and the texture smooth. The fat used was hydrogenated soy oil. The mix was frozen in a hand freezer and packed in freezing compartment of refrigerator in tray. Some crystallization, or 'iciness' was observed after a couple of weeks."

This Carver Laboratory film only covers the first half of 1945. Numerous other log books in this accession in the Ford Archives cover work elsewhere during the 1950s.

Note: This is the earliest document seen (Sept. 2001) concerning Holton W. ("Rex") Diamond and soy. Address: Dearborn, Michigan.

1364. McCay, Jeanette B.; Loosli, J.K.; Adolph, W.H.; Brewer, Lucille; Munn, M.T.; Neidert, Marion; et al. 1945. Soybeans: An old food in a new world. *Cornell University, Extension Bulletin* No. 668. 65 p. Feb. Illust. Index. 28 cm. Produced by the Soybean Committee of the New York State Emergency Food Commission. [38 ref]

• ***Summary:*** Contents: A potential food resource: Introduced into the United States, new American industries. Composition and food value of soybeans: Proteins, fats, carbohydrates, minerals, vitamins, the enzymes of the soybean. How to use soybeans and soy products (contains many recipes): Fresh green soybeans (how to cook, how to can, how to freeze), dry soybeans (how to cook, how to can, how to freeze, 3 recipes, salted soybeans [oil-roasted soynuts], how to prepare bean pulp {by running drained cooked soybeans through a meat chopper}, 4 recipes), sprouted soybeans (vitamin C forms during sprouting, exposure to light does not affect vitamin C, riboflavin and niacin are also increased, how to sprout soybeans at home {9-step process}, store sprouts in refrigerator, how to freeze sprouted soybeans, how to cook sprouted soybeans, illustration of apparatus [equipment] for sprouting soybeans in quantity, 6 sprouted soybean recipes), grits, flakes and flour (protein equivalents {one pound of low fat soy flour is equal in protein value to two pounds of cheese, 2 pounds of navy beans, 2½ pounds of beefsteak or chicken, 3 dozen eggs, 5 pounds of bread, or 12 pints of milk}, a little soy flour with wheat flour improves protein quality, amount of protein, iron, and calcium also increased, 23 soy-grits and flour recipes {divided into 3 main dishes, 3 quick breads, 17 desserts}), a stronger staff of life–bread (rats fed bread containing only 5% soy flour grow much better than those eating white bread, does soy bread taste good?, little change required in baking with soy flour, 6 yeast bread recipes), soybeans in large-quantity cooking (6 recipes), other soybean products (soybean curd, soybean milk, soy sauce). Production, varieties, and culture of soybeans. Soybeans in animal feeding: For cattle, for sheep, horses, swine, and poultry, soybean hay a substitute for alfalfa, for dogs and fur-bearing animals. References. Index.

Contains nine bar charts in the form of illustrations / pictorial drawings / symbolic graphics (which may be by Kenneth Washburn).

How to sprout soybeans at home (p. 26-27):

"1. Select a stock of clean, bright, new-crop soybeans of one of the field varieties. The yellow seeds have less conspicuous skins than do the black beans, although the black beans may be preferred. The garden varieties are not satisfactory because the sprouts break off easily, but the exact variety is unimportant so long as the seed is good.

"2. Handpick the seed thoroughly, and discard everything except clean, whole beans.

"3. Wash the beans and place them in a suitable container for sprouting, such as a one- or a two-quart glass fruit jar. The bean sprouts increase to about six times their original volume.

"4. Cover the seeds with at least four times their volume of lukewarm water and let them stand for a few hours, or at most overnight, until they are swollen.

"5. Pour off this water, and wash or rinse the swollen beans thoroughly, then pour off the last wash water.

"6. Cover the top of the jar with a piece of cheesecloth or other thin cloth, and tie it on securely. Quarter-inch mesh screening also makes a good cover.

"7. Invert the jar and place it in a cupboard or dark place, in a slightly tilted position, so that the excess water can drain away.

"8. At least three times a day, or better every four hours, place the jar under the water tap or pour on plenty of cool water, thus thoroughly and carefully washing the swelling and sprouting seeds, so that bacteria or molds which may have developed are carried away. The better the washing, the better the sprouts. After washing, place the jar back in its slanting position.

"Chlorinated lime water to kill fungus growth is not needed if the seed is well selected. If such a solution is used (1 tablespoon of chlorinated lime in 1 gallon of water), it should not remain on the seeds longer than for ½ hour; the soybeans are injured by a longer exposure.

"9. In from three to four days at room temperature, the sprouts will be from 1 to 2 inches long and ready for use. Then pour the sprouts into clean cold water and shuck off the skins if this is desired. With the yellow-seeded varieties, however, the skins are not conspicuous and need not be removed. If a flower pot or similar receptacle is used for sprouting with a piece of cloth over the bottom hole for drainage, be sure that the surface of the beans is also covered with a piece of moist cloth to prevent drying; otherwise the sprouts will be tough and will not be uniform.

"It is not wise to attempt sprout production in the summer, because good sprouts will not be produced in warm weather unless the place where they are sprouted can be kept at about 70ºF. The sprouting of old, badly cracked, discolored or shriveled soybeans should not be attempted, for this only causes trouble. Soybeans packaged for cooking and baking are not likely to sprout too well. When in doubt, one

should make a preliminary trial. If, after the first day, or after soaking, the beans become soft or soggy, they are probably unfit for sprouting.

"The commercial production of soybean sprouts in large quantities proceeds along the same lines as outlined, except that larger sprouting devices or tanks are used and the process is more carefully controlled. An apparatus with an automatic watering device developed at Cornell University to sprout a large quantity of beans is shown in figure 6.

"Store sprouts in refrigerator: Sprouts not used immediately must be stored in a covered container in the refrigerator, as is any fresh, crisp vegetable, for as long as a week. They must be kept moist; otherwise they will wilt or discolor. If kept longer, they must be blanched for 2 minutes, then canned as a green beans, dried, or frozen."

Tables show: 1. Proximate and mineral composition of soybeans and soy flours. Essential amino acids in servings of certain protein-rich foods (lean meat, eggs, cooked soybeans). 3. Calcium, iron, and B vitamins (thiamine, riboflavin, niacin) supplied by common serving portions of certain foods. 4. Vitamin composition of 7 soy products. 5. Food values of sprouted soybeans and of some common vegetables per 100-gram edible portions. 6. Thiamine, riboflavin, and niacin content of soybeans during sprouting, storage, and dehydration. 7. Soybean milk, cow's milk, and human milk (typical nutritional analyses). 8. Composition of some [seven] soybean products used for food in the Far East. 9. Varieties of soybeans most suitable in New York State for animal feed and human food (For green vegetables: "Garden varieties such as Green Giant, Hokkaido, Jogun, Bansei, Fuji, Tortoise Egg, and Willomi").

Concerning "Fresh Green Soybeans: When gathered from the garden while the pods are still greenish and the seeds are still soft but fully developed, the soybean is a new green vegetable that some persons say is more attractive and delicious than the fresh lima bean. Many Victory gardeners have grown them for the first time, and they may be purchased commercially canned as are green peas."

Note: This is the earliest English-language document seen (Aug. 2003) that contains the term "protein quality." Address: New York.

1365. Nicholls, Lucius. 1945. Tropical nutrition and dietetics. 2nd ed. London: Baillière, Tindall and Cox. xii + 370 p. Feb. Illust. Index. 22 cm. [30+* ref]

• ***Summary:*** This 2nd edition, which contains more than twice as many pages as the 1st, is extremely clear and well written, especially for beginners. Both books were written when the knowledge of nutrition was undergoing rapid development. It contains new information on major vitamins (nicotinic acid, vitamin K), several minor vitamins, several minerals including "trace" elements, much recent knowledge on the constituents of foodstuffs, foodstuffs more or less peculiar to the warm climates, diets suitable for hospitals, prisons and other institutions and for labourers at large, public health activities related to nutrition, food poisoning, insect pests of grain foods. The great progress in parasitology and nutrition has led to the lowering of death rates, especially infantile mortality; this "is producing such an increase in the numbers of the populations of the tropics that one may wonder what will be the nature of the end of it, for an end there must be." There is "growing acceptance that all persons have a right to diets adequate for good growth and health, as in another sphere, it has long been accepted that all children have a right to primary education" (p. v-vi).

Fats and lipoids (p. 4-8): "The fats and lipoids may be defined as substances which are soluble in ether, chloroform or benzene, but insoluble in water, and can be used as food by living organisms." Edible oils include olive, coconut, and sesame (gingelly) oil. "The fats are compounds of glycerol, which is trihydric, and fatty acids, which are monobasic, hence on hydrolysis the fats split up into three molecules of fatty acids and one of glycerol." An example is given. The naturally occurring fats are made up of many triglycerides plus various acids. There are two categories of fatty acids: Saturated and unsaturated. In saturated fatty acids (which contain carbon, hydrogen, and oxygen), the number of hydrogen atoms is twice the number of carbon atoms. The names and formulas of 8 saturated fatty acids are given. In unsaturated fatty acids, the number of hydrogen atoms is less than double the number of carbon atoms. These include oleic acid, linoleic acid, linolenic acid (first found in linseed oil), and arachidonic acid. "The unsaturated fatty acids can take up iodine (or other halogen) by addition to form saturated compounds. The amount of iodine taken up by a fat is more or less characteristic of that fat, and is known as the *iodine number,* and this number roughly indicates the amount of unsaturated fatty acid in the composition of the fat. Table III (p. 6) gives the iodine numbers of 13 vegetable oils and 5 animal fats. The highest iodine numbers are found in linseed oil (175-205), soya bean oil (137-41), and maize [corn] oil (113-25). The lowest iodine numbers are found in coconut oil (9), butter (26-28), palm oil (20-56) Chinese "tallow" (30), margarine (50), shea butter (56), and lard (60-70).

"Soft fats or oils, which are rich in unsaturated fatty acids, can be hardened to a desired consistency by hydrogenation, by which they are saturated with hydrogen by the aid of a catalyst, such as powdered nickel. The process has been widely used for the production of *margarine* and lard substitutes from vegetable and whale oils." "Human needs for fat. Fats are deposited in the subcutaneous tissue as a protection against cola and injury, and in the abdomen as a padding and support for the viscera. Their light, compact and soluble nature enables the storage of them to take place without the addition of water, and this can occur with no other substance. The fats are composed of the same three elements as the carbohydrates, but they are superior to them as a supply of energy because they have less oxygen

in proportion to the carbon and hydrogen, and hence on complete combustion produce more energy [more than twice as much per gram]. Any normal deposit of fat is a reserve store for the production of heat and work."

Lipoids fall into three groups: Sterols, phospholipides (incl. lecithin), and glycolipides.

Chapter 4, titled "Vitamins: History, animal experiments, etc.," contains an excellent history of the subject. "The history may be considered to have started with the slow realization that the disease scurvy was due to a dietary error." Doubtless in ancient times it had been common in besieged towns, but it was not mentioned in the literature until Europeans began to take long ocean voyages. In 1498 Vasco da Gama lost 100 of his 160 men to scurvy. In 1535 Jacques Cartier first used a fresh vegetable preparation (a decoction of spruce tree needles, on the recommendation of Red Indians in Newfoundland) to effectively treat scurvy. "Two names stand out in connection with the dietetic treatment of scurvy in the 18th century." An Austrian army doctor, Dr. J.G.G. Kramer, (Physician to the Imperial Armies of Hungary, 1720-1730) wrote at this time: "3 or 4 ounces of orange or lime juice will cure this dreadful disease without other help." In 1747 James Lind, a British naval surgeon, performed a famous experiment on 12 men who were severely ill with scurvy. He divided them into 6 groups and tried six therapeutic measures of which the only successful one was two oranges and a lemon daily. In 1757 his famous *Treatise on Scurvy* as published. In 1795 the British Admiralty finally adopted Lind's recommendation– after 100,000 lives had been lost to scurvy. Similar histories of beriberi and rickets are given.

There is a small section on "Roughage" (p. 162). In Chapter 11, "Analyses of foodstuffs," the information on the same 14 pulses, including Soya bean (p. 184), is slightly more detailed. Under nuts and seeds (p. 192-93) are: Coconut milk. Gingelly seeds. Mustard seeds, Brassica juncea. Rape seed, Brassica napus. See also: Adlay (Job's tears), Coix lachryma (p. 182, 214). A good section on "Pulses, dhals, and beans" (p. 215-17), includes the soya bean. "The beans and peas fall under the general term pulses. Split peas are called *dhals* in Southern India, and dried peas, especially the smaller kinds, are called *grams.*" "Unfortunately the pulses are not very digestible and do not find a prominent place in the diets of the well-to-do." The commonest of the dhals is the lentil, sometimes called *Massur dhal.* There are two methods of making dhal: dry and wet. The best dhals are prepared by the dry method. The dhals are more digestible than the grams. Beans are "pulses with seeds more or less kidney shaped... The dried beans are the least digestible of the pulses."

The section on "Nuts and oil seeds" (p. 227) has much about coconuts, coconut oil and coconut milk. The section on "Fluorosis" (p. 306-09) notes: "When the amount of fluorine in the water exceeds one part per million some degree of mottling of the teeth usually occurs among the children drinking it.

The section on "Saponins in foodstuffs" (p. 309-10) lists the many foodstuffs in which they are found, including the soya bean.

Lucius Nicholls was born in 1884. Address: M.D., B.C., B.A. (Cantab.), Colombo, Ceylon.

1366. Olmsted, Fred L. 1945. Who's who and why [Herbert Marshall Taylor and Delsoy]. *Detroit News.* April 16. p. 4.
• ***Summary:*** Herbert Marshall Taylor is a native of Canada. When "hail, frost, and influenza" put an end to his farming in Alberta, he returned to Toronto, where he had received a university degree 6 years earlier. "He acquired American rights to a gadget which British housewives had bought in quantity to make cream from butter and milk through homogenization. He sold 30,000 in the United States, but it wasn't a big-time success.

"By 1937 Taylor had perfected a product using a milk base and vegetable fat. And he had motorized the gadget. He started selling the product to bakers in New York. It saved them $1 a gallon on whipping cream. The idea spread to other cities."

In Nov. 1942 the War Food Administration issued an order prohibiting the sale of whipping cream in America. After dairy interests forced Taylor to leave Chicago, he picked up a partner, Eric R. Swanson, who is still with him, and in Dec. 1943 started a business in Detroit. [Note: Swanson lived most of his life in Dearborn.] Though dairy people continued to oppose him, his "business soared. In 1944 it jumped from 1,400 to 20,000 gallons a month. He sold at wholesale, then added half pints for the home trade. Now he claims 1,500 independent distributors here [in Detroit]. But along came a War Food Administration order placing a 19 per cent limit on all fats–animal or vegetable– used in his product [which combined a milk base with vegetable fat]. WFA also cut his milk quota. So he started using soy milk as a base, producing an all-vegetable product.

"Taylor drew the fire of OPA [Office of Price Administration], too. He says it is demanding damages for overcharges which would put him out of business. But Taylor isn't through. He grossed $267,000 last year. He added a plant in Dearborn to his start in Detroit. He's planning to market soy milk, butter, cheese [tofu?], and frozen dessert [soy ice cream]. There is an indication that Henry Ford is interested."

Note 1. This is the earliest English-language document seen (March 2007) that uses the term "frozen dessert" to refer to soy ice cream.

Note 2. Herbert Marshall Taylor learned how to make soymilk and soy-based whipped topping from Bob Smith and Rex Diamond at Henry Ford's George Washington Carver Laboratory in Dearborn.

"'The dairy lobby in Washington [DC] is powerful,'

says Taylor. 'But I've been fighting the dairy interests for 12 years. They'll never stop me.'" A photo shows Mr. Taylor.

An ad below this article (not in *The Detroit News*, but in Rex Diamond's scrapbook; original source and date unknown) is titled "What is Delsoy? It's the dessert topping that's winning the enthusiastic approval of housewives by the hundreds of thousands. Delsoy is the original topping made of natural vegetable products." The ad shows illustrations of two non-dairy whip toppings: (1) In the foreground, "Delsoy Super Whip: Instant Dessert Topping" which is sold in a pressurized can. The ad states: "Introduced in August 1944, the first product of its kind, Delsoy dessert topping has gained tremendous popularity. Continuing to grow by leaps and bounds..." (2) In the background, "Delsoy: A delicious whip," a refrigerated perishable product which is sold in a half-pint paper container shaped like a truncated cone.

1367. Gattoni, Luis A. 1945. Frijol soya [Soybeans]. *Honduras Agricola* No. 8. p. 5-7. June. English-language summary in Soybean Digest, March 1946, p. 29. [Spa]
• ***Summary:*** The diet of the people of the tropical countries of America is composed almost exclusively of rice, bananas, corn, and beans. The author believes that the ideal daily diet consists of daily consumption of 1 pound of meat and a half liter of milk. However since the people cannot afford such a diet, especially with the rapid population growth, Mr. Gattoni believes that these countries are faced with a postwar nutrition crisis.

As a partial solution, he recommends that they produce soybeans on a large scale, both to be consumed as whole soybeans, and to be made into oil and flour. He proposes that the schools, radio, movies, conferences, etc. be used as mediums for educating the people about soybean production. He points out that soybeans can be cultivated satisfactorily in areas where corn, beans, and peanuts are grown. In Honduras, the best soil and climate for the crop exists in the tropical zone of the coast. Some interesting experiments with adapted varieties are being conducted at the Pan American agricultural school of El Zamorano.

In the area of La Lima in the department of Cortés (a "county" in northwest Honduras), according to a report of the Office of the Institute of Inter-American Affairs, 9 soybean varieties have been tested (see USDA Farmer's Bulletin 1520 of 1939). "In the Experimental Grains department of the Institute of Inter-American Affairs at Toncontín, Comayagua (35 miles northwest of Tegucigalpa), and Danlí (45 miles east of Tegucigalpa), the following edible yellow varieties were sown, besides some forage types: Mammoth Yellow, Bansei, Funk Delicious." Yields were good when the soybeans were inoculated.

In Santa Ana, Wallace Farm, Costa Rica, 11 varieties (Fuji, Hahto, Hakute, Gogun [Jogun], Kanro, Kura, Sato) were tested. Seed yields ranged from a high of 3,186 lb/acre (53.1 bu/acre) for Hahto No. 20, down to 868 lb/acre for Hakute.

On May 15 the following varieties were planted at Toncontin: Ogden, Arksoy, Ralsoy, Volstate, Cherokee, Delsoy, Tastee, Hahto, Rokusun, Aoda, and Woods Yellow.

The author then discusses soybean cultivation, soils, bacteria that fertilize the plants, planting, harvest, and yield. He concludes: "Note: The National Commission on Food and Agriculture encourages all people interested in soybean cultivation to apply to them, indicating the quantity of seed that they wish to cultivate so that, for one-time trials to find the best-yielding and most useful varieties in Honduras, we can tell how much we need for planting in September, which is the most appropriate time for its cultivation."

Photos (black and white) show: (1) An experimental plot of inoculated soybeans cultivated at the Central Project of Toncontin [near Tegucigalpa]. The development and yield have been satisfactory. (2) The same soybean varieties planted in the same soil but without inoculation; the results are noticeably inferior.

Note 1. This is the earliest document seen (Jan. 2011) concerning soybeans in Honduras, or the cultivation of soybeans in Honduras. This document contains the earliest date seen for soybeans in Honduras, or the cultivation of soybeans in Honduras (May 1945). The source of these soybeans is unknown. It seems likely (but not certain) that the soybeans described in this paper were planted in Sept. 1944.

Note 2. This is the earliest document seen (June 2013) that mentions the soybean variety Delsoy. Note: It seems like there must be an earlier record announcing this variety in the USA. Address: Ingeniero Agronomo del Instituto de Asuntos Inter-Americanos (Inst. of Inter-American Affairs), Honduras.

1368. De, Sasanka S.; Subrahmanyan, V. 1945. Processing of soya-bean for the production of milk. *Current Science* (*Bangalore, India*) 14(8):204-05. Aug. [8 ref]
• ***Summary:*** "During recent years, milk shortage in India has assumed alarming proportions." In India, the per capita consumption is estimated to be only 7 oz. per day compared to 35 oz. in the U.S.A. "The minimum requirement of milk for a growing child is 32 ozs. and 16 ozs. for an adult." Since it will be at least several years before these levels of production can be reached in India, our attention has been "directed to the possible utilisation of soya-bean to make up the deficit in our milk supply."

By working to improve the process, the writers have been able to prepare a "milk" that has an agreeable taste and good nutritional value. The vitamin C content of soymilk is 21.6 mg/100 gm. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore, India.

1369. Miller, Carey D. 1945. Thiamin content of Japanese soybean products. *J. of the American Dietetic Association*

21(7):430-32. Aug. [10 ref]

• ***Summary:*** The approximate amount of thiamin retained in various soybean products is as follows: Raw soybeans, 100%. Soybeans pressure cooked for 60 minutes at 121ºC, 26% (i.e., 74% of the thiamin is lost). Soybean "milk" (*tonyu*), 74%. Soybean curd residue (*kirazu*), 19%. Soybean curd (*tofu*), 18%. Tofu contains 54 mcg. thiamin per 100 gm. About 7% of the thiamin in tofu appears to be destroyed by the cooking process, about 20% remains in the residue (*kirazu*), and the remainder of the thiamin (almost 60%) is lost in the discarded liquid which drains off when the protein in precipitated and pressed.

The author acknowledges the help of the Yokoyama Tofu Factory. *Kirazu* may be used as a human food in combination with vegetables, etc. "However, in Hawaii most of the *kirazu* is fed to pigs. To make tofu, hot soybean milk "was mixed with a liquid containing magnesium and calcium sulfates, a by-product obtained in the manufacture of salt from sea water, which precipitated the tofu as a flocculent curd."

Note: This is the earliest English-language document seen (June 2013) that uses the term "Soybean curd residue" to refer to okara.

Aburage (a fried soybean curd) loses additional thiamin as a result of the cooking process. "Miso, made from cooked soybeans and fermented rice, which is allowed to age in huge wooden vats for 2 months or longer, is a relatively good source of thiamin," containing about 130 mcg. per 100 gm. But since relatively small amounts are used, even by people who favor this food, its contribution to the daily thiamin need is not great. Address: Nutrition Dep., Hawaii Agric. Exp. Station, Univ. of Hawaii, Honolulu.

1370. *Soybean Digest.* 1945. Delsoy topping: An all-vegetable cream. Aug. p. 24.

• ***Summary:*** "Delsoy is the new brand name for Devonshire Topping, all-vegetable whipping product. And the name of the manufacturing firm has been changed from Devonshire Topping, Inc., to Delsoy Products, Inc., Herbert Marshall Taylor, the manufacturer, has announced. Headquarters are in the Graybar Building, New York City.

"Delsoy Topping has had an interesting history, having encountered the usual pitfalls of a new food product that is bedeviled with bureaucratic interference and the opposition of powerful economic interests.

"Topping is the name bakers have for the fluffy white dressing they use on the top of pies. Whipped cream is the traditional topping.

"Taylor began over a decade ago by manufacturing and selling a machine with which bakers could whip up their own cream from mixtures of powdered milk and butter, an operation saving them a dollar a gallon.

"When, as he says, the Chicago creameries put him out of business, he moved to Detroit and began to manufacture the topping to sell through retail stores. The product was made from a milk base and a vegetable oil until WFA [War Food Administration] cut the firm's milk allotment. Then Taylor switched to a soy milk base and the topping became an all-vegetable product. According to the *New York Herald Tribune* it whips to two and one-half times its original volume and looks, tastes and acts like whipped cream.

"Taylor claims 1,500 independent dealers for Delsoy Topping in Detroit. He has added a plant in Dearborn to the one in Detroit, and announces that he plans to manufacture

and sell soy milk, soy chocolate milk, soy butter, soy cream cheese and ice cream. This spring the topping was introduced through retail stores in New York City."

A large photo shows Herbert Marshall Taylor using a spatula to scoop his whipped Delsoy Topping from a metal bowl onto the top of a pie. Nearby is an eggbeater and a truncated conical carton, in which Delsoy is sold.

Note 1. Rich Products Corp.'s Whip Topping was introduced shortly after Delsoy, and sold in the same shaped container. Note 2. No mention is made in this article of Delsoy sold in a pressurized can.

Note 3. This is the earliest English-language document seen (March 2007) that uses the term "soy cream cheese."

Note 4. This is the earliest English-language document seen (March 2007) that uses the term "soy ice cream," but in the form "soy cream cheese and ice cream."

1371. *Vegetarian Messenger and Health Review* (*Manchester, England*). 1945. Soya bean protein. Aug. p. 145. [1 ref]

• ***Summary:*** This summary of an article from the *Journal of the American Medical Association* (3 Feb. 1945) compares the digestibility and biological value of three sources of soybean protein with that of egg protein. The results are: soybeans (90.5 / 94.5%), soy flour (94 / 91.7%), and soybean milk (89.6 / 89.6%).

"Apart from these tests which give results in mathematical terms, the centuries of experience in parts of China, where soya bean protein has been the principal, and in some cases, the only protein available in adequate amounts, amply confirms the value of this legume as a body-building food."

1372. A.P.I. [Associated Press of India]. 1945. Milk from Soya bean: Bangalore experiments. *Times of India* (*The*) (*Bombay*). Sept. 13. p. 9.

• ***Summary:*** Dr. V. Subramaniam, Professor in Charge of the Bio-Chemistry Department of the Indian Institute of Science (Bangalore), explained at a press conference on Tuesday afternoon that milk extracted from the soya bean could greatly contribute to a solution to the problem of milk shortages in India. At the conference, pressmen were treated to refreshments in which soya-milk (or products made from it) was an essential ingredient.

"Dr. Subramaniam said that soya-milk could be produced easily at home by the housewife or in a factory." The cost of making the milk should be about 2 pice per pound–far below the cost of dairy milk.

He said that his department has also made milk from other vegetable sources, such as cashew nuts and ground-nuts.

He said there was a proposal to make a comparative study of the effect of soya-milk, cow's milk and a mixture of the two on three groups of 100 children each.

He said the soya-bean was unique nutritionally in that it contained no starch, but had some other carbohydrate, with proteins, fats, and minerals in the right proportion.

Note: This is the earliest document seen (Sept. 2010) that mentions the "Indian Institute of Science" (Bangalore, founded in 1909) in connection with soya-milk.

1373. Arnold, Julean. 1945. Soy–China's Cinderella. *Soybean Digest.* Sept. p. 36-37, 69.

• ***Summary:*** In the summer of 1937 masses of Chinese refugees poured into Shanghai in frantic efforts to escape Japanese armed forces. The immediate problems were food and shelter. One relief agency, China Child Welfare, Inc., with which the author worked, helped to establish 220 refugee camps to accommodate 250,000 people. Since tofu is too concentrated for infants, the group turned to soybean milk. "Fortunately the Peking Union Medical College of the Rockefeller had several decades earlier carried on extensive research with the soybean under the direction of a Russian scientist Dr. A. A. Horvath. He became a great enthusiast on the nutritive properties of the soybean. He found that by adding a certain amount of calcium lactate, sodium chloride [table salt] and sugar to the soybean milk, it would be possible to produce a substitute for cow's milk, and at a fraction of the cost of cow's milk. Chinese trained under him carried on research experiments.

"Thus when we were interested in preparing a scientific, sanitary, and standardized soybean milk we looked for assistance to Doctors Ho and Tso who were trained at the P.U.M.C. but later came to Shanghai to join the Lester Institute where they continued their work on soybean nutritive products. So we impressed them into service. We also secured much aid from Dr. W.S. Fu, who supervised a Chinese children's hospital in Shanghai. He gave us accommodations for setting up a small plant for the manufacture of soybean milk in one of the court-yards of his hospital." A description of the equipment and process used is given. After boiling the soymilk for 20 minutes, calcium lactate, sodium chloride, and sugar were added. The soybean milk was served hot to the children in the camps. The plant was managed by Miss Nellie Lee, a Chinese who graduated from Mt. Holyoke College and had studied dietetics and social science.

After taking the milk from the soybean, there is a residue [okara] very rich in protein. We found by adding 40 percent coarsely ground wheat flour which is also plentiful in China, plus the other ingredients above mentioned, we could make a biscuit which when baked in an oven proved to be very palatable. It represented probably the greatest food value for the cost obtainable. A Chinese department store baked them for us. We distributed millions of them to the refugee camps.

"In order that our committee might take the fullest possible advantage of the very able assistance we received

from Chinese scientists, doctors and others we organized the China Nutritional Aid Council with Chinese and American members for the express purpose of popularizing a properly prepared soybean milk and other soybean nutritional products." This council, backed by China Child Welfare, Inc. of New York, launched a campaign to share with people in other parts of China "the advantages of our experiences in providing soybean milk for from 25,000 to 37,000 children daily in the refugee camps in addition to several millions of soybean biscuits furnished the refugees."

"Another American medical missionary, Dr. H.W. Miller, went much further in his experiences with soybean milk products. He became so enthusiastic about their possibilities that he set up a modern plant in Shanghai for their manufacture, with facilities for producing qualities acceptable to those whose palates rebelled against the ordinary types of soybean milk."

After the Japanese bombing of Pearl Harbor, the China Nutritional Aid Council and its soymilk plant moved to Chung-king [or Ch'ung-ch'ing, a city in southern Szechuan province; the Kuomintang made it the political capital of China from Oct. 1938 until the end of World War II]. Nellie Lee has worked for 5 years "spreading the gospel of soybean milk for the great masses in that country."

"When John D. Rockefeller Jr. came to Peking about 25 years ago to dedicate the Peking Union Medical College of the Rockefeller Foundation, he told me that he found it harder to spend money than to make it." A large photo (p. 36) shows a Chinese mother feeding her children "soy milk and soy cakes at a food shop where highly nutritious foods are made and sold at cost prices."

Note 1. This is the earliest document seen (July 2012, one of two) that uses the word "Cinderella" in connection with the soybean. The author, however, does not elaborate on this idea. This is the earliest document seen (July 2012) with "Cinderella" in the title.

Note 2. In the winter of 1937 K.S. Lo of Hong Kong, age 27, happened to be in Shanghai on other business. There he attended a talk by Julean Arnold titled "Soya Bean: The Cow of China." This talk inspired Lo to establish the Hong Kong Soya Bean Products Co., Ltd. in March 1940. This company later made the world-famous Vitasoy soymilk. If the date and title of this talk are correct, this would be the earliest date seen (Aug. 2002) for the use of the term "Cow of China." Address: Berkeley, California.

1374. Diamond, Holton W. 1945. Excerpts from "Cumulative Work Report," George Washington Carver Laboratory–June 1943 to September, 1945. Dearborn, Michigan. 5 p. Unpublished manuscript.

• ***Summary:*** At some unknown date (after Sept. 1945 and probably before Aug. 1947) "Rex" Diamond wrote a summary of the work he had done at Henry Ford's George Washington Carver Laboratory in Dearborn: 1. Chlorophyll and its derivatives: Edible and inedible chlorophyll compounds. 2. Soybean oil. Two types of investigations were made: (A) Deodorizing and deflavoring. "Experiments were made to determine the optimum conditions for removing the unpleasant odor and flavor from the oil produced at the Rouge Plant. There were found to be: Temperature of the oil, 140ºC; temperature of the steam, 70-80ºC; pressure, less than 4 inches of mercury; time, 40-60 minutes. (B) Extraction of oil from wet soybean flakes following alkaline extraction of protein." Only 50% of the oil was recovered in this process compared with 97% in the extraction of the whole dry flakes with hexane. However the flavor of the oil was better.

3. Gelatinous form of soybean protein. "During experiments which were directed toward obtaining a 'soy cream' which would not curd in coffee, a 'protein' with phenomenal gelatinous properties was prepared... It was thought such a 'vegetable gelatin' might find use in the food and pharmaceutical industries... Note 1. This is the earliest document seen (Aug. 2013) concerning a non-dairy coffee creamer; in this case it was made with soy protein.

"4. Wheat Milk. Several attempts were made to make milk by process similar to that used in making soy milk, but were largely unsuccessful... 5. Peanut Milk. A few experiments were conducted with peanut protein. One batch of milk was made, of unpleasant color and flavor, due to the inclusion of the red 'skins' and the staleness of the nuts themselves.

"6. Soybean 'dairy' products. (A) Soy Milk. Since the manufacture and development of soy milk is one of the major projects of the Carver Laboratory, much of my work has had to do with this product. Investigations were largely in six general fields. (B) Soy Cream. (1) Non-curding cream for coffee. Quite a large number of experiments have been made to prepare a 'soy cream' which will not 'curd' when used in coffee. These experiments are still proceeding. As yet, no palatable non-curding cream has been prepared. (2) Soy whipping cream. Various types of vegetable fats, emulsifiers, and proportions of these with 'skim soy milk' were tried in seeking a cream that would 'whip'. 'Sweetex' fat, manufactured by Procter and Gamble, homogenized at pressures under 500 pounds per square inch with soy skim milk makes an acceptable 'topping' which 'whips' and resembles whipped cream in appearance. The flavor of this product is generally considered to be an improvement over the flavor of regular soy milk, probably due to the dilution of the soy protein with fat and air. [Note 2. No mention is made of mono- or diglycerides. See Florence Diamond interview of Dec. 1992.]

"(C) Soy 'cream cheese' spreads. Different methods of chemically 'souring' straight 16% soy cream were tried, using citric acid and calcium chloride as precipitating reagents, and different combinations of the drained and pressed precipitate with pimentos, pickles, and other flavoring materials were made. A number of different

varieties of 'cheese spread' of this sort were made. The texture and flavor of these spreads are comparable with the flavor and texture of the common spreads made from cow's milk.

"(D) Soy 'Cheddar' cheese. A number of attempts were made to prepare an acceptable 'hard' or 'Cheddar' cheese from soy milk by chemical souring and mechanical pressing. In all cases, however, the pressed cake was brittle, with a tendency to crumble, quite different in texture from ordinary Cheddar cheese. The flavor in each case was considerably inferior to ordinary American cheese.

Note: This is the earliest English-language document seen (Feb. 2007) that uses the term "Soy 'Cheddar' cheese" to refer to a Western-style soy cheese.

"(E) Soy ice cream. (1) Refrigerator tray type. It was found that by substituting soy topping for whipping cream and 16% soy cream for coffee cream specified in ordinary cow's-milk recipes for refrigerator ice cream, an acceptable product could be obtained."

See also Diamond's "Laboratory Notebook," starting Feb. 1945. Address: Dearborn, Michigan.

1375. International Nutrition Laboratory. 1945. Soyalac (Ad). *Soybean Digest.* Sept. p. 40. [1 ref]
• ***Summary:*** This full-page ad (see next page) is mainly for bottled "Soyalac: A spray dried infant food." It notes that this company also makes "* Miller's Soya-Malt. A malted soya milk mostly used as a beverage milk. * Miller's Chocolate Soya-Malt. Also a tasty beverage milk. * Miller's All-Purpose Soyalac. A natural soya milk for both beverage and cooking purposes. Packed in 1-lb., 4-lb., and 20-lb. containers." Three photos show 1-lb glass jars of "Soyalac: A spray dried infant food." On each jar is a photo of a seated baby. Address: Mt. Vernon, Ohio.

1376. *Let's Live.* 1945. Have you tasted the new formula? Kevo has amazing flavor–Gives more pep (Ad). Sept. p. 19.
• ***Summary:*** This 2¼ by 3½ inch ad states: "This hearty food beverage offers you something delightfully different–a smooth, chocolate-like flavor but contains no chocolate. Kevo powder makes a delicious drink hot or cold. Try it with your meals every day for a week. Carry Kevo Tabulets (Enurgets) in your pocket or purse and eat like candy for more pep.

"You will keep coming back for more because Kevo tastes So Good and makes you fell so good.

"Kevo is made from the following natural foods that give True Minerals and Vitamins: Whole soy bean, germ of whole wheat, dextrose, soy bean milk, deep sea kelp, mint leaves, rhubarb plant, spinach, carrot, celery, W.H.Y. Blended flavoring, Special calcium, phosphorus, iron, copper, iodine.

"Ask your Pure Food dealer for Kevo. If he is temporarily out, send his name, address and 10¢ to the factory. We shall mail you a generous trial size of Kevo and Enurgets, post paid. Kevo-L-2, Azusa, California." Address: Azusa, California.

1377. *Madison Health Messenger* (*Madison, Tennessee*). 1945. Madison Foods–Madison College, Tennessee. 7(1):4. Undated.
• ***Summary:*** A full-page photo shows the following canned products, with a brief description of each and the price: Stake-Lets (a combination of gluten and soy beans). Not-Meat (a meatless loaf for cutlets, roasts, patties, croquettes, salads, etc.). Yum (a mild Bologna flavor. Contains soy beans, wheat gluten, and seasonings). Zoyburger (excellent for sandwich spreads or served like a steak with onions). Vigoroast (a vegetable steak). Wheatasoy (an alkaline breakfast food, ready to eat. Contains rich grain malt, whole wheat, and soy-bean flour). Zoy-Koff (Prepare like coffee. No trace of caffeine. No nerve stimulants. Two grinds–regular and fine). Kreme O'Soy (a soy milk for those allergic to cow's milk and for special diets. A liquid not concentrated). Soy Cheese (soy curd (tofu) seasoned for croquettes, salads, sandwich spreads, etc.).

A separate photo across the top of page 1 of this issue shows a ground-level view of the "Madison College Campus, Home of Madison Foods."

1378. Myco Biological Laboratories. 1945. A wonderful food drink–Almon-O (Ad). *Let's Live.* Sept. p. 17.
• ***Summary:*** This 4½ by 2 inch ad states: "The all-year, all-round nourishing product, rich in almonds. Once you drink Almon-O you will always like it. Ask for it at your health food store." Address: 2075 North Fair Oaks Ave., Pasadena 3, California.

1379. *Madison Survey* (*Madison, Tennessee*). 1945. Food-manufacturing industry. 27(19):76. Oct. 17.
• ***Summary:*** "Again Madison Foods has made a carload shipment of nearly 65,000 pounds to the Pacific Coast, to distributors in Los Angeles [California] and Seattle [Washington]. This car contained Zoy Koff, the cereal drink, 350 cases of Kreme O'Soy Milk, and 1,350 cases of the protein foods-Vigorost, Yum, Zoyburger, Not Meat, Stakelets, and Soy Cheese."

"It is now an established fact that we are not dependant on flesh foods for the protein content of the daily rations." After discussing an article about soybeans in *Reader's Digest* titled "How we can help feed Europe's hungry" (Sept. 1945, p. 50-52), the *Madison Survey* concludes: "Madison is fortunate at such a time as this to be able to manufacture and market products that are helping in the solution of the greatest food problem the world has known."

1380. *Times of India* (*The*) (*Bombay*). 1945. The fact that milk prepared out of soya bean can be used in exactly the same way as cow's milk for ice cream or curds [tofu]... Oct.

SOYALAC

★ A time-tested and medically approved nonallergic infant food.

Miller's Spray-Dried Soyalac is a soluble soya milk modified and reinforced with proper proportions of essential oils, carbohydrates, minerals, and all required vitamins except vitamin C.

While Soyalac is the distinctive and only soluble spray-dried, completely modified vegetable milk offered to replace either mother's or cow's milk, and intended for babies and children of early years, other types of spray-dried soya milk are available for general family use. All these contain the equivalent of cow's milk in food value and calcium.

★ **Miller's Soya-Malt.** A malted soya milk mostly used as a beverage milk.

★ **Miller's Chocolate Soya-Malt.** Also a tasty beverage milk.

★ **Miller's All-Purpose Soyalac.** A natural soya milk for both beverage and cooking purposes.

Packed in 1-lb., 4-lb., and 20-lb. containers. Priced on a level with cow's milk. If your druggist or health food store does not have Miller's Soyalac Infant Food, packed in 1-lb. glass jars, or other brands of Miller's Soya Milk, write to Box 388.

℞ NOTE TO PHYSICIANS: A manual on Soya Milk Infant Feeding is obtainable from the address below.

Distinctive Values in Infant Feeding

1. Ready preparation.
2. Easy digestion.
3. High protein availability.
4. A complete infant food requiring only the addition to the diet of vitamin C in form of orange or tomato juice.
5. Nonallergic; thus it can be substituted for cow's milk for children with eczema, regurgitation, dyspepsia, etc.
6. Nonconstipating.
7. Costs no more for baby's diet than prepared baby foods from animal milks.
8. Soya protein most readily assimilated. Since protein is the growing portion of the baby's diet, it is important that the child has the maximum intake it can utilize.

INTERNATIONAL NUTRITION LABORATORY · MT. VERNON, OHIO

30. p. 5.
• ***Summary:*** "... is suggested in a note prepared by Prof. V. Subramanian [Subramaniam, Subrahmanyan] and Dr. S.S. De, of the Indian Institute of Science, Bangalore." The say that 1 lb. of soya bean will yield 6 lb. of milk having about the same nutritional composition as cow's milk.

Note: See *Times of India,* 13 Sept. 1945.

1381. Claudel, Paul. 1945. La plante qui donne du lait [The plant that gives milk]. *Figaro* (*Le*). Dec. 16. Reprinted in *Revue International du Soja,* March 1946, p. 35-36. [Fre]
• ***Summary:*** Claudel was the French ambassador to Japan before World War II. Address: France.

1382. Holman, Ross L. 1945. A chemurgic fantasy. *Yale Review* 35(2):282-91. Dec. Condensed as "New riches from farm synthetics" in Science Digest. 1945. 17:53-55. March.
• ***Summary:*** The farm chemurgic movement, started in 1934 to find industrial markets for surplus farm crops, has begun to grow. W.J. Hale is the founder of the present chemurgic movement. "There is no farm crop that the test tube has turned into more industrial products than soy beans. It is surprising to see what the soy bean can become in the hands of a chemical juggler. To offset war scarcities it can be processed into many things, from gunstocks for guns to a good substitute for butter; from vitamin K for our blood to a handkerchief for our tears.

"America's industrial pioneer number one with soy beans is Henry Ford. With a staff of chemists, a laboratory, and several thousand acres of soys he is turning these beans not only into a large variety of things to eat but into something to wear and ride, to keep the rain off and to doctor our liver troubles. We may recall how extravagant Ford sounded to us in the Twenties when he said that some day we would be able to dispense with the farm cow and drink synthetic milk [See *New York Tribune,* 9 Feb. 1921]. This fantastic prophecy made rich material for newspaper reporters and cartoonists. There were comic caricatures of a robot cow pouring out synthetic milk to be churned into a synthetic butter. Today reporters and cartoonists know that the joke has backfired. Ford's chemists have been getting milk from soy beans for years. The milk has been shown to have important food values. The list of Ford's soy foods includes meats, cheese, breakfast foods, macaroni, bread, crackers, sweet milk, buttermilk, and coffee."

Reichhold Chemical Corporation and one or two other companies are producing soy-bean rubber at the rate of 25,000 tons a year.

The author also discusses how Henry Ford uses soy beans to make synthetic wool. "Ford himself frequently wears a soy-bean suit, and experiments seem to prove that it can be manufactured at less cost than any other textile fiber. Two Japanese scientists processed a wool from soys before the war and insisted that wool for a whole suit of clothes could be manufactured for less than a dollar."

"The climax of Ford's pre-war chemurgic achievements was the manufacture of a car with a all-plastic body. The body, made largely of soys, was 1,000 pounds lighter than a similar car with a steel body... Just about the time it was ready to go into production Pearl Harbor stalled the manufacture of cars for the duration.

"Madison College near Nashville, Tennessee, is an educational institution that has turned farm chemurgy into a bonanza... The chief crop handled here is the soy bean, which is manufactured into 30 foods ranging from meat to coffee." The students, working their way through college, make the foods and student nurses and boys taking pre-medical courses play a major role at the school's sanitarium, where "patients are nursed back to health on soy foods."

At Taftville, Connecticut, the National Dairy Products Corporation is now manufacturing 10 million pounds a year of Aralac, a wool-like fiber made from the casein in skim milk.

"America's pioneer chemurgist, who performed scientific miracles before chemurgy ever got its name, was the late Dr. George W. Carver, of Tuskegee Institute in Alabama. Dr. Carver's record of processing over 300 industrial products from the peanut and 120 from the sweet potato is too well known to need discussion here."

Note: This is the earliest document seen (April 2002) that mentions vitamin K in connection with soy.

1383. Mayo, J.K. 1945. Soya beans in Nigeria. *Tropical Agriculture* (*Trinidad*) 22(12):226-29. Dec. [10 ref]
• ***Summary:*** "The first recorded trial of soya beans was made in 1910 at Ibadan. The crop was a failure.

"In 1928, in response to requests to the United States and Southern Rhodesia for fodder legumes likely to succeed in Nigeria, the Department of Agriculture received several varieties of soya beans. These were grown for some years at Kano, Zaria, Yandev and Ibadan. Yields up to 500 lb. per acre were recorded at Zaria in small scale trials and nodules developed without inoculation. As a fodder plant it was found inferior to other plants, as an export crop it had no prospect at that time in competition with Manchuria, and as a food for human beings it was not seriously considered. Trials were discontinued in 1933. The best of these varieties seemed to be Otootan (black seed) which gave 500 lb. per acre at Zaria and 430 lb. at Yandev in 1930 and 1932. Five varieties from Russia were discarded after two years' trial.

"The Missions, especially the Church of the Brethren Mission at Garkidda on the plateau and the Leper Settlement in Itu in the Eastern Provinces have, from time to time, introduced and tried a number of varieties. They grow the crop solely as a food for human beings

"In 1937, tropical varieties were introduced and tried by the Botanist at Ibadan and Zaria. These varieties came from Trinidad, British Guiana, Malaya, India, the Philippines,

Ceylon, the Dutch East Indies, the United States and South Africa... From 1940 onward the more promising varieties were grown at most of our farms with very variable success... variable yields were recorded sometimes as high as 800-1,200 lb. seed per acre, the best yielders being Malaya and Benares... In the Cameroons soya beans have been tried at Bamenda (4,500 ft.) and Esosong (3,300 ft.) which lies on a slope of Mount Kupe...

"The peasants have not begun to grow soya beans in Nigeria, except here and there under the direct encouragement and example of Europeans, *e.g.* at Yandev and Ilorin, in the Anchau 'corridor' in Zaria Province, and near Bamenda...

"Dr. Ogle carried out a controlled experiment on school children in Lagos in 1942 using soya bean milk and flour. She concluded that 'it is dangerous as well as difficult to interfere with native diets' and recommended that further tests with steamed flour and soya bean milk be carried out and beans distributed to teachers and health workers for trial in their homes... The army tried soya beans as part of the rations of West African troops in 1944, but further trials by the Medical Department are needed." Address: Senior Botanist, Dep. of Agriculture, Nigeria.

1384. Diehl, Harold S. 1945. Textbook of healthful living. 3rd ed. New York and London: McGraw-Hill Book Co. 707 p. Illust. Index. 20 cm. [150+* ref]
• ***Summary:*** In Chapter 7, titled "Dietary Dangers," in the section on "Dietary Fads and Fallacies," page 147 states: "*Vegetarianism.* The disciples of this fad usually follow it either because they consider animal foods deleterious to health or because they object to the destruction of animals to supply food for man. This latter reason is purely sentimental; but the former merits consideration."

"Professor E. V. McCollum, leading authority on nutrition, has written that "a vegetarian diet, supplemented with fairly liberal amounts of milk, is the most satisfactory type of diet that a man can take." [Prof. McCollum continues: "Palatable and attractive as they [meats] may be, I feel confident they are not very satisfactory as human foods when adhered to over appreciable periods."] "But this is not true vegetarianism. In fact, milk, butter, eggs, cheese, and other dairy and animal products are rarely left out of the diets of vegetarians. Hence, most 'vegetarians' are not really vegetarians but only abstainers from meat."

In the section titled "Milk–A Potentially Dangerous Food," the author begins by stating: "Of all foods in the dietary of man milk is the most perfect. Unfortunately, however, it is an ideal food not only for man but for many of his microscopic enemies as well... Disease-producing germs may get into milk either from a diseased animal or from human beings who have contact with milk.

"The diseases of animal origin which one may get through milk are tuberculosis, undulant (malta) fever, foot and mouth disease, and intestinal ailments resulting in diarrheal conditions, especially in children... The diseases of human origin most commonly spread by milk are typhoid fever, septic sore throat, scarlet fever, and diphtheria. In the twenty years from 1908 to 1927, 429 milk-borne outbreaks of typhoid fever with a total of approximately 15,000 cases were reported in the United States."

Fortunately the disease-producing germs found in milk are easily killed by a heating process called "pasteurization." "At the present time approximately 90 per cent of the milk used in American cities of 10,000 population and over is pasteurized, but all too many smaller communities are still exposed to the hazard of raw milk."

Note: This is the earliest document seen (July 1999) with the term "Preventive Medicine" in the author's title in the USA–at the University of Minnesota. Address: Prof. of Preventive Medicine and Public Health, and Dean of the Medical Sciences, Univ. of Minnesota.

1385. Lager, Mildred. 1945. The useful soybean: A plus factor in modern living. New York and London: McGraw-Hill Book Company, Inc. xii + 295 p. Illust. General index. Index of recipes. 22 cm.
• ***Summary:*** One of the most important and innovative books on soyfoods ever written. Contents: Preface. 1. Agriculture's Cinderella: America discovers the soybean, our wonder beans, soy as a food in the United States, soy in rehabilitation food programs, soybeans as an emergency crop, soybean terminology. 2. World-wide use of soybeans: A real antique, monarch of Manchuria, soybeans in mechanized warfare–Germany, soybeans in other countries (USSR, Italy, Spain, Belgium, Holland, Norway, Denmark, Sweden, Great Britain, Canada), soybeans in Lend-Lease and United States Agricultural Marketing Administration, Food for Greece, soybeans and the Mexican Indian, soybeans in Hawaii (Mr. C.G. Lennox). 3. Soybeans and industry: The versatile soy, uses of soybean in industry, soybean paint (from soy oil, incl. Duco finishing), soybean protein (used in making plywood, plastics, water paints, paper sizing, leather finishes, and insecticide sprays), Henry Ford and soybeans, soybean glue (I.F. Laucks and the firms he has licensed turn out some 30,000 tons of soybean glue annually), rubber substitute (Norepol), paper industry (Glidden), plastics, soy-cotton helmets, firefighting compounds, lecithin, fertilizers. 4. Nutritional nuggets: Food value of soybeans and soy products (vegetable or edible types of soybeans, protein, fat & carbohydrate, minerals, vitamins, lecithin, alkaline ash, economy, exaggerated claims), principal uses of soybeans and soy products (meat substitutes, meat enrichers, fortifying foods with soy flour). 5. From soup to nuts: Green beans, dry beans, frozen beans, roasted soybeans, sprouted soybeans, the cow of China–soy milk, the meat without a bone–tofu or soy cheese, the little giant among protein foods–soy flour, soy grits, puffed grits, soy oil, miscellaneous soy products

(soy butter [soynut butter, p. 99-100], sandwich spreads, malts, coffee substitutes, soy sauce, soy albumen–a new product, greatly improved during the past two years, is now used to "replace egg albumen in candy manufacture" [as in marshmallows]).

Note 1. This is the earliest English-language document seen (March 2001) that refers to tofu as 'the meat without a bone.' In 1938 Horvath called tofu 'the meat without the bones.' Note 2. This is the second earliest document seen (Aug. 2002) in which the soybean is called the "cow of China."

Note 3. This is the earliest English-language document seen (Aug. 2003) that uses the term "soy albumen" (or "soy albumens") to refer to isolated soy protein as a product.

6. The blazed trail: Introduction (history and pioneers), our tardy acceptance, food pioneers (health-food stores, Dr. W.D. Sansum of Santa Barbara and soy bread, allergy studies, vegetarians, Seventh-day Adventist food companies, meatlike products, Madison College of Tennessee, Loma Linda Food Co., the International Nutrition Laboratory and Dr. H.W. Miller, special dietary concerns and diabetic diets), establishing soybeans in the kitchen (The Edison Institute and Henry Ford, the USDA and the U.S. Bureau of Home Economics, the Agricultural Marketing Administration, U.S. railroads, the Soy Products Division of the Glidden Co., the Soy Flour Association). 7. The challenge of nutrition: The dangers of hidden hungers, nutrition and health, corrective nutrition, starch-restricted diets, meatless diets, allergy diets, bland diets, building diets, reducing diets, acidophilus culture, lecithin. 8. Our wonder crop: Jack and the beanstalk, early history, new varieties, aids to the industry (Regional Soybean Industrial Products Laboratory, American railroads, American Soybean Association, Fouts Brothers of Indiana, *Soybean Digest* and George Strayer in Hudson, Iowa, Soy Flour Association with Edward Kahl as first president, Soya Kitchen in Chicago (Illinois) opened in Jan. 1943, National Soybean Processors Assoc., National Farm Chemurgic Council), educational program, restrictive regulations. 9. Soybeans and the farmer: Varieties, sources of information, seeding and inoculating, harvesting, grading, soybean diseases, crop rotation, damaged beans. 10. Tomorrow: Acreage and production, soybeans on the farm, soybeans in nutrition, postwar industrial uses, future improvements. 11. A few suggestions for better living: Kitchen diplomacy, personal opinions, soybeans for everyone. Recipes: Green soybeans, dry soybeans, sprouted soybeans, roasted or toasted soybeans, meat-substitute dishes, soy-enriched meat dishes, soy noodles, macaroni, spaghetti, sauces and gravies, soups, salads, dressings, soy spreads, soy milk, tofu or soy cheese, soy butter, soy cereals, soy desserts, soy candies, soy beverages, soy-flour recipes, bread and muffins, pancakes and waffles, soy gluten recipes, baking-powder biscuits, pastry, cookies and doughnuts, cakes.

Contains recipes for "Soy milk molasses shake (p. 238). Soy puddings. Soy ice cream (p. 250; "Soy milk may may be used in place of milk in ice-cream recipes... adding whipped cream"). Soy fruit ice cream. Soy chocolate dessert (Eggless) (p. 250-51). Soy shake "(p. 254, made in a "liquefier or mixer").

The story of Allied aid to Greece [p. 24-26] is one of the great mercy stories of World War II. Starting in March 1942, as many Greeks were starving, the first mercy ship sailed to Greece with food and medicine. Up to Nov. 1943, the United States through Lend-Lease sent 82 million pounds of food to Greece. A number of these foods (including soup powders, stew mixes, and spaghetti) were based on soy flour and grits, and specifically developed to suit Greek tastes.

Concerning Henry Ford (p. 35-38), his "first experiments were made in a laboratory in connection with the Edison Institute in 1930. In these experiments, several tons of wheat were used, also several thousand bushels of carrots; sunflower seeds, which have a high oil content; cabbages; onions; and cornstalks. It was not until December, 1931, after a long series of experiments with the soybean, that Mr. Ford and his chemists felt that they were at last approaching a solution to the problem of finding a basic farm material from which the ordinary farmer could develop a commercially profitable product."

Note 4. This is the earliest English-language document seen (March 2007) that uses the term "Soy ice cream" (p. 250).

Note 5. This is the earliest document seen (July 2007, one of two) that uses the word "Cinderella" in connection with the soybean. The author, however, does not elaborate on this idea.

Note 6. This is the earliest English-language document seen (June 2011) that uses the term "soy-flour." Address: Southern California.

1386. Lager, Mildred. 1945. Madison College (Document part). In: Mildred Lager. 1945. The Useful Soybean: A Plus Factor in Modern Living. New York and London: McGraw-Hill Book Company, Inc. xii + 295 p. See p. 106-07.
• ***Summary:*** "There are several large and small Seventh-day Adventist food concerns in this country that manufacture a complete supply of soy products, most of which are cooked and ready to use.

"As pioneers, all these Adventist concerns have done considerable research on soybeans, and most of them employ chemists who have had firsthand experience with the beans in China. These men know the food value of the bean, what it has meant nutritionally elsewhere, and they strive to perfect formulas for well-balanced and complete vegetable protein foods to take the place of meat. Most of these concerns also manufacture soy milk, fortified to equal dairy milk in food value. Their meatlike products at first were for the use of their own people, their hospitals and institutions; but demands for vegetable protein have brought them into

health-food stores and food specialty shops. Sales on these products have been steadily increasing with a rapid rise in the last 3 years, climaxed by meat and cheese rationing..."

"Perhaps the best known of the pioneer institutions is Madison College, Tennessee. It is doing an outstanding job in maintaining a self-supporting college and a sanitarium and in developing a complete line of soy products that are being sold on an international scale. Madison's curriculum includes 27 campus industries run by the students to support the college and themselves. A 900-acre college farm is operated entirely by student labor and is also self-supporting. The student canning factory was started when the college was in its infancy, almost forty years ago; and several years of research in food chemistry have resulted in many new products built around the soybean. Madison College is largely responsible for making soybeans appetizing. They have developed a soy milk that has received world recognition; observers have come from Africa, India, and other countries where milch cows are scarce, to study the methods of Madison's soybean dairy. They also make soy cheese [tofu] and several meat substitutes, as well as a soybean beverage. These foods are now well distributed over the United States and some foreign countries, including South Africa."

Note. This is the earliest English-language document seen (Aug. 2013) that uses the term "soybean beverage" to refer to soy milk. Address: Southern California.

1387. Lager, Mildred. 1945. Loma Linda Foods (Document part). In: Mildred Lager. 1945. The Useful Soybean: A Plus Factor in Modern Living. New York and London: McGraw-Hill Book Company, Inc. xii + 295 p. See p. 107-08.
• ***Summary:*** "The Loma Linda Food Company of California was originally established to supply nutritious vegetarian foods to institutions and hospitals, but it soon outgrew that field. Its sales in the last 3 years has grown by leaps and bounds. The first 6 months of 1943 almost double 1942; and today the company has national distribution of a complete group of soy products including canned beans, soy milk, cheese, several meat substitutes, a soy coffeelike beverage, and soy-fortified cereals." Address: Southern California.

1388. Longrée, Karla. 1945. Soybeans and peanuts: With 51 original recipes worked out by students in experimental classes at Hampton Institute. Hampton, Virginia: Hampton Institute Press. 47 p. Summarized in Soybean Digest, Feb. 1946, p. 22. [19 ref]
• ***Summary:*** Dr. Longree, who joined the staff of Hampton Institute in 1941, is a native of Germany and has been in the USA since 1933. She became an American citizen in 1939. She earned PhD degrees at both the University of Berlin and Cornell University. The many soy-based recipes include those made with whole soybeans, "soyflour, soygrits, soymilk, and sprouted soybeans." Address: Prof. of Foods & Nutrition, Hampton Inst., Hampton, Virginia; PhD Univ. of Berlin and Cornell Univ.

1389. Löbbe, Henrique. 1945. Cultura da soja no Brasil. 7th ed. [Culture of soybeans in Brazil. 7th ed.]. Rio de Janeiro, Brazil: Directoria de estatistica da produccao, Ministerio da Agricultura. 74 p. 2nd ed. was 1935. [Por]
Address: Eng. Agronomo, Brazil.

1390. Colombia. Servicio Cooperativo Interamericano de Salud Publica. Seccion de Nutricion. 1945? Un alimento maravilloso: la soya [A marvelous food: The soybean]. Bogota, Colombia: Aire Libre. 8 p. Undated. [Spa]
• ***Summary:*** Contents: Have you heard talk about soya? A little history. Soy preparations: Soymilk, how to prepare soymilk and okara (*el afrecho de soya; afrecho* means "bran"), soy cheese [tofu], whole soy flour. Some soy recipes: Arepa with corn and soya. Maizena with soymilk. Arequipe with soymilk. Soy sprouts (*tallos alimenticios de soya*). Bread with corn and soya. Bread with wheat and soya. Soya galletas. Soya ponqué. Soya bollos. Soy soup.

Note: This is the earliest Spanish-language document seen (June 2013) that uss the term *el afrecho de soya* to refer to okara. Address: Colombia.

1391. De, S.S.; Subrahmanyan, V. 1946. Processing of soya bean for the preparation of milk and other food products. *Indian Farming* 7(1):17-19. Jan.
• ***Summary:*** Contents: Introduction. Industrial and other uses of soya bean (soy milk, butter, and bean curd [tofu], Russia). Soya bean in India (unsuccessful attempts to use like dhal). The soya milk (The Chinese method, the improved method). The flavour and taste of soya milk. Nutritive value of soya milk. Possibilities of soya bean in India (to supplement the supply of cow and buffalo milk, which may be decreasing on a per capita basis). Uses of soya milk (sour curd, sweeter curd [tofu]). Production of soya bean [in India]. Other soya products.

"In Russia there is very intense propaganda for the use of soya bean. Soya bean dishes have been introduced in restaurants and homes. A Soya Research Institute has been organized in Moscow and in a special exhibition of soya food, 130 varieties of soya dishes including cutlets, pastry, salads, candy, and beef were shown. A dinner prepared entirely of soya bean was served to representatives of trade unions, factories, the Red Army and the Soviet press. The food was unanimously declared to be excellent."

"Over a considerable part of India, the chief dairy product used by a large section of the population is only the sour curd or the butter milk. Owing to the high cost of cow's milk, the corresponding curd and buttermilk are now becoming increasingly difficult to obtain. Even at the present high price of the bean (roughly 4 as. per lb.), the soya milk cost only about one-fifth of that of cows milk, so the curd

obtained from it would come within easy reach of a large section of the population."

"An important step would be the establishment of a soya foundation in order to promote the creation of a National Organization for Soya Research an example of which already exists in the U.S.S.R." Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1392. Indian Research Fund Association, Nutrition Advisory Committee, Sub-committee on the Soya Bean. 1946. Report on soya bean. *Indian Research Fund Association, Special Report* No. 13. 35 p. Jan. (Cawnpore, India: The Job Press). [83 ref]
• ***Summary:*** This study was compiled by the following four organizations: 1. The Biochemical Laboratory, Univ. of Dacca, under Dr. K.P. Basu; 2. The Seth G.S. Medical College, Bombay, under Dr. V.N. Patwardhan; 3. The University Chemical Laboratories, Lahore, under Dr. Bashir Ahmad; 4. The Nutrition Research Laboratories, Coonoor, under Dr. W.R. Aykroyd.

Contents: Introduction and review of the literature. The composition of soya bean. Soya bean in the feeding of infants and children. The investigation of the biological value of the proteins of soya bean and other pulses (incl. rat experiments). The effect of soya bean in supplementing rice diets. Discussion. Summary and conclusion (13 points).

The final opinion: "Taking the results obtained so far into consideration, the Sub-committee is of the opinion that as a supplement to typical Indian diets based on cereals, but supplied adequate in quantity, soya bean has no special advantage over common Indian pulses."

"The sub-committee is not in a position therefore to advocate *immediately* the encouragement of the production of soya bean on a wide scale in India as a substitute for Indian pulses." Address: Indian Research Fund Assoc.

1393. International Nutrition Laboratory. 1946. Dealers order blank. P.O. Box 388, Mount Vernon, Ohio. 1 p. Catalog. Jan.
• ***Summary:*** Lists 14 Soyalac products (all-purpose in 4 sizes, malt flavor in 4 sizes, chocolate in 3 sizes, infant food, natural liquid, and chocolate liquid), Giant Green Soya Beans in 3 sizes, Giant Select Soya Beans, Soya Beans with Tomato Sauce in 2 sizes, Soya Spread, Chili Con Carne (Vegetarian; with wheat gluten, no soy), Chop Suey (Mein Jing, Vegetarian, with soy sprouts), Cutletburger (Vegetarian; with wheat gluten, no soy), and Cutlets (Vegetarian, 4 sizes, no soy). Address: Mount Vernon, Ohio.

1394. Smith, A.K.; Beckel, A.C. 1946. Soybean or vegetable milk. A résumé and bibliography. *Chemical and Engineering News* 24(1):54-56. Jan. Also published as USDA Bureau of Agricultural and Chemical Engineering, AIC-113 (Feb. 1946) and in Soybean Digest (May 1946). [124 ref]
• ***Summary:*** A very useful document with 124 bibliographic references. Address: Oil and Protein Div., NRRL, Peoria, Illinois.

• ***Summary:*** Contains long sections on soymilk and almond milk. In 1932 Léon Rouest tasted a good-tasting soymilk in Moscow. One specialist who has studied the problem of improving the flavor of soymilk is Dr. Louis Gutschy, professor of agronomy at the University and Polytechnic School of Zagreb, Yugoslavia. He has succeeded in making a "a seductive and savory soymilk." Address: France.

1396. De, Sasanka S.; Subrahmanyan, V. 1946. Processing soyabean to increase its nutritive value. *Science and Culture* (*Calcutta*) 11(3):437-39. Feb. [20 ref]
• ***Summary:*** This is a brief review of the literature on soybean nutrition. Treatment of dehulled ("decuticled") soaked soybeans with warm dilute sodium bicarbonate solution removed to a large extent the bitter principles. The vitamin C content of soy sprouts is 33.8 mg/100 gm. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore, India.

1397. *Honduras Agricola.* 1946. La soya: Excellente alimento para el hombre como para el ganado y valiosa materia prima de numerosos usos industriales [The soybean: Excellent food for people and for livestock and valuable raw material with numerous industrial uses]. No. 14 & 15. p. 7-9. Jan/Feb.; No. 16. p. 10-11. March; No. 17. p. 16-17. April; No. 18. p. 18-19. May; No. 19 & 20. p. 17-18. June/July; No. 21. p. 10-13. Aug. [Spa]
• ***Summary:*** Contents continued: No. 14 & 15: Varieties. Fertilizer and manure to prepare the soil. Inoculation with bacteria. Time of sowing. Methods of sowing. Plant density. Depth of sowing.

No. 16: Tillage (*Labores*). Rotations. Mixed cultures: Soya and maize, soya and Sudan grass pasture, Soya and sorghum (*zahina*). Harmful animals (especially insects). Diseases. II: The harvest. Introduction. Cutting and preparation of soya for dry forage or hay. Time of harvest and reaping

No. 17: Method of harvest. Curing the pasture or hay. Baling the hay. Exhaustion of the soil. Harvest and preparation of the grain. Time of gathering. Methods of reaping. Curing and manipulation. Threshing.

No. 18: Special machines. Exhaustion of the soil. Storage of the seeds. II. Uses of soybeans. Introduction: The plant. The flour made from the seed. Green vegetable soybeans and sprouts (*Las soyas verdes y grillos*). Dry soybeans (*Las soyas secas*) and products made from them. The oil and its uses. The soybean as a human food:

Introduction, dry soybeans, green vegetable soybeans (*Soyas frescas*). Soy sprouts.

No. 19 & 20: Introduction. Flour. Oil. Soy sauce. Soymilk. Soy curds or tofu (*Cuajada o requesón de soya*). Soybeans as food for animals. Soy oil. Extraction of soy oil.

Issue No 21: Uses of the oil. Soybean meal (*pulpa, o bagazo de soya;* which remains after extraction of the oil). Use of soy meal [or flour] in human foods. The meal as a feed for livestock, for poultry, and as a fertilizer. Soy hay: For fattening cattle, for dairy cows, for mules and horses, for other animals. Soya pastaderos. Fresh soy forage. Soya for ensilage. Soy straw. Soya as a green manure.

On page 10 of this last part is a full-page cartoon of a woman with fruits and a cooked chicken. "Soya is the ideal food for children; it nourishes more and costs less. It is a good source of proteins, oils, carbohydrates, and vitamins. It can serve as a substitute for milk, eggs, meat, fruits, and pulses or vegetables (*legumbres*)." Page 11 states that people interested in planting soybeans can contact Prof. Raul Zaldivar, Director of the Rural School at Toncontin for Training Elementary Teachers (*Director de la Escuela Normal Rural de Toncontin*), Tegucigalpa, Honduras. Address: Honduras.

1398. **Product Name:** [Natural Sojarine (Soy-Based Infant Formula)].
Foreign Name: Sojarine Natura.
Manufacturer's Name: Natura.
Manufacturer's Address: 8, Quai de Passy, Paris 16, France.
Date of Introduction: 1946. February.
New Product–Documentation: Ad (1/8 page) in *Revue Internationale du Soja.* 1946. March. On unnumbered page before title page. "Sojarine Natura. A base de soja. Suraliment parfait. Convient aux nourisons, enfants, viellards, atteints de troubles gastro-intestinaux ou de diarrhees-rebelles [Made from Soy. The Perfect Food Supplement. Suited for Nursing Babies, Infants, Old People, and those Suffering From Gastro-Intestinal Troubles or Diarrhea]." Ad still running in 1949.

This ad also appeared in *Revue Internationale des Produits Coloniaux et du Material Colonial Revue Internationale du Soja.* 1946. July/Aug.

Note: It is hard to tell if Sojarine Natura was *truly* an infant formula, with all the necessary vitamins and minerals to sustain life and growth in place of mother's milk. It was developed during or right after World War II, so ingredients were scarce and times were very hard in France. But it was the first such product that we have seen made in France.

1399. *Revue Internationale du Soja.* 1946. Pourquoi il n'y a pas de lait de soja en France [Why there is no soymilk in France]. 5(23-24):19. Jan/Feb. [3 ref. Fre]
• ***Summary:*** The celebrated soyist (*sojaïst* [*sojaist*]) Li Yu-ying, after having spoken about soymilk in 1905 at the Congrès de la Laiterie, founded a laboratory for studies in Paris in 1908. Then he created at Vallées, near Colombes (Seine), a factory named *La Caséo-Sojaine* which produced a beautiful line of soyfoods (*aliments sojaïques*). This company went bankrupt fairly quickly, because certain "sharks" in our trade worked to suffocate it.

"Later other idealists have taken up the work of the Chinese scholar and scientist. Too bad for them. The same big businessmen attacked again and spread death and destruction. On this subject, see the article by Mr. René Bataille in the *Eclaireur de Nice et du Sud-Est* (No. 268, 24 Sept. 1940).

Will trusts [a powerful combination of firms designed to reduce competition] still today be able to prevent the manufacture of soymilk products? The shortage of animal milk will continue and soymilk could really help us. Of course, soy flour mixed with water is not soymilk. We need a real soymilk, made in the proper way, checked, graded, and standardized. It is not to be confused with the soymilk used as a calf milk replacer.

"Likewise, we will need soy cheeses (*fromages de soja*), made in factories. The late Dr. Alexis Carrel said during this war that the French youth would not have become [nutritionally] deficient if the Third Republic [1870-1940, proclaimed after Napoleon III was captured by the Prussians] had not strangled all attempts at soybean production and developing soyfood industries." Address: Paris, France.

1400. Claudel, Paul. 1946. Le soya coopératif [The soya cooperative]. *Figaro* (*Le*). March 20. [1 ref. Fre]*
Address: France.

1401. Claudel, Paul. 1946. La plante qui donne du lait [The plant that gives milk]. *Revue Internationale du Soja* 5(25):35-36. March. Reprinted from *Figaro,* 16 Dec. 1945. [1 ref. Fre]
• ***Summary:*** Claudel was the French ambassador to Japan before World War II. Address: France.

1402. Contreras C., Moisés. 1946. La soya; su cultivo y su importancia [The soybean; its cultivation and importance]. Ciudad Trujillo, Dominican Republic: Secretaria de Estado de Agricultura, Pecuaria, y Colonizacion. 12 p. March. [Spa]
• ***Summary:*** Contains many recipes. Address: Agron., Republica Dominiciana.

1403. Doherty, Lawrence E. 1946. Imitation or improvement? Dairy 'replacement' products widening market, seeking to equal margarine's success. *Food Business.* March. p. 22-23, 56.
• ***Summary:*** "In the family of vegetable-fat dairy replacements, the Big Brother Who Made Good is oleomargarine. The other family members–including

whipped topping, coffee whiteners, and mellorene [mellorine]–are working to be equally successful... Today vegetable whipping preparations, both powdered and aerosol, reportedly outsell dairy whipping cream." Two companies long associated with the dairy industry now make powdered coffee whiteners or creamers: Carnation makes Coffee-mate (launched in 1961, and now the market leader), and Borden's makes Cremora (launched in the autumn of 1963). Photos show a jar of each product. "The non-dairy coffee whitener market" is now experiencing fast growth. These products have two advantages over cream: they are less expensive and they keep longer. It was during World War II "that 'ersatz' dairy products got their big boost, due to some shortages of dairy products on the home front, and the need to develop non-spoiling dairylike foods for military men on the move.

"Since that time whipped topping and coffee whiteners have made important strides, especially in the institutional field where lower cost and increased shelf life are telling advantages. On almost all coffee vending machines, the 'cream' button releases what is actually a vegetable-base cream replacement, either powdered or liquid."

"Robert E. Rich, whose Rich Products Corp. sells frozen liquid Coffee-Rich, predicts that within five years vegetable fat coffee whiteners will be outselling dairy cream for coffee. Rich Products, of Buffalo, New York, is a pioneer in the non-dairy field. In 1945 Bob Rich, who then (as now) operated a large dairy company, learned of work done by the George Washington Carver Laboratories [of the Ford Motor Co., Dearborn, Michigan] on making milk and cream from soy beans, and used this work plus other research to produce a soy cream that would whip. Rich's Whip Topping produces more volume when whipped, remains firmer longer, combines with any acid fruit or juice, and costs less. This was followed in 1961 by Coffee-Rich, and this is where the company ran into a barrage of legal battles...

"Rich's Coffee-Rich is probably the largest seller of liquid non-dairy coffee whiteners. Carnation's Coffee-Mate is said to be the leader among the powdered cream... In the whipped topping field, Rich is said to be the largest seller of liquid topping. General Foods' Dream Whip, introduced in 1957 in powdered form, is the leader among the dry packaged whips. Lever Bros.' Lucky Whip mix, introduced in 1961, is considered in second place. Lucky Whip is also sold in aerosol containers, as is Whip Topping."

"H.W. Diamond, research vice-president of Rich Products, who holds the 'Diamond process' patents for vegetable fat whippable emulsions, foresees a fine future for non-dairy products. 'Generally speaking, vegetable fat replacements for dairy products can be created, manufactured, distributed, and sold at a lower cost in man hours of effort than can comparable dairy products. The vegetable fat products represent a more efficient utilization of the food producing capacity of the soil and the labors of man,' he said."

One ad for Rich's Coffee Rich shows it being poured into a cup of coffee. "New non dairy coffee compliment. Shipped frozen. Keeps 3 weeks after thawing in your refrigerator." It is sold in a Pure Pak carton. A second ad states "Rich's Coffee Rich wins again!" A Wisconsin cow, so labelled, is being carried away in a cage. The sign across the top which read "Legally Dangerous" has been changed to "Legally Meek," since Coffee Rich won a big legal victory in the dairy state of Wisconsin. Coffee Rich can be sold there and it need not be labeled "imitation cream." Rich has now won this legal battle in 7 states.

Note 1. This is the earliest document seen (Jan. 1999) that uses the term "coffee whiteners" (or "coffee whitener"). It is also the earliest document seen (Jan. 1999) that uses any term to refer to this new product category, and the earliest document seen (March 2001) concerning the etymology of such products.

Note 2. This is the earliest English-language document seen (March 2007) that uses the term "mellorene" to refer to a frozen dessert made with vegetable oils instead of butterfat.

Note 3. This is the earliest English-language document seen (Aug. 2013) that uses the word "dairylike" to refer to products resembling dairy products. Address: Assoc. editor.

1404. Jamyn, Stephan. 1946. Farine ou lait végétal de soja; Lait animal et artériosclèrose [Soy flour or milk; animal milk and arteriosclerosis]. *Revue Internationale du Soja* 5(25):38-39. March. English-language summary in Soybean Digest, Aug. 1946, p. 25. [6 ref. Fre]

• ***Summary:*** Researchers have recently concluded that the addition of soya to the "human diet tends to reduce arteriosclerotic lesions, while the casein of milk intensifies them. In an experiment on rabbits, hardening of the arteries was artificially produced by cholesterol.

"Since soya, due to the unsaponafiability of its oil in phytosterols, has been recognized as a protector against the sclerotic factor while animal casein increases its power, here is a new and powerful argument for the admission of the soybean into the western diet and culture, in the opinion of the author.

"Since experiments seem to prove that it is only animal casein which would be apt to cause arteriosclerosis, this is a new objection to the misuse of milk in the diet of aging adults. It is known that an excess of lactic acid menaces the heart. The author suggests that soya offers to older people the opportunity of nourishing themselves well and of even safely drinking milk, since it is exempt from harmful residues." Address: France.

1405. Emory, Mayo L. 1946. Soybean milk-substitute as used on Okinawa. *U.S. Naval Medical Bulletin* 46:616-18. April.

• ***Summary:*** Near the end of World War II, after the campaign for Okinawa, "the nutrition of the native children

presented a serious problem. Both malnutrition and undernutrition were universal and starvation was common." "Breast-fed children suffered most," followed by orphans under the age of 6.

"Soybean was one of the foods available. It was found that a substance closely resembling milk (table 1) was produced as a intermediate step in the preparation of a native soybean dish *tofu*.

"On 18 July 1945 the formula was made up experimentally in a native kitchen and tried out in General Hospital G6-59 on the pediatric ward. The following day the formula was used in the orphanage of 142 children of Dispensary G10-20. The food was readily accepted by the children... One cupful, approximately 200 cc, was given to each child before the noon meal. Those who wished more were given more." It was found that dehydrated egg powder could be added easily to the soybean formula to make a more valuable food. After only a month, on Aug. 19, the experiments were concluded.

The method of preparation was simple; the formula is given (for 1 lb dry soybeans, 1 lb of dehydrated egg powder and 3/4 lb sugar could be added). "Four natives (one cook and three helpers) could prepare enough milk-substitute to feed a thousand children." The "bean residue" [okara], a by-product of the process, was generally eaten "in soups by both adults and children, but it was not suitable for infants." Address: Surgeon U.S.P.H.S [U.S. Public Health Service].

1406. *Indian Farming.* 1946. Soya bean. 7(5):223-24. May.
• ***Summary:*** "Within recent months, much has been said and written, some of it in this journal, of the merits of the soya bean as an article of food. We have now before us the *Report on Soya Bean* submitted by the special sub-committee of the Indian Research Fund Association's Nutrition Advisory Committee. It is an authoritative statement which does nothing to strengthen the opinion that in the soya bean lies the solution to many of India's dietetic problems. The Woodhead Famine Inquiry Commission agreed with the finding of the Nutrition Advisory Committee."

The soya bean has never been cultivated to any large extent in India "although 30 years ago [in 1916, during World War I] some 20,000 acres were being grown in north Bengal, Nepal, Bhutan and Sikkim.

"The Nutrition Advisory Committee in 1937 stated that 'The nutritive value of soya bean has been studied by experiments on animals and also by controlled experiments on school children. The general conclusion is that soya bean, considered as a supplement to typical Indian diets, is not of outstanding value; it does not appear to have any advantage over various common pulses which have long formed part of the diet of the Indian people. While it would be advisable that the results obtained at the Coonoor Laboratories should be confirmed elsewhere, existing data suggest that at present the encouragement of the production and consumption of soya bean need not be made a prominent part of nutritional and agricultural policy in India.'

The soundness of that opinion was questioned both within and without the Committee, so that at the seventh meeting of the Committee in 1941, it as decided that 'further work was necessary to elucidate the problem.' Accordingly a sub-committee was appointed to suggest lines on which further experiments on soya bean might be carried out by different laboratories, and it is the record of the work done by experts in the laboratories in Dacca, Bombay, Lahore and Coonoor that is to be found in the present report." We must understand clearly that only the nutritive value of the soy bean in Indian diets is under examination.

A summary of seven key points is given. It should be clear that in India, the use of food for industrial purposes is out of the question. The soya bean "is a poor milk substitute but a valuable addition to a deficient milk supply. In the latter respect it somewhat resembles the position of *vanaspati* with regard to *ghee*–both soya bean and *vanaspati* must be used to augment a deficient supply of a superior article while neither can be a substitute for it." Address: India.

1407. Smith, A.K.; Beckel, A.C. 1946. Soy or vegetable milk. A resume and bibliography. *Soybean Digest.* May. p. 18-23. First published in Chemical and Engineering News, 24:54-56. [123 ref]
• ***Summary:*** The 123 references comprise the most extensive bibliography on this subject up to this time. A photo shows A.K. Smith. Address: Oil and Protein Div., NRRL, Peoria, Illinois.

1408. De, Sasanka S.; Desikachar, H.S.R.; Subrahmanyan, V. 1946. A practical approach to the milk problem in India (Vegetable milk–Their nutritive value and ultimate practical possibilities). *Science and Culture* (*Calcutta*) 11(12):692-95. June.
• ***Summary:*** Contents: Introduction (Need for milk in India). India's needs are beyond her capacity for production. Bad distribution of available supply. Imported milk products will be quite insufficient. Animal milk–a luxury product. Soya milk is used by hundreds of millions. Comparative composition of cow and soya-milk. Vitamin content per liter of soya-milk and cow's milk. Importance of processing; some recent work on soya-milk. Soya-bean should not be used as DHAL. More comprehensive scientific research is needed. Improvements in the preparation of soya-milk. Other vegetable milks. Cow's milk can be excelled by improved vegetable products. Immediate need for supplementing our present supply. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore, India.

1409. Illick, Edith Windels. 1946. A study of soybean milk: Its preparation and its use in some Chinese and American recipes. MS thesis in Home Economics, Cornell University.

47 + xiv p. June. [38 ref]
• ***Summary:*** Contents: Introduction. Review of the literature. Experimental procedure: Preliminary experiments (variety of soybeans, milk supplementation), preparation of soybean milk (equipment used, standard recipe, variables in experimental procedure, scorecards and judging), use of soybean milk in cookery (in Chinese dishes, in American dishes). Results and discussion: Preparation of soybean milk (amount of soaking water to be used, length of soaking time required, time for grinding, amount of water to be used for straining, time for straining, length of cooking time), revised recipe for preparing soybean milk, use of soybean milk in cookery (in Chinese dishes, in American dishes [chocolate ice cream, junket, Spanish cream, baked custard, cream of tomato soup]).

Using chocolate ice cream recipe II, "no conspicuous differences were observed in the chocolate ice creams made with either cow's milk or soybean milk." The recipe is as follows: ½ cup soybean milk (or dairy milk). ¼ cup sugar. ¼ tablespoon flour. 1/8 teaspoon salt. ½ ounce (½ square) chocolate, cut fine. ½ egg yolk, slightly beaten. 1 teaspoon vanilla. 1 cup light [dairy] cream. Note that this is not a non-dairy product.

Tables: (1) Recipes for making soybean milk. (2) Summary of methods of preparing soybean milk. (3) Composition of soybean milk. (4) Composition of cow's milk. (5) Composition of human milk. (6) Approximate percentage of amino acids in some animal and vegetable proteins calculated at 16% nitrogen. (7) The digestibility of the protein of soybean milk compared with cow's milk. (8) Effect of variations in procedure in making soybean milk on the yield of raw and cooked milk. (9) Effect of variations in procedure in making soybean milk on the appearance and palatability of the milk. (10) Results of substituting soybean milk for water in some Chinese products. (11) Results of substituting soybean milk for cow's milk in some American products.

The Introduction states: "'So old and yet so new,' is one adage that could rightfully be applied to soybean milk, or vegetable milk as it is sometimes called. Soybean milk is said to have been developed by the Chinese philosopher Whai Nain Tze long before the Christian era, and is known to the Chinese under the name of Fu Chiang or bean curd sauce. It is used in fresh, evaporated, condensed and powdered forms, according to Piper and Morse (1923).

"Despite its early discovery, soybean milk has not been used extensively. Only in the last two or three decades has man some to realise the potentialities of this product. Although it does not compare equally with cow's milk or other animal milks, it is sufficiently rich in the known food nutrients to make it worthy of consideration for more extensive study and use.

"To make soybean milk more comparable with animal milk, it is possible to supplement it in various ways with such nutrients as calcium, sodium, chlorine and sugar. This supplementation does not give it equality, but does produce a product of high food value.

"Even before World War II, malnutrition was manifested on every hand in China. only those individuals who were able to supplement the foundation diet of rice with large enough quantities of vegetables, meat fish, eggs and fruit, consumed an adequate diet. These cases were comparatively rare in proportion to the total population. To alleviate this serious situation, further study was imperative. Siddall and Chiu (l93l) believed that part of the answer could be found in the use of soybean milk, since soybeans are a native product of China, even though they are little used as a regular part of the diet.

"Because soybean milk is approximately five to ten times cheaper than cow's milk, the latter of which is virtually unobtainable to the average Chinese family, the possibility of its increased use appears more significant. To date, the average Chinese has not incorporated this milk in his daily cooking.

"During the last decade, soybean milk has received recognition in America also. Physicians, realizing its food value, have begun to use it in the diets of persons allergic to animal milk. It is usually referred to commercially as Mull-Soy, a product developed by Dr. Julius F. Muller (1943).

"What is the value and usefulness of soybean milk? In this study, an attempt will be made to produce the most palatable soybean milk and to incorporate it in some Chinese recipes calling for water and in some American recipes requiring milk. The substitution of this nutriently rich vegetable milk for water in the Chinese recipes appears to be a plausible method of improving the food value of the average diet." Address: Cornell Univ., Ithaca, New York.

1410. Marquis, Arnold. 1946. The Pacific story. Radio broadcast. National Broadcasting Company (NBC). Hollywood, California. June 2. 30 minutes. 23 p. transcript.
• ***Summary:*** This radio broadcast is a fascinating story–told by many voices–of how the Japanese scientifically developed soybean production, utilization, and export in their puppet state of Manchukuo, and, how the USA intends to capture the soybean export markets lost by the Japanese when they lost World War II.

The Chinese speak of the soybean this way: "It is the poor man's meat. It is the cow of China. It is meat without bones. The Japanese speak of it this way: If we could have held Manchuria, it would have guaranteed that Japan could never be starved out. American nutritionists speak of it this way: It is high in protein. It is rich in vitamins–in A, B-1, C, G, and E–and also in the bloodclotting vitamin K. Weight for weight it contains several times as much B-1 as beefsteak. And as for minerals: One-half cup of soy flour contains as much calcium as a whole cup of milk... [and] as much phosphorus as two cups of milk. And weight for weight,

it contains as much iron as liver, twice as much iron as molasses, and three times as much iron as whole wheat flour. The soybean is a wonder food. One pound of soy beans is almost a complete one-day ration for an adult."

The USA is now developing two famine-relief foods based on soybeans. The first contains 50% soybean, plus split peas, wheat flour, and a little peanut-meal, onion, salt, and fish-oil. Four million pounds of this mixture and twelve million pounds of another soy-based mixture are being sent "to the famine areas of China." In other words, soybean are being sent from the USA to the land of their origin, "where they have been a mainstay for five thousand years."

Discusses: The growing of soybeans in Manchuria. The Japanese takeover and extension of their control via the South Manchuria Railroad, whose terminus is Dairen. The importance of Manchurian soybeans to Japan. The Japanese Central Laboratory at Dairen and its research on soybeans. The two Japanese agricultural experiment stations in Manchukuo. Development of the benzine [benzene] solvent extraction process for soybean oil, "until there were 200 large bean plants in southern Manchuria." Soybeans as a livestock feed in Manchuria. Use of soybeans as food in China: "Tofu is bean-curd... This is fermented tofu. It is very good. Tofu is eaten in several forms. Fresh, fermented, dried or frozen. Just about any way it is prepared, its food value is preserved... We also use the oil of the soy bean. And with the soy bean we make soy sauce." Many Asiatic peoples also use soybeans to "make bean milk and bean flour." "They roast them for confections [kinako]. They eat them green [green vegetable soybeans]. They sprout them [soybean sprouts] and they even make drinks of them.

Note 1. This is the earliest English-language document seen (Oct. 2011) that contains the term "fermented tofu.

Industrial uses of soybeans in America. How Dairen became Japan's great center of the soy bean industry in Manchuria, and the Mixed Storage System. "About 55% of the soybeans grown in Manchuria are used for human food."

"You see, its all tied together. The growing of the bean, the processing, the transportation, and the export. Since 1937, the economy of Manchuria has been developed for the benefit of Japan." The Japanese and the Bank of Manchukuo (which is an instrument of the powerful Mitsui and Mitsubishi financial combines) are "buying up all the soybean business" and trying to eliminate the major European companies that were exporting soybeans before the Japanese moved in, such as Dreyfus Co. (France), and Wassard Co. (Denmark). Although the Japanese claim that Manchukuo is an independent nation, other nations realize it is a puppet state. The Chinese Eastern Railway, which was built by the Russians and has its terminus at Vladivostok, is in competition with the Japanese-controlled South Manchuria Railroad for the soy bean business of Manchuria. The latter uses rebates (kickbacks) to try to eliminate competition.

In 1937, after 6 years of dominating Manchuria, Japan invaded China proper–using Manchuria to supply their troops. "By 1941, Manchuria was yielding some four million tons of soybeans. The Japanese controlled every pound of it. And by 1941 they had fostered the growing of soybeans in Korea, and also in Japan itself. Also, by this time, the Japanese had seized a good part of the soybean country of China proper. But by Pearl Harbor [7 Dec. 1941], the United States was also growing soybeans: Over 3 million tons in 1941. By 1945 it was nearly 6 million tons."

Now that the war is over, the Japanese have lost the entire soybean industry in Manchuria–including the laboratories, bean oil mills, Dairen, the South Manchuria Railroad, and the Bank of Manchukuo which controlled it. China, which now controls Manchuria, "will consume much of the soybeans which, before the war, were exported to European countries, and to Japan." The United States has begun to supply this soybean export demand, and in fact "is already shipping soybean products back to the Far East–to the famine stricken areas of China."

America Doctor: "So far most of our soybeans have gone for feeding livestock. But now we known what they can mean to man. Narrator: Now, in this great crisis, we are learning what the Chinese have known for thousands of years. Chinese: It is the poor man's meat. It is the cow of China. It is meat without bones... Announcer: This is the story of the wonder food and the part it has played in our time."

Next comes a 5-minute segment in which W.J. Morse of the USDA Bureau of Plant Industry (Beltsville, Maryland) talks about the significance of the soybean and its development, and the new Pacific Program. Then the conclusion: "For a reprint of this program, send ten cents in stamps or coin to University of California Press, Berkeley, California. The Pacific Story is written and directed by Arnold Marquis. The original musical score was composed and conducted by Thomas Peluse. Your narrator–Gayne Whitman... This program came to you from Hollywood. This is N.B.C.–The National Broadcasting System." Note 2. A cover letter accompanies this manuscript. It is from Arnold Marquis, Writer-Producer, The Pacific Story, to Mr. John Baker, Department of Radio, USDA, Washington, DC. The letterhead reads: National Broadcasting Company, Inc., A service of Radio Corporation of America, Sunset and Vine, Hollywood 28, California. [Phone]: 6161. Dated May 13, 1946. Address: USDA.

1411. *Vegetarian Messenger and Health Review* (*Manchester, England*). 1946. Cookery demonstration. June. p. 115.

• ***Summary:*** On May 6 a public cookery demonstration was given at Croyden by Mrs. Fay K. Henderson of London. She prepared four nutritious savouries without meat and three sweets without eggs or milk. Of the latter 3 dishes, one was

a Semolina Mold in which soya flour was whisked to a milk in a pint of warm water, and another was Date Cake which contained 2 oz of soya flour.

1412. Basu, U.P. 1946. Soya bean. *Science and Culture* (*Calcutta*) 12(1):43-44. July.
• ***Summary:*** "Considerable discussion has taken place on the subject of soya bean and its potentialities as a food crop in India." But a recent report states that the soya bean has no special advantage over common Indian pulses as a supplement to typical Indian diets.

1413. Krishnaswamy, N.; De, S.S.; Subrahmanyan, V. 1946. Digestibility of soya milk (Letter to the editor). *Science and Culture* (*Calcutta*) 12(1):51-52. July. [4 ref]
• ***Summary:*** "Soya-bean milk is a highly digestible product. Experience in different parts of the World has shown that it is more easily digested than cow's milk. In America and other countries, persons who are allergic to cow's milk or otherwise experience difficulty in digesting it, experience no such discomfort when using soya-milk. In Canada, where there is no milk shortage, the sweet soya curd is flavoured for feeding children as it produces no digestive disorders.

"Our recent experience with feeding soya milk in child welfare centres has shown that even very young children can drink fair quantities of the milk without any discomfort. Even babies have been fed on soya milk without any ill effect."

"Soya milk forms a soft curd which disperses readily on either side of the iso-electric point. Cow's milk curd remains as such over a wider range."

"Further work bearing on the digestion of soya milk in the animal system is in progress. It is hoped that this study will throw fresh light on the digestibility of other vegetable milks as well." Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1414. McWethy, John A. 1946. Soybean success: War boom continues as many plants expand, bring out new products. Examples: Meat flavor, wool-like fibre, bottle cap adhesive, soymilk cheese. St. Louis meeting draws 400. *Wall Street Journal.* Aug. 31. p. 1.
• ***Summary:*** This article is about the 3-day meeting of the American Soybean Association in St. Louis, Missouri. The soybean industry thrived during the depression, more than doubled in size during World War II, and is now continuing to grow. The A.E. Staley Manufacturing Co., America's largest soybean processor, has just started construction of a new $1 million plant that will turn soybeans into monosodium glutamate (MSG), making one million pounds a year. MSG has been previously made on a small scale in the USA from wheat, but Staley's plant will be the first to make it on a large scale from soybeans.

The Drackett Co. in Cincinnati is putting the finishing touches on a commercial plant that will make a wool-like fibre from soybeans. Robert A. Boyer, the firm's research director, said the new fibre will be used mostly for blending with rayon. He thinks it may sell for less than wool.

ADM, one of America's four largest soybean processors, earlier this year completed a plant to make a "whipping agent" from the versatile soybean; it can replace egg albumin, which is much more expensive.

Dr. Harry W. Miller, president of the International Nutrition Laboratory (Mt. Vernon, Ohio), "started making soybean products in Shanghai, China, in 1935. Bombed out in 1937 by the Nips [Nipponese = Japanese], he came to this country and began making similar products here in 1939. Now his firm does a $500,000 a year business and could do a lot more if sugar and other ingredients used with soybeans were available." His most popular items are [soy] milk, cutlets, and canned green soybeans. He says the milk tastes "rather like malted milk and is especially good for infants and others allergic to animal milk. His company has also developed a cheese made from soymilk, a prepared mix for ice cream from the soymilk, and "albumen sheets" [yuba], which are very popular in China.

These sheets aren't much thicker than a piece of paper and are used in China to make the layers of a loaf filled with mushrooms. The Chinese also use soybeans [yuba] to make products that taste like both fish and chicken. In American kitchens, an excellent substitute for butter can be made "by combining soya oil, soya milk," carotene oil for color, and salt.

One big American breakfast cereal maker is said to be planning to introduce a "soya flake cereal soon, similar in appearance to cornflakes. Another may soon market a puffed soyabean cereal, a third may introduce a cooked cereal made from soybeans, oats and wheat."

General Mills is building a factory for producing a synthetic resin from soybeans–a product developed at the Northern Regional Research Laboratory in Peoria, Illinois. Dr. G.E. Hilbert, NRRL's director, says this new resin shows "considerable promise as a protective coating and as a heat-sealing and moisture-proofing agent.

During the past few years, soybean processors have been switching to the solvent extraction systems, from the expeller system, for obtaining oil from soybeans. Most newer plants use hexane solvent. The advantage of the solvent system is that it removes all but about half of one percent of the oil, compared with 3½% to 5% left in the meal when expellers are used. The meal currently sells for 3 cents/lb compared with 11.75 cents/lb for the oil.

NRRL has recently developed a process that uses alcohol instead of hexane. This yields superior "soyflour." Before the war, production of soyflour was 25 million lb/year; this year it is expected to top 400 million lb. Roth Products Corp. of Chicago has already used 6 million pounds of soyflour this year in its dehydrated soups, baked goods,

pancake flour mixes, and sausage filler.

The soybean industry (especially the NRRL) is also working to make soybean oil more stable. It "has a tendency to develop a grassy or painty flavor on standing." A process obtained from Germany "goes a long way toward preventing the development of these objectionable flavors."

The Lincoln soybean variety, developed at the U.S. [Regional] Soybean Laboratory at Urbana, Illinois, and first made available to farmers during the war, is playing a major role in increasing yields. Today farmers in the corn belt are getting 25-30 bushels/acre with Lincoln, compared with only 15-16 bushels/acre in the early 1920s with varieties then available. Moreover, today's soybeans contain 20-21% oil compared with only 15-17% about 20-25 years ago.

1415. *Soybean Digest.* 1946. The culture of soya in France. Aug. p. 6, 16.

• ***Summary:*** "Information concerning the status of the soybean in France used in the accompanying article was kindly supplied to us by Am. Matagrin, formerly scientific librarian at Lyons and technical advisor to the National Soya Center. Mr. Matagrin is author of *La Culture du Soja* and other books." A portrait (illustration, line drawing) shows Matagrin, bearded and with monocle.

"Soy sprouts were furnished to the Parisian markets in 1875. In 1900 French physicians were prescribing soy bread for diabetics. Prior to the first world war a Chinese scientist [Li Yu-ying] was running a small factory near Paris which manufactured such soy foods as oil, flour, milk and cheese... During the first world war Am. Matagrin was collecting all the information he could find on soybeans in the English, French, German, Italian and Spanish languages. In 1936-38 he was growing a large number of varieties from different countries in Choutagne...

"But in spite of all the effort by enthusiasts there was little general interest in soybeans until France was defeated by Germany in 1940 and began to go hungry. Then an excessive interest in the crop developed. But most attempts to grow soys were ill advised and failed... Newspapers carried extravagant accounts of the returns that might be obtained from soya. People quickly bought out editions of books on soybeans by Matagrin and the author Rouest. (The puppet Vichy government prohibited reprinting of Matagrin's book, since it looked on him as a 'resistant.')

"The National Soya Center (C.N.S.) was founded by Jo Philippart, a big oil miller. The large mills of Chartres and soybean cooperatives at various places encouraged farmers to grow the crop. Many organizations distributed seeds. There was a surprising increase in garden plantings, or 'little cultures' as the French call them. Garden and horticultural societies distributed over 125,000 packets of soybean seed in 1943, while Matagrin personally gave away more than 200 kilograms of selected seed in small lots.

"A monthly magazine, *Revue Internationale du Soja*, began publication in 1941. It is still being issued. Thus the soybean became almost fashionable under German occupation. But growers were disappointed as in most cases returns were small... But one-fourth of the French people became acquainted with the soybean during the war–a great advance... In 1945 the total crop amounted to perhaps 5,700 tons.

"[Matagrin] asserts the French soybean will always cost too much to produce for technical uses, and will be grown preferably for fine food products. France is adapted to intensive rather than extensive production."

1416. Miller, Harry W. 1946. Feeding the world with soya. *Soybean Digest.* Sept. p. 56, 58, 61.

• ***Summary:*** Soybean production has extended so rapidly during the past decade "into many corners of the world, that encouraging a worldwide dependence on it nutritionally may not seem presumptuous."

For years the world has been facing acute nutritional shortages, with millions of people either starving or half-starving. Even in peace time millions showed signs of being undernourished or died of malnutrition "because of the lack of satisfying portions of protein. There is no more weakening and disease inviting situation than that observed among people robbed of essential protein. It is the first requisite of nutrition." Protein is essential for growth, tissue repair, fortification of the body against bacterial invasion, and the maintenance of all organs of the body in harmonious balance and action.

"Loss of protein in the diet cannot be supplanted by either oils or starches, no matter in what abundance they

may be found." "Well prepared soya foods" are an excellent source of protein in the diet. Soybean protein excels that of corn and wheat in both quantity and quality, and it is less expensive.

"Present prices of vegetable protein average about 40 cents a pound, oil 15 cents a pound, and starches or carbohydrates 5 cents a pound." These "figures give a nutritional value of $285 per acre for soybeans, while an acre of wheat will yield $132.75 and an acre of corn $201.25. Yet the yield of corn is almost double that of wheat or soybeans, so the premium crop for the farmer today is corn.

"Vegetable protein vs. animal protein: Vegetable protein (as from soybeans) is much less expensive than animal protein–such as meat, milk, or eggs. The reason for this becomes clear when we realize that animals live on feed consisting vegetable proteins." For example: "Taken on average, a cow will eat 800 pounds of food units in order to yield 100 pounds of nutritional units in the form of milk solids. To produce meat it requires between 1,100 and 1,200 pounds of feed to yield 100 pounds of tissue storage in the animal made available as food.

"I am going into these facts and figures somewhat to call attention to the economic losses in time of food scarcity in feeding the nutritious legumes and grains to livestock to get small nutritional returns."

"It is possible that these facts that I have given were in the mind of the Secretary of Agriculture when he issued a few months ago a request to the American people to send their wheat and corn to the starving people of other lands rather than feed them to pigs and cows and sheep of this country.

"Processed soya foods: In the third of the world's population not accustomed to soya foods there is a psychological prejudice to overcome. I am glad to say today it is solved.

"Many companies, recognizing the unpopularity of the word 'soya' worked on the plan of incorporating it into other foods, particularly soy flour used in various products in order to enrich and extend them. Defatted and whole soy flour has been incorporated with wheat flour by bakers and housewives into bread, biscuits, cookies, crackers and other bakery products such as cakes and pie crust. In 10 to 20 percent proportions, it has yielded improvement in quality and added to its nutritive value.

"One of the latest breakfast foods, which bids fair to become one of the most popular, is made by a 50-50 combination of soy flakes and corn grits run through a shredder and toasted. Its crisp and nutty flavor recommends it as an appetizer as well as a decided improved nutrient. This cereal has nearly 20 percent protein.

"Soy flour has become very successful in the manufacture of noodles. It has been used as an extender for bologna, hamburgers, sausage and incorporated in a very large number of recipes for meat loaves. In all these instances a little soya adds better flavor and higher nutritive yield. For all of these products the ordinary field variety of the soybean can be readily used.

"It also can be announced today that the newer methods of manufacture and the better understanding of the utilization of the soybean enable us to adopt many of the field varieties into the edible group. In fact, most of the types of soybeans that have the white hilum can be readily utilized for edible purposes. It is commonly believed that further experimentation will enable soybean food producers to take the ordinary varieties of soybeans and make tasty foods very similar to those now processed from the edible group.

"Other foods: We have a still much larger list of foods that today are made directly from the soybean. In these the soybean must stand on its own merits and it has proved acceptable to 90 percent of people sampling it. The large edible soys are now becoming available the world over. The canned mature beans, when properly processed and flavored by a suitable vegetable bullion or with tomato sauce, are very acceptable. It must be remembered that soybeans contain three times the quantity of protein and nine times the amount of oil found in either peas, lima beans, lentils or the ordinary navy bean." Continued. Address: M.D.

1417. Miller, Harry W. 1946. Feeding the world with soya (Continued–Document part II). *Soybean Digest.* Sept. p. 56, 58, 61.

• ***Summary:*** Continued. "The green edible soybean offers an additional line for canneries and freezing plants packing peas, lima beans, corn and other vegetables. It also offers another tasty item to the cook to adorn the dinner plate.

"Green soybeans can be canned with exactly the same equipment that all canneries have and can be shelled with the same sheller that is used for peas. The canning season is not in conflict with that of any other product unless it be sweet corn. The varieties can be planted so that they will not seriously interfere with this product. There is nothing we can put into the cans exported to other countries and for the areas of large population of our own country that will give people greater returns nutritionally than the immature green soybean. It has a nutty flavor and does not in any way harbor the beany taste that lingers in the minds of some people who think of soy foods.

"Canned sprouts: Canneries could develop a very fine winter industry by canning soybean sprouts. Or the frozen food people could very well add a package of frozen soy sprouts to their lines. These could very nicely come into our markets as a fresh vegetable along with Brussels sprouts, lettuce and other raw foods, to be incorporated into salads and cooked dishes. The sprouting of the soybean again removes the characteristic taste and gives a nice vitamin-yielding food, along with its rich content of minerals. Any good field variety may be used for sprouting.

"There is much to be learned from the Orient regarding

usages of soybeans in the diet, in the many forms in which they prepare them. They first make a water extraction of the protein, curdle it and make cheese [tofu]. With this bean they can make foods simulating milk, fish, fowl and meat in appearance and taste.

"Already, in this land hundreds of infants have been started from birth using modified soy milk. A very large group of others who are allergic to animal milk are substituting soy milk for the dairy milk. It is being made into varieties of delicious cheeses, and has possibilities in the cheese industry the equivalent of cow's milk curd. The lactic acid soy milk is the most pleasing beverage. The acidity of the milk covers wholly any semblance of the characteristic beany flavor.

"Albumen sheets: We now have albumen powder made from the soy extraction flakes utilized like egg powder by the big candy industry in ever increasing amounts. The soy albumen sheets [yuba], because of their labor and painstaking requirements, have not been made in this country as they are in China. However, we are finding ways of providing for their manufacture.

"A halt has been made on the production in Michigan of a competitive margarine called soy butter. Still, there is available to every housewife a method of making a butter with far less work than churning cow butter. Such a butter is made from soy oil and soy milk which is colored with carotene oil and salted to taste.

"Dry mature soybeans can be readily transported to any part of the world without requiring refrigerator space. They are a form of concentrated nutrition the world can easily be taught to use. Seventeen dollars worth of soybeans at 5 cents per pound will supply enough protein for a family of five for an entire year.

"In a paper such as this it would seem to be in place to give a few concrete suggestions on what might be done to help solve the world food shortage.

"1. Encourage more soybean production in America. This could be done if soybeans were given their proper economic value.

"2. Forward seed to various countries in the world, encouraging its production through helpful instructions in growing, processing and using. There are very limited areas where soybeans have proven entirely unsuccessful when given a fair trial.

"3. We should devote more time on experimental work in cooking and preparing the food and overcoming any objectionable features that seem to prevent its widespread use. The feeble efforts that have thus far been put forth have really done wonders in furthering the adoption of the soybean in the diet.

"In closing, allow me to say that with the present world yield of soybeans, if used exclusively to relieve human starvation, relief could come to all the destitute areas of the world." Address: M.D.

1418. Chick, Harriette; Slack, E.B. 1946. Malted foods for babies: Trials with young rats. *Lancet* ii(6426):601-03. Oct. 26. [7 ref]
• ***Summary:*** "A malted food for infants to provide a supplement or substitute for milk, when this is very scarce, was [developed] by Dr. G. Caprino in the laboratories of Peroni's brewery in Rome and was called by him 'Maltavena.'" Two types of Maltavena preparations were supplied to the European Regional Office of UNRRA. One contained (on a solids basis) about 80% malt extract, 10% wheat flour (80% extraction of the grain), and 10% skimmed-milk powder. The other contained 10% soya flour in place of the milk powder. "Both the wheat flour and the soya flour had also been subjected to digestion with the enzymes of malt extract for a short time." These and closely related products were tested on growing rats as sources of proteins and B vitamins. It was found that a formula containing 70% malt extract, 10% wheat flour, 10% soya flour, and 10% skimmed-milk powder was the best, being equal in growth promoting value to a mixture of proteins in milk when fed in a diet of equal protein content.

Note: The Lister Institute of Preventive Medicine was established in 1891 to support biomedical research. As of 1994 it was located at Brockley Hill, Stanmore, Middlesex, England. Address: Lister Inst. of Preventive Medicine, London, England.

• ***Summary:*** In adult human subjects, the average percentage utilization of the calcium in evaporated cow's milk (Whitehouse brand) was found to be 29.1%, in calcium (the pure chemical compound) 23.7%, in soybean "milk" [actually soy-based infant formula] (Mull-soy, provided by the Borden Co.) 22.6%, and in whole cooked soybeans 10.4%. Address: Dep. of Physiological Chemistry, Wayne University College of Medicine, Detroit, Michigan.

1421. Childs, Margaret M.; Additon, E.G.; Ehlers, M.S. 1946. Soybeans and soy products in quantity cookery. *Michigan Agricultural Experiment Station, Circular Bulletin* No. 204. 56 p. Nov. Summarized in Soybean Digest, Dec. 1946. p. 22-23.
• ***Summary:*** Contents: The versatile soybean. Food value of the soybean and its products. Experimental work: Use

of soybean as a vegetable (green soybeans [fresh], dry soybeans), use of soy flour, use of soy grits, use of soy sprouts (method and directions for sprouting soybeans at home or commercially, suggested containers for sprouting soybeans, directions for sprouting), use of soy butter (in making cakes), soybean vegetable milk. Availability of soybean products (reprint from USDA sources, as published in the *National Restaurant Newsletter* for 9 Sept. 1943–by state). Literature cited. Appendix: Recipes for soybean and soy products (36 pages, p. 20-56).

Concerning "soy butter" (p. 13-15), this is probably soy margarine. In this study, soy butter was used only in making cakes, not as a spread for bread. It was used in place of shortening in a standard Gold Cake. Address: Michigan State College, Agric. Exp. Station, Section of Home Economics, East Lansing, Michigan.

1422. Stahel, Gerold. 1946. Foods from fermented soybeans as prepared in the Netherlands Indies. I. Taohoo, a cheese-like substance, and some other products. *J. of the New York Botanical Garden* 47(563):261-67. Nov.

• ***Summary:*** Contents: Introduction. Sprouts and milk from soybeans. Cheese-like products. How taohoo is made. Condiments made with Aspergillus.

In East Asia–as in Surinam–people have developed "means for overcoming the rather bitter taste of soybeans and their failure to cook soft. They have learned to ferment the soybeans with quick-growing fungi, thus making several palatable and wholesome foods.

"Most important of these foods are *taohoo* and *tempe;* also *taokoan,* a cheese made from *taohoo; taotjo,* a fermented paste-like condiment, and *ketjap,* which is soy sauce. Soybean milk is also made, but without a fungus, and sprouted soybeans are widely used by orientals."

"In the Netherlands East Indies [later Indonesia] sprouted soybeans are called *tokolán* or *taogé.* They are one of the ingredients of every 'rijst-tafel' (rice table, or combination of dishes) and therefore are never lacking in the 'passar' (market). Even in our Paramaribo market *tokolán* is displayed every day."

In China, soy milk is used in the same manner as cow's milk. It is also consumed in the United States, though on a very limited scale. In the Netherlands East Indies, soy milk "is only slightly known as food, but it is produced in large quantities for the manufacturing of soy cheese, called *taohoo* or *tahoo."*

The curd [tofu] "is either eaten fresh or baked in oil or lard. In China it is sometimes processed further into a kind of real cheese by impregnating the curd with turmeric and reducing the water content by heavier pressing. This cheese, called *taokoan* [Chinese: doufugan], has a yellow color and can be shipped abroad."

"After tempe [made with *Rhizopus Oryzae*], taohoo is the most common form of soybean product eaten in the Netherlands East Indies. In China, it is the most important soy product. Taohoo is manufactured here in Surinam only on a very limited scale, by a single Chinese store-keeper close to the Paramaribo market-halls along the Surinam river. Twice daily, between 2 and 4 o'clock in the morning and again in the afternoon, he manufactures 11½ kilograms of taohoo, to be sold after 6 o'clock the next morning." A detailed eyewitness description of the tofu-making process is then given.

Describes briefly how to make taotjo (a kind of paste) and ketjap (soy sauce) with *Aspergillus oryzae,* another fungus. Taotjo is not made in Surinam, but ketjap is. "To make taotjo, boiled soybeans are mixed with roasted meal of wheat or glutinous rice. The mass is wrapped in hibiscus leaves, which commonly harbor the *Aspergillus* fungus." After 2-3 days the moldy mass is immersed in brine, where it is kept for several weeks. "Palm sugar is added at intervals. Taotjo must be made in the dry season, because every day it has to be brought outside into the sun and air for hours." This dish is eaten in East Asia with the 'rijst-tafel.'"

To make ketjap, soybean are boiled, cooled, then wrapped in hibiscus leaves–but without mixing in roasted meal. After fermenting for 2-3 days, the mass is immersed in brine, as with taotjo. Each day, for one to several months, it is exposed to the sun. A little palm sugar is added at intervals. Then the fluid is filtered off and the solid residue is cooked several times with fresh water to extract all the soluble material. "The fluid is then concentrated by slow boiling. Spices and other piquant materials are added, according to the *specialité de la maison.* These may include galangal, ginger, cloves, Jew's ear fungus, and dried and ground fish and chicken meat."

Photos show: (1) Chinese kitchen [shop] equipped with implements for tahoo manufacture, with hand-turned millstones, soybean mash flowing into cheesecloth bag hanging in wooden barrel, press, earthenware pot filled with brine for the "coagulation of the curd." (2) Four pieces of fresh taohoo, four-fifths natural size. (2) Four pieces of freshly baked taohoo, four-fifths natural size.

Note: This is the earliest English-language document seen (April 2013) that uses the word "taohoo" or "taokoan" to refer to tofu. Address: Agric. Exp. Station, Paramaribo, Surinam.

1423. A.P.I. [Associated Press of India]. 1946. Food research centre to be opened in Bangalore. *Times of India* (*The*) (*Bombay*). Dec. 27. p. 8.

• ***Summary:*** The Government of India is said to be planning a food research unit to be attached to the bio-chemical laboratories of the Indian Institute of Science, Bangalore. The new unit will focus on solving practical food problems.

"The Central Food Department has studied the potential possibilities of soya bean milk and related products as supplements to the present limited supply of milk and milk

products and has decided...” to conduct more feeding trials at additional centres similar to the Indian Institute of Science.

Moreover the Government have decided to provide more funds for research on the manufacture of large scale well processed and balanced soya milk.

1424. Norton, C.L.; Eaton, H.D. 1946. Dry calf starters for dairy calves. *New York* (*Cornell*) *Agricultural Experiment Station, Bulletin* No. 835. 32 p. Dec. [7 ref]*
• ***Summary:*** Satisfactory results with calf starters containing 16-18% of a processed soybean oil meal were reported. They fed 350 lb. of whole milk per calf. Soy is mentioned on pages 21, 23, and 24. Address: Ithaca, New York.

1425. *Soybean Digest.* 1946. Soy products in quantity cookery: For hotels, restaurants. Dec. p. 22-23.
• ***Summary:*** This is a summary of *Michigan Agricultural Experiment Station, Circular Bulletin* No. 204 titled “Soybeans and Soy Products in Quantity Cookery,” by Margaret M. Childs, E.G. Additon, and M.S. Ehlers. (Nov. 1946, 56 p.). Contains a recipe for Meat Loaf (with 2 lb soy grits and 2½ lb each ground beef and ground pork). A photo (courtesy of A.E. Staley Mfg. Co.) shows the meat loaf.

1426. *Soybean Digest.* 1946. Grits and flakes... from the world of soy: Clifton’s Cafeterias, Los Angeles... Dec. p. 30.
• ***Summary:*** “... plans to offer its patrons a drink which is 95 percent whole milk, 5 percent soya milk, with vitamin C enrichment, to be called ‘Mil C.’ Clifton’s objects, however, to labeling the product ‘imitation milk’ as required by California’s law.”

1427. **Product Name:** [Maltavena].
Foreign Name: Maltavena.
Manufacturer’s Name: Peroni’s Brewery.
Manufacturer’s Address: Rome, Italy.
Date of Introduction: 1946.
Ingredients: Water, malted oats, malted soybeans.
New Product–Documentation: Chick and Slack. 1946. Lancet. 251:601-03. Oct. 26. “Malted foods for babies: Trials with young rats.” “A malted food for infants to provide a supplement or substitute for milk, when this is very scarce, was [developed] by Dr. G. Caprino in the laboratories of Peroni’s brewery in Rome and was called by him ‘Maltavena.’” Two types of Maltavena preparations were supplied to the European Regional Office of UNRRA. One contained (on a solids basis) about 80% malt extract, 10% wheat flour (80% extraction of the grain), and 10% skimmed-milk powder. The other contained 10% soya flour in place of the milk powder. “Both the wheat flour and the soya flour had also been subjected to digestion with the enzymes of malt extract for a short time.”

L. Nicholls. 1950. Food Manufacture. March. p. 96-97. “Considerable work has been done in war-devastated Italy and Germany to find a milk substitute for infants and children. One such substitute, called *Maltavena*, was produced early in 1945 by Dr. Caprina, chemist to the Peroni brewery, Rome. It consisted of an emulsion prepared from a cereal [probably barley] which had been malted in the usual manner of brewers; later malted soya bean was included as well as the cereal.”

Note: This is the earliest known commercial soy product made in Italy.

1428. Desikachar, H.S.R.; De, S.S.; Subrahmanyan, V. 1946. Studies on the nutritive value of soya milk. I. Nutritive value of the protein. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 6(2):49-56. [12 ref]
• ***Summary:*** Biological value of soymilk proteins is about 90% that of cow’s milk proteins. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1429. Desikachar, H.S.R.; De, S.S.; Subrahmanyan, V. 1946. Studies on the nutritive value of soya milk. II. Comparison of the vitamin B complex content of soya milk and cow’s milk. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 6(2):57-60. [4 ref]
Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1430. Desikachar, H.S.R.; De, S.S.; Subrahmanyan, V. 1946. Studies on the nutritive value of soya-bean milk. III. Supplementing value of soya milk to a poor Indian diet. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 6(2):61-64. [8 ref]
• ***Summary:*** The authors studied the supplementary value of soya-bean milk (without addition of extra calcium) to a poor South Indian diet consisting mainly of rice. Soya-bean milk or cow’s milk was fed to the rats at a level of 10 ml per day along with the basal diet. The average weekly increase in weight of the rats was followed over a period of 7 weeks. The results showed that on a basal rice diet, the average weekly increase in weight was 2.8 gm. When 10 ml of soya-bean milk was added to the basal diet, the average weekly increase in weight climbed to 5.4 gm, and when 10 ml of cow’s milk was added instead of soy milk, the average weekly increase climbed to 8.2 gm. Thus, a small amount of soya-bean milk given as a supplement practically doubled the growth rate. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1431. El Salvador Ministerio de Agricultura. 1946. La soya [Soya]. San Salvador. 89 p. [Spa]
• ***Summary:*** The two Latin American countries in which soybean cultivation has acquired importance are Argentina and Brazil. In Argentina, cultivation began in 1908. In 1940 Argentina produced 15 tonnes of soybeans on 300 hectares, increasing in 1941 to 204 tonnes on 5,000 hectares. Rio

Grande do Sul in Brazil exported 6,420 kg of soybeans in 1937, rising to 40,000 kg in 1939. Address: El Salvador.

1432. Esat-Kadaster, Isfendiyar; Kansu, Sedat. 1946. Cigit ile Pamuktohumukuspesinin yemkarakterleri [The nutritive value of soybeans]. *Ankara Yuksek Ziraat Enstitusu Dergisi* (*Turkey*) 6:61-112. (Chem. Abst. 1947, 41:1049). Summarized in Revue Internationale du Soja 9(51):41 (1949). [38 ref. Tur]
• ***Summary:*** At the Agricultural Institute of Ankara, in the course of a series of investigations which also pertain to the nutritional value of gourds and squash, beetroots, cottonseeds, peanut milk etc., soya was also studied. It was fed to flocks of poultry, mixed with dried clover. An analysis of the dry beans shows that they contained: protein 36.71%, fats 14.9%, cellulose 4.32%, non-nitrogen extract 25.07%; the starch equivalent approached 100%. Because of the high digestibility of their protein (34.94%), soybeans were declared superior, for raising livestock, to the other legumes produced in Turkey.

Note: This seems to imply that soybeans were being grown in Turkey at the time, but we cannot be sure. Address: 1. Prof. Dr. Ziraîkimya Professor; 2. Doc. Dr., Ziraîkimya Doçenti. Both: Turkey.

1433. Hauser, Gayelord. 1946. The Gayelord Hauser cook book: Good food, good health, good looks. New York, NY: Coward-McCann, Inc. viii + 312 p. Illust. 21 cm.
• ***Summary:*** This is a health food (but not a vegetarian) cookbook; it uses meats, poultry, and fish. Soy-related recipes include: Soya tomato soup (with soya flour, p. 48). Soya soup (with soya flour and soy sauce, p. 49). Soya cheese sticks (with soya grits, p. 111). Roasted soybeans (p. 115; p. 114 notes that the soybean is a first-class protein food). Cranberry soya pudding (p. with soya flour, p. 154). Caramel soya custard (with soya milk, p. 163). Rice pudding (with soya milk, p. 164). Soya ice cream (with soya milk and agar-agar, p. 167).

In the chapter on baked goods, p. 179 shows that soya flour is rich in protein, vitamin B-1, riboflavin, and niacin. And pages 180-81 give a detailed discussion of the benefits of soya flour and how to use it. Page 182 discusses gluten flour. Recipes include: Whole-wheat soya bread (p. 183). Soya nut waffles (p. 186). Soya muffins (p. 188). Steamed soya bread (p. 189). Four nutritious sandwich spreads with ½ cup soya flour (p. 191). Delicious soya cake (p. 193-94). Quick service cake (p. 195-96). Soya-flour pie crust (p. 197). Soya cookies (p. 204). Soya sand tarts (p. 206).

Fletcherizer (p. 221, a type of electric blender). Fletcherized drinks: Cream of soya milk (with soya flour, p. 222), vege-nut milk (with soya flour), almond-, pecan-, walnut-, filbert-, or cashew milk. Cream of soybean soup (p. 224).

In the chapter titled "Yogurt, brewer's yeast, and other special foods" is a long section on soybeans and gluten (p. 237-42) including basic information on soybean oil, soya flour and grits, soy flakes, soy meats (split or coarsely ground soybeans), soybeans as a vegetable [fresh-green soybeans], soybean milk, and soybean curd or tofu. Instructions are given for making soybean sprouts at home. Recipes include: Boiled soybean sprouts. Fried soybean sprouts. Green soybeans. Baked soybeans. Soybean milk. Soybean parsley croquettes. Soybean nut croquettes. Vanilla soya ice cream. Homemade gluten dough. Gluten steaks or chops. Address: Beverly Hills, California.

1434. Krishnaswamy, N.; De, S.S.; Subrahmanyan, V. 1946. Studies on the nutritive value of soya milk. IV. Digestibility of soya milk–"in vitro" experiments. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 6(2):65-68. [5 ref] Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1435. *Soya Francais* (*Le*)*: Bulletin Mensuel du Bureau Francais du Soya.* 1946?. L'aliment le plus économique du monde: Comment manger le soya [The most economical food in the world: How to eat soya]. Special number. 34 p. Undated. [Fre]
• ***Summary:*** Includes a remarkable assortment of ads and descriptions of commercial soyfoods, plus many recipes. Address: Bureau Français du Soya, 15 rue Cauchois, Paris 18eme; Societe Francaise des Produits du Soja, 6 rue Cave–Levallois-Peret. France. Phone: Pereire 23-80.

1436. Chin, Kuo-Chun. 1947. Nature du lait végétal de Soja et précautions à prendre dans son emploi [The nature of soymilk and precautions to take when using it]. *Comptes Rendus des Seances de l'Academie des Sciences* (*Paris*) 224(4):288-90. Jan. 27. [2 ref. Fre]
• ***Summary:*** Soymilk was prepared by the Chinese philosopher Whai-Nan-Tze well before the Christian era. Its production was described by Champion (1885), Li Yu-Ying (1905), Miller (1941), Mildred Lager (1946), and others. Starting in 1888 many authors (Balland, Cazalis, Dujardin-Beaumetz, Graux, Labbé, Lecerf, Maurel) and other partisans of vegetarianism, right up until the present (1930-46, Dr. Dresses, Donela, and Yen 1933) have recommended the use of soy flour or milk in infant feeding (*dans l'alimentation des nourrissons*).

Tables show: (1) A nutritional analysis of soymilk conducted by the Municipal Laboratory of Paris (*le Laboratoire Municipal de Paris*). (2) A nutritional analysis of cow's milk. (3) A nutritional analysis of soymilk conducted by Prinsen (1896). (4) Two nutritional analyses of soymilk conducted by Li Yu-Ying in the factory *caseo-sojaine.*

Conclusion: It appears that the chemical composition of soymilk varies considerably.

1437. Stoesser, Albert V. 1947. Influence of soybean products on the iodine number of the plasma lipids and the course of eczema. *J. of Allergy* 18(1):29-31. Jan. [10 ref]
• ***Summary:*** "The present study deals with changes in iodine numbers of the total fatty acids of the plasma lipids in milk-sensitive infants who were fed daily 900 to 1,200 gm of a soybean food [Mull-soy], which contained 4 per cent soybean oil with an iodine absorption value ranging from 119 to 135. Seventeen patients from 3 to 14 months of age were chosen, and divided into two groups. Eleven were acutely ill with erythema and papules, oozing and crusting confined chiefly to the cheeks, but spreading to the forehead and scalp or ears and neck. Six had less of the exudative characteristics, there being redness, thickening, induration, and scaliness of the skin, with marked itching and a tendency to spread to the trunk and extremities.

"The infants with the more severe skin changes had iodine numbers averaging 71, which is much below normal. However, after three or more weeks of ingestion of the soybean milk, the values rose until an average of 118 was reached which is within the normal range. This situation was associated with a favorable response to external therapy.

"The other group of children with moderate but widespread skin manifestations had little change in the iodine numbers... The results reveal that there is some correlation between the level of the unsaturated fatty acids of the plasma lipids and the type and course of infantile eczema." Address: Minneapolis, Minnesota.

1438. *Soybean Blue Book.* 1947-1966. Serial/periodical. Hudson, Iowa: American Soybean Assoc. Annual. Titled Soybean Blue Book from 1947-1966; Soybean Digest Blue Book from 1967-1979; Soya Bluebook from 1980 to present.
• ***Summary:*** A directory and information book for the soybean production and processing industries–but with much greater emphasis on processing and utilization. One of the most valuable sources of worldwide information on soybeans. During the period from 1947 to the 1960s, the Blue Book was usually published in March or April of each year.

In the 1966 Blue Book (p. 28-29) are two full-page tables titled "World Soybean Production." The first gives acreage in 1,000 acres, yield in bushels per acre, and production in 1,000 bushels. The second gives hectarage, yield in kilograms per hectare, and production in 1,000 metric tons. Figures are given for: 1950-54 (average), 1955-59 (average), 1963, 1964, and 1965. Statistics are given for the following countries: North America: Canada, United States. South America: Argentina, Brazil, Colombia, Paraguay. Europe: Italy, Rumania, Yugoslavia, Other Europe (excluding USSR). USSR (in Europe and Asia). Africa: Nigeria, Rhodesia, Tanzania. Asia: Turkey, China (Mainland), Cambodia, China (Taiwan), Indonesia, Japan, Korea (South), Thailand. Estimated world total. Address: Hudson, Iowa.

1439. *Soybean Blue Book.* 1947. Manufacturers and handlers of soy foods. p. 69-73.
• ***Summary:*** Arranged alphabetically by product category: Beverages; Breakfast Foods; Soy Butter (probably like margarine; the only source is Daglish Health Foods in Santa Cruz, California); Canned Green Soybeans (Note: These are probably canned mature green vegetable type soybeans. In the 1948 Bluebook this section is titled "Canners of Green Vegetable Soybeans." List compiled from 1947 edition of *Canners' Directory,* published by the National Canners Association); Coffee Substitutes; Cookies, Crackers, Toasts and Wafers; Soybeans for Cooking and Sprouting; Soy Flour, Flakes and Grits; Soy Flour Mixes; Soy Food Consultant (Donald S. Payne); Health Food Stores, Supply Houses; Lecithin; Macaroni, Spaghetti, Noodles; Meat Substitutes; Soy Milk; Sprouts; Roasted Soybeans or Nuts; Sausage Binders; Salad and Cooking Oils, Shortening; Soy Sauce; Toppings [Whip]; Whipping Agents.

1440. *Soybean Blue Book.* 1947. Uses of soybeans. p. 97.
• ***Summary:*** This is a full-page diagram with four columns. In the left column are: Forage, green manure, and pasture. Meal. Oil. Green bean. Dried bean.

In the second column, for example: After green bean, listed vertically, are: Canned, frosted, green vegetable, salad. After dried bean, listed vertically, are: Baked, boiled, breakfast foods, feeds, flour, roasted, soy sauce, sprouts, vegetable milk.

In the third column: After feeds, listed vertically, are: Cattle, hogs, poultry, sheep. After roasted are: Candied, coffee substitute, salted.

In the fourth column after flour (with a dotted line crossing the second and third columns), listed vertically, are: Baked products, breakfast foods, candies, chocolate, diabetic foods, health drink, ice-cream cones, ice-cream powder, infant foods, macaroni products, meat products (filler). Note: There are too many uses on the diagram to describe them all here.

1441. Lo, K.S. 1947. Soy milk in China. *Soybean Digest.* April. p. 8, 10.
• ***Summary:*** "To the editor: It may be of interest for you to know that I am the founder of Hong Kong Soybean Products Co. Ltd., which engages in the production of fresh soybean milk for local distribution. It was established in 1940 and just before the outbreak of the Pacific war [Dec. 1941], our 'Sunspot Soya Milk' had daily sales of 13,000 to 15,000 one-half pint bottles of milk. The company was forced to close down during the occupation but started again last summer [1946].

"The main object of our company has been the turning out of highly nutritious soybean foods at the lowest cost

for the benefit of the majority of the working class who otherwise are barred from obtaining cow's milk and milk products due to their high cost. A half-pint bottle of fresh cow's milk costs 50 cents, whereas our soybean milk is sold for only 20 cents per half-pint.

"We find the school children and the working class are our best customers, although we also care for the needs of the hospitals. We are still supplying a very substantial quantity of our milk to Queen Mary Hospital, which is the largest government in Hong Kong... We were experimenting in the making of the condensed soybean milk when the war intervened. We propose to continue with this experiment as soon as circumstances permit and the required equipment can be brought over from the United States.

"If there are firms who are interested in setting up plants in China for the manufacture of soy milk powder, and condensed and evaporated soybean milk in tins, we are most willing to cooperate.

"There are immense opportunities for such an industry as soybean food products in China which is the home of the soybean and where the major part of the population is too poor to have access to cow's milk and its products. A double opportunity awaits those who wish to render a real service to mankind and make a business for themselves."

Note 1. This is the earliest publication seen on the Hong Kong Soya Bean Products Co., Ltd. and Vitasoy. The author has apparently established a new company in anticipation of doing business in China.

Note: This is the earliest document seen (Aug. 2013) that contains industry or market statistics for soymilk by individual companies. Address: China International Commercial Co., Ltd., Hong Kong.

1442. *Revue Horticole: Journal d'Horticulture Pratique* (*Paris*). 1947. Le grand congrès du soya à Paris [The great soya congress in Paris]. 119(2140):277-78. April. [Fre]
• ***Summary:*** On Monday, March 16, 1947, at 2:30 p.m., at the City University, the first Grand Soya Congress ever held in Europe took place. It was organized by the French Bureau of Soya (*Bureau Français du Soya*), the Laboratory of Soya Experiments (*Laboratoire d'Essais du Soya*), and the France-China Association (*l'Association France-Chin*). Mr. Marius Moutet, the Minister of French Colonies and Territories (*Ministre de la France d'Outre-Mer*) presided. The two presidents were Prof. Blaringhem, president of the Academy of Sciences, and his excellency the Chinese Ambassador to France.

It was indeed a brilliant assembly of numerous scientific and agronomic personalities, including Mr. Lévèque, delegate from the Belgian Soy Group (*Groupement Belge du Soya*).

Includes a brief summary of the presentations by the following people: René Brochon, president of the French Bureau of Soya (*Bureau Français du Soya*). Mr. Schad, director of the Agronomic Research of Clermont-Ferrand (*la Station de Recherches Agronomiques de Clermont-Ferrand*). Mr. Simonet, Director of Scientific Research for Vilmorin (*Etablissements Vilmorin*), who discussed the varieties he had developed at the Center for Agronomic Research of Antibes (in southeastern France). Mr. Salaberry, an agronomic engineer. Mr. Blanchard, head of works at the Station for Seed Trials at the Ministry of Agriculture. Mr. Chouard, Prof. of Agriculture at National Conservatory of the Arts and Crafts. Messrs Brochon and Matagrin discussed the nutritional value of soy.

Mr. Chin Kuo Chun, director of the Laboratory of Soya Experiments (*Laboratoire d'Essais du Soya*), discussed the results of his work on manufacturing soymilk, tofu, and soy sauce in France, using traditional Chinese processes. Prof. Gounelle, Director of the Foch Hospital gave a brilliant discussion on the use of soy flour to combat nutritional edema and diabetes. Mr. Boutroux showed brilliantly that soymilk can successfully replace cow's milk in the feeding of defective babies.

Mr. Siao Yu, former Chinese Minister of Agriculture, recounted how Mr. Li Yu Ying, presently vice-chancellor (*recteur*) of the University of Peking, established in 1908, near Paris, a soyfoods factory; it made soymilk, tofu, cakes, etc. He saluted with emotion the members of this first Soy Congress to be held in Europe.

Mr. Villars, director of a cooperative for the production of soybean seeds. Mr. Matagrin, technical consultant to the French Bureau of Soya. Mr. Vançon, president of the Family Association of the Gardens of the north of France (*du Nord de la France*).

The Congress was closed by three excellent speeches by conference leaders Blaringhem, Bineau, and the Chinese Ambassador.

A reception in honor of China, cradle of the soybean, was then held and a buffet was served consisting of soy pastry and cakes, soy chocolates, and soymilk.

1443. *Revue Internationale du Soja.* 1947. Congrès du Soja [Soy Congress (Europe's first, held in Paris, March 16, at the City University)]. 7(37-38):30-31. March/April. [Fre]
• ***Summary:*** Li Yu-ying (President of the National Peiping Research Academy) was there, along with a luminous throng of the greatest soy devotees in France, including: M. Brochon (President du Bureau Français du Soja), M. Simonet (director of scientific research at Etablissements Vilmorin), M. Blanchard (chef de travaux à la Station d'Essais de Semences of the Ministry of Agriculture), and M. Chouard.

Mr. Chin Kuo Chun (director of the laboratoire d'Essais du Soja) discussed the results of his work on the production in France of soymilk, tofu, and soy sauce using the traditional Chinese processes, and of projects to organize family gatherings to taste these products. Prof. Gounelle (director of the Foch Hospital) showed how soy flour can

be extremely beneficial in curing edema and malnutrition, and is perfectly suited for diabetics. Mr. Boutroux showed brilliantly that soymilk (*lait de soja*) is beneficial in replacing cow's milk in the diets of undernourished babies, and spoke of the industries presently producing soy products (*produits au soja*) in France. Note: This is the earliest English-language document seen (Nov. 2002) that uses the word "undernourished."

Mr. Siao YU, former Minister of Agriculture in China, recalled how Li YU Ying created in 1908 near Paris a factory for food products from soya: milk, cheese (tofu), cakes, etc. He saluted with emotion the First Soy Congress to be held in Europe. Address: Paris, France.

1444. Tsien, Tai. 1947. Allocution [Concluding remarks]. *Revue Internationale du Soja* 7(37-38):34-35. March/April. [Fre]

• ***Summary:*** It is an honor and a great pleasure for me to say a few words at the end of your soya congress, which has been honored by the presence of the French Foreign Minister (M. le Ministre de la France d'Outre-Mer), Mr. Marius Moutet; and by my compatriot, Prof. Li Yu Ying, president of the Academia Sinica.

I would like to thank the *Bureau Français du Soja*, the *Laboratoire d'Essais du Soja*, as well as the *Association France-Chine* for having organized this interesting congress. At this congress we have learned about soymilk, pressed tofu, fermented tofu, soy sprouts, and the use of soy flour in French pastries and cakes. Address: Prof.

1445. Kerle, W.D. 1947. Soybeans. *Agricultural Gazette of New South Wales* 58(5):227-31. May 1; 58(6):295-98. June 1. Summarized in Soybean Digest, Nov. 1947, p. 34.

• ***Summary:*** Contents: Introduction. World distribution. Experience in New South Wales. Soil and climatic requirements. Soil preparation. Time and methods of sowing. Fertilisers. Inoculation of seed. Varieties. After cultivation. Rotation. Harvesting. Storage. Yields. Insect pests and diseases. Uses of soybeans (soybean oil for food and industrial purposes, soybean meal for livestock feed, soybean plastics and wool, soybean flour, green vegetable soybeans, soybean milk, sprouts, mature soybeans). Economic aspect of soybean growing.

Experience with soybeans in New South Wales extends over the past 30 years [i.e., since about 1917]. Hundreds of varieties have been imported from East Asia, the USA, and other countries, and field experiments have been conducted in all districts of the State. Numerous trials have been conducted at Hawkesbury Agricultural and Experiment Farms with varieties, cultural practices, fertilisers, seed inoculation, etc. Several soybean varieties are now recommended and the Northern Tablelands have been shown to be the district best suited to seed production, yet the yields there (averaging 7 bushels/acre over a ten year period) have not been sufficient to recommend soybeans as a commercial crop. Yields of over 20 bushels/acre, however, have been obtained in variety trials. The best variety is Potchefstroom 169, originally from South Africa. Other good varieties available in NSW include Easy Cook [Easycook], Haberlandt, Otootan, Lincoln, Dunfield, and Richland.

Before World War II, soybeans were imported from China and the Netherlands East Indies for about 6 shillings per bushel. During the war the price for soybeans (whose production was very small) was as high as 42 shillings per bushel, and contracts were let at 25 shillings by the Commonwealth Government in 1942-43. Of all the states of Australia and New Zealand, Queensland now seems to show the best promise of success in growing soybeans.

In 1924 in the USA only about 6% of soybean production was crushed for oil, but in 1940 this figure rose to 83%.

Photos show: (1) Farmer standing in a field of high soybeans on the North Coast. (2) A field of soybeans in the early stages of growth. (3) Soybean roots showing well-developed nodules. (4) Mature plant of Potchefstroom 169. (5) A man examining Easy Cook [Easycook] soybeans growing in a field. (6) Soybeans "cocked" after harvesting with reaper and binder. (7) Soybeans being grown as a green manure crop between tung oil trees. Address: Special Agronomist, New South Wales.

1446. Brillmayer, Franz A. 1947. Geschichte der Einfuehrung der Soja in Frankreich [History of the introduction of the soybean to France (Document part)]. In: F.A. Brillmayer. 1947. Die Kultur der Soja in Oesterreich. Vienna: Scholle-Verlag. 97 p. See p. 20-23. [Ger]

• ***Summary:*** The first soybeans in France were grown at the *Jardin des Plantes* in Paris in 1779, and served mainly scientific interest. In 1857-58 the National Society for Acclimatization did culture trials in Vitry sur Seine and got good results. The seeds were planted May 10-12, they set flowers July 25, were harvested at the end of October, and yielded an average of 183 seeds per plant.

In 1859 the House of Vilmorin-Andrieux had a bad harvest with late varieties from China.

After the 1873 Vienna Exposition, the work of Prof. Haberlandt and his writings had their effects in France.

From 1874 to 1880 the Society of Horticulture of Etampes (Etampes, Seine et Oise) had great success with a yellow soybean variety from China; its properties and chemical composition were thoroughly studied by Lechartier. A doctor from the surrounding area made plant cheese (*Pflanzenkäse*) from soybeans. Yet is spite of all this, the harvest found no buyers.

In 1880 the Vilmorin catalog offered the Haberlandt variety, which had been acclimatized in Austria. The Society for Acclimatization now organized cultural trials all over France and the results were excellent. The soybean was

described in many publications and its value set forth. Yet, in spite of all this, its value was forgotten and disappeared. Note: The author implies a long period of no interest; but the interest only diminished.

Then the soybean was introduced as a new vegetable, praised above all for its high nutritional value, without investigating how (practically) it could be introduced into the diet. However if the soybean (*die Sojafrucht*) is cooked like other beans, it remains hard and does not taste so good. Today we know that there is a bitter principle in a thin layer just under the seed coat and that this adversely affects the soybean's flavor. Moreover, there was no need for a new foodstuff, for the French colonies provided everything by way of food and shelter. The brief burst of enthusiasm petered out, and again soybeans came to be forgotten. Thereafter it was medical doctors and scientists who concerned themselves with the soybean–not the farmers.

In 1919 Prof. R. Lepine published the results of interesting research in Algeria, and investigations of soymilk. In the environs of Paris, Dr. Le Goff attempted, with the Japanese soybean variety Tokyo Black, to grow large areas for use in canned foods for diabetics.

These attempts and efforts persuaded Mr. Rouest to continue his selection research with soybeans, which he had begun in 1907, but it was not until 1925 that he was satisfied with the results. At that time he described 42 varieties (out of a total of 2,000). Rouest attempted to interest the French government and other existing places, but he had no success. In 1929 the Soviet government proposed that Rouest continue his soybean research in the USE and at the end of 1930 he left France with his family to settle down in Rostow [Rostov] on the Don [in southwestern Russia, just 46 km / 21 miles northeast of the Sea of Azov]. Here he began with an area of 1 hectare, where he observed the 200 soybean varieties he brought with him. His successes were very satisfying. Then, because of practical considerations, his work was moved [about 250 kilometers (150 mi) southward] to Krasnodar [a city in Southern Russia on the Kuban River in the North Caucasus, located around 80 kilometers (50 mi) north-east of the Black Sea port of Novorossiysk].

In France, Rouest had attempted to find an early soybean variety that gave a good yield; therefore the majority of his varieties were short, and since the yield is directly correlated with the length of the growing season, his yields were somewhat low. The Soviets wanted an early variety which grew with a minimum of hand labor, could be harvested by machines, and gave a high yield. Rouest was not able to achieve this goal, so in 1936 he returned to France, where he died in 1938. His son, who returned to France from military service in the French colonies several years ago, would like to continue his father's work where his father stopped.

So far as I know, Rouest's varieties are the only ones available in France which have been significantly improved by breeding. The following varieties, developed by Rouest, have been grown and observed in my breeding nursery (*Zuchtgarten*)*:* Grignon No. 37, No. 34, No. 39, No. 1, No. 10, No. 5, No. 82, No. 45. Rouest No. 9, No. 346, No. 250.

There was little interest in the soybean in France before World War II, but during the German occupation [which started in June 1940] 17 new associations that were active with soybeans appeared in France, largely because of the lack of food. Many were simply interested in buying soybeans abroad and selling them in France.

At an earlier time, the following worked with soybean breeding: Abbé Souillet in Anjou [a province in north western France centered on the city of Angers in the lower Loire Valley], Charles Eckenfels, and Mr. Jean Bordas, director of the Agricultural Experiment Station in Avignon [in southeastern France on the Rhône River].

Through propaganda and as an author, Dr. Jean Balzli made a name for himself in the field of soybeans. Likewise Amadee Matarin as a manufacturing technologist and chemist.

In Tunisia, H. Gay did soybean breeding worked as advisory director for the trade delegation to Tunis.

The authorized ventures for soybean seed production and cultivation and expansion in the soybean industry are:

(1) National Soya Center (*Centre National du Soja*), Bordeaux.

(2) Agricultural and Industrial Society for Soya (*Société Agricole et Industrielle du Soja*), Paris.

(3) Cooperative of Soybean Producers at Lot and Garonne (*Cooperativ des producteurs du Soja de Lot et Garonne*), Agen.

(4) Cooperative of Soybean Producers in the Valley of the Rhone (*Cooperativ des producteurs du Soja de la valée du Rhone*), Valence.

(5) Cooperative of Soybean Production and Sales of Selected Seeds (*Cooperativ des production et vente de semences selektionées*), of Massif Central Clermont-Ferrand.

(6) Toulouse Interregional Soya Cooperative (*Cooperativ toulousaine interrégional du Soja*), Toulouse.

(7) Reynaud Geilinger establishment (*Etablissements Reynaud Geilinger*), Marseille [Marseilles].

(8) Mr. Hébert, Great Mill at Chartres (*M. Hébert, Grands Moulins de Chartres*), Eure et Loire.

(9) Cooperative Society of Soybean Planters in Provence (*Sociéte cooperativ provencale des planteurs de Soja*), Marseille.

Authorized establishments working on food uses of soya are:

(10) *Laboratoires Dulfrance,* Bayonne.

(11) *Société francaise des produits de Soja,* Levallois-Perret.

(12) *Société "Les aliments de régime,"* Levallois-Perret.

(13) *Soociété "Soja" 57 rue Pierre Charron,* Paris.

Climatically, France is a diverse country, so soybean research must be done in each region. It is now certain that

with seriousness and enthusiasm, soybean cultivation in France will advance.

As a postscript, the House of Vilmorin near Paris, still has, after many long years, an acre of land where all 800 soybean varieties obtainable worldwide are grown, observed botanically, and classified. They have also developed soybeans with seeds as big as small cherries. Address: Braunsdorf–Vienna, Austria.

1447. *Family Circle.* 1947. Whip Topping: The frozen pure soy cream for whipping (Ad). May.
• ***Summary:*** A small (1.75 by 2.5 inch) black and white ad. "Delicious and nutritious for desserts, salads, etc. At all fine food stores and grocers." There are two seals: "Guaranteed by Good Housekeeping," and recommended by "Parents Magazine." Illustrations show: (1) A small gable-top carton of the Whip Topping. (2) A parfait topped with a cherry and plenty of Whip Topping.

1448. *Soybean Digest.* 1947. Henry Ford was a soybean pioneer. May. p. 37.
• ***Summary:*** "Henry Ford, who died at his home in Dearborn, Michigan, April 7, left a name that will be closely associated with the soybean for years to come.

"The Ford Motor Co. had discontinued all its soybean operations at the time of the great industrialist's death. But Ford did some of the pioneering work in developing new uses for the crop; and gave soybeans publicity that vastly increased the interest of the public in them...

"Ford's policy was to produce raw materials as close to the point of processing as possible. With this in mind, he gave a great deal of effort to increasing soybean acreage near the Ford plants in southern Michigan. Then in 1937-39 the Ford Motor Co. built three solvent extraction plants at Saline, Milan and at the Rouge plant in Dearborn.

"Before the war Ford was using soybean products in many ways in the manufacture of automobiles. For a number of years the car body enamel contained 35% soybean oil. In 1937, 300,000 gallons of soybean oil was used for this purpose. The firm used thousands of gallons for shock absorber fluid. The foundry used both soybean oil and meal, the latter as core binder.

"But by far the most spectacular in the public mind was Ford's work with plastics. The actual usage was small compared with the tremendous publicity resulting. But some auto parts were made for several years from soybean molding compound. These included coil cases, accelerated pedals, horn buttons and distributor heads.

"Work on soy fibers was done at the Ford plant. This was under Robert Boyer, who has continued the project with The Drackett Co. Ford also experimented with soy food products, manufacturing soy milk and canning edible soybeans.

"It was the efforts of the Ford publicity machine, probably more than anything else, that caused the soybean to become associated chiefly with paint and plastics in the public mind, although other uses have always been far more important.

"Most soybean usage was discontinued by the Ford firm during the war and all its soybean processing plants have been sold.

"Ford offered considerable inspiration to the farm chemurgic movement. He was one of the founders of the National Farm Chemurgic Council." A small portrait photo shows Henry Ford at about age 60.

1449. A.P.I. [Associated Press of India]. 1947. Finding food value of vanaspati: Delhi research scheme. *Times of India* (*The*) (*Bombay*). June 12. p. 6.
• ***Summary:*** The Central Food Department has sanctioned two research projects on vanaspati. One is to determine its nutritive value and the other to determine its [not legible].

Research on the first project will be carried out at the Indian Institute of Science, Bangalore, and the University College of Science at Calcutta. Research on the second project will be conducted at Bombay, Delhi and either Mysore or Madras.

Another research project sanctioned "is in connection with a pilot plant for the manufacture of soya bean milk."

1451. Chin, Kuo-Chun. 1947. Contributions à l'étude du soja [Contributions to the study of the soybean]. *Revue Internationale du Soja* 7(39-40):51-54. May/June. [Fre]
• ***Summary:*** Contents: I. First attempts at production of soy sauce. II. The nature of soya, and vegetable meat (tofu). III. The nature of soymilk (*lait végétal de Soja*) and precautions to take in its use. IV. The nature of soybean cake and its judicious use. Address: Directeur du Laboratoire d'Essais du Soja, France.

1452. De, Sasanka S.; Desikachar, H.S.R.; Karnani, B.T.; Subrahmanyan, V. 1947. Investigations on soya bean milk and related products. *Science and Culture* (*Calcutta*) 12(12):587-91. June.
• ***Summary:*** Contents: Introduction. Animal experiments. Human feeding experiments: In welfare centers, in children's hospitals, feeding primary school children. General observations. The flavour of pure soya milk. Supply of soya bean–the bottleneck in extended production. The cost of soya milk. Equipment for large-scale production of soya milk. Various uses of soya milk and related products (sour {lactic fermented} curd, or buttermilk). Some outstanding

problems: Further improvement in the flavour of the milk (adding barley malt helps), enhancement of the nutritive value (supplement with a small amount of cereal protein, plus calcium, other minerals, and fat-soluble vitamins), improvement of manufacturing methods, organised production of the right varieties of beans.

The paper begins: "Our studies on the above subject were started, about two years ago, with the background of the earlier work done under the auspices of the Soya-bean Sub-Committee of the Indian Research Fund Association. That committee conducted its researches, mostly, on the nutritive value of the whole bean. The committee concluded that the bean, used in that form, is not superior to the average Indian pulses. We also came to the same conclusion regarding the whole bean as we found that the biological value of the protein in the *dhal* was only about 55."

"There is remarkable improvement when the bean is suitably processed and converted into the milk. It is in this form that the bean is largely utilised in China, Japan and other countries. After extensive trials, we found the following to be important steps for improving the taste, flavour and nutritive value. (1) steeping and incipient germination; (2) extraction of the kernel with dilute sodium bicarbonate to remove the colouring matter and bitter principle; (3) pasting to very fine condition; (4) adjustment of reaction and vigorous boiling; (5) incorporation of calcium in some suitable form; and (6) addition of salt and a small percentage of cane-sugar or invert sugar."

Supply and bottleneck: "There is already a good deal of public interest in the production of soya milk and related products. Many cities and commercial organisations have already expressed a desire to start large-scale feeding trials. The chief 'bottleneck' at the present time is the availability of the bean at a reasonable price. Every province in India can grow soya bean, but at the present time, there is very little production. Some area is now being brought under the crop and it is hoped that, at least during the present season, sufficient quantity of beans will be grown so as to facilitate trials at a larger number of centres. The co-operation of the Government Agricultural Departments is badly needed."

This far-sighted paper ends with these observations: "Organised production of the right varieties of beans.– Among the oil-bearing seeds that we have so far tried, soya-bean yields, by itself, the milk of the highest nutritive value. The pulse is unique in many respects. In composition and properties it comes half way between a typical legume and an oil-seed. It has considerable potential possibilities not only as a food but also in the plastic and other industries. The Government should therefore take keener interest in the cultivation of soya-ban [sic, soya-bean] in all the provinces of the country; There is already some experience in growing the bean, but more information is required regarding the right variety for each area, the season for sowing, manurial and other requirements and so forth. There is immediate need for at least some hundreds of tons for carrying out extended trials in different parts of the country and to popularise the use of the milk and the related products. It is earnestly hoped, therefore, that both the Central Agricultural Departments and the Provincial Departments will take more active interest in the subject and set up the necessary organisations for ensuring a steady supply of the bean in different parts of the country."

An editorial on this article (p. 559-60 of this issue) notes: The authors express the view that, when soya bean is processed according to their method, a remarkable improvement takes place in the quality of the soya milk. They claim that (1) it has a higher digestibility than cow's milk, (2) when prepared from beans after 3 days' germination, it has a higher biological value than cow's milk, and (3) when supplemented with calcium and some vitamins, it is in no way inferior to cow's milk. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1453. *Science and Culture* (*Calcutta*). 1947. The case for soya bean. 12(12):559-61. June.
• ***Summary:*** This editorial argues for more widespread cultivation and use of the soya bean. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1454. *Soybean Digest.* 1947. Paris soybean meeting. July. p. 30.
• ***Summary:*** According to Am. [Amédée / Amadee] Matagrin, the first Congress of Soya was held on 16 March 1947 at the Maison Internationale of the City University of Paris. The meeting, an indication of the French interest in soya, was organized by the French Bureau of Soya and its president, Mr. Rene Brochon, with the cooperation of the Experimental Laboratory of Soya and the France-China Association.

"The honorary presidency of the Congress was divided between M. Marius Moutet, French foreign Minister, and Li-Yu-Ying, president of the French-Chinese Society of Education and warden of the University Pekin [Peking], who as long ago as 1912 published with the agronomist Grandvoinnet a work on soya in French, and set up a little factory making soy milk, flour and oil in the suburbs of Paris.

"But the real presidency of the Congress was conferred on Prof. Louis Blaringhen, of the Sorbonne, president of the Academy of Sciences. Speakers were French research men and members of Universities, and the former French minister of agriculture. A paper from A.A. Horvath of the United States was read. There were addresses by President Blaringhen and the ambassador from China.

"The agricultural attache of the U.S. and a delegate from the Belgian Association of Soya assisted with the Congress."

1457. *Huntington Herald Press* (*Huntington, Indiana*). 1947. Chinese educator begins duty Monday at Huntington College. Sept. 14. p. 1, 4.
• ***Summary:*** "Dr. Y.T. Chiu, Chinese educator in the areas of science and religion, will commence his duties as a member of the Huntington college faculty Monday. The visiting professor will preside in the chemistry and practical foreign missions department..."

"Dr. Chiu came to the United States in August 1908 to attend the University of California [at Berkeley], where he received his Bachelor of Science degree in 1913. He continued his studies in the graduate field at Columbia university and received his Master of Arts degree in 1915, and then returned to China. Chiu came back to the United States in September of 1925 to enter the Cornell university graduate school [Ithaca, New York], where he received his Doctor of Philosophy degree in 1927 before returning to China."

"He is the author of a number of books including a textbook on chemistry, on English, on Quantitative analysis, a study of physical and chemical properties of soybean milk, and an analysis of Chinese tea... In addition to these he has written treatises on nutrition and health, the human body, and theological discussions relative to science and religion. Dr. Chiu presented a thesis on the soybean milk for his Ph.D. degree, which is essential to the people of China who suffer from a scarcity of milk." A portrait photo shows Dr. Y.T. Chiu.

1458. Sahasrabudhe, M.R.; Desikachar, H.S.R.; Lakshminarayana Rao, M.V. 1947. Biological value of "soya-bean milk" proteins by regeneration of liver protein in the rat. *Current Science* (*Bangalore, India*) 16(10):313-14. Oct. [8 ref]
• ***Summary:*** Soymilk has better quality protein than whole dry soybeans; 81.5% that of casein. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore, India.

1459. Rodrigo, P.A. 1947. Soybean culture in the Philippines. *Philippine J. of Agriculture* 13(1):1-22 + 5 plates. Third quarter. Summarized in Soybean Digest, May 1948, p. 41. [14 ref. Eng]
• ***Summary:*** Contents: Introduction. Description and history. Climatic and soil requirements. Varieties. Propagation. Preparation of the soil. Fertilizers and lime. Inoculation. Planting. Care of the crop. Harvesting and production: For day, for seed. Cost of production. Uses of soybeans. Diseases. "In the big cities in the Islands, many of the soybean products like soy sauce or toyo, tokua, tajuri [fermented tofu], tojo [soymilk curds], miso, etc. are becoming more popularly used by the Filipinos, and will be more so as their nutritive values become more fully realized. Already, in some sections of the country where soybean is being grown, the seed is used either as a green or as a dry vegetable. The dried bean is roasted and is eaten offhand or is used in adulterating coffee, and the bean in the dough stage is boiled and eaten like peanut" (p. 2).

Note 1. This is the earliest English-language document seen (Oct. 2011) that uses the word *tajuri* to refer to fermented tofu.

Table 1 shows annual imports (in kg) of soybeans and soybean products into the Philippines from 1929 to 1940, including dried beans, soy sauces, soybean meal, tausi (fermented black soybeans, salted), paste (miso), and total. By far the leading import (by weight) from 1929 to 1937 was dried soybeans. In 1929 some 4,574,497 kg were imported. This figure rose gradually (with ups and downs) to a peak of 5,660,575 kg in 1937, then fell sharply to only 237,666 kg in 1940. Soybean sauces were the No. 2 import, starting with 606,231 kg in 1929, rising to a peak of 1,441,563 kg in 1932, then remaining above 1,000,000 for most years thereafter. Imports of soybean meal started in 1935 with 660,699 kg; they reached a peak 1,023,303 in 1936 (the next year), then remained near 1,000,000 thereafter. Tausi was first imported in 1940, the amount being 151,571 kg.

Table 2 shows the value of these items (in pesos). In 1940 the imports of greatest value were soy sauces (120,346 pesos), soybean meal (50,682), and tausi (20,280).

"In the Philippines, while the plant has been under cultivation since the Spanish regime [1571-1898], it has not gained much headway due mainly to the lack of a variety suitable for commercial planting, and perhaps due to want of interest among farmers" (p. 4-5). The Philippine Bureau of Plant Industry has, to date, introduced more than 200 soybean varieties to the Philippines from the USA, China, Japan, Hawaii, Java, and India, but it presently recommends only a few varieties for commercial planting. These include Ami, which has long been cultivated there and is well adapted to the varied soil and climatic conditions.

Based on the results of a number of years' trials in

different regions of the Islands, the following varieties have been found to be productive: Yellow Biloxi Hybrid (introduced from Hawaii in 1936), Mis 28 E.B. Str. 3910 (introduced from India in 1937), Mis 33 Dixi (introduced from India in 1937), Head Green (introduced from the USA in 1935), and American Black. All of these varieties are good for May and June planting, and all but Yellow Biloxi Hybrid are good for September to December planting (dry season).

"In the Philippines, the green but fully developed pods are harvested, and the seed is cooked and eaten in practically the same way as lima bean or patani... In Lipa, Batangas, soybean in the dough stage is boiled in the pod and sold and eaten offhand" like peanuts. The more common soy products made in the Philippines are soy sauce or *toyo*, tokua [tofu], tausi [fermented black soybeans], and miso. "Soybean milk is being manufactured by the Bureau of Plant Industry in a limited scale and a big modern firm has started putting soybean milk and other products in the local markets" (p. 15-16).

Note 2. This is the earliest English-language document seen (Nov. 2011) that uses the word *tausi* to refer to fermented black soybeans. Address: Chief, Horticulture Research Section, Bureau of Plant Industry.

1460. Genin, G. 1947. Supplément technique: Le lait de soja ou lait végétal [Soymilk or vegetable milk]. *Lait* (*Le*) 27:633-38. Nov/Dec. [19 ref. Fre]
• ***Summary:*** Describes how to make soymilk based on previous reports in the literature.

Note: *École Pratique du Commerce et de l'Industrie* ceased to exist in 1959. Address: Ingenieur E.P.C.I [École Pratique du Commerce et de l'Industrie].

1461. Miclot, A. 1947. Le lait de soja: Son emploi dans les maternités indigènes. Ses résultats [Soy milk: Its use in indigenous maternity wards. Its results]. *Medecine Tropicale* (*Marseille*) 7(5):465-469. Nov/Dec. [3 ref. Fre]
Address: Medecin Capitaine du Corps de Sante Colonial, France.

1462. **Product Name:** Delsoy Super Whip: Instant Dessert Topping (All-Vegetable Soymilk-Based Non-Dairy Whip Topping Sold in a Pressurized Can).
Manufacturer's Name: Delsoy Products, Inc.
Manufacturer's Address: Livonia Dairy, 2001 S. Telegraph Rd. at Harvard, Dearborn, Michigan.
Date of Introduction: 1947.
Ingredients: Incl. soymilk, vegetable oil, sugar.
Wt/Vol., Packaging, Price: Pressurized metal can.
New Product–Documentation: Detroit News. 1945. April 16. "Who's who and why." [About Herbert Marshall Taylor and Delsoy]. A photo shows Taylor. An ad (below this article in Rex Diamond's binder; original source and date unknown) is titled "What is Delsoy? It's the dessert topping that's winning the enthusiastic approval of housewives by the hundreds of thousands. Delsoy is the original topping made of natural vegetable products." The ad shows illustrations of two non-dairy whip toppings: (1) In the foreground, "Delsoy Super Whip: Instant Dessert Topping" which is sold in a pressurized can. The ad states: "Introduced in August 1944, the first product of its kind, Delsoy dessert topping has gained tremendous popularity. Continuing to grow by leaps and bounds..."

Interview with Robert A. Smith by Donald V. Baut. 1979. June 21. "Delsoy Products." p. 44-72. This is the single best source seen on the origin and history of this product. However Bob Smith calls the product Presto Whip (which is also sold in a pressurized can) and gives the date of introduction as 1946 or 1947, which is 2-3 years after Delsoy Super Whip was introduced.

Talk with Robert Rich, Sr., founder and chairman of the board of Rich Products Corp. 1993. July 13. He strongly disagrees with Bob Smith's statement that Delsoy was the first non-dairy whip topping to be sold in a pressurized can. Mr. Rich believes that Rich Products' non-dairy Whip Topping was the first such product to be sold commercially in a pressurized can. It was on the market in Oct. 1948. Bob never heard of Delsoy Super Whip; he thinks Delsoy's product in a pressurized can was named Presto Whip.

1463. **Product Name:** Lo Hi Milk.
Manufacturer's Name: Lo Hi Food School.
Manufacturer's Address: 618 Adams Ave., Muskegon, Michigan.
Date of Introduction: 1947.
New Product–Documentation: Soybean Blue Book. 1947. p. 72.

1464. **Product Name:** Soy Milk.
Manufacturer's Name: Natural Foods Institute.
Manufacturer's Address: 624 Prospect Ave., Cleveland, Ohio.
Date of Introduction: 1947.
New Product–Documentation: Soybean Blue Book. 1947. p. 84. Not clear whether this company is a manufacturer or a handler.

1465. Bragg, Paul C. 1947. Paul Bragg's health cookbook [1st ed.]. New York, NY: Alfred A. Knopf. xii + 402 + xxx p. Index. 21 cm.
• ***Summary:*** Contents: Section I: Flavor. 1. Flavor, the soul of food. Section II: Recipes. 2. Salads (7 types). 3. Salad dressings. 4. Soups. 5. Vegetables. 6. Meats. 7. Fish. 8. Poultry and game. 9. Vegetarian entrees and cheese dishes. 10. Eggs and egg dishes. 11. Cereals. 12. Bread, rolls, and muffins. 13. Pancakes and waffles. 14. Pies and fillings. 15. Cakes and frostings, 16. Cookies. 17. Desserts (fruit desserts, other desserts). 18. Sauces. 19. One world cookery ("Health"

foods in many lands, Mexican, Creole, From France, the Near East, the Far East, etc.). 20. Candies. 21. Drink health the new way ("cocktails" made without alcohol, from fresh fruit and vegetable juices). 22. Canapés. 23. Sandwiches and fillings. 24. Canning.

Section III: Special-purpose recipes. 25. Reducing. 26. Gaining. 27. Food allergies. 28. Invalid food or bland diets. Appendixes. Herb chart. How to grow a savory herb garden. The window-box herb garden. Organic gardening: Good nutrition starts in the ground. How to make a compost pile.

Soy-related recipes: Substitutes. Soybean milk for cow's milk. Beans and especially soybeans for meat. Whole-grain flours for white flour (p. 5). Sprouted soybean salad (p. 45). Soybean soup (with "1 cup {dry} soybeans," p. 72). Black soybean soup (p. 72-73). Sour-cream bean soup (p. 73).

In the chapter on "Vegetables" there is a section titled "Soybeans" (p. 92-95) with this contents: Introduction ("The soybean is one of the richest of all foods in protein and in minerals, and it also makes a very delightful addition to good meals... but only in recent years have Americans and Europeans become awakened to its possibilities as a meat substitute and also its great value as a food staple"). How to make soybean sprouts. Soybean sprouts en casserole. Sprouted soybean omelet. Soybean sprouts with onions and mushrooms. Soybean recipes ("for preparing the magic soybean"). Green soybeans (in pods). Dried soybeans. Canning recipes. Soybeans used as meat substitutes. Soy milk. Soybean cheese [tofu].

Chapter 9: Vegetarian entrees and dishes. Lentil loaf with milk or soy milk. Soybean loaf (with dry soybeans and soy milk). Soybean macaroni loaf. Vegetable and soybean stew. Soy vegetable roast (with 1½ cups cooked soybeans). Vegetable hash (with soy sauce). Boston baked soybeans. Stuffed peppers with soybeans. Vegetarian sausages (with cooked soybeans). Vegetarian chop suey (with soy sauce and gluten steaks). Soybean cheese (homemade tofu made from soy milk allowed to curdle in a warm place; cut and serve with soy sauce).

Whole-wheat soy bread (with soy flour, p. 195). Soybean waffles (with soy flour, p. 212). Whole-wheat soy pie crust (with soy flour, p. 213). Canned [green vegetable] soybeans (p. 324, 336). Soybean waffles (wheatless, with soy flour, p. 369). For those with food allergies: Soy milk and Soybean cheese (see p. 95).

In this book, Bragg uses the word "aminos." "The link between protein and body tissues is the amino acids. When the aminos enter the blood stream, they are carried to every part of the body, where they set to work repairing, rebuilding, and maintaining body tissue, building up rich red blood, and 'conditioning' the various organs" (p. 6).

Note 1. Throughout his life, Paul Bragg seems to have had an ambivalent feeling about eating and recommending red meat and poultry. In his later years, fish became his favorite flesh food.

Note 2. This book contains no autobiographical information about Paul Bragg. Address: P.O. Box 428, Burbank, California.

1466. Kent-Jones, Douglas William; Amos, Arthur J. 1947. Modern cereal chemistry. 4th ed. Liverpool, England: The Northern Publishing Co., Ltd. vii + 651 p. See p. 89, 109-113, 118, 150, 302, 349, 376, 568-69. 20 cm. [3 soy ref] • ***Summary:*** The first edition of this book was published in 1924 in Liverpool. Chapter 4, titled "Rye, oats, maize, rice, soya and potato," contains details on the soya bean from various sources (p. 109-13) including: Production in major countries (1934-39), chemical composition, amino acids, constants of soya oil, fatty acids of soya oil, carbohydrates of soya bean, mineral content of selected foods, composition of various milks, and uses of soya flour.

Page 150 discusses soya lecithin, gluten, baking, and flour strength. Page 302 discusses the benefits of soya flour in making less expensive forms of cakes and various confections.

Chapter 14, "Cereal and balanced rations for livestock" (p. 349-) contains a short section on soya bean cake (p. 376). "At one time a mixture of soya bean and cottonseed cakes were sold as 'Soycot Cake' and attained considerable popularity."

Tables on p. 568-69 show the contribution of soya bean cake and soya bean meal (extracted) to mixed feeds. Address: Analytical and consulting chemists, England.

1467. Radwansky, Andor (pseudonym of Dr. A. Medriczky). 1947. Der "Gelbe Gottessegen," die Sojabohne im Haushalt und Kleingarten [The "golden blessing," the soybean in home and garden]. Murnau (near Munich): Verlag Sebastian Lux. 31 p. Series: Die kleine Reihe, 4. 17 cm. [21 ref. Ger] • ***Summary:*** Contents: Foreword. 1. Soybeans and nutrition. 2. What does the soybean look like? 3. The soybean–commercial products (Edelsoja whole soya flour, soy flakes, soy oil, soy margarine, soy lecithin, soymilk and tofu [these were once made by a German firm in Frankfurt], soy sauce, Worcestershire sauce, soy chocolate and cocoa). 4. Soybeans in the household (incl. the above commercial products plus soy coffee, soy sprouts). 5. Growing soybeans on farms and in home gardens. Hope for the founding the "Society of Soybean Producers and Friends of Soya" (*Gesellschaft der Soja-Anbauer und Sojafreunde*). 6. The different methods of soybean production. Growing soybeans in a small garden.

On page 15 the author uses the term "Sojaspeisen" to refer to soyfoods. On page 17 he uses the term "Gruenbonen" to refer to green vegetable soybeans. Address: Herwegstr. 5, Stuttgart, Germany.

1468. **Product Name:** Presto Whip (All-Vegetable Soymilk-Based Non-Dairy Whip Topping in a Pressurized Can with Valve–Refrigerated).

Manufacturer's Name: Delsoy Products, Inc.
Manufacturer's Address: Livonia Dairy, 2001 S. Telegraph Rd. at Harvard, Dearborn, Michigan.
Date of Introduction: 1947?
Ingredients: Incl. soymilk, vegetable oil, sugar.
Wt/Vol., Packaging, Price: 10 oz pressurized can with valve.
How Stored: Refrigerated.
New Product–Documentation: Interview with Robert A. Smith by Donald V. Baut. 1979. June 21. "Delsoy Products." p. 44-72. This is the single best source seen on the origin and history of this product. Originally Delsoy Topping was sold in paper containers purchased from the Sutherland Paper Co. in Kalamazoo, Michigan. Delsoy bought the containers by the carload, 300,000 at a time. When Sutherland went out of business, Delsoy switched to buying containers from the Crown Cork and Seal Co. in Philadelphia. During World War II Crown Cork and Seal had developed a pressurized can to use for insecticide sprays by the military. Delsoy was the first to realize that the can's unique valve (produced by the Super Whip Co. in Chicago and used with nitrous oxide gas) made it suitable for whipping cream. So the company modified its formula for Delsoy Topping, put it in this pressurized can, and in 1946 or 1947 named it Presto Whip. Delsoy Products was the first company to ever put a topping in a pressure can and sell it. It immediately became a huge success, was widely advertised, and was soon sold by every chain store in the area. Soon Delsoy Products was working 3 shifts, making 25,000 cans a day–sold mostly in the Detroit area. Soon they were selling the products over a range of 350 miles in lower Michigan, Ohio, and parts of Indiana, Pennsylvania, and New York. By 1963 they had 23 distributors.

Letter from Robert A. Smith (of Delsoy Distributors, 1847 South Telegraph Rd., Dearborn 8, Michigan) to Mr. Holton W. Diamond (in Whiting, Indiana). Smith expresses interest in obtaining Rex Diamond's services and patents. Printed in the lower left corner of the letter is a picture of a pressurized can of Delsoy Presto Whip. In the lower right corner is a picture of a container of Delsoy Topping in the shape of a truncated cone.

Talk with Robert Rich, Sr., founder and chairman of the board of Rich Products Corp. 1993. July 13. He strongly disagrees with Bob Smith's statement that Delsoy was the first non-dairy whip topping to be sold in a pressurized can. Mr. Rich believes that Rich Products' non-dairy Whip Topping was the first such product to be sold commercially in a pressurized can. It was on the market in Oct. 1948. Delsoy Products had problems with the name of its product "Presto Whip." Delsoy Products and the Presto Whip Co. in California both had a lawsuit against each other since they were both using the same name. The California company probably won, since they used the name for many years afterwards.

Note 1. The relationship between this product and Delsoy Super Whip, both soy-based whip toppings sold in a pressurized can and made by Delsoy Products, is not clear. Note 2. This early non-dairy whipped topping was NOT made with enzyme-modified soy protein.

1469. Liang Shih-chiu [Shiqiu]. ed. 1947? Zui xin shi yong Han Ying ci dian A new practical Chinese-English dictionary. [Taipei, Taiwan]: The Far East Book Co. Ltd. 1355 p. See p. 1037-38. 22 cm. [Eng; Chi]
• ***Summary:*** Gives the Chinese characters and their pronunciation for the following soy-related terms: Soybean cake; bean curd; a semi-transparent film formed on the surface of soybean milk; a store where bean curd is made for sale; spiced and dried bean curd; soybean cheese; legume; (said of girls) in teens; the pods of beans or peas; soybean milk; fermented beans in paste form; residue of soybeans in making bean curd; fermented and seasoned soybeans; pisolite [bean + stone]; legumin; bean sprouts as a vegetable; soybean oil. Address: Editor in Chief.

1470. **Product Name:** [Lactavena].
Foreign Name: Lactavena.
Manufacturer's Name: Unknown.
Manufacturer's Address: Rome, Italy.
Date of Introduction: 1947?
Ingredients: Water, malted oats, malted soybeans.
New Product–Documentation: L. Nicholls. 1950. Food Manufacture. March. p. 96-97. "Considerable work has been done in war-devastated Italy and Germany to find a milk substitute for infants and children. One such substitute, called *Maltavena*, was produced early in 1945 by Dr. Caprina, chemist to the Perani brewery, Rome. It consisted of an emulsion prepared from a cereal [probably oats] which had been malted in the usual manner of brewers; later malted soya bean was included as well as the cereal. The idea was taken up by a British Medical Unit working in Germany, and a modified product was used with considerable success in feeding infants and children. This product has been developed on a small commercial scale under the name *Lactavena."*

1471. Cort, Mabel Gilson. 1948 Personal report of Mabel Gilson Cort for the year 1947. Chiang Mai, Thailand. 2 p. Unpublished typescript. Undated.
• ***Summary:*** She has spent the entire year of 1947 at home in Chiengmai [Chiang Mai], Thailand, doing mainly dietetic work, but also some evangelical work. She has developed special diets for patients with particular diseases. "Because of the high cost of living and the scarcity and high price of such foods as milk and eggs and the number of orphan babies we have in the hospital and the number of patients requiring milk diet, we have used quantities of soy bean product to increase our milk protein and supplies. Every day we make great quantities of white soy bean milk which is

used to feed the babies, make cream soup, egg nogs, custards and even ice cream occasionally. We make tasteless soy bean flour, which I learned to make at home. We also use the ground browned soy bean flour [kinako] to feed babies, to make a beverage we call soy bean coffee, which is drunk as a beverage, using coconut milk and sugar. It is used in many hospital diets and the nurses drink it. We enrich it with sugar, starch and calcium, thus making it nearly equivalent to milk in value. We make soy bean flour, rice bran and rice flour muffins for beriberi and soy bean flour and rice bran muffins for diabetes. We also send out the browned soy bean flour to mothers in the country to make soy bean milk for their babies as the browned flour will keep indefinitely and country mothers have not the facilities for keeping the white milk which sours very easily. We buy bean curd from a Chinese merchant. We use this in curries, soups, etc. We have also increased the value of the protein in our diets and the use of the bean products are increasing every where. We think this is good public health work. All this requires a great deal of reading and compiling from books from China, Malay, the Philippines and America."

Note: Mrs. Mabel Gilson Court worked was a Presbyterian missionary in Siam (later called Thailand) from 1903. Her husband was a physician and fellow missionary. They were married in 1910. In 1915 Dr. Cort took charge of McCormick Hospital in Chiang Mai, and Mrs. Cort took charge of dietetics at McCormick Hospital.

1472. *Soybean Digest.* 1948. Grits and flakes... from the world of soy: Milquo Ltd. is now Vi-Tone. Jan. p. 34.
• ***Summary:*** "Milquo Limited has changed its firm name to Vi-Tone Products Limited, 198 Gage Ave. S., Hamilton, Ontario. Ray H. Bissell is president."

1473. *Huntington Herald Press* (*Huntington, Indiana*). 1948. Dr. Chiu to speak at Union Church. Feb. 28.
• ***Summary:*** "Dr. Y.T. Chiu, visiting professor of chemistry and foreign missions at Huntington college, will speak at Union church, Union township, at 10:30 a.m. Dr. Chiu will discuss conditions in China, their effect upon the mission work and what missions are doing to alleviate suffering... He served as professor on the staff of Lingnan University in Canton, China, from 1915 to 1942, and was principal of the Pui Ching middle school, the largest high school in southern China, from 1942 to 1946. For his Ph.D. degree Dr. Chiu presented a thesis on soybean milk which was essential to the people of China who suffer from a scarcity of milk."

1474. *American Magazine.* 1948. Interesting people (William Morse): Ice cream grows on bushes. Feb. p. 101.
• ***Summary:*** Shows a nice full-page photo (by Vincent Finnigan) of William Morse eating soy ice cream. "Ice cream, as indicated here by Dr. Morse, can be made from powdered soybean milk. To launch the soybean in America Dr. Morse spent 2 years in the Orient collecting 5,000 soybean samples." When he returned, he used his wife, daughter, friends and himself as guinea pigs to test the beans. They made entire meals out of soybeans, including soybean wine. The idea gradually caught on. Dr. Morse is a graduate of Cornell University, soft-spoken, shy and at 63 years old, still busy at the Department of Agriculture's experimental farm in Beltsville, Maryland. He feels the surface has hardly been scratched.

The photo was also run in *Soybean Digest*, April 1948, p. 41.

This digital photo was sent to Soyfoods Center by Joyce Garrison (William Morse's granddaughter) of West Hartford, Connecticut (July 2004).

1475. **Product Name:** Sunspot Soya Milk [Chocolate].
Manufacturer's Name: Hong Kong Soya Bean Products Co. Ltd.
Manufacturer's Address: Great George St., Causeway Bay, Hong Kong.
Date of Introduction: 1948. February.
Wt/Vol., Packaging, Price: Bottle.
New Product–Documentation: H.W. Miller. 1948. *Soybean Digest.* June. p. 22-23. "Survey of soy foods in East Asia." "From Manila I went to Hongkong where 8 years ago a small company known as the Hongkong Milk Factory made a beginning in homogenizing a constituted soy milk. On this last trip to Hongkong, K.S. Lo, the manager, took me through their plant. He informed me that they are now serving to each of the school children a half-pint bottle of the soy milk, both in the natural and the chocolate flavors, at their noon lunch.

"The Hongkong Milk Factory is in reality a soybean dairy. As you view the equipment including the bottle filling machine and the refrigerating unit, you would not know you were not in an American dairy."

1476. *St. Louis Globe-Democrat* (*Missouri*). 1948. $213,000 peanut crop had origin as slave food. March 1.
• ***Summary:*** Peanuts came to America in slave ships, but they originated in Peru. The conquistadores found the Incas munching on them between meals. The Spaniards took these peanuts in their treasure galleons back to Spain, where they flourished. Then they took them from Europe to Africa, where they became involved with the slave trade. "The slavers fed them to the natives because they were cheap and easy to grow. The natives called them 'goobers.' When the slavers crammed the natives into holds and began the long journey to America they used the peanuts as slave food. Upon landing, the slaves built crude cabins, and planted peanuts near their cabin doors. Gradually peanuts spread through the south and changed from a slave to a money crop. They continued as a southern specialty until the civil war."

"In the 1890s a doctor at Battle Creek, Michigan, named

Kellogg thought peanuts possessed excellent dietary qualities for invalids. This was the fabulous era when corn was being flaked, and oats and other grains exploded into breakfast cereals. Kellogg crushed the nuts into a creamy mass and called it peanut butter. He said it was more easily digested by sick people this way."

The late Dr. George Washington Carver played a major role in the development of peanuts in America. "He perfected dozens of extracts from peanuts, including peanut coffee and peanut milk and cream. At one point in his career he experimented with peanut oil as a massage for after-treatment of infantile paralysis."

Peanuts are now a price-supported crop. Georgia is the largest peanut-producing state. Peanut yields are now decreasing because peanut farmers have used backward methods and not replenished the soil. Some authorities believe the soybean has come to the front because of these backward methods.

1477. Roberts, F.G. 1948. The return of the edible soya bean. *Nature's Path to Health* (*Melbourne, Australia*). Feb/March. p. 22.
• ***Summary:*** "The Soya Bean is a complete vegetable protein containing all the Amino acids in assimilable form; one pound of Soya Beans equals the protein value of two pounds of beef, which is much more expensive." Soybeans are an alkaline food with a wonderful chemical content.

"We are doing our best to encourage the growing of Soya Beans in Australia, we have promised the farmer a fair margin and we hope to distribute many tons of Grade 1 Soya Beans through our many branches, and other grades will be used for making Soya Flour, Soya Bean oil, Soy nut roast, Soy milk compound, Soya Bean and Soya Beans in Tomatoes."

Note: This is the first article about soy to appear in this periodical (published by F.G. Roberts and wife) since Aug. 1940, a gap of more than seven years. Hence use of the word "Return" in the title. Address: Reg. Dietitian, Australia.

1478. Desikachar, H.S.R.; De, S.S.; Subrahmanyan, V. 1948. Protein value of soya-bean milk: Human feeding experiments. *Indian J. of Medical Research* 36(2):145-48. April. [1 ref]
• ***Summary:*** When cow's milk curd protein, fed along with a poor South Indian rice diet, is replaced by an equivalent amount of soya bean protein, the mixed proteins of the diet in both cases are utilized to about the same extent. By following the nitrogen balance method on two adult subjects, they reported that the average digestibility coefficient and the biological value of soya-bean milk protein compared to egg protein are 96.6 and 94.0 respectively.

The calcium of soya-ban milk curd (tofu) fed to 6 adult subjects along with a basal low calcium ration was utilized about 90% as much as the calcium of cow's milk curd. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

• ***Summary:*** The protein of soymilk was found to be about 90% as efficient as casein for haemopoiesis in the rat. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1480. Gehrke, Charles W.; Weiser, Harry H. 1948. A comparative study of the biochemical activity of *Streptococcus lactis, S. citrovorus*, and *S. paracitrovorus* when grown in cow's milk and soybean milk. *J. of Dairy Science* 31(4):213-22. April. [17 ref]
• ***Summary:*** These three microorganisms are widely used to culture butter. "Soybean or vegetable milk is used extensively throughout Japan and China for infant feeding as well as for adults." The introduction of soybean milk to the American people has occurred only recently. Soybean milk has been manufactured in the form of a powder. It has been used with good results... especially in those countries that find it cheaper to use a vegetable milk... The development by butter organisms of diacetyl [which is partially responsible for the aroma of butter] and related compounds in vegetable milk and products made from it may be desirable from a commercial standpoint."

The butter cultures were obtained from the Department of Dairy Industry, Iowa State College, Ames. The soybean milk was obtained from Harry Miller, Director of the International Nutrition Laboratory, Mt. Vernon, Ohio. Cow's milk and soybean milk were inoculated and incubated, then measurements of the following were taken at regular intervals up to 216 hours: pH, titratable acidity, volatile acidity, and Mg Ni salt. The production of acetylmethylcarbinol (AMC) and diacetyl in soybean milk by butter culture organisms was not evident until after an incubation period of 48 hours; however, upon incubation of cultured soybean milk for 168 to 216 hours, larger amounts of the flavor and aroma compounds were produced in soybean milk than in cow's milk. "The values obtained for the titratable acidity in cow's milk and cow's milk to which 0.15 per cent citric acid had been added were nearly twice as great as those secured for the soybean milk. Address: Dep. of Bacteriology, The Ohio State Univ., Columbus, Ohio.

1481. *Times of India* (*The*) (*Bombay*). 1948. New treatment for plague: Research in India. June 17. p. 5.
• ***Summary:*** Field trials were conducted in Bengal and Bihar to test the effectiveness of sulphaguanadine, a new drug for combating plague.

Research on nutrition is being carried out at a number of centres across India under the auspices of the Indian Research Fund Association. "Experiments to determine the nutritive value of soya-bean milk and soya-bean curd [tofu] have been conducted at the Indian Institute of Science, Bangalore." Feeding trials now being conducted in Bangalore suggest that soya-bean milk and its products can provide an inexpensive and nutritious substitute for cow's milk.

1482. Miller, H.W. 1948. Survey of soy foods in East Asia. *Soybean Digest.* June. p. 22-23.
• ***Summary:*** The primary objective of Miller's company "was to develop a milk built up to formula for babies, children, and adults that could be utilized by Oriental populations where animal milk is not available, and which for economic reasons can never be a dependable source of food supplies for the masses.

"Before the war the Laboratory had branches both in Manila, Philippine Islands, and Shanghai, China. The war saw the plant in Shanghai completely demolished and the equipment destroyed. In Manila, the building was left, but all the equipment was removed. Therefore we have been busy since the end of hostilities in restoring these plants.

"In 1946 and 1947 and during this last January and February the writer made trips and spent time in connection with these institutions. I am glad to report that on my last visit to the Philippine Islands I was able to see the plant there start its operations. The machinery and equipment are practically restored.

"At the present time there are no soybeans under cultivation in the Philippine Islands... though certain parts are very well adapted to the growth of the southern type of soybeans.

"The Manila plant is interested in marketing bottled 'Soyalac' (soy milk) both in natural and chocolate flavors, and also in entering the production of soy ice cream–we are permitted to call it that in the Philippines.

"From Manila I went to Hongkong where 8 years ago a small company known as the Hongkong Milk Factory made a beginning in homogenizing a constituted soy milk. On this last trip to Hongkong, K.S. Lo, the manager, took me through their plant. He informed me that they are now serving to each of the school children a half-pint bottle of the soy milk, both in the natural and the chocolate flavors, at their noon lunch.

"The Hongkong Milk Factory is in reality a soybean dairy. As you view the equipment including the bottle filling machine and the refrigerating unit, you would not know you were not in an American dairy. Mr. Lo informed me that if they had refrigeration they could be putting this soy milk out in many of the other cities of China on a very large scale.

"The firm obtains it beans from China, mostly from the province of Chang Tung, though some come from Manchuria. The beans are not of a very fine quality."

At Shanghai there were two soybean enterprises that particularly attracted my attention. The one for which we helped secure the machinery and equipment is being run under the name of the International Nutrition Products Co., Ltd. It is to be run very much like the Manila plant in the manufacture of liquid soy milk. The company will develop along with it a soy margarine and soy spread in the form of a mayonnaise dressing.

"The other enterprise is being undertaken by the government. The Chinese Army Quartermaster Department has purchased a property where ice cream, dried eggs and butter, and also candy were made. This large property has a splendid group of buildings with refrigeration." Here the Chinese Army intends to run a "soybean factory and a vegetable dehydration plant.

"The Chinese Army has secured the help of my son, Harry Willis Miller, Jr. He is there at the present time erecting this plant. It is perhaps the largest soy protein processing plant we know of at present. The firm has bought equipment for large-scale production of a spray-dried soy milk powder. This is to be included in other rations of a dehydrated character for use of the Chinese Army."

In Japan, the author found the people to be "greatly undernourished, especially in regard to protein. Soybeans are scarcely to be had... Bean curd plants are all closed down... I know of nothing that the Japanese nation needs worse than soybeans... I found the Japanese people, even to the advisor to the Emperor, whom I met, pleading with us to establish a plant similar to that which we have in China and the Philippines. However we have no financial interest in those plants. They are carried on wholly by local capital. Our part is simply the 'know-how' in setting them up and transmitting the processes to them."

Note: This is the second earliest document seen that uses the term "soy foods" in the title. Address: International Nutrition Lab., Mt. Vernon, Ohio.

1483. *Times of India* (*The*) (*Bombay*). 1948. Research in India: Research on nutrition. July 17. p. 5.
• ***Summary:*** "Experiments to determine the nutritive value of soya-bean milk and soya-bean curd have been conducted at the Indian Institute of Science, Bangalore." Feeding trials now being conducted in Bangalore, indicate that soya-bean milk and its products can provide an inexpensive, nutritious substitute for cow's milk.

This nutritional research is being conducted under the auspices of the Indian Research Fund Association.

1484. *Soybean Digest.* 1948. German soy milk. July. p. 25.
• ***Summary:*** "A soy milk that is on a par with cow's milk has been perfected at Hamburg, Germany, by W. Tiling, chief physician there. Dr. Tiling reported in a recent article.

"Scarcity of food especially for children during the

period following the war made research for suitable foods highly necessary, he reports. He recalled the part soybeans have played in the nourishment of Chinese children for 5,000 years, and investigated them as a source of milk for the undernourished German children.

"A soybean emulsion was produced which with a little water added looks just like cow's milk. It can be used for cooking purposes, and keeps as well as cow's milk, says Dr. Tiling. 'We have found this milk to agree with children, and that the children who have used it have made very satisfactory and normal progress,' he states."

1485. De, Sasanka S. 1948. Soybeans in India. *Soybean Digest.* Sept. p. 45-47.
• ***Summary:*** Contains a good photo of De, the author. Address: Indian Inst. of Science, Bangalore, India, and Massachusetts Inst. of Technology.

1486. Karnani, B.T.; De, S.S.; Subrahmanyan, V.; Cartner, D. 1948. Relative utilization of calcium from soya milk (fortified with di-calcium phosphate) and cow's milk by growing children. *Indian J. of Medical Research* 36(4):355-60. Oct. [7 ref]
• ***Summary:*** Since soymilk contains much less calcium than cow's milk, the authors raised the calcium content of milk to the level of 80 mg calcium/100 ml by the addition of di-calcium phosphate after adjustment of the pH of the milk. Calcium-fortified soya milk and cow's milk were fed to "six growing children (age 7 to 9 years) who received the milks as a supplement to a basal diet composed mainly of cereals and which provided only a small amount of calcium (224 mg.) per day. When fed the basal diet alone, the children showed a negative calcium balance, the excretion exceeding the intake by 20 mg to 135 mg per day. On supplementing the diet with fortified soya or cow's milk, the children received 362 mg per day of calcium in the case of the former and 365 mg per day from the latter. As the result of this, the calcium balance was changed from an average of -54 mg per day in the case of the basal diet to +29.0 mg in the case of soya milk and +28.9 mg in the case of cow's milk. In spite of the initial negative balance, the extent of utilization of the supplementary calcium was only 23.1 per cent in the case of soya milk and 22.8 per cent in the case of cow's milk. The response of the two milks was practically the same." Address: 1-2. Dep. of Biochemistry, Indian Inst. of Science, Bangalore; 4. Lady Curzon Hospital, Bangalore.

1487. Karnani, B.T.; De, S.S.; Subrahmanyan, V. 1948. Fortification of soya-bean milk with calcium and study of its availability to young growing rats. *Indian J. of Medical Research* 36(4):349-54. Oct. [15 ref]
• ***Summary:*** "Although soya milk is fairly adequate in other respects, it is nevertheless deficient in calcium (about 20 mg calcium in 100 cc) as compared with cow's milk (about 120 mg calcium in 100 cc). Apart from its general importance, calcium is of special significance in the dietary of vegetarians and particularly as a supplement to the poor South Indian rice diet which is highly deficient in that element."

"It was found that more than minute amounts of calcium in any form could not be added to soya milk without the risk of clotting on subsequent heating unless the reaction was suitably adjusted. There was also marked difference in regard to the extent to which each calcium salt could be incorporated... Whenever possible, the calcium salt was prepared in the form of a solution and added in small instalments till the limit of stability was reached. Before incorporating any further quantity, the reaction was adjusted by addition of bicarbonate and fresh calcium then added. The maximum concentration aimed at was 120 mg. of calcium in 100 c.c. but it could not be attained in any of the cases."

Table I shows the fortification of soya milk with calcium using different calcium salts: calcium gluconate (8% solution), calcium lactate (10% solution), calcium glycero-phosphate, marble (di-calcium phosphate or limestone), and calcium carbonate ($CaCO_3$). In the case of marble, a maximum of 417 mg of calcium salt could be incorporated into 100 cc of soya milk with the pH adjusted to 6.7. The calcium content of the soya milk after fortification was 48 mg/100 cc. In the case of calcium carbonate, the corresponding figures were 167 mg, pH 6.8, and 46.2 mg/100 cc. In the authors' semi-large-scale preparations they used marble or calcium carbonate. They prepared about 400,000 lb of soymilk and used it for school feeding and other experiments.

The authors concluded: "The calcium content of soya milk can be raised by incorporation of different calcium salts after suitable adjustment of reaction. Di-calcium phosphate can be added so as to raise the level of calcium to about 80 mg. per 100 c.c. of milk. The fortified product has a pleasant taste and flavour. Other calcium salts, such as gluconate, lactate and glycero-phosphate, can also be incorporated, but the phosphate generally gives a better product. Calcium carbonate has the advantage that it can be easily incorporated–though at a lower level–without any special precautions in regard to previous adjustment of reaction.

"It was found that rats retained 82 per cent of the calcium and 87 per cent of the phosphorus ingested from fortified soya milk. The growth rates of rat on a calcium-free synthetic diet supplemented with cow's milk and soya milk respectively, on the same volume basis, were practically of the same order."

Note: This is the earliest study seen on the fortification of soya milk with calcium. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1488. Rangnekar, Y.B.; De, S.S.; Subrahmanyan, V. 1948. Soya-bean ascorbicase. *Indian J. of Medical Research* 36(4):361-70. Oct. [17 ref]

• ***Summary:*** "No attempt seems to have been made to isolate and study the enzyme from germinating seeds, although its presence in germinating soya bean has been reported (Ito, 1938; Shen *et al.*, 1945). During the course of studies on vitamin C in soya bean and soya milk (Rangnekar *et al.*, 1948), it has been observed that the bean possesses a powerful ascorbicase activity which is dormant in the dry seed but develops quickly on germination. The important bearing which this aspect has on the final vitamin C values of the soya milk prepared from the bean after extended germination has also been discussed from the viewpoint of the scalding of bean prior to milk preparation. The present studies relate to the isolation, properties and chemical nature of soya-bean ascorbicase...

"In germinating soya beans the ascorbicase activity is developed practically to a maximum after 48 hours. After that period, it remains more or less stationary in the cotyledons but decreases in the sprouts." Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1489. Fairchild, David. 1948. Early experiences with the soybean. *Soybean Digest.* Nov. p. 14-15. [2 ref]

• ***Summary:*** "It was not until 1897 that I first saw soybeans growing... I found my friend Merton B. Waite had been trying to grow soybeans on his farm outside Washington [DC, in Maryland; see Fairchild, Oct. 1948], but with little success. They had been sent in by some American consul or missionary, I believe. At about the same time Dr. George T. Moore [who by 1903 was Physiologist in Charge of the Lab. of Plant Physiology, Bureau of Plant Industry, USDA, working on soybean root bacteria] in working on the root nodules of leguminous plants had discovered that the nodules contained bacteria. Waite and I talked over the matter of the failure of his soybeans and wondered if they might require special bacteria, so I wrote out to Japan and imported several pounds of soil from a soybean field.

"We made a little experiment, planting alternate rows of soybeans with and without the addition of this Tokyo soil. The effect of the imported soil was immediately apparent as the plants grown in it made a far better growth and had their roots covered with bacterial nodules, whereas the control were practically without any.

"Photographs had yet to come into any general use as records of agricultural experiments, but Waite had taken up photography as a hobby and made excellent photographs with his stand camera. So at harvest time he pulled up an equal number of soybean plants from the soil-treated rows and from the controls, and the only photographic record in existence of this little experiment (the first of its kind, I suppose, in the world) is this negative taken by Waite in the autumn of 1897.

"Although these experiments did not at the time lead to more extensive trials, they indicate the awakening of our interest in soybeans.

"In that fall of 1897 it was my privilege to organize the office of plant introduction in the Department of Agriculture. We began introducing a great number of different kinds of plants, among them, as I see from our inventories printed at the time, occasional small collections of soybeans from China and Japan. They were obtained mostly through correspondence with missionaries and consuls stationed there.

"At that time the Department had no testing ground near Washington where we could grow miscellaneous vegetables, including these soybean collections. It was not until several years had passed that facilities were provided on the so-called 'Potomac Flats' [in Washington, DC] and James H. Beattie, an enthusiastic young horticulturist, took over the planting of our introduced seeds.

"The soybeans did well and Beattie soon had on his hands a quantity of seeds. But we didn't know just what to do with these strange beans. When cooked in the way other beans were prepared they had a strange flavor that nobody seemed to like...

"It was not, I think, until the office of forage crop investigations was organized and C.V. Piper took charge that the soybean as a forage crop attracted attention and Beattie's experiments came to be looked upon as important. We planted larger patches of soybeans on a tract of land near Bethesda, MD...

"And then we ran into the difficulty of harvesting the soybeans. P.H. Dorsett of the office, one of the most ingenious and most indefatigable workers I have ever known, and his friend Rankin, who was running the little experimental farm, put their heads together and adapted a bean picker then in use–in California I think–and discovered that it was perfectly possible to harvest soybeans mechanically...

"I went out exploring again and my travels with Mr. Lathrop this time took me into the soybean fields of Japan. The tremendous importance of the crop as I saw it there made a great impression on me. Also the almost universal use of soy sauce, which Americans were just beginning to appreciate, fixed my interest...

"Dr. Yamei Kin, an extraordinary Chinese woman whose acquaintance I had made on the boat returning from Japan, made a visit to Washington and captivated us all by her enthusiasm over soybeans. She introduced us to 'tofu,' a delicate cheese which has not even yet attracted the attention it deserves from the American public.

"In 1903 A.J. Pieters came to me one day and told me of an amazing young Hollander who had been a gardener of the great geneticist, Hugo de Vries. He was then on his way back from a trip on foot to Mexico, and I wired him to come to Washington. For 13 years, as agricultural explorer of our office, Frank N. Meyer tramped from village to village over much of China. He gathered soybeans whenever he saw them, for he felt it was important to secure all the local

varieties he could for our plant breeders before they should have disappeared as the result of the spread of standard varieties he thought was bound to come.

"The importance of getting as many as possible of these local varieties and these, or selections from them, form, I believe, the basis of the very extensive soybean breeding that has been done by the various plant breeders of America."

Note: According to Vivian Wiser of the USDA and to the Washington D.C. Historical Society (13 Feb. 1991; phone 301-785-2068, Mrs. Offut), in 1897 Merton Waite lived in downtown Washington, D.C. in a built-up area. There is no record of his owning a farm outside Washington D.C., but he may have owned the farm as a sort of summer home or he may possibly have worked with the group at the USDA farm at Somerset, Montgomery County, Maryland. He was a plant pathologist and physiologist, in charge of diseases of orchard fruit trees, especially pears and peaches. There is a collection of David Fairchild's materials at Coconut Grove. His personal residence, The Kampong near Coconut Grove, is still (as of 1998) well preserved and open to the public. Address: "The Kampong," Coconut Grove, Florida.

1490. *Madison Health Messenger* (*Madison, Tennessee*). 1948. King Cotton welcomes King Soybean: American soybean convention highlights. Fall. p. 1-2, 5-6.

• ***Summary:*** The American Soybean Association held its 28th annual convention on 13-15 Sept. 1948 in Memphis, Tennessee (on the banks of the Mississippi River in southwestern Tennessee) at the historic and famous Peabody Hotel. Nearly 1,000 people attended, representing 28 states and 9 foreign countries. Madison College is in Tennessee, so representatives attended.

Memphis became the largest spot cotton market in the world, the largest cotton seed products market in the USA, and (at one time) the largest mixed feed center. In 1884 the Memphis Merchants Exchange was organized.

"Early in the twentieth century, experiments were made in this market in the use of blackstrap molasses, then a worthless by-product, mixing it with alfalfa hay and grain. It proved to be an excellent animal feed and was placed on the market as commercial mixed feed. Memphis can probably claim the honor of originating the mixed feed business that was the forerunner of the scientifically prepared stock feeds that now comprises one of our nation's largest industries." The feed industry created an enormous demand for protein which was largely derived from cottonseed meal. That source, however, proved inadequate, and so 'Necessity being the mother of invention' the soybean was introduced into American agriculture and began to be produced in considerable quantities about 1920.

"Having about the same protein content as cottonseed meal it has practically doubled the supply of protein available for mixed animals feeds. Geographically Memphis is the center of the production of high protein vegetable meals. The crops of cottonseed and peanuts of the Mississippi Valley in the South, blend here with The soybean crops of the North Mississippi Valley states. Memphis, therefore, is the natural location for the world's only protein futures market. The price of cottonseed meal and soybean meal established by this open market is recognized throughout this country, as well as abroad, as the basis price for trading in both commodities.

"Barge lines on the Mississippi River now handle a vast tonnage of merchandise and bring millions of bushels of grain and soybeans to Memphis for distribution throughout the South and for export via barge to the Port of New Orleans. So important is the Port of Memphis that millions of dollars are being spent to improve and enlarge its facilities for handling an ever increasing tonnage while 'Old Man River He Just Keeps Rolling Along.'

"Convention highlights: The Soybean Conventioners were welcomed royally by Mayor Pleasants, President Williams of the Memphis Commercial Exchange, and the friendly staff of Peabody Hotel. Ladies of the Memphis Commercial Exchange entertained the ladies attending the convention and it seemed from the gardenia corsages given to all the ladies (100 attending) by the Memphis Commercial Exchange, the luncheons, parties, tours. and the annual banquet, planned for the guests, that King Cotton himself and all Memphis bent their efforts to make Kong Soybean their honored guest. The conventioners were profoundly impressed with the beautiful city of Memphis and its never-to-be-forgotten genuine warm hospitality. With every exhibit space in the large hall taken with interesting displays of soybean products, machinery, supplies, and technical services offered, it was obvious that the industry was well organized and integrated to meet the heavy demand put upon its young shoulders.

"Efficient President Walley and aggressive Secretary Strayer of the American Soybean Association gave every evidence of providing the unusual leadership required for the development of a national organization to serve the soybean industry in the United States.

"President Walley reported fresh from his summer stay in Europe where he studied conditions relating to the interest and needs of the people with respect to the potential possibilities of supplying soybeans to aid in the recovery program. He said in part, 'From The best available information, France could use oilseeds equivalent to at least 10 or 15 million bushels of soybeans per year at the present time... soybeans have become more popular and more appreciated by the French.' In Italy it is about the same story. 'I was particularly impressed with the fine work being done by CRALOG (Christian Relief Organizations Authorized to Operate in Germany), cooperating with German food manufacturers in preparing soybean products in the most palatable form.' Large quantities of soy flour are being flown to Berlin over the blockade. Belgium processors

were pleased with the quality of America soybean varieties. 'In England I found many friends of soybeans and much progress has been made in the use of soy products in food.' 'One of the principal paint companies of England is very enthusiastic about the use of soybean oil in paint and is doing everything it can to encourage the growing of soybeans in South Africa in order to augment its needed supplies.'

"'... let us take the cost of protein for human consumption in Germany. At the time I was there 40 grams of protein purchased at the store in the form of full fat soy flakes cost only one-third to one-sixth as much as 40 grams of protein secured through any animal product and that cost was figured on the basis of soybeans being worth between $8 and $10 a bushel in Germany.' Here is a large fertile opportunity market that can mean much to the American soybean grower.

"'Gentlemen, in my opinion, this "cold war" is hotter than you think. Today national security is our most important business."

"'As producers of a potent weapon in that war [soybeans] let us carry on, keeping this in mind: a continued and assured production of soybeans in the United States can have much to do with the preservation of individual liberty here and abroad–a treasure more important than any immediate consideration of price or profit.'

"Two films, *Progress in Products,* the margarine film produced jointly by the American Soybean Association and the National Cotton Council, and the Allis-Chalmers film, *The Soybean Story,* were shown and, as you might surmise, Madison Foods comprised a part of the section of the story on the screen showing foods produced from soybeans.

Soybean milk experiment: Dr. Sasanka S. De of the Indian Institute of Science, Bangalore, India, and now a research fellow in the Department of Food Technology, Massachusetts Institute of Technology (MIT), reported on his experimental work with soybean milk. He found "that it was possible to prepare a fortified soya milk that would have a high supplementary value in the Indian diet comparable to that of cow's milk and without increasing the cost greatly... In the human experiments, nearly 6,500 infants, children and youth were used as subjects in Welfare Centers, Orphanages, and Schools."

"Visit to the world's largest cotton plantation: The last day of the conference was set aside for a field day in the rich Arkansas delta at the Arkansas Agricultural Experiment Station, Clarkedale, Arkansas, and at Wilson, Arkansas, to see the world's largest cotton plantation. In this rich northeastern section of Arkansas the flooding mighty 'Old Man River' deposited layer upon layer of black loam silt until it reached the incredible thickness of 1,200 feet (the average topsoil depth around the world is seven inches).

"At the Clarkedale experiment station the staff prepared test plots for this field day showing all the named commercial varieties of soybeans in the U.S. Flame weeding was also demonstrated..."

Over 500 guests attended the Soybean Banquet in the Ball Room of the Peabody Hotel. Madison Stakelets and Zoy-Koff were served. "Dr. Morse, father of the soybean, Chief Agronomist of the Department of Agriculture said, 'I always enjoy Madison Soybean Foods, especially Zoy-Koff for it takes the place of coffee which I do not use.' Dr. De of India, previously mentioned, said 'I liked your Stake-Lets very much and ate them with intense interest. Both the flavor and texture are so much like meat.'"

1491. *Madison Health Messenger* (*Madison, Tennessee*). 1948. Soybeans–A wonder food: Madison College works with the soybean. Fall. p. 1, 3-4.

• ***Summary:*** The soybean originated in China. However this "food of the ancients now seems destined to turn its antiquity into one of the most valuable foods in the modern world.

"The first actual mention in the literature of this wonder bean is recorded in Emperor Chen Nung's Materia Medica, written under date 3838 B.C. In the Legendary period of China the story of bandits attacking a merchant caravan has been handed down through generations in which it is said that the miracle wonder food, soybeans, were the lifesavers of some merchants, who, being surrounded and besieged by bandits until their own provisions were exhausted, noticed a vinelike plant bearing a legume which they had never seen before from which they made flour and baked cakes. Energized therewith, they fought off the enemy until help came. So the legend goes, soybeans became the staff-of-life in the great nation of China which still ranks first in population in all the world."

Soybean "oil is used extensively in Margarine in which it is used up to 80% in certain brands (Sure Good, sold by A. & P., and Nu-Maid, sold by Kroger)." Many brands of margarine contain 20-80% soybean oil.

Discusses the work of Henry Ford with soybeans and soyfoods. "His research staff made soybean milk and cheese, soybean-nuts, canned green soybeans, soybean sprouts, and a hundred other things."

"With the knowledge of widespread disease in the animals used for food by man, the founders of Madison College adopted a vegetarian diet supplemented with dairy products and eggs. For over 44 years this has been strictly adhered to in the food preparation for the students, faculty, workers, and patients at its 165 bed sanitarium and hospital... For over 30 years [since 1918 or before] Madison has been growing soybeans. They have occupied a place of prominence in its menus for many years." Then Madison began to manufacture soybean food for the public. More and large equipment was added. "In 1941 a new plant was started and today Madison Foods are produced in a fine daylight plant of modern design and construction..."

A list of Madison's foods is given, together with the weight of the can or bag in which each is sold: Kreme O'Soy,

Zoy-Koff, Stake-Lets, Yum, Zoyburger, Vigorost, Not-Meat, Soy Cheese [Tofu].

1492. *Madison Health Messenger* (*Madison, Tennessee*). 1948. A unique food developed [Kreme O'Soy]. Fall. p. 3.
• ***Summary:*** "Realizing the need of a milk substitute for infants and adults who could not tolerate cow's milk, Madison turned to the soybean and made an emulsion so near in appearance that even the choosy cat drinks its and licks its chops. Manufactured exclusively by Madison Foods and sold under the registered trade name of Kreme O'Soy, this creamy homogenized emulsion of soluble soybean protein fortified with dextrose, calcium phosphate, and soybean oil, is compounded to take the place of human and animal milk in human nutrition.

"In thousands of cases Kreme O'Soy has been used to replace human and cow's milk in feeding infants, children, youth, and adults, and the infants develop normally, children make the usual gains, and adults maintain normal weight and health. It contains less calcium than cow's milk because the human organism requires less calcium than the calf for which the cow's milk is obviously intended. However it contains almost twice as much iron as cow's milk and forty times as much copper.

A black-and-white photo shows a can of Kreme O'Soy. The text reads: "A tasty milk-like drink. Homogenized. Shake well." Two large photos show healthy babies raised on Kreme O'Soy. A table compares the composition of Kreme O'Soy, human milk, and cow's milk. A list of ingredients is given on p. 4: Soybeans, soy oil, dextrose, calcium phosphate, and sodium chloride.

1493. De, H.N.; Dutta, P.K. 1948. Investigation on soyabean-milk powder. *Science and Culture* (*Calcutta*) 14(6):248-49. Dec. [2 ref]
• ***Summary:*** Describes how a "soyabean milk powder" was prepared. It has a "pleasant odour and taste." The average composition was: Protein 41.70%, fat 33.35%, carbohydrate 18.42%, and ash 4.37%.

"The biological value and the digestibility of the soyabean milk powder protein as deduced by the balance sheet method on rats were found to be 69.7 and 89.2 respectively."

Note: This is the earliest English-language document seen (Aug. 2013) that contains the term "soyabean milk." Address: Nutrition Research Unit, Biochemical Lab., Dacca Univ., Dacca, India.

1494. Genin, G. 1948. Le lait de soja ou lait végétal [Soymilk or vegetable milk]. *Revue Internationale du Soja* 8(47):7-9. [Fre]*
Address: Ingenieur Chimiste E.P.C.I.

1495. Karnani, B.T. 1948. Investigations on vegetable milks. PhD thesis, Bombay University. *
• ***Summary:*** The author studied the utilization of calcium from soya-bean milk by young human subjects, 7-8 years of age, who received the milk as a supplement to the basal diet. It was found that when 363.5 mg of calcium from either cow's milk or soya-bean milk was added to the basal diet per day, the average daily calcium balance was changed from -54.5 mg to +24.0 mg in the case of soya-bean milk and to +28.9 mg in the case of cow's milk. The availability of calcium from the 2 milks was practically the same, as the average utilization of supplementary calcium from soya-bean milk for affecting positive calcium balance was 23.1% and that from cow's milk was 23.8%. Address: Bombay, India.

1496. **Product Name:** Loma Linda Soyagen. Soy Beverage Powder for Adults [Liquid, or Powdered; All-Purpose/Plain, Malt, or Carob].
Manufacturer's Name: Loma Linda Food Co.
Manufacturer's Address: 11503 Pierce Place, Arlington, California. Phone: 714-687-7800 (3/88).
Date of Introduction: 1948.
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable.
New Product–Documentation: Today's Food. 1964. Autumn. p. 5; All purpose or malt available. Today's Food. 1966. Carob flavor now available; Wholesale price list. 1968. Soyagen Liquid sold in 17 oz. and 30 oz. cans for $0.36 and $0.42 retail respectively. Powder sold in 1 lb or 4 lb cans for $1.05 or $3.61 retail respectively. Label for a can, 8 by 10 inches, color. Reprinted in Soyfoods Marketing. Lafayette, CA: Soyfoods Center. "Vitamin & Mineral Fortified." Ad (full page, color) in Bestways. 1988. March. p. 11. "Soyagen. Good-tasting and so good for you too." Available in 3 flavors–All purpose; no-sucrose (with no cane or beet sugar), and carob. Photos show cans.

Burnett (1951, p. 998) notes that a 1948 label for liquid canned Soyagen, made by Loma Linda Food Co., gave the following composition: Water 88.6%, protein 3.03%, fat 3.48%, carbohydrates 4.53%, ash 0.36%. Vitamins (all in units per liquid quart): vitamin A 2000 USP, thiamine 500 mcg (micrograms), riboflavin 1000 mcg, vitamin D 500 USP. More sophisticated versions of the same product with the same name appeared in 1963 (All Purpose), 1965 (Carob flavor), and 1977 (Plain).

1497. Maillard, J. 1948. Le lait de soja [Soybean milk]. *Lait* (*Le*) 28(279-80):585-88. [30 ref. Fre]

1498. **Product Name:** Soy Milk (Dried, or Liquid).
Manufacturer's Name: Natural Foods Institute.
Manufacturer's Address: Olmstead Falls, Ohio.
Date of Introduction: 1948.
New Product–Documentation: Soybean Blue Book. 1948. p. 102. Not clear whether this company is a manufacturer or

a handler.

1499. **Product Name:** Soylac (Powdered Spray-dried Mixture of Soyolk and Cereal Flour).
Manufacturer's Name: Soya Foods Ltd.
Manufacturer's Address: 40 St. Mary Axe, London, E.C.3., England. Phone: AVEnue 4971.
Date of Introduction: 1948.
How Stored: Shelf stable.
Nutrition: Protein 26%, fat 11%, total sugars 26%.
New Product–Documentation: Ad in Confectionery News (England). 1948. Began March 5th and ran at two-week intervals to Oct. 1, then at different intervals until 4 March 1949. "The ideal ingredient for all Ice-Cream mixes. Complete recipes available from the manufacturers."

Staines. 1950. Ice-Cream Making and Selling. p. 21. "There is also a proprietary powder on the market based on soy flour. Known as 'Soylac,' it is specially prepared, pasteurized and spray dried and is treated to increase solubility." Soybean Blue Book. 1953. p. 103. Soy Flour Mixes. Soya Foods Ltd, 40 St. Mary Axe., London, E.C. 3, England. Plant at Cardiff, South Wales. Affiliate of Spillers Ltd. States that Soylac is a spray-dried mixture of Soyolk and cereal flour.

Indian Council of Medical Research, Special Report Series No. 31. 1955. p. 3. Based on a personal communication (in which the product name is given as Soyalac) from S.S. Bhatnagar and F.G. Donnan. "Early in the twenties, Donnan and Bhatnagar processed soya-bean to yield a product which was subsequently marketed in the United Kingdom under the name 'Soylac.' This type of product is still being produced, though on a relatively small scale, in the U.K."

Letter from Mrs. I.B. MacKay. 1983. May 24. "Soylac was a milk-like powder for use in cakes and confectionery. It was last produced in 1952."

Note: This is the earliest known soy protein product used in making ice creams.

1500. Desikachar, H.S.R.; De, S.S.; Subrahmanyan, V. 1948. In vitro digestibility of soya bean milk and the tryptic inhibitor in soyabean. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 8(3/4):93-96. [6 ref]
• ***Summary:*** "The poor in vitro digestion of soya milk is due to the presence of the tryptic inhibitor in it... Under in vivo conditions, however, the soya milk protein is nearly as digestible as cow's milk." Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1501. Engelbeen, M. 1948. Le soja au Congo Belge [Soya in the Belgian Congo]. Brussels, Belgium: Ministere des Colonies. 94 p. 25 cm. [200 ref. Fre]
• ***Summary:*** Contents: Preface. 1. The soybean: Habitat and acclimatization: Genus and species, sub-species and varieties, habitat and acclimatization. 2. The principal factors in soybean production: Climate, nature of the soils, symbiotic bacteria, selection and hybridization, cultural methods, enemies and diseases. 3. Seed storage and multiplication. 4. Nutritional value of soya: Generalities, soymilk, tofu, okara (*tourteau de soja;* the pulp remaining after filtering off soymilk), soy oil, soy flour. 5. Industry and commerce. 6. Perspectives on soya in the Belgian Congo. Summary. Bibliography consulted.

The section titled "Introduction and Acclimatization to the Belgian Congo (p. 30) states: "Known in Africa for 30 years, the cultivation of soya has not yet passed the experimental stage. Numerous introductory trials were conducted with multiple varieties which originated in East Asia and the United States.

"Soya was mentioned for the first time in the Belgian Congo by Commandant Lemaire [Charles François Alexandre Lemairé], who first encountered them at Stanleyville [later renamed Kisangani] in 1908. It was introduced, shortly afterwards, to the Eala botanical garden (near Coquilhatville). The first agronomic trials took place in 1915; the agronomist Mestdagh, at Lusambo (Sankuru [Kasai]) harvested 1,472 kg of yellow soybeans and 1,786 kg of black soybeans."

Note 1. I.N.E.A.C. stands for Institut National pour l'Étude Agronomique du Congo Belge.

Note 2. This document contains the second earliest date seen for soybeans in Zaire (1908). The source of these soybeans is unknown. These soybeans were probably being cultivated in 1908, but we cannot be sure. Address: Ingenieur agronome colonial Lv., Chef du Bureau d'Etudes de l'I.N.E.A.C.

1502. Jacobson, Norman L. 1948. Modified soybean-oil-filled milks and their effects when fed to dairy calves. PhD thesis, Iowa State University. In: Doctoral Dissertations Accepted by American Universities, 1948. *
• ***Summary:*** Most soy-based milks used as calf-milk replacers were made from the protein portion of the soybean. This type substituted soy oil for butterfat in cow's milk. Address: Iowa State Univ., Ames, Iowa.

1503. Rangnekar, Y.B.; De, S.S.; Subrahmanyan, V. 1948. Studies on vitamin C in soyabean and soyamilk. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 8(3/4):99-104. [4 ref]
• ***Summary:*** 72 hours germination of the beans (preferably the white variety) yields a fair quality milk containing nearly optimum amount of vitamin C–22.6 mg per litre–which is appreciably higher than the average value given by cows' milk.

Note 1. This is the earliest English-language document seen (Aug. 2013) that contains the word "soyamilk." It appears in both the title and the text. Address: Dep. of

Biochemistry, Indian Inst. of Science, Bangalore.

1504. Rangnekar, Y.B.; De, S.S.; Subrahmanyan, V. 1948. Stability of vitamin C in soyamilk as compared to cows milk. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 3(2/4):105-08. [6 ref]
• ***Summary:*** It has been known for quite some time that copper (Cu) and sunlight are instrumental in causing a severe destruction of vitamin C in cowsmilk. The high stability of vitamin C in soyamilk against both types of destructive agencies has pointed out the presence of vitamin C protecting factor or factors in soyamilk which are absent in cowsmilk. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1505. Rotondi, Pietro. 1948. Vegetarian cookery. 2nd ed. Hollywood, California: Published by the author. 150 p. Recipe index. 21 cm. 1st edition was 1942.
• ***Summary:*** This book is identical to the original 1942 edition except that: (1) It is now published in paperback by the author; (2) A color photo of the smiling author, standing at the door of his office by a sign "Dr. P. Rotondi, Chiropractor, Nature Cure," appears on the front cover; (3) The author's business card, which includes the address of his chiropractic office, appears at the bottom of the copyright page; (4) The last page of the index, p. 151, was accidentally not printed. • ***Summary:*** This work consists of a contribution of the National Center of Agronomy (*Centro Nacional de Agronomia*) of El Salvador that was established and works with the collaboration of the government of El Salvador and the Office of Foreign Agricultural Relations of the United States. The present cooperative investigations were carried out using funds provided by the Interdepartmental Committee of the United States for Cultural and Scientific Relations together with financial support provided by the government of El Salvador. Address: Santa Tecla, El Salvador.

1507. Desikachar, H.S.R.; Subrahmanyan, V. 1949. Infant feeding experiments with soya-bean milk. *Indian J. of Medical Research* 37(1):77-83. Jan. [10 ref]
• ***Summary:*** The authors, conducting feeding experiments in 30 children ages 1-3 years, found that soya-bean milk protein was 86% as much utilizable as cow's milk protein. Address: Dep. of Biochemistry, Indian Inst. of Science, Bangalore.

1508. Raymond, Jack. 1949. "Ersatz" milk and meat with taste of genuine foods made in Germany. *New York Times.* Feb. 13. p. 1, 20. Sunday.
• ***Summary:*** Working to overcome food shortages in Germany, "a group of Allied and German scientists has produced and is ready to distribute two food substitutes that are said to taste and have the same nutritious qualities as milk and meat...

"'This is potentially the greatest innovation in human feeding since people began to cook,' declared Gwynn Garnett, an official at the United States Military Government Food and Agriculture Branch... 'These synthetic foods can be a boon not only to the people of Germany but to hungry areas throughout the world. They are cheap and could be useful in the United States too.'

"The new foods consist of combinations of protein extracts from such diverse sources as soy beans, peanuts, wood, yeast, wheat, corn, and coal."

Henry C. Sherman, Prof. Emeritus at Columbia University and an outstanding authority on ersatz foods, notes that these are not new and gives extensive comments. Address: Frankfort, Germany–Special to the New York Times.

1509. Smith, Allan K. 1949. Oriental use of soybeans as food: Notes on Oriental farming practices. II. China. *Soybean Digest.* March. p. 26-28, 30, 32, 34.
• ***Summary:*** Contents: Soy sauce in China. Sweet flour paste–Tien Mien Chang [Chiang]. Soy or vegetable milk (incl. Willis Miller, yuba). Soybean curd or tofu (incl. use in Buddhist restaurants to look like meat, poultry, or fish dishes).

Soybean cheese [fermented tofu]. Fen-t'iao from mung beans (vermicelli). Fermented soybeans [fermented black soybeans] (made from small black soybeans). Vinegar fermentation process.

Concerning soy milk: "The Chinese National government has taken an active interest in soy milk for use by its army, Willis Miller, with offices and business connections in the Henningsen Produce Co. in the Dollar Building at 51 Canton Road, Shanghai, has just completed building a soy milk plant for the Chinese government. The process is patterned after that of the International Nutritional Laboratories [Dr. Harry W. Miller] at Mt. Vernon, Ohio, for making a powdered or spray-dried milk. Mr. Miller is also supervising the installation of a vegetable canning plant for the same purpose." Address: Northern Regional Research Lab., Peoria, Illinois.

1510. Culbertson, Raymond E.; Smith, Allan K. 1949. Oriental uses of soybeans as food: With attention to fermented products. Notes on Oriental farming practices. V. Korea. *Soybean Digest.* June. p. 15-18, 20, 22.
• ***Summary:*** Contents: Introduction. Breeding work.

Topography. Land use. Soybean varieties. Climatic relations. Soils of Korea. Cultural practices. Marketing. Soybeans as foodstuff. Soya sauce. Green pods on the bush. Bean sprouts. Parched beans. Curd (soybean curd [tofu]) and milk. Kochuchang. Other uses.

"Prior to World War II, North Korea planted (1940-44 averages) slightly more than 905,000 acres of soybeans annually which yielded some 7,700,000 bushels. During the same 5-year period South Korea was planting 626,000 acres which yielded a little over 5 million bushels. The latest available figures (1947) for South Korea show a production of 4,480,000 bushels from 662,000 acres."

Concerning food uses of soybeans in Korea: "Soya sauce:... is found on the tables of all Koreans, where it is used quite generally on rice, sukiaki [sukiyaki], fish, chicken, and other meats and for the flavor it adds to the soup. It is a very popular appetizer. Most families make soya sauce and are allocated 2.7 kilograms of salt per person annually for this purpose. Yearly consumption is about 6 liters per person. In addition to homemade soya sauce, a supply is also available from many small factories making it. There are more than 10 plants in Seoul, the capital city. Making soya sauce in the home starts about January or February. It is the custom at this time to take a batch of beans and boil them in water until soft, following which they are mashed and formed into a ball, placed in a rice-straw bag and hung up in a heated room to ferment for a 3-month period. Following fermentation, the ball is cut open, broken into pieces and allowed to dry in the sun. When dry, water and salt are added, inoculant (yeast) introduced and the mixture allowed to stand in an earthen crock 2 to 3 months. The liquid is then poured off, boiled about 2 hours and filtered, following which it is considered to be sauce. The sediment remaining in the crock is known as paste. This is used primarily for making soup. In both home and commercial production of soya sauce parched and browned wheat or barley is frequently used in conjunction with the soybeans.

"Green pods on the bush: It is common practice to market early beans on the bush. The plants are pulled, dirt shaken from the roots and the leaves removed. The braches are tied with a string (usually hemp) and the plants are taken to market where they are sold by the bunch. The housewife prepares them for eating by picking off the pods and boiling, and the plant stem is used for fuel.

"Bean sprouts: Bean sprouts are much in demand especially during the winter months. They are used in combination with meat, Chinese cabbage, spinach, turnips, soups and various other cooked dishes. Sprouts are nourishing and supply much-needed vitamins to the Korean's usual polished rice diet. In some instances the beans are left on the sprouts, in others they are removed. The beans are sprouted in central places and usually peddled in two-wheeled, man-drawn carts. Sprouting requires about a week. They are sold on a weight basis.

"Parched beans: For parching, soybeans are simply placed in a pan over a fire and heated slowly until the skin breaks and part of the beans are slightly blackened. They are eaten like peanuts or mixed with other foods. Most varieties are quite palatable and well liked for parching. Note: The Korean name for parched soybeans is *kong*.

"Curd and milk: Soybean milk is consumed in Korea but not so extensively as in China. The milk is made in a manner similar to the Chinese method which was described in an earlier report.

"A large percentage of the soybeans' growth in Korea are consumed as soybean curd. In addition to the huge quantities made at home, curd is also made in literally hundreds of small factories. In Seoul alone there are more than a hundred. Small units, which on the average employ five men, can work up about 10 bushels of soybeans daily.

"Kochuchang: Practically every Korean family makes kochuchang. Boiled [soy] beans are mashed and hung up in sacks to cure well for 2 or 3 months. This material is then broken up, dried in the sun, and ground to a fine powder, usually in an old type hand-operated stone mill. Red peppers are ground fine, the lot is mixed and salt and water added, then it is allowed to stand in crocks 2 to 3 months. To prepare kochuchang for the table, it is taken from the crock and boiled with the addition of ground meat and sugar, if the latter is available."

Note: This is the earliest (and only) English-language document seen (March 2009) that uses the word "kochuchang" to refer to Korean-style red pepper and soybean paste (miso).

Photos show: (1) A man standing in a field of sorghum interplanted with soybeans in Korea. (2) A Korean woman examining different varieties of soybeans in woven baskets in the market place in Seoul, Korea (Aug. 1948). (3) A boy carrying a wooden bucket on each end of a wooden shoulder pole. The buckets are used for transporting night soil to the land in Korea. (4) Soybean curd (cut into cakes) and vegetables in the market place at Seoul, Korea (Aug. 1948).

An outline map of South Korea and its provinces shows the principal varieties of soybeans grown, the section where each variety is grown, acreage and production. A chung or chungbo is 2.45 acres, and a suk is 5 bushels. The yields appear very low but this may be due to the custom of interplanting soybeans with other crops.

Tables show: (1) The 15 chief varieties of soybeans grown in Korea. For each is given: The name of each variety (romanized, with a translation of each word). Days to maturity. Flower color. Stem length. Color of seed coat and hilum. Weight of 1,000 seeds. Yield per acre. Rank in test. Year approved (1921-1939). For example: Chang Tan Paik. "Chang Tan" is the name of a town in Korea; Paik means "white."

(2) Analytical data for improved varieties of soybeans on the basis of the size of the bean. The 3 sizes are large,

medium, and small. Examples of locations are: Southeast Korea. Northeast Korea. Central Korea. Southeast Korea. Address: Northern Regional Research Lab., Peoria, Illinois.

1511. Smith, Allan K. 1949. Oriental methods of using soybeans as food: With special attention to fermented products. Notes on Oriental farming practices. *USDA Bureau of Agricultural and Industrial Chemistry.* AIC-234. June. 40 p.
• ***Summary:*** Page 1 states: "The text of this bulletin, with slight revisions, is as it appeared serially in *The Soybean Digest,* issues of February through June, 1949, although many additional photos appear herein. It is processed with the publisher's permission." Note: An enlarged 65 page edition was issued in July 1961.

Photos show: (1) Nine people in a field cultivating soybean with hoes near Nanking, China. All of these workers but one are women. July 1948. (2) "The three-man shovel, Korean version of the turning plow. The motive power is supplied by the mean holding the ropes." (3) A man and donkey threshing wheat with a stone roller. (4) A water buffalo and man pumping water from the rice fields. All parts of the pump and elevator are made of wood. Near Nanking, China, July 1948. (5) Windmill used for pumping water. The sails or vanes are mats woven from grass. (6) Children with baskets of soybean sprouts and inflated Chinese national currency in the market place at Canton, China. Aug. 1948. (7) Soybean milk for sale on the streets of Canton, China. Aug. 1948. It is in bottles, carried using a shoulder pole. (8) A wedge press for oilseed operations at Canton, China. Preformed disks of the flaked or ground meal are inserted in the slot and turned clockwise in the hollow log; pressure is applied with wooden wedges. July 1948. (9) Equipment for steaming soybeans preparatory to making soy sauce. Steam is passed upward through the wooden tanks from a boiler beneath. Peiping, China. 1948. (10) Soy sauce preparation. Steamed soybeans are placed in woven baskets or trays for 3 to 7 days to permit the growth of the mold *Aspergillus oryzae.* Nanking, China. July 1948. (11) Many earthenware jars for soy sauce production in a courtyard surrounded by houses. "Following the growth of a thick mold on the soybeans, they are mixed with parched and cracked wheat and placed with salt solution in earthenware jars for fermentation, which lasts 3 months to 2 years. Soy paste [chiang] is fermented in a similar manner but it contains less water and the fermentation period is about 3 months. Shanghai, China. Aug. 1948." (12) "Soybean curd and vegetables displayed for sale in market place, Seoul, Korea. Aug. 1948." (13) Squares of soybean curd covered with white mold on round, woven bamboo trays. "This is the first step in making soybean cheese. Canton, China, Aug. 1948." (14) Two rows of large hydraulic presses in the mill of the China Vegetable Oil Company, Shanghai. June 1948. (15) Men loading round, hydraulic-pressed soybean cakes onto a truck, on the Bund. Shanghai, July 1948. (16) Men and an ox preparing a seed bed at a Japanese agricultural experiment station near Tokyo. 1948. (17) "A miso plant in Tokyo. The large tubs [vats] in foreground are used for the fermentation of miso. A part of this plant was destroyed by bombs during the war. Aug. 1948." (18) Three men standing by presses destroyed during bombing raids over Tokyo. These presses formerly were used for filtering monosodium glutamate. July 1948. (19) Many stacked wooden tubs of ajinomoto (monosodium glutamate) ready for shipment at a plant located between Tokyo and Yokohama, Japan. Aug. 1948. This plant had a maximum production of 7.5 million pounds of ajinomoto in 1937. (20) Agricultural Experiment Station near Seoul, Korea. This station was built by the Japanese during their occupation of Korea. Later it was taken over and administered by the newly formed Korean Government. Aug. 1948. (21) A Korean boy standing in a field of sorghum interplanted with soybeans; this is a common practice in Korea. 1948. (22) A boy using a shoulder pole to carry two wooden buckets of night soil to the land. Korea. 1948. (23) A wooden shopper looking over the different varieties of soybeans in the market place at Seoul, Korea. Aug. 1948. (24) Outline map of Korea showing where principal varieties of soybeans are grown, the section in which each variety is found, the acreage, and production. Address: Head of Meal Products Investigations, Oilseed Crops Lab., Northern Utilization Research and Development Div., Peoeia, Illinois.

• ***Summary:*** Fresh tofu coagulated with calcium chloride contained the equivalent of about 172 mg of calcium per 100 gm, whereas that coagulated with magnesium chloride contained the equivalent of about 60 mg of calcium per 100 gm. Address: State College of Washington, Pullman, Washington.

1513. Gandhi, Mohandas Karamchand. 1949. Diet and diet reform. Ahmedabad, India: Navajivan Publishing House. xii + 176 p. July. See p. 32, 40-41, 51-54, 136-48. 22 cm.
• ***Summary:*** The purpose of this anthology is "To bring together Gandhiji's writings [articles, essays, and correspondence] on the subject in... *Young India* and *Harijan* [1935]. Gandhiji's writings are included in Part I of this book and those of others in Part II." See also "The Moral Basis of Vegetarianism" (p. 8-12). Gandhi lived 1869-1948. Address: Bombay, India.

1514. International Nutrition Laboratory, Inc. 1949. Milk-equivalent nutrition for the whole family: The only spray-dried soya milk (Ad). *Soybean Digest.* Sept. p. 89.
• ***Summary:*** A 2/3-page vertical ad. A large photo near the

top shows cans of Miller's Soyalac Soya Milk (Spray Dried) in All Purpose and Malt Flavors and a can of Soyalac Infant Food.

The text reads: "Scoring again, the Soybean brings everyone, everywhere a delicious, palatable drink equaling cow's milk in nourishing qualities. This spray-dried all-vegetable milk is Different from liquid soy milks and is the only one which has been granted a U.S. Patent. It is an excellent, non-allergic protein beverage for the entire family. Available in two distinct flavors to suit most tastes–All-Purpose and Malt Flavor."

Note: This is the earliest English-language document seen (Aug. 2013) that contains the term "protein beverage," which probably refers to soy milk.

"Miller's Soyalac is thoroughly processed by being atomized into a sterilized chamber resulting in a quickly soluble powdered milk. Best of all it is easily digested because it forms a soft, fine curd in the stomach which speeds up absorption, giving fast fatigue-relief.

"Infant Food–Choice of doctors who know! Non-allergic and quickly assimilated by the most sensitive baby's stomach, Soyalac Infant Food assures the baby of healthy growth and balanced development. It is vacuum-packed and fortified with essential elements and vitamins. Babies love it–and thrive on it!

"Other Soya Bean Products we pack include: Green Soya Beans, Giant Select Soya Beans, Soya Beans in Tomato Sauce, Sandwich Spread and Vegetable Cheese."

A small illustration (line drawing) shows the outside of the plant in Mt. Vernon, Ohio. Address: Mt. Vernon, Ohio, Manila [Philippines], Shanghai [China].

1515. *Madison Health Messenger* (*Madison, Tennessee*). 1949. The story of Madison Foods. Vol. 49-3. p. 1-6. Undated.

• ***Summary:*** "Over 45 years ago [actually in 1904] a group of educators founded an institution in Madison, Tennessee, where special study was given to healthful living. They began by operating a school on a farm. Later a sanitarium was built. And, finally, a food production department was opened, now known as Madison Foods... People who came to the sanitarium were helped by the treatments and the plain wholesome food. However, because when they returned to their homes, they were unable to obtain some of the foods which proved helpful, many sent their orders to us for these foods. The popularity of the foods increased and now they are available in many stores throughout the 48 States."

"In 1941 a building program was started to completely rebuild the Madison Foods plant on the original site. Modern offices, adequate storage and shipping facilities, a five story production section, complete revamping of processing equipment, and a re-arrangement of the plant were realized step by step, and now the Madison Food plant, built of concrete, blocks, and steel, with tile and plastered interior, and a building of modern design for greater efficiency, stands as a monument to the devotion of its founders and the perseverance of those who carried the torch onward.

"A character builder: As part of the vocational training program at Madison College, Madison Foods is primarily concerned with building strong physical bodies and strong minds."

Photos show: (1) East side view of the new Madison Foods plant. (2) A can (with label) of Stake-Lets (the original gluten-soy product, a complete protein food, sold in 14, 20, and 30 oz sizes). (3) A young man standing next to a large autoclave used for cooking canned foods. (4) Four young ladies hand picking peanuts to insure quality. (5) Front view of the new Madison Foods plant ranging from 2 to 5 stories in height. (6) A can of Yum (14 oz, made with grains, legumes, and vegetables). (7) A young man operating an homogenizer that is homogenizing Kreme O'Soy. (8) A student operating a machine that is labeling cans.

Page 5 contains a description of the various products, with their ingredients, made by Madison Foods: Zoy-Koff–an alkaline beverage used in place of coffee. Contains no coffee–no nerve stimulants. Two grinds–regular and fine. Prepare like coffee. Ingredients: Soybeans, bran, brown

sugar. 1 lb bag.

Kreme O'Soy–a rich-bodied, homogenized soy beverage. May be used in place of milk. Ingredients: Soybeans, soy oil, dextrose, calcium phosphate, sodium chloride. 20 oz cans.

Zoyburger–excellent for sandwich spread, serve like steak with onions. Ingredients: Soybeans, gluten, raw peanut meal, vegetable seasonings. 14 & 20 oz cans.

Stake-Lets–a combination of gluten and soybeans sliced in meatlike sauce. Ingredients: Gluten, soybeans, soy sauce, seasonings. 14, 20 & 30 oz cans.

Not-Meat–a smooth-textured loaf for vegetable roasts, salads, sandwiches, etc. Ingredients: Whole peanut meal, soybeans, and seasonings. 14 & 20 oz cans.

Vigorost–a fibrous-textured vegetable steak used like meat. Also for sandwiches, salads, etc. Ingredients: Gluten, soy cheese, whole peanut meal, seasonings. 14 & 20 oz cans.

Yum–a mild bologna-like-flavored, meatless loaf, used hot or cold. Ingredients: Soybeans, gluten, soy cheese, whole peanut meal, seasonings.

Cheze-O-Soy–a curd made from soybean milk, to be used in salads, sandwiches, spaghetti, etc. Ingredients: Coagulated soybean proteins, seasonings. 14 & 20 oz cans.

Bite-Size Stake-Lets–gluten and soy bits in rich sauce simulating stewed bits of beef in rich gravy. A choice food. 20 oz cans.

"A statement of ingredients, use and recipes is on each package and can of Madison Foods."

1516. Adolph, William H. 1949. Important aspects of nutrition research in China. *Science and Technology in China* (*Nanking*) 2(5):80-83. Oct. [53 ref]

• ***Summary:*** One section titled "Vegetarian diets" discusses the nutritional value of soybeans and soybean milk. Table 1 shows the percentage of total calorie intake provided by four food groups: Cereals and legumes 88%, vegetables 5%, fats 4%, meat and eggs 3%. Table 2 shows the average per capita daily nutrient intake: Calories 2,500, protein 80 gm, fat 30 gm (11% of calories from fats), carbohydrates 480 gm, calcium 400 mg, phosphorus 1,200 mg, iron 20 mg. Address: Peking Union Medical College, Peking, China.

1517. Chatfield, Charlotte. 1949. Food composition tables for international use. *FAO Nutritional Studies* No. 3. 56 p. Oct. [158* ref]

• ***Summary:*** A table on page 11 shows "Food composition in terms of retail weight ("as purchased") for soybeans and various soybean products: Whole seeds, dry; Flour, full fat (seed coat removed); Flour, low fat–grits, flakes (partially defatted); Curd, tofu (yield 3.5); Fermented beans–Japanese natto; Fermented beans–Chinese tsiang [chiang]; Soybean milk (yield 7.5); Paste, miso (made with small amounts of rice or other starchy materials) (yield 2.5); Shoyu sauce (yield 3.5). The following are given for each product: Calories per 100 gm, percentage of protein and fat, and yield from 1 kg of soybeans.

Similar but expanded information is given on p. 25, including carbohydrate, fiber, ash, and refuse. Address: Nutrition Div., FAO, Rome, Italy.

1518. *Vegetarian News Digest* (*Los Angeles*). 1949. Health in the news: The soy bean–wonder food of many uses. 1(9):21. Sept/Oct.

• ***Summary:*** "Allan K. Smith of the Northern Regional Research Laboratory, Peoria, Illinois, recently returned to the United States from the Orient where he learned of countless uses for soy beans. In China, Japan and Korea he found soy beans being fermented, ground, and processed in various ways. In its motherland, Smith discovered, the soybean is a source of flour and cake, oil, bean sprouts, vegetable milk,

various sauces and pastes, curd, cheese, and several other foods." Describes how soy milk is made in China. One restaurant that Smith visited prepared more than 25 different dishes from soybeans.

1519. Dawn, W.J. 1949. Soy milk in Africa. *Soybean Digest.* Nov. p. 66.
• ***Summary:*** The author of this letter, who runs a home for rescued children of leprous parents, wants to learn how to make milk from soybeans or soy flour to replace expensive Klim. "We can grow the soybeans here and we can also buy them." Address: Heart of Africa Mission, Belgian Congo.

1520. Gouri Devi, S.; Ganguly, J.; De, S.S. 1949. Studies on the nutritive value of germinated soya-bean and soya-milk. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 9(5-6):213-216. Oct/Dec. [9 ref]
• ***Summary:*** "The effect of germination on the nutritive value of soyabean was studied by rat growth method and it was found that while raw soyabean powder [flour] gives a biological value of 0.95, after 48 hours germination the biological value of the soyabean powder becomes 1.33.

"The effect of germination on the nutritive value of soyabean milk was studied and it was found that on 48 hours germination the biological value becomes 1.41 where as cow's milk (from Imperial Dairy Research Institute) give 1.44.

"The effect of supplementing milk prepared from germinated soyabean with 20% cow's milk was studied and it was observed that supplementing increases the biological value." Address: Food Technology Section, Indian Inst. of Science, Bangalore.

1521. **Product Name:** Malted Milk (Soymilk), and Meat Substitutes.
Manufacturer's Name: Brilliant Foods (Formerly named Tastee Soy Foods).
Manufacturer's Address: 354 E. Girard Ave., Philadelphia, Pennsylvania.
Date of Introduction: 1949.
New Product–Documentation: Soybean Blue Book. 1949. p. 102. Not clear whether this company is a manufacturer or a handler.

1522. **Product Name:** Soy Powder for Vegetable Milk. Renamed Vi-Vi-Ta by 1958.
Manufacturer's Name: Vegetable Products Co.
Manufacturer's Address: 24 Windsor St., P.O. Box 145, Rochester, New York.
Date of Introduction: 1949.
New Product–Documentation: Soybean Blue Book. 1949. p. 102. Also listed in 1960, 1965.

1523. Balzac, S.S.; Vasyutin, V.F.; Feigin, Ya. G. eds. 1949. Economic geography of the USSR. American edition, edited by Chauncy D. Harris, translated from the Russian by Robert M. Hankin and Olda Adler Titelbaum. New York, NY: Macmillan Co. xlv + 620 p. See p. 341, 391, 404-05. Preface by John A. Morrison. 22 cm. [30+* ref. Eng]
• ***Summary:*** The section on the soybean is in Chapter VI, "Distribution of Agriculture in the USSR," under Section 6. "Distribution of Industrial Crops." "The soybean is a new crop. It has highly diverse uses in the food industry. Edible and industrial oils, flour, milk products, and other products are made from its seeds. Unripened soybeans are suitable for canning. The young plants serve as fodder for livestock. Before the Revolution sowings were insignificant. In 1937, 173,000 hectares were sown in the USSR. The soybean requires much heat–an annual total of daily temperatures not less than 2,500º. The chief regions of its distribution are the Far East (about half of all sowings), the southern part of the Ukrainian SSR, and Krasnodar Kray."

1527. **Product Name:** Dr. Fearn's Pure Soy Bean Milk Powder (for Making Soy Bean Milk).
Manufacturer's Name: Fearn Soya Foods.
Manufacturer's Address: 355 W. Ontario St., Chicago, Illinois. Phone: DELaware 7889.
Date of Introduction: 1950. March.
New Product–Documentation: Invoice dated 20 March 1950. "Dr. Fearn's Pure Soy Bean Milk Powder."

Invoice dated 5 Dec. 1951. The product name is the same but the company name has changed to Fearn Foods Co. at the same address. The telephone number is DELaware 7889.

Soybean Blue Book. 1952. p. 105. Dr. Fearn's Pure Soybean Milk Powder (for Making Soymilk). Also listed in 1960, 1965, 1970, 1977.

1528. Nicholls, Lucius. 1950. Production of milk substitutes. *Food Manufacture* (*London*) 25:95-97. March.
• ***Summary:*** Throughout most of the tropics, little or no milk is available for the poorer classes. The soya bean is good for making milk substitutes because of its high biological value.

"The bulk of milk substitutes might well be prepared from rice and soya bean." Addition of vitamins may be desirable. The Chinese have long made "soya bean emulsions. Being rich in proteins, these make good supplements in diets consisting to a large extent of rice or other cereals; yet the nutritive value of soya bean preparations is far from being equal to cow's milk because they lack several vitamins and are deficient in calcium.

"A 'soya milk' factory has been operating in Hong Kong for several years, the emulsion of the beans being prepared under sanitary conditions and issued in hermetically sealed milk bottles...

"Several soya bean preparations have been placed on the American and European markets. One of these is *Soyalac*, a spray-dried emulsion, which is claimed to be an almost complete infant food lacking only vitamin C.

"Considerable work has been done in war-devastated Italy and Germany to find a milk substitute for infants and children. One such substitute, called *Maltavena*, was produced early in 1945 by Dr. Caprina, chemist to the Perani brewery, Rome. It consisted of an emulsion prepared from a cereal [probably oats] which had been malted in the usual manner of brewers; later malted soya bean was included as well as the cereal. The idea was taken up by a British Medical Unit working in Germany, and a modified product was used with considerable success in feeding infants and children. This product has been developed on a small commercial scale under the name *Lactavena."* Address: England.

1529. Wassersug, Joseph D. 1950. The case against vegetarianism. *American Mercury* 70:407-13. April.
• ***Summary:*** The author, who tries to refute the reputed health benefits of a vegetarian diet, believes there is no scientific proof that consumption of animal foods is harmful to human beings. "It is from the medical standpoint that vegetarians have least justification for their position... Most plants do not have all the amino acids the human body needs. Unless the vegetarian diet is exceedingly well thought out, nutritional deficiencies are likely to occur... The contention that cancer is related to the diet of the individual is without scientific proof."

According to a recent report from the Milk and Food Section of the U.S. Public Health Service, milk-borne diseases have led to 804 deaths and 40,177 illnesses in the last 20 years in America. "These include typhoid fever (7,449 cases, 541 deaths), streptococcal infections such as scarlet fever and septic sore throat (182 deaths), gastroenteritis, undulant fever, dysentery, diphtheria, and other illnesses." Moreover milk and eggs are rich in cholesterol. "In recent years, scientists have found more and more reason to believe that cholesterol is a causative factor in hardening of the arteries." Address: Instructor in medicine, Tufts Medical School [Boston, Massachusetts].

1530. Van Duyne, Frances O. 1950. Recipes for using soybeans: Fresh green soybeans and dry soybeans. With directions for growing in the home garden. *Illinois College of Agriculture, Extension Circular* No. 662. 16 p. June.
• ***Summary:*** Contents: Why use soybeans: An excellent food, easy to grow in home garden. Green soybeans: Shelling and cooking, recipes, freezing, canning, drying. Dry soybeans: Using the cooked beans, using soybean pulp ("This pulp is made simply by passing cooked dry beans through a meat grinder."), roasting soybeans, making and using soybean milk, making and using soybean curd, soy sprouts. Contains 25 recipes.

Note: This is the earliest English-language document seen (June 2004) that uses the term "Fresh green soybeans" in the title. Address: Assoc. Prof. of Foods, Univ. of Illinois.

1531. *Soybean Digest.* 1950. Soy foods from a unique college [Madison]: This little Tennessee college has long been noted for its soy foods. Nov. p. 14-15.
• ***Summary:*** This is the second in a series of articles by the Soya Food Research Council. Photos show: (1) "Attractive packaging of soy foods which have been pioneered by Madison College." These include: Kreme O'Soy (sliced bread), Stake-Lets, Kreme O'Soy (canned soymilk), Cheeze-O-Soy, Zoy-Koff, Yum, Not-Meat, Zoyburger, Vigorost, Kreme O'Soy Muffins. (2) Dr. E.A. Sutherland, standing, writing in a notebook. (3) A young man operating an homogenizer that is homogenizing Kreme O'Soy.

"Down in Tennessee nearly a half century ago Dr. E.A. Sutherland was obsessed with an irrepressible idea. He believed that any boy or girl willing to work for a college education should not be denied the right. He set out to achieve that end and succeeded against overwhelming odds.

"Madison College, at that time styled Nashville Agricultural Normal Institute, had only these assets: 11 students, some tumbled down buildings, and 400 acres of tired, soil-depleted land. Those acres had been bought by Dr. Sutherland and a small group of teachers with their last dollars.

"Today Madison College at Madison, Tennessee, has 4O0 students from 40 odd states and many foreign lands. Without endowment, as such for operating expenses, it has poured almost a million dollars from its own earnings into buildings, lands and farm equipment. Down south it is referred to as 'the college with a soul.'

"Soy Spotlighted: Of course Madison College lacks some of the gay social activities and other distractions that drain time and energy of students in many big-name institutions of learning. But students at Madison enjoy life. They are a determined lot, dead set on acquiring an education. The curriculum includes a variety of campus industries, in which students cooperate to support the college and themselves. Soy has a spot-lighted place in the over-all

program.

"Under the Madison plan as set up by Dr. Sutherland every student must work for at least half, and preferably all of his academic expenses. Two-thirds of the students enter the college with only the required fee of $50. They complete a 4-year college course for a B.S. degree and may graduate with the original deposit intact. In all that time the efficient hard-working student need receive no outside help. Moreover, he will leave the college well equipped to do more than a single job.

"Before launching his experiments at Madison, busy Dr. Sutherland had been president of two colleges. At the outset his chief problem was to provide an income for the new school. This he did by farming and establishing a sanitarium. This permitted the training of health workers as well as the care of ill students. To do the job right, he discovered, he should be fully qualified as a medical scientist. He had set a rugged course for his students–they work 5 hours and study 5 hours a day the year round–and he was even less considerate of his own schedule. On top of all other duties he studied medicine for 4 years at Vanderbilt University Medical School and the University of Tennessee Medical School and finally, at the age of 50, received his M.D. It is inspiring today to go through the Madison Rural Sanitarium and Hospital with its large staff of physicians, its patient capacity of 165 and its complete modern medical equipment. Much of the work of the institution is done by students who earn while they learn. The best hospitals snap up the graduate nurses. Many of its students have matriculated in medical schools, colleges and universities and have been awarded Baccalaureate, Masters, and Doctorate degrees.

"Of the foresighted Dr. Sutherland it has been said: 'In any field, in any land, he would have been a great success.'

"By Student Effort: His enthusiasm and determination were infectious. That helps explain how the many college and sanitarium buildings, cottages and dormitories on the 900-acre grounds have been built with students supplying much of the brawn and brain; how the biology class grows many of its excellent specimens; how physics students have built much of their own equipment; and why there are more student applicants than can be admitted.

"Madison is justly proud of its school farm, which is as important economically as its Sanitarium, with its sprawling acres of gardens, fruit trees, vineyards, its greenhouses of flowers for hospital rooms, and its fine dairy.

"Madison is also noted for its 27 years of practical research in special foods development. This research has distinguished the institution as a unique center and pioneer of soy food development primarily intended for human use.

"Long ago it became evident that the new foods being fashioned at Madison–where good health and strong bodies always have been a chief aim–were too useful to be confined to campus menus. Accordingly, Madison Foods was founded, and has grown steadily over the years.

"It came about in this way. Dr. Sutherland and his associates believed in a simple life. They were convinced that plain wholesome foods–such as whole wheat bread and whole grain cereals, fresh fruits and vegetables, nuts, dates, honey and soy protein–helped patients to early recovery and contributed to permanent good health. Many of these patients, after returning to their homes, ordered these foods in ever-increasing volume. Demand grew until it became necessary to put them into retail stores and now they may be purchased in all 48 states.

"Convinced long ago of the high nutritive value of soy protein, Madison food chemists experimented with more than 200 varieties of soybeans. They solved the taste factors, and went on with the creation of savory breakfast foods, bread, coffee substitutes, soy milk, various meat substitutes, and other products.

"Through measured scientific research they developed soy milk until now it is not only as economical as special formula cow's milk but, according to the American Medical Association Journal, better for some babies. From Africa, India, and other countries where dairy cows and cattle are scarce, observers have come to study the methods of Madison's soy milk 'dairy' and its 'vegetarian slaughter house.'

"Today many authorities believe that a properly prepared dry soy milk powder would help to solve the child feeding problems in protein-starved nations of the Orient and in Latin-American countries, and research to that end is in progress.

"More Frontiers: Food scientists at Madison, dipping deeper and deeper into the protein mysteries of the soybean, are convinced that new frontiers will be pierced, and that the astonishing progress already made is but a prelude to a much greater future.

"Meantime, 85-year-old Dr. Sutherland, the man who made a dream come true, has lightened his daily load, but still carries on many duties. He is president of the Layman Foundation, member of the board of directors of Madison College and of a half dozen other rural schools in the South which he was instrumental in developing.

"In Dixieland they say 'the college with a soul' is but the lengthened shadow of a great man, a man with the courage to fight for an ideal."

1532. *Indian Farming.* 1950. Research on soya bean in the Punjab. 11(11-12):547-48. Nov/Dec.

• ***Summary:*** Discusses soybean breeding, agronomy, chemical composition, and utilization in the diet (as flour, soybean milk, and tofu). "Soybean milk has a peculiar flavour and taste but the curd prepared from it is palatable."

"A scheme for research on soyabean has been in operation at Lyallpur, in the undivided Punjab, from 1944 to 14 August 1947; after the partition [of the Punjab between India and Pakistan], it was transferred to Ludhiana, and it

finally terminated on 31 March 1950." About 90 soybean varieties collected from India and abroad were tested during the years 1947-50. The erect and compact varieties ripened earlier than the erect and loose; the viny creeping types were late maturing. The yellow-seeded varieties had a higher protein content than the black, chocolate, or green-seeded ones. Natural shattering was absent in Behrum varieties. Varietal trials showed that Punjab-1 was much superior to the other varieties and yielded as much as 2,791 lb/acre. Average field germination of 50% was increased to 80% by soaking the seed in water for 12 hours before planting. Address: India.

1533. Gómez, F.; Ramos, R.; Bienvenu, B.; Cravioto, F. 1950. The recuperation of undernourished children using proteins of vegetable and animal origin (Abstract). In: Report of the 6th International Congress of Pediatrics, Zurich. Summaries of communications. See p. 26. *
• ***Summary:*** Gomez and his co-workers at the Mexico City Children's Hospital obtained satisfactory results with two groups of undernourished schoolchildren kept under observation for 6 months, by using two diets, each containing 50 gm of protein. In one diet, 22 gm of protein were provided by milk and eggs, while in the other, 20 gm of protein were provided by soybeans. Examinations included the measurement of weight, height, haemoglobin content, and serum protein, plus observation of the effect of the diet on ocular lesions due to avitaminosis. Address: Mexico.

1534. **Product Name:** ViVi-Ta Hi-Fat Soy Flour, Soy Flakes, Soy Powder for Vegetable Milk (Renamed Vi-Vi-Ta by 1958).
Manufacturer's Name: Vegetable Products Co.
Manufacturer's Address: 510 S. Clinton St., Syracuse, New York.
Date of Introduction: 1950.
New Product–Documentation: Soybean Blue Book. 1950. p. 86.

1535. Coorengel, G.B. 1950. Katjang kedelai [The soybean]. Jakarta: Balai Pustaka. 34 p. 20 cm. [Ind]
Address: Jakarta, Indoensia.

1536. Masuno, Minoru. 1950. Daizu to sono riyô [The soybean and its utilization]. Tokyo: Sangyo Hyoron-sha. 197 p. [Jap]
• ***Summary:*** A very nicely done predecessor to Watanabe et al.'s book *Daizu Shokuhin.* Address: Tokyo Daigaku Kyoju, Kôgaku Hakase, Japan.

1537. Morse, W.J. 1950. History of soybean production. In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 3-59. [59 ref]
• ***Summary:*** Contents: 1. Origin. 2. Ancient history. 3. Modern history. 4. Description of soybean plant. 5. World distribution. 6. Climatic adaptations. 7. Soil preferences. 8. Soil erosion and practices. 9. Varieties and variety improvement. 10. Fertilizer and lime requirements. 11. Inoculation. 12. Cultural methods: Preparation of seedbed, methods of seeding, time of seeding, rate of seeding, depth of seeding, cultivation. 13. Rotations. 14. Mixture with other crops. 15. Hay production. 16. Seed production. 17. Soil improvement. 18. Diseases. 19. Insect enemies. 20. Other enemies (rabbits, pigeons, pheasants).

This chapter contains many original, interesting photos and a map. Figures (photos unless otherwise indicated) show: (1) Wild soybeans, cultivated soybeans, and *Glycine gracilis.* (2) Unloading soybeans from farm carts and storing the seed in osier bins in a Chinese merchant's storage yard–Manchuria. (3) Map of the principal soybean seed producing areas and countries of the world. (4) A soybean grain market in Korea. (5) "Fertilizer used for soybeans by Manchurian farmers is compost placed in piles in the field and scattered between rows of previous year's crop just before planting soybeans." (6) Roots of soybean plant (2 photos) showing abundant development of nodules. (7) Ordinary grain drill (pulled by a tractor) may be used in sowing soybeans in rows or close drills. (8) Soybeans sown by hand on ridges in rows about 21 inches apart in Manchuria. Two horses pull a wooden plow. (9) Korean woman planting soybeans along ridged rows. (10) Soybeans planted along edges of rice paddies in Japan, China, and Korea are used for home consumption. (11) Cultivating soybeans in rows, using a tractor-pulled rotary hoe, weeder, or harrow, in the Corn Belt. (12) Hand-cultivation of soybeans in Manchuria. (13) A field of plants: "The Korean farmer grows many other crops with soybeans: millet, mung beans, buckwheat, sesame, susu, or castor beans." (14) A field of soybeans and Kaoliang in China planted in alternate hills. (15) The combine has been one of the most important factors in the economic production of soybeans in the United States. (16) Harvesting soybeans by hand methods in Manchuria. (17) Threshing soybeans in Manchuria using a stone roller pulled over the plants by horse or donkey. (18) Primitive wind method of separating soybean seed from threshed plant material in Manchuria. (19) Korean farmers threshing soybeans with bamboo flails on the home threshing ground. (20) Japanese farmers turning under soybeans in a rice paddy for soil improvement. Address: 6809 Fifth St. N.W., Washington, DC; formerly Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, USDA, Beltsville, Maryland.

1538. Morse, W.J. 1950. History of soybean production: 9. Varieties and variety improvement (Document part). In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons.

xvi + 1145 p. See p. 17-23.

• ***Summary:*** "Varieties of soybeans are very numerous [especially in East Asia], no doubt because of the fact that the soybean seems to be peculiarly sensitive to changes of soil and climatic conditions." Differences in behavior of the same pure-line variety in different locations are often so striking that it is difficult to believe that the variety is the same.

In China, soybean varieties are quite numerous and "are classified according to color, size, shape, time of planting, method of planting and use. The local names of varieties differ in different localities so that it is very difficult to obtain a variety which is widely known." There has not been much organized research on soybean varietal improvement in China. "The University of Nanking has done more work of this kind than any other organization."

Although many soybean varieties are grown in Manchuria, only three types are distinguished: yellow, green and black. This has apparently been found adequate for commercial purposes. In detail, these three groups are:

(1) Hwang Tou–yellow beans. (a) Pei Mei (white eyebrow, pale hilum). (b) Chin Huang (golden yellow or golden round). (c) Hei Chi (black belly), dark hilum. These three varieties are highly prized for the quality of their oil, but Pei Mei and Chin Huang are also valued for the soybean curd [tofu] made from them.

(2) Ching Tou–green beans. (a) Green with yellow germ or cotyledon. (b) Green with green germ or cotyledon. The green bean with the yellow germ yields more soybean curd but of an inferior quality compared to that of the yellow varieties. The green bean with the green germ is preferred for making sprouts.

Hei Tou or Wo Tou–black beans. (a) Ta Un Tou (large, black), green germ. (b) Hsia Un Tou (small, black), yellow germ. (c) Puen Un Tou (flat, black), yellow germ. The Ta Un Tou is used for oil, the Hsia Un Tou for oil and Horse feeds, and the Puen Un Tou for salted fermented soybeans [fermented black soybeans].

"Most of the varieties grown by Manchurian farmers consist of a mixture of varieties of which more than 90% are yellow-seeded types." The distribution throughout Manchuria of the various types is discussed. Native Korean soybean are classified into eight different groups.

Since 1898 the USDA had brought into the United States more than 10,000 introductions from China, Manchuria, Korea, Japan, India, Netherland Indies [Indonesia], South Africa, and several European countries.

Table 1 (two pages) shows the "Characteristics of soybean varieties most generally grown in the United States," arranged into seven groups from very early to very late maturity. For each variety in every group is given: Seed color (black, brown, green, olive or greenish yellow, straw yellow), hilum color (black, brown, dark brown, light brown, pale), seeds per lb., oil %, protein %, iodine value (range: 119 to 140), pubescence color (gray, or tawny), flower color (purple, white, or purple & white), shattering (little, medium, or much), and use (commercial {grain or oil and meal}, forage, or vegetable). The groups are: (1) Very early: Agate, Capital, Cayuga, Flambeau, Goldsoy, Habaro, Kabott, Mandarin, Mandarin 507, Mandarin (Ottawa), Minsoy, Ontario [developed in USA], Pridesoy, Sac.

(2) Early: Adams, Bansei, Earlyana, Hawkeye, Illini, Kanro, Lincoln, Manchu, Manchu 3, Manchu 606, Manchukota, Mendota, Montoe, Richland, Seneca.

(3) Medium Early: Chief, Dunfield, Hokkaido, Hongkong, Jogun, Mandell, Mingo, Mukden, Scioto, Viking.

(4) Medium: Aoda, Boone, Funk Delicious, Gibson, Kingwa, Macoupin, Mount Caramel, Patoka, S100, Virginia, Wabash, Wilson.

(5) Medium late: Arksoy, Arksoy 2913, Haberlandt, Laredo, Ogden, Ralsoy.

(6) Late: CNS, Mamloxi, Mammoth Yellow, Palmetto, Roanoke, Tanner, Tokyo, Volstate, Woods Yellow.

(7) Very late: Acadian, Avoyelles, Gatan, Otootan, Pelican, Seminole, Yelnando.

"Varieties now grown in the United States may be divided into three general groups, namely commercial (grain), vegetable, and forage. Varieties for commercial seed production are preferably yellow-seeded and are used largely for processing for oil, meal, and soybean flour, but these varieties may also be used for forage purposes if heavier rates of seeding are used. The varieties used principally for forage and green manure are the black- and brown-seeded varieties, which for the most part are low in oil but yield a finer and heavier forage than the commercial and vegetable varieties.

"The term 'vegetable varieties' has been applied to varieties introduced from oriental countries where they are used solely as green vegetable or dry, edible soybeans. In extensive tests of the quality of the green and dry beans made by the Bureau of Human Nutrition and Home Economics, Department of Agriculture, and by departments of home economics of various agricultural colleges, the vegetable varieties have proved much superior to the field or commercial varieties in flavor, texture, and ease of cooking. Many of these vegetable types have been found through experiments to be superior to commercial types for soybean milk, soybean flour, soybean curd, salted roasted soybeans, and other food products. (See Chapter XXV). The varieties used for processing and forage purposes usually do not cook easily and have a raw 'beany' flavor. Nearly all vegetable varieties cook easily and have a sweet or bland nutty flavor. The most suitable vegetable varieties are those with straw-yellow, greenish-yellow, or green seed, although a few black, brown, and bicolored varieties do have superior qualities as green shelled beans. Vegetable varieties, ranging in maturity from 75 to 175 days, have been developed for all soybean-producing areas in the United States.

"Several commercial companies have canned large packs of the green shelled beans of the vegetable varieties. Quick-frozen green shelled beans alone and in succotash have been placed on the market by several companies, the frozen product being highly satisfactory in color, texture, and flavor. For canning or quick freezing in the green stage, the yellow- and green-seeded varieties make a more attractive product than the black-, brown-, or bicolor-seeded varieties. Vegetable varieties have also become quite popular with the home gardeners and many seedsmen in various sections handle two or more varieties" (p. 22).

Listed from very early to very late, vegetable varieties include: Agate, Sac, Bansei, Kanro, Mendota, Hokkaido, Jogun, Aoda, Funk Delicious, and Seminole. Address: 6809 Fifth St. N.W., Washington, DC; formerly Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, USDA, Beltsville, Maryland.

• ***Summary:*** The iron in soybean flour and soyamilk is well utilized by rats. Address: Food Technology Section, Indian Inst. of Science, Bangalore.

1540. Worth, Miklos. 1950. Soyabeans: The fabulous food that supplies meat, milk, cheese, proteins, amino acids, vitamins, minerals. New York, NY: Ideal Health Books. 62 p. A MacRichard publication.
• ***Summary:*** This book consists of many short chapters. Contents: The bean that is not a bean. A therapeutic substance. Chemical requirements of life. Natural foods supply basic needs. Disease–A disturbance of mineral salt balance. Essentials in man's diet. The big five. A balanced mineral supply. Soybean oil valuable to health. Carbohydrates in soybeans. A storehouse of vitamins. How vitamins are to be used. Soyabeans in Rheumatism. Nervous exhaustion. Rickets. Gastro-intestinal disorders. A perfect food for invalids. Constipation. Obesity–An easy way to reduce. Loss of weight. Dandruff and loss of hair. Eczema and other skin disorders. Sciatica. Hardening of the arteries. Excellent food for diabetics. An excellent blood builder. Soyabeans influenced civilization. The poor man's meat. Introduction to America. Revolutionizing modern economy. Soyabeans could enrich the diet. How to make soya milk. Soyabean sprouts. Soyabean curds. Soyabean coffee. Soyabean oil. How to cook soyabeans. Soyabean flour in baked products. Its use in green salads. Soyabean sauce. Health through soyabeans.

Chapter 1 begins: "Soyabean, the wonder-plant of the Far East that has given sustenance to the peoples of the Orient since time immemorial, is not only a nourishing food, but plays a host of roles in natural health because of its medicinal and therapeutic properties... There is no other single plant known to man which yields such bounty of goodness. All the essential ingredients for health and long life are gathered and packaged in this singular food."

Note 1. This is the earliest English-language document seen (April 2013) that uses the term "soyabean curds" to refer to tofu.

Note 2. This is the earliest English-language document seen (Jan. 2013) that uses the term "soyabean sprouts" to refer to soy sprouts.

Note 3. This is the earliest English-language document seen (Nov. 2012) that uses the term "soyabean coffee" to refer to soy coffee.

Note 4. This is the earliest English-language document seen (April 2012) that uses the term "soyabean sauce" to refer to soy sauce.

Note 5. This is the earliest English-language document seen (Oct. 2001) that uses the term "soyabean flour."

1541. **Product Name:** Loma Linda Soyalac Infant Powder (Soy-Based Infant Formula).
Manufacturer's Name: Loma Linda Foods.
Manufacturer's Address: 11503 Pierce Place, Arlington, California.
Date of Introduction: 1951. January.
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable.
New Product–Documentation: H.F. Meyer. 1960. Infant foods and feeding practices. A photo (p. 82) shows this canned product. A photo of a baby's face appears on the front panel. See also p. 88 and 90. Page 121 gives a detailed analysis of the product. The powder, after being reconstituted, contains: Fat 3.2%, protein 2.85%, carbohydrates 5.4%. Calories per ounce: 18. Tablespoons per oz.: 4. Added vitamins and minerals: ferrous sulphate, calcium carbonate, dibasic calcium phosphate. Affected by terminal sterilization: No. How formulated or reconstituted: 1 vol. milk to 7 vols. water. Chemical definition and essential clinical uses: "Contains soya bean solids, dextrose, maltose, dextrins, sucrose, soya oil. A spray-dried soya food to serve the nutritional needs of the bottle-fed infant. Completely soluble and formulated to simulate human milk. Used for infants allergic to dairy milk." Meyer gives the manufacturer as International Nutrition Laboratories, but with two addresses: 11503 Pierce Place, Arlington, California, and Box 388, Mt. Vernon, Ohio.

1542. **Product Name:** Loma Linda Soyalac Infant Concentrate (Liquid Soy-Based Infant Formula).
Manufacturer's Name: Loma Linda Foods.
Manufacturer's Address: 11503 Pierce Place, Arlington, California.

Date of Introduction: 1951. January.
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable; refrigerate after opening.
New Product–Documentation: H.F. Meyer. 1960. Infant foods and feeding practices. A photo (p. 82) shows this canned product. A photo of a baby's face appears on the front panel. See also p. 88 and 90. Page 121 gives a detailed analysis of the product. The liquid concentrate, after being reconstituted, contains: Fat 4.0%, protein 2.05%, carbohydrates 6.0%. Calories per ounce: 20. Added vitamins and minerals per quart: vitamin B-12–2 micrograms, vitamin A–3,0000, vitamin D 400, salt, calcium gluconate, calcium hydroxide, ferrous sulphate. Affected by terminal sterilization: No. How formulated or reconstituted: 1 can milk to 1 can water. Chemical definition and essential clinical uses: "Similar to Soyalac Infant Powder but in liquid form." Meyer gives the manufacturer as International Nutrition Laboratories, but with two addresses: 11503 Pierce Place, Arlington, California, and Box 388, Mt. Vernon, Ohio.

1543. Cravioto, Rene O.; Massieu, G.H.; Guzman, J.G.; Cravioto, O.Y.; Gomez Pagola, J.; Calvo de la Torre, J. 1951. Posibilidad de utilizar en la alimentación mezclas de leche y productos de soja [Possibilities of using mixtures of dairy milk and soy products in the diet]. *Ciencia* 11(1/2):37-40. Feb. 15. [11 ref. Spa; eng]
• ***Summary:*** "Replacement of 50% of milk by soyabean flour or milk of soya [soymilk] does not affect deeply its nutritive value." Address: Instituto Nacional de Nutriologia, Secretaria de Salubridad y Asistencia, Mexico, D.F.

1544. Nicholls, Lucius. 1951. Tropical nutrition and dietetics. 3rd ed. London: Baillière, Tindall and Cox. ix + 476 p. Feb. Illust. 24 cm. [40+* ref]
• ***Summary:*** Table XI (p. 22), "Chemical and biological evaluation of proteins for growing rats," contains 6 columns: Foodstuff, digestibility, Biological Value, Net Utilisation [NPU], Protein efficiency ratio, chemical score, and limiting amino-acid. "There is agreement in all methods of the high value of milk, eggs, and other foods of animal origin, and among those of vegetable origin, the proteins of soya bean flour hold a high place." Values for soya bean curd [tofu] are also included. The next section is on supplementing proteins.

The long section titled "Pulses (legumes)" (p. 219-35) has this contents: Introduction. Dhals (Dals; peas which have been shelled, split and polished). Peanut. Bambara earth pea (*Voandzeia subterranea*). Soya bean: Importance in Asia, used in may forms: Nearly-ripe seeds [edamamé or green vegetable soybeans], dry seeds, soya bean emulsion ('Milk'–contains a detailed description of how soya milk [Vitasoy] is made in Hong Kong, including exact amounts of all ingredients for 800 oz and the nutritional composition (%)), soya bean curd (may be smoked or dried), fermented curds [fermented tofu], fermented beans (témpé), soya bean sauce, sprouted soya beans, soya bean flours, mixtures of soya beans and cereals, milk substitutes (for infant feeding in China). The genus Phaseolus may be divided into two types: Those of Asian origin and those of New World origin (Americas). Cow pea (*Vigna sinensis, V. unguiculata, V. sesquipedalis*). Egyptian kidney bean (Dolichos lablab). Horse gram. Chick pea. Cluster bean (*Cyamopsis psoralioides*). Four-angled bean or Goa bean (*Psophocarpus tetragonolobus*). Locust bean (*Ceratonia siliqua*). African locust bean (*Parkia biglobosa, P. filicoidea*). Sword bean (*Canavalia gladiata*). Jack bean (*Canavalia ensiformis*). Velvet bean (*Mucuna* spp.). Honey locust (*Prosopis juliflora*). Garden pea (*Pisum sativum*). Broad bean (*Vicia faba*–not a tropical plant). Yam bean (*Pachyrrhizus erosus*). West Indian locust (*Hymenæa courbaril*). Madras thorn (*Pithecellobium dulce*).

Phaseolus–Asian: *Phaseolus aureus:* green gram [mung bean]. *Phaseolus mungo:* black gram. *Phaseolus calcaratus:* rice bean. *Phaseolus actinifolius:* moth bean. *Phaseolus angularis:* adzuki bean. New World: *Phaseolus lunatus:* lima bean. *Phaseolus vulgaris:* kidney bean. *Phaseolus multiflorus:* scarlet runner. The subsection titled "Substitutes for milk" (p. 231-35) discusses soya milk. Goitrogenicity of [raw] soya beans (p. 376). Saponins in foodstuffs (incl. soya bean; p. 385). Table 62 (p. 404-05) gives the botanical name and composition of pulses, incl. soya bean, soya bean curd, soya bean milk, carob bean, Goa bean, tepary bean. Table 66 (p. 410-11) does the same for fresh legumes, incl. broad bean, French beans, pea, pea nuts, and sprouted soya. Table 67 does the same for nuts, oil seeds, and miscellaneous seeds, incl. almonds, coconut, coconut "water," coconut "milk," linseed, pumpkin seed, sesame (gingelly), sunflower seed, and sunflower seed (kernel).

Note 1. This is the earliest English-language document seen (Oct. 2011) that uses the term "fermented curds" to refer to fermented tofu.

Note 2. The title C.M.G. (Companion of St. Michael and St. George) is an honor conferred upon those for distinguished service in the British colonies or commonwealth.

Also discusses: Marmite (autolysed yeast, p. 158, 302). Fluorine in teeth and fluorosis (p. 170, 38). The many species of millet and sorghum (p. 216-18). Coconut, coconut milk, palm oil, red palm oil benniseed of Nigeria, gingelly oil, sesame, sim-sim, til (p. 254-60). Yeast (dried; Torula utilis, Brewers' yeast, Bakers' yeast, Marmite) (p. 302-03).

Lucius Nicholls was born in 1884. Address: C.M.G., M.D., B.C., B.A. (Cantab.). Late Director of Bacteriological and Pasteur Institutes, and Director of Div. of Nutrition, Ceylon; Lecturer in Nutrition, Ceylon Univ.; Late Lecturer on Tropical Medicine, Ceylon Medical College; Nutrition Adviser to Commissioner General, South East Asia. Presently at Cookham Dean [just west of London, England].

1545. Rajagopalan, R.; De, S.S. 1951. Agricultural and economic aspects of "soya milk" production. *Indian Farming* 12(1/2):4-7. Jan/Feb. [5 ref]
• ***Summary:*** Contents: Introduction. Good substitute. Growing soyabeans. Yield of milk from cow. Immense possibilities.

Tables: (1) Composition of the residue [okara] obtained from the processing of soyabean milk. On a dry basis it contains 57% proteins, 6% fat, and 12% fibre. (2) Yield of proteins per acre from grass, groundnut, beans, wheat, milk, and meat (ox). (3) Approximate annual yield of milk per cow in provinces and States of India (ranges from 65 lb per year in Central Provinces to 1,315 lb in Sind).

Concludes: "The foregoing observations would serve to indicate the immense possibilities of producing large quantities of soyabean milk and thus meeting the requirements of the growing and under-nourished population. Although soyabean milk may not be considered as nutritive as cow milk in all respects, the vegetable milk, besides being cheap, has certain special advantages."

"In view of the fact that the *per capita* consumption of milk and milk products in India is extremely poor, both on account of inadequate supplies and high cost, soyabean milk could make up this deficiency to a very considerable extent and be within the easy reach of even the poorer class." Address: Food Technology Lab., Indian Inst. of Science, Bangalore.

1546. Porterfield, W.M., Jr. 1951. The principal Chinese vegetable foods and food plants of Chinatown markets. *Economic Botany* 5(1):3-37. Jan/March. See p. 5-9. [68 ref]
• ***Summary:*** The soybean "is referred to by Chinese as 'the poor man's meat and the poor man's milk.'" In New York City, soybeans are sold in Chinese shops in three main forms: seeds [whole dry soybeans], bean sprouts, and bean curd. Soy sauce and soybean oil are also available. Soy sauce "is a heavy dark fluid which is used as a condiment to supply saltiness that brings out flavor,..."

When soybean milk is heated, a skin [yuba] such as forms on milk rises to the surface. Other [Western] uses of soybeans include soybean flour, meal, lecithin, shortenings, and margarine.

Nitrogen fixation takes place in the nodules of the soybean plant, which makes it useful as a green manure. Crude soybean oil goes into the manufacture of soap (both soft and hard). Soybean meal can be used to make plastic and "protein fibers" which are called "soybean wool. "During the war about 1,000 pounds of soybean wool were produced each day, and all of it went into the winter uniforms of the armed forces."

Some 36 different varnishes with 100% of their oil content as soybean oil have been developed and given exposure tests. A rubber substitute named "norepol" has been developed and can replace rubber in "insulation, shoe heels, fruit-jar rings, gaskets, and tubing." Soybean protein has been used as a stabilizer in fire-fighting foam. Other industrial uses, which are too numerous to mention, include enamels, printing ink, linoleum, foundry cores, glycerin, notepaper, and billiard balls. In the United States, soybean crops and products create an annual income of $45 million.

Tables show: (1) Nutritional composition (on an "as-is" basis) of: "Bean cheese (Tou-fou; 13.5% protein). Soybean milk (3.13% protein). Bean oil (Tao-yu; 7.49% protein). Soy sauce (Tao-jung; 12.67%). (2) Nutritional composition of soybeans.

Half-page photos (each with a black background) show: (1) Bean sprouts ready for cooking. (2) A square of firm "Tou-fu, bean curd, a cheese made from soybeans." Address: 3334 Prospect Ave., N.W., Washington &, DC.

1547. Rich, Robert E. 1951. Rich's testimony. I. Buffalo, New York. 7 p. March. Unpublished manuscript.
• ***Summary:*** Frank S. Mitchell, a former early key employee of Rich Products Corp., sued Rich Products Corp. and Robert E. Rich. On 7 Feb. 1951 a summons was served on the defendants. This draft was presumably prepared in anticipation of a hearing which was scheduled from 19 March 1951. The testimony contains a detailed early history of Rich Products Corp. and its relationship with Frank Mitchell seen from Robert Rich's point of view.

"When in Detroit, serving as Milk Administrator for the War Food Administration, I became interested in a filled cream called Devonshire Topping. This product had a milk base and any product combining milk and vegetable fat is not allowed to be sold in New York State.

"However, the purchasing agent of the Ford Hospital [in Dearborn, Michigan] came to my office one day on another matter, and during our conversation he told me that the Ford Motor Company was making soybean milk and soybean cream at their laboratory, the George Washington Carver Laboratory, and that this soy milk and cream was being used exclusively in the Ford Hospital. He advised me further that one of the employees at the George Washington Carver Laboratory had been attempting to interest the Devonshire Topping people in placing a whole soy cream on the market instead of the milk base soy cream that they were making at that time. He mentioned that the Ford Company was going to sell the rights to the continuous flow soybean milk extraction to the Devonshire Topping people for $1.00 a year. He mentioned further, he was sure the Ford Company would make the same offer to any other company deciding to manufacture a soybean milk or cream.

"Several weeks later, Mr. Sam Lustig, Manager of Dealer Dairy Products, Detroit, came to see me and advised me that Devonshire Topping was making plans to put a whole soy cream on the market. He stated, that he had been granted the franchise for this product for New York and Pennsylvania and wondered if I would be interested in

distributing this product in the Buffalo area. I advised him I was interested and we arranged tentatively for the rights to distribute in Syracuse, Rochester, Buffalo and Erie.

"About a week later, Lustig called and advised me that it would not be possible for him to grant us the distribution in the area mentioned, as Mr. Taylor, the head of the company placing Devonshire Topping on the market, did not want to deal with dairies, but rather with jobbers, who were handling noncompetitive products that were held at dairy case temperature.

"Shortly after obtaining this information from Mr. Lustig, I requested our dairy sales manager to go to Toledo and purchase some of the whole soy cream that Devonshire Topping had just placed on the Toledo market. Mr. Hannon purchased eight or ten samples in Toledo and flew them back to Buffalo. I immediately took several of these samples downtown to Dr. Alexander Schwarcman, who is Research Director and Vice President of the Spencer Kellogg Company. I whipped up one of the samples to show Dr. Schwarcman the whipping ability of this product and told him I wished to breakdown the product and manufacture a similar product in Buffalo, in as much as, the Devonshire Topping people did not wish to do business with us. Dr. Schwarcman, after studying the ingredients, advised me that such a product could be placed on the market at a price much lower than dairy cream."

Mr. Chase, in charge of sales of edible fats for the Spencer Kellogg Co. advised Mr. Rich "that there were several chemists working for the Spencer Kellogg Company, who would be interested in earning some extra money working on the breakdown of this product after hours. At that time he mentioned the name of Frank Mitchell, a friend of his." The following Saturday Mitchell expressed interest in doing the work. Mr. Rich "gave him several samples of a new batch of the soy cream which I had purchased in Detroit the previous week, as Devonshire Topping had turned over part of their production to a whole soy cream topping, which they sold in addition to their topping with a milk base." Mitchell worked on developing the product, aided by information from the Buffalo Testing Laboratory. "However, it took slightly longer than we had anticipated and we [Rich Products Corp.] did not put a soy cream on the market until the last day of March [1945] instead of early March as we had hoped.

"During this time I was working with Mr. Howard Fanet, president of the R.G. Wright Company, on picking up used pieces of equipment that could be used in the manufacture of the soy cream itself. This equipment included two Cherry Burrill pasteurizers, a Manton Gaulin homogenizer, a surface cooler, a Cherry Burrill filler and the necessary amount of tin copper piping lines. This was the equipment we needed with the exception of the equipment necessary to make the soy milk which we were going to use as the base and which Mitchell was working on at that time. In the meantime, we were attempting to obtain the authorization from the Ford Motor Company for the use of their patent, which we had been given to believe would be granted us for $1.00 per year. We were not successful in our attempt, so I asked Mr. Faust if he would go to Detroit with Mr. Mitchell and look at the equipment being used at the George Washington Carver Laboratory for the manufacture of the soybean milk base. This he did and when he returned he advised me that the same work could be done by a batch system with the addition to our equipment of a 300 gallon extraction tank, two 300 gallon settling tanks and a clarifier. This equipment was purchased and once it was set-up, we obtained a 43% extraction, which was considerably higher than the extraction obtained by the Ford Company on the continuous flow system."

"On February 21, 1949, Mr. Mitchell incorporated as Mitchell Food, Incorporated and began the manufacture of a soybean cream similar to ours. He attempted without much success, to obtain our customers for his product. He was of considerable nuisance but not much competition." Continued. Address: Rich Products Corp., 1145 Niagara St., Buffalo 13, New York. Phone: GArfield 3211.

1548. Wallace, H.D.; Loosli, J.K.; Turk, K.L. 1951. Substitutes for fluid milk in feeding dairy calves. *J. of Dairy Science* 34(3):256-64. March. [16 ref]

• ***Summary:*** Table 2 (p. 257) shows that "high fat soya flour" was used at the level of 20% in formula No. 4.

"Mixtures containing 20 per cent of high-fat soya flour, or dried beet pulp, or as much as 60 per cent of dried whey resulted in slower growth rates and more digestive disturbances than the other mixtures studied." Address: Animal Nutrition Laboratory, Dep. of Animal Husbandry, Cornell University, Ithaca, New York.

1549. Sternberg, S. David; Greenblatt, I.J. 1951. Serum protein values in infants fed soya-bean milk. *Annals of Allergy* 9(2):190-94, 204. March/April. [8 ref]

• ***Summary:*** "In the course of caring for infants fed cow's milk formulas, the pediatrician may be faced with the necessity of removing milk from an infant's diet because of allergic reactions such as eczema, vomiting, diarrhea, abdominal cramps, and various manifestations in the respiratory tract.

Milk sensitivity may be classified into three types: (1) Species specific factor of cow lactalbumin. (2) Common factor to both cow and goat lactalbumin, (3) casein.

"In group (1) a change to goats milk is indicated. In group (2) Goat's milk may give little improvement. In group 3 goat's milk is valueless. Therefore Hill has stated that he often prefers to do away with milk entirely if milk sensitivity exists. As a substitute for animal milk various 'milks' from a vegetable source have been utilized."

We therefore decided to conduct the following study "to

determine the effects on serum proteins of infants fed 'milk' prepared from soya-beans for the first three months of life." Address: 1. M.D.; 2. PhD. Both: Dep. of Pediatrics and Dep. of Biochemistry, Beth-El Hospital, Brooklyn, New York City, NY.

1551. *Soybean Digest.* 1951. Accept "Soyalac" as infant food. July. p. 22.
• ***Summary:*** "'Soyalac,' a vegetable milk produced by the International Nutritional Laboratory, Mt. Vernon, Ohio, has been accepted as an infant food by the Council on Foods of the American Medical Association, Dr. H.W. Miller, the president announces.

"Miller began development of 'Soyalac' in China over 15 years ago. It is prepared from the valuable protein and oil of the soybean. Its carbohydrates are a combination of sugars and it is reinforced with minerals to build it up into infant food to care for nutrition problems from birth to weaning time.

"'In order to meet the requirements of the American Medical Association, a vast amount of experimental work was necessary, not only to produce feeding results with 'Soyalac' by leading child specialists, but to obtain records of the feeding of large groups of babies over a long period of time,' said Dr. Miller. 'These results were obtained in America, Japan, the Philippine Islands and China. 'Soyalac' was granted acceptance on the basis of its splendid record as a hypoallergic food.'

"International Nutrition Laboratory was recently purchased by Loma Linda food Co., Arlington, Calif., and is now being conducted as the latter firm's eastern division. Products manufactured by the Mt. Vernon plant will be almost exclusively derived from the soybean.

"The firm has set up the International Research Foundation in charge of Dr. Miller. The plan is to continue research into and investigation of soy products."

1553. Adolph, Wm. H. 1951. Nutrition under the Chinese communist government. *Scientific Monthly* 73(2):128-30. Aug. [3 ref]
• ***Summary:*** "The first action of the new regime when it came into power in 1949 was to lower the standard of living, not only in respect to food, but also in respect to clothing and manner of life. This was not a gradual development; it was immediate, brought about in part by decree, but carried into effect by an overwhelming wave of patriotic feeling that made it unbecoming for anyone to be found eating food better than that available to laborers and farmers... The dietary of the Chinese people has been the subject of considerable study. It is essentially vegetarian, with approximately 90% of the calorie intake in the form of cereals; in south China the cereal is rice, in north China, wheat, millet, maize, and kaoliang. The amount of meat or animal food is in general very small, and only about 5% of the protein intake is animal protein... The amount of milk and milk products consumed is practically nil... The average intake has been estimated at 2,200-2,400 calories per capita per day." Address: Dep. of Biochemistry, Peking Union Medical College; Then School of Medicine, Yale Univ., Connecticut.

1555. *Times of India* (*The*) (*Bombay*). 1951. High nutritive value of soya beans: Interesting facts revealed by research. Oct. 30. p. 2.
• ***Summary:*** The U.S. Department of Agriculture requested from India seeds of improved soya bean varieties; herein lies a tribute to research work conducted by the Indian Council of Agricultural Research [ICAR].

Note: This is the earliest document seen (Sept. 2010) that mentions the Indian Council of Agricultural Research. A search on Google Books (Advanced) for "Indian Council of Agricultural Research" and (soya or soyabean or soyabeans) from 1928 to 1955 gets 25 hits / results; the earliest is dated 1939. The main focus of research was on the soyabean as a fodder crop, although soyabean flour was also studied.

Investigations sponsored by ICAR and conducted on soya-bean cultivation in the Punjab have been highly successful. The purpose of these investigations was to introduce soya bean varieties from outside the area, acclimatise them to local conditions, and select the most suitable varieties, considering both their agricultural and dietetic properties.

ICAR collected about 90 soya bean varieties from places as distant as Manchuria and the United Kingdom. All these beans could be divided into two types by growth habit: (1) Erect and compact types; (2) creeping types. The erect and compact varieties generally proved superior; they ripened earlier. Yellow seeds had, in general, a higher protein content

than black, chocolate, or green coloured seeds. Small seeded varieties tended to have hard seeds and to cook poorly.

Eventually, a yellow-seeded variety was selected from a variety that came from Nanking, China. It is high yielding, ripens early, and has good tasting seeds, which contain 43.2% protein and 19.5% oil. "Above all, this variety has proved to be the best for the production of soya bean milk, flour, biscuits, confections and other edible products." The best time of planting and rate of planting are discussed. The Punjab was found to be best suited for hilly tracts; it yielded more than 34 maunds (1 maund = about 82.28 pounds or 37.32 kg) per acre.

Wide variation in the nutritional composition was noticed in the 25 varieties of soya beans grown at Ludhiana–in the Indian state of Punjab.

The Punjab experiments have shown that up to 25% of soya bean flour can be mixed with wheat flour without any change in the appearance or flavour of the blended product–which is good for making confectionery. Milk made from the soya bean was found to have a peculiar flavor, but the curd [tofu] was found to be palatable.

Experiments conducted at the Indian Institute of Science, Bangalore, have shown that the nutritive value of soya beans can be conserved and even enhanced by proper processing and storage.

1556. Ruddiman, Edsel A. 1951. The reminiscences of Dr. Edsel Ruddiman. Dearborn, Michigan: Ford Motor Company Archives, Oral History Section. iv + 9 p. Oct. Unpublished manuscript. Courtesy of Henry Ford Museum & Greenfield Village Archives (Dearborn, Michigan).

• ***Summary:*** These reminiscences are based on a tape-recorded interview with Dr. Ruddiman conducted by Mr. Owen Bombard in March and April, 1951. A chronology of Dr. Ruddiman states: 1864 Dec. 27–Born in Dearborn, Michigan. 1886–Pharmaceutical Chemist, University of Michigan. 1887–Master, Pharmacy, Univ. of Michigan. 1887-1890–Chemist in charge of manufacturing laboratory, Milburn and Williamson. 1893–M.D., Vanderbilt Univ. 1897-1920–Chemist to Tennessee Board of Pharmacy. 1890-1920–Prof. of Pharmacy and Materia Medica, Vanderbilt Univ. 1919-1920–Dean, School of Pharmacy, Vanderbilt Univ. 1921-1926–Chief Chemist, John T. Milliken & Co. [St. Louis, Missouri]. 1926-1942–Research Chemist, Ford Motor Co. [Dearborn, Michigan].

He was born in what was then known as the Scotch Settlement in Dearborn, about 2 miles from Henry Ford's father's farm. He and Henry Ford attended the same primary school and from the first day of school they sat together in the same wooden seat, and often attended the same Episcopal church on Sundays. As a young man, Henry showed his mechanical genius. He often drove his cars himself in early automobile races. In 1926 Dr. Ruddiman accepted an invitation from Henry Ford to work for him. Dr. Ruddiman's laboratory was in what was then called the Engineering Laboratory, in Greenfield Village, not far from Mr. Ford's office. "In my work I followed a more or less independent line of research." "Most of the time I worked for him, it was along the dietary line. When he talked to me about food and diets, it was about making more healthy foods and improving the parts, protein and so on.

"Most of my work was with soybeans. It was just about the time they were beginning to grow them around there, and Mr. Ford wanted to know particularly if they were good as food. I did a lot of chemical analysis on them; separating them, of course, into their parts (protein, carbohydrates, etc.) and then fed those to the rats. I had quite a number of white rats to experiment on. I used them to test the food values.

"I used to enjoy that work; I was interested in it and I wanted to do what he wanted me to do, of course. I followed out his suggestions. He came in frequently and made suggestions, or to see what I was doing, and what the results were.

"I guess I was as responsible as anyone for the making of synthetic milk from soybeans. We just rubbed it up with water and saw that it had properties that made it look like milk, then we tested it to see the amount of protein, sugar, etc. it had in it. We then made up the soybean milk to agree with the ordinary cow's milk in those constituents that were deficient. I was very well satisfied with it. It tested out very well on the rats.

"We talked of putting it on the market commercially but decided not to, though I don't remember any particular reason why we did not.

"We also made up a powder from the beans, like a flour. That was used somewhat in place of wheat flour. Mr. Ford used some of this in his home occasionally, though he didn't make a practice of it. He had a great interest in this line of research.

"I also worked in making plastics from the soybean. We broke the beans into their parts, the proteins largely, and worked this into a stiff mass. We didn't use it much as a powder. I didn't do much in making the plastic for the car, but it was through my work in showing what could be done with the soybean that the car was made." Address: 22179 Long Boulevard, Dearborn, Michigan.

1557. Nickerson, Jane. 1951. News of food: Finalists in national baking contest vie for $138,000 worth of prizes. *New York Times.* Dec. 11. p. 56.

• ***Summary:*** The contest was held in the ballroom of the Waldorf-Astoria Hotel. For the third year in a row 100 finalists competed in the Pillsbury national baking contest.

Mrs. Gloria Eldridge Yuin of Freeport, Long Island [New York], baked a Chinese-style hot biscuit [probably *yu-tiao*] that she learned from her Chinese-born husband. She said it is "the poor man's breakfast in China when eaten with hot soy milk."

1558. **Product Name:** Canned Soy Milk.
Manufacturer's Name: Chicago Dietetic Supply House, Inc.
Manufacturer's Address: 1750 W. Van Buren Ave., Chicago, Illinois.
Date of Introduction: 1951.
Wt/Vol., Packaging, Price: Can.
New Product–Documentation: Soybean Blue Book. 1951. p. 94. Not clear whether they are a manufacturer or a handler.

1559. **Product Name:** Chocolait (Soy-based Chocolate Milk).
Manufacturer's Name: John Sexton & Co.
Manufacturer's Address: Sexton Square, Chicago, Illinois.
Date of Introduction: 1951.
New Product–Documentation: Soybean Blue Book. 1951. p. 90. "Other plants at Long Island City, Boston, Philadelphia, Pittsburgh, Detroit, Atlanta, Dallas, and San Francisco."

1562. Burnett, R.S. 1951. Soybean protein food products. In: K.S. Markley, ed. 1951. Soybeans and Soybean Products. Vol. II. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 949-1002. [125 ref]
• ***Summary:*** Contents: 1. Soybean flour, grits, and flakes: Introduction, early history, types of soybean flour–standard definitions, amount of soybean flour and related products produced, methods of manufacture, soybean flour in bread, soybean flour in other baked goods, soybean flour in the meat industry, soybean flakes in breakfast foods, soybean flakes and derived peptones as brewing adjuncts, miscellaneous uses of soybean flour. 2. Isolated and modified soybean proteins: Aerating agents for confections and related products, neutral spray-dried soybean protein [isolates], soybean protein in [whipped] toppings, soybean protein and flour in confections, soybean protein and flour in ice cream, soy sauce, monosodium glutamate from soybeans, soybean vegetable milk, tofu, miso, yuba, and other Oriental soybean foods (incl. natto and Hamanatto).

The soy flour industry in the U.S. has grown steadily in recent years. Deliveries of soy flour "from the years 1930 to 1940 averaged about 25 million pounds annually. The deliveries have increased considerably since 1940 partly as a result of an increase in domestic use and partly as a result of deliveries of soybean flour to various government agencies, largely for export. In 1941, Federal purchases amounted to about 10 million pounds of soybean flour. In 1943, the amount increased to 170 million pounds when large shipments were made to Great Britain and the U.S.S.R. under lend-lease. Purchases of soybean flour by the Federal government decreased for several years, but increased in 1946 to an estimated 200 million pounds under the UNRRA [United Nations Relief and Rehabilitation Administration] program. Total soybean flour deliveries for 1946 were approximately 380 million pounds. In the domestic market the bakery industry was the largest consumer. About 40% of the domestic sales of soybean flour were for bakery use. Since the Bureau of Animal Industry has legalized the use of soybean flour as a binder in meat products, about 20% of domestic sales are to the sausage industry. The balance is used in prepared dough mixes, macaroni, candy, and in institutional feeding.

"In 1947, domestic sales of soybean flour were over 60 million pounds. This amount, plus government purchases and exports, amounted to about 415 million pounds. Two-thirds or more of the present domestic consumption of soybean flour is by the bakery, meat processing, and pet foods industries."

Table 155 (p. 953) shows Bushels of soybeans used for U.S. soy flour production (1942-1947). In 1942-43, the amount of full-fat soy flour produced in the USA was roughly 40% of the amount of defatted. In 1944-45 it was about 49%, but thereafter the percentage dropped rapidly to only 5% in 1946-47.

Note: These statistics relate to Soya Corporation of America, Dr. Armand Burke, and Dr. A.A. Horvath.

Concerning soybean flakes and derived peptones as brewing adjuncts (p. 974-77): "Soybean flakes and grits have been employed by the brewing industry to improve the body and flavor of beer, to increase foam stability, and to stimulate yeast growth.

"Improvement in foam stability and flavor can also be attained by adding directly to the finished beer a hydrolyzed soybean protein which has been broken down to the peptone and proteose stage...

"The early history of the use of soybean products as whipping agents is of interest since this work stimulated the development of processes which eventually led to the production of the present soy albumens. In 1939, Watts and Ulrich pointed out that an active whipping substance could be prepared from solvent-extracted soybean flour in which the protein had not been heat denatured, by leaching it at the isoelectric point of the protein. This extract was found to whip more readily and to a much greater volume than suspensions of the original flour... The active principle in the whipping substance prepared by Watts and Ulrich was probably the nonprotein nitrogenous material present in the soybean flour which is soluble at the isoelectric point of the protein."

Tables show: (155) Soybeans used in the production of low-fat and full-fat flour and grits (1942-1947, 1,000

bushels). (156) Peroxide value of fat extracted from pastries stored at -17.8ºC. (0ºF.), containing different percentages of soybean flour for periods of 0-6 months. (157) Analysis of uncooked liverwurst emulsion and of processed (water-cooked) sausage containing added soybean flour and water. (158) Losses in cooking liverwurst containing added soybean flour and water. (159). Analysis of frankfurter emulsion and of smoked sausage made with 3.5% of various binders. (160) Losses in smoking frankfurters made with 3.5% of various binders and after consumer cooking. (161) Effect of the addition of soybean peptone on volume and life of foam on beer. (162) Composition and pH of soybean albumens. (163) Composition of ice creams containing soybean flour. (164) Comparison of soybean milk with cow milk. One sample of cow's milk is compared with 4 samples of soybean milk (probably Oriental) and 3 samples of modern U.S. soybean milk reconstituted (Soyalac for infants, all purpose Soyalac, Soyagen canned from Loma Linda Food Co., California).

Figures show: (199-201, p. 981) Comparison of whipping ability of egg albumen and soybean albumen in different proportions and combinations. (202) Flow sheet for the acid hydrolysis process used in making HVP soy sauce. Address: Protein By-Products Research, Research and Technical Div., Wilson & Co., Inc., Chicago, Illinois.

1563. Ciancio, Pedro N. 1951. La soja y el problema alimentario del Paraguay [The soybean and Paraguay's nutritional problem]. Asunción, Paraguay: Edit. "El Grafico." 505 p. No index. 25 cm. Contains a 17-page English-language summary. Ciencia de la Nutrition (Metabolismo). [50 ref. Spa; eng]

• ***Summary:*** On cover: *Ciencia de la nutrición* (*metabolismo*). Contents (from English-language summary, p. 477-94): 1. Report on the soybean, presented at the First Interamerican Congress of Medicine (*Primer Congreso Interamericano de Medicina*), sponsored by the National Academy of Rio de Janeiro [Brazil], September 7-16, 1948 (the soybean was the 6th subject on the program; the report by Dr. Pedro Ciancio, which emphasized the nutritional benefits of soya as a protective and basic food, was unanimously approved by the scientific assembly). 2. The "Paraguayan Soybean," a new variety (developed after 20 years of cultivation in Paraguayan soil). 3. The nutritional value of soy in the light of modern science. 4. Deficiencies in the dietetic regimen in Paraguay and how to correct them; particular importance of the soy bean to correct these deficiencies. 5. Peculiarities of the biochemical structure of the soybean and the medical applications deriving therefrom. 6. Soy cultivation ("Paraguayan soil is excellent for the cultivation of soy... The average output ranges from 1,500 to 2,000 kilos per hectare but in some regions of Caazapá (Rosario, Charará, Buena Vista, etc.)... I obtained the enormous output of 4,000 kilos per hectare, and this without any inoculation whatever!"). 7. The place of soy in the diet. 8. World production of soy. 9. Conclusion. More about soy milk (p. 493).

The author emphasizes the many nutritional benefits of using soy flour (he used the term "whole soy flour," p. 493), toasted soy meal, and soy milk in the Paraguayan diet. He believes that soya can be used to improve the diet without increasing its cost. In 1950 the author conducted experiments, in collaboration with the distinguished biochemist Prof. Dr. Ramón Codas of the Faculty of Chemistry and Pharmacy (Asunción), feeding soy milk to undernourished families living in the Department of Caazapá. When 1 liter/day of soymilk was added to the usual diet for 2 months, "most of the groups had increased their weights, and better coloring and greater activity could be noted in all the members of the groups under observation. He recommended using the resulting okara in soups or tortillas.

Chapter 8, "World production of soy," states (p. 490): "Cultivation of soy began in 1921, the year in which I introduced the plant to our country. Although its cultivation is only slowly increasing, at the present time there are already many villages where soy is cultivated, though on a small scale."

In 1950 a group of renowned scientists (Bergmann, Weizmann, and Willstater) at Weizmann's Institute of Science at Rehovoth, Israel, confirmed the importance of soy in banishing world hunger. They developed a soy powder and Bergmann wrote a report about it.

Note 1. This document contains the earliest date seen for soybeans in Paraguay, or the cultivation of soybeans in Paraguay (1921). In 1989 E.R. Alvarez-Britos wrote: "In 1921, Dr. Pedro N. Ciancio, considered the apostle of soybean cultivation in Paraguay, introduced the varieties Hollybrook, Manouth [Mammoth?], Pekin [Peking], and Shanghai, from Argentina, the USA, and Japan."

Note 2. Much of this book was written between 1940 and 1942. Address: Prof., Dr., Asunción, Paraguay.

1564. Dean, R.F.A. 1951. The nutritional adequacy of a vegetable substitute for milk. *British J. of Nutrition* 5(2):269-74. [11 ref]

• ***Summary:*** "The problem of supplying a substitute for milk can be resolved into the separate problems of finding substitutes for the various components: minerals, carbohydrate, fat, protein and vitamins." The writer intends to find a good diet from plant sources alone, and in this area most of the literature (which he reviews) is about soya beans or cereal-soya diets. However the soya bean is not universally available.

Soya preparations are widely used in the USA for feeding children who cannot tolerate cow's milk, but when Stoesser (1944) conducted a clinical trial using one of the most widely advertised of these, "his results were very poor."

Conclusion: "We know there are millions of undernourished children. We believe they could be better

nourished if we used our plant resources more perfectly. We must find means of translating our belief into fact." Address: Dep. of Experimental Medicine, Univ. of Cambridge and Medical Research Council.

1565. Law, James Thomas. 1951. Law's grocer's manual. 4th ed. Edited and revised by W.G. Copsey. London: William Clowes and Sons, Ltd. xv + 814 p. See p. 467, 510. Illust. 22 cm. With a foreword by W.R. Austen Hudson, M.P., F.G.I.
• ***Summary:*** Page 467, under the heading "Soy bean," discusses soy sauce, tofu, natto, miso, and soy milk. Page 510 gives more details on tofu and describes (quaintly and inaccurately) how to make this "fresh bean cheese." "The beans are soaked in water for 3 or 4 hours, cooked, and reduced to a paste. The milky fluid is strained through a coarse cloth to remove stalk and fibre [okara], and when cooled is precipitated by the addition of crude salt. The precipitate, which is rich in protein and fat, is then kneaded and pressed into cakes called fresh Tofu. They are then dipped into a solution of curcuma." Address: W.G. Copsey is Secretary of the Inst. of Certified Grocers; Hudson is President of the National Assoc. of Multiple Grocers.

1566. Nicolici, Dumitru. 1951. The original diet. New ed. 4th impression [printing]. Summer Hill, NSW, Australia: Printed by Religious Liberty Publishing Assoc. 151 p. Illust. 21 cm. [81* footnotes]
• ***Summary:*** Quoting extensively from Biblical scriptures and the writings of Ellen G. White, this Seventh-day Adventist book presents the principles of vegetarian nutrition, and gives details of the adverse effects on health and character from consumption of meat, dairy products, eggs, alcohol, spicy condiments, and stimulants of all kinds. Contains recipes for fruit, nut, grain, and vegetable dishes. The author was born in 1896.

Chapter 9, titled "Milk, Butter, Eggs & Cheese" is very critical of these products as foods, and suggests that they be dispensed with as soon as possible. "Thousands of infants die annually because of indigestion set up by the use of cow's milk." Cow's milk contains large numbers of germs, some of which produce diseases such as typhoid fever and tuberculosis. "Cheese must certainly be ruled off our tables as unfit for human food" since it contains large numbers of germs and microbes–"in every pound nearly twice as many as there are people upon the face of the earth."

Chapter 10, titled "The Soya Bean," provides an alternative to dairy products and meat. It begins: "The soybean has been referred to as the Wonder Food of the world... It is called the 'meat without bones.'" It is an "ideal source of protein." From soybeans can be made soya milk which is "entirely free from the disease germs that make milk a potential disease carrier." Soy-related recipes include: Mayonnaise without egg (p. 138). Soy-bean mayonnaise (with soy-bean milk, p. 138). Cooked dressing (with soy bean flour, p. 138). Soy-bean milk (p. 139). Baked soy-bean croquettes (with cooked, ground soybeans, p. 139).

1567. Pappas, B.B. 1951. A high protein food–the soybean. *Healthful Living* (*New York City*) 7:33-34.
• ***Summary:*** "The United States Department of Agriculture recognized its value and set up a separate Soy Bean Research Laboratory to find new dietary and industrial uses for this wonderful bean. It has now been proven that the protein of the soy bean can very well replace the protein of meat, eggs and dairy products, and many manufacturers have taken advantage of this knowledge to produce a fine group of soy bean foods. Today we have such foods as soy bean cookies, roasted soy beans (crunchy and delicious), soy bean milk powder, malt and soy drinks, soy flour, soy spaghetti, macaroni and noodles, soy bean bread, soya salad oil, soy sandwich spread, soy bean meat in cans, etc., etc. The number and variety of items now being made from the soy bean is extraordinary. The American people have come to a full realization of the value of this miraculous bean and are making it an integral part of their daily food.

"Soy bean cheese: The soy bean is used by the Chinese not only in place of milk but it is also made into cheese. Tofu, or soy bean cheese, is extensively used in China and has the advantage over cheese prepared from cow's milk in that it is not putrescent. This bean also serves as a substitute for eggs–containing as it does, protein and fat (including lecithin) equivalent to that supplied by the white and yolk of the egg. Kellogg says that Tofu omelette is more palatable and wholesome than an ordinary egg omelette.

"Most proteins are what is known as 'incomplete proteins' and therefore not capable of supporting life alone. The tests made by the United States Department of Agriculture show that soy bean protein appears to be as valuable as the casein in milk. Osborne and Mendel, two of the most famous investigators and research workers in nutrition in the world, show that the soy bean furnishes a 'complete protein' of high nutritive worth which may be used as a substitute for animal protein. This protein is highly digestible and has twice as much as meat, for example. The soy bean likewise has a high fat content but practically no starch.

"It resembles a nut more than a bean, and is superior to nuts as a protein because of its alkalinity. Most nuts are acid-forming.

"We have spoken of soy bean milk. This does not necessarily mean liquid milk, for a perfectly fine soy bean milk is made by mixing dry soy bean milk powder with water to get an excellent tasting beverage. This is superior to cow's milk because of its much greater capacity to counteract intestinal putrefaction. Soy bean milk is not only free from putrefactive bacteria but furthers the development of Bacillus Acidophilus which counteracts the putrefactive type of bacteria. It is certain that it will keep the intestinal tract of a

child in a purer state than cow's milk.

"Please don't get the impression from this that soy bean powder is strictly an infant food. Far from it. That is only one of its many uses.

"Three thousand years before the Christian era millions of Chinese were living–and thriving–on a vegetarian diet that was based on the soy bean as its principal food. This miraculous oriental bean was used in place of meat, fowl, eggs, butter, cheese, fish and milk. Often in their long experience the Chinese were saved from starvation and extinction by the soy bean.

"Protein substitute: In the Orient the soy bean still replaces both the cow and the chicken, being used as a substitute for such proteins as milk, butter, cheese and eggs. As a matter of fact, a milk made from the soy bean is used for infant feeding because of its easy digestibility and its lack of putrefactive agencies. As the famous Rout said: 'The properties of soy bean milk and curd are similar to those of milk obtained from cows, and the action of the rennet, etc., is the same. Lactic ferments also act upon it in the same way, also the ferments of certain European cheeses. Throughout China, vegetable milk is extensively used for infant feeding, and is, bottled and delivered each day to regular customers. Investigators in America and Europe indicate that vegetable (soy bean) milk can be successfully used to replace cow's milk.

"A vitamin food: The soy bean is also high in alkalinity. The lima bean was considered a high alkaline food, or bean, but Becker has proved that the soy bean stands higher than all vegetables in this respect. The soy bean is also rich in Vitamin D, which is one of its many striking characteristics. Outside of egg yolk and cod liver oil very few foods have any of this valuable vitamin."

1568. Ray, Georges. 1951. Technologie laitière. 2e éd. [Dairy technology. 2nd ed.]. Paris: Ed. Dunod. vii + 743 p. See p. 703-09. Illust. Index. 25 cm. [Fre]

• ***Summary:*** The chapter on "Milk substitutes" (p. 696+) contains a subchapter titled "Soymilk (*Lait de soya*)*"* (p. 703-09), which has the following contents: Introduction. General rules to follow in the preparation of soymilk. The North Vietnamese (*Tonkinoise*) method. Method of preparation used in dairies in the Far East: Castagnol process. Modern methods for the preparation of soymilk. Composition of soymilk. Properties of soymilk. Fermented soymilk (using *Bacillus acidophilus*, British patent No. 441,574, 22 Jan. 1936). Concentrating / condensing and drying soymilk (including yuba). Soymilk curds (*Caillebotte de soya*). The future of soymilk.

Contains two full-page ads by Alfa-Laval for dairy milk equipment.

Vegetable milks have certain advantages over animal milks. They are easily made in a state of microbial purity, free of tuberculosis bacteria. Their casein precipitates more rapidly than that of cow's milk and does not coagulate in the same manner in the stomach. And it can be sold at a lower price. Later: It contains no cholesterol, and makes better use of world food supplies. Disadvantages: It has a lower calcium content and many Westerners prefer the flavor of animal milks.

Here is a quick review of the processes for making soymilk, described at length in a monograph (written under the direction of G. Ray) by D. Kaltenbach and J. Legros [1936]. Precise information about the soya industry is assembled is a more recent work by A. Matagrin. Soymilk pioneer in France were [Li Yu-ying], L. Rouest, and H. de Guerpel (p. 703).

The Castagnol process was developed by Ray at the agronomic research Institute in Indochina (p. 704).

Starting in 1910, a Franco-Chinese society was founded for the study of the utilization of artificial milk from the soybean. The experiments were abandoned in 1912. In 1916 Prof. O. Laxa of Prague recommended for making soymilk on a small scale. Note: It is not important (p. 705).

In London, before World War I, a synthetic milk syndicate launched a type of [soy] milk adapted to European tastes. It applied the process of F. Goessel [of Germany]; 100 liters of soymilk were obtained from 10 kg of ground soybeans, 5 gm of sodium phosphate, 2.4 kg of lactose [milk sugar], 2 kg of sesame oil, 6 gm of salt, and 60 gm of sodium bicarbonate [also known as baking soda or bicarbonate of soda]. Melhuish, an Englishman, patented a process for enriching the [soy] milk with various oils that did not change its taste. Some years after World War I, Bertrand received a patent for the manufacture of deodorized soymilk. Among the American processes are those of Horvath and Kloss (p. 705).

In Germany, the Soyama factory in Frankfort makes a fresh soymilk very similar to cow's milk but with a different flavor. A table shows the nutritional composition of three different types of milk. After standing, the cream of Soyama soymilk separated. This soymilk has a more neutral and softer flavor than that of cow's milk. Bread made with this soymilk is excellent. In 1932 the French engineer Max Adler patented a process for soymilk without the characteristic flavor and odor (p. 706).

In China during World War II, soymilk was used extensively in refugee camps and saved many lives, especially those of children (p. 708).

The Annamites are fond of soymilk during the hot season. Each morning soymilk merchants can be seen circulating through the streets of the native villages of Hanoi. The product is consumed sweetened or unsweetened, cooked with rice, or added to various soups (p. 708).

Fermented soymilk: John H. Kellogg received a British patent for acidophilus soymilk. No. 41,574. 22 Jan. 1936. Yuba is the concentrated film of dried soymilk lipo-proteins (p. 708).

In France, Rene Jarre is specializing in the preparation of soyfoods (*produits alimentaires à base de soja*). Monahan and Pope (1915) added to powdered soymilk malt, cacao and chocolate–U.S. patent 1,165,199 of 21 Dec. 1915 (p. 709).

The future of soymilk: The main challenge now is to find a way to deodorize soymilk. Note: And to remove the flatulence factors (p. 709). Address: Honorary Prof. (Tunis, Rennes, Grignon), former Head of Technical Services, International Institute of Agriculture, Rome (Ex-Chef du Service Tecnique, a l'Institut d'Agriculture de Rome).

1569. Rombauer, Irma S.; Becker, Marion Rombauer. 1951. The joy of cooking. Indianapolis and New York: Bobbs-Merrill Co. 1011 p. Illust. by Ginnie Hofmann. Index. 22 cm.
• ***Summary:*** This is the earliest known Rombauer-Becker edition of this famous cookbook. Marion Rombauer Becker is the daughter of Irma von Starkloff Rombauer. A large percentage of the recipes contain meat, fish, or poultry. Soy-related recipes and descriptions include: Soybean cheese [tofu] (p. 192, made from soybean milk curded without a coagulant like cottage cheese. Season with salt, cinnamon or chives, and caraway). Suggestions for the use of soybeans (similar to the 1943 edition) with the following recipes for cooked soybeans: Soybean loaf. Soybean dinner in one dish. Soybean soufflé. Soybean salad. Then some ideas for "Peanuts as a meat substitute." Soybeans (p. 269; "Young vegetable type, not field varieties of beans, must be used. The pods should still be green"). Roasted soybeans. Cooked dry soybeans (p. 269). Sweet and sour milk substitutions and equivalents (p. 502-03; "If you use Soya Milk, page 817, substitute 1 cupful for 1 cupful of milk"). Soya bean milk (p. 817).

There is a nice, early chapter titled "The Electric Blender" (p. 895-98), which begins: "Throw away your tamis cloth and hair sieve, if you still have these relics of a by-gone age, and replace them with a piece of equipment that makes them obsolete, the electric blender." Includes 4 paragraphs about blenders. This chapter includes recipes for cocktails, cream soups, eggnog, beverages (incl. cold fruit sherbets and a "Blender health drink"), puréed vegetables, custard, and ice creams. For the sherbets: "A fairly creamy result comes from a fresh peach, a banana or canned pineapple juice. A velvety concoction is: 1 small banana, 1 cup milk. Add vanilla or rum, no sugar needed. You may add to this 1 tablespoonful chocolate sirup [syrup] or 4 tablespoonfuls vanilla ice cream. Also try stewed or canned apricots with milk, apricot, pineapple and lemon juice with cracked ice cubes, frozen strawberries with sour or sweet cream."

The chapter titled "Nutrition and calorie chart" states (p. 931): "Proteins are known to contain amino acids. These complex acids are still being studied by chemists, but it is known that some of them are essential to growth and life. All of these acids are not found in complete form in all protein foods. They are most fully represented in meat, fish, eggs, milk and cheese. They are present but less well represented in nuts, legumes and cereals. Since the vegetable groups are incomplete in themselves, it is wise to draw half to two thirds of the daily protein intake from the animal sources given above."

Note 1. In the *Betty Crocker Picture Cook Book* (1950, General Mills), no mention is made of the electric blender. A hand-turned rotary beater is used to make a milk shake.

Note 2. In *Joy*, there is no index entry for milk shake or organic (as "organic gardening"), or vegetarian. Address: 1. St. Louis, Missouri; 2. Cincinnati, Ohio.

1570. White, Julius Gilbert. 1951. Abundant health: Expounding the Learn-how-to-be-well system of daily living. 5th printing. Pine Mountain Valley, Georgia: Health and Character Education Institute. xix + 477 p. Illust. 24 cm. See p. 367-82. [25 ref]
• ***Summary:*** About vegetarianism, diet, and hygiene. Note that the author was formerly (for 11 years) head of the Lecture Bureau at Madison College, a Seventh-day Adventist college and sanitarium. A portrait photo (p. vi) shows Julius G. White.

One chapter titled "The soybean: The wonder food of the world" (p. 367-82) discusses (with some recipes) the nutritional value of soybeans, Soybean milk and the pulp left after making it, soy flour, whole soybeans, vegetable meat (meat substitutes), soybean cheese [tofu], home-made soy butter (made from 4 tablespoons each soy flour and water, 1 cup of oil, a little salt and butter color if desired), soy mayonnaise, soy acidophilus milk, soy sprouts, soy sauce, soy coffee, and soy protein substitute for egg-white.

1571. Morse, W.J.; Cartter, J.L. 1952. Soybeans for feed, food, and industrial products. *Farmers' Bulletin* (*USDA*) No. 2038. 41 p. Feb. Supersedes Farmers' Bulletin No. 1617 (Morse 1930, 1932).
• ***Summary:*** Contents: Importance of the soybean and its byproducts. Direct use of soybeans on the farm: Soybean hay (for dairy cattle, beef cattle, horses and mules, sheep, swine, poultry), soybeans for pasturage (hogging down soybeans, sheep, beef and dairy cattle, poultry on soybean pasturage), soybean for soilage, for silage, for soil improvement, for livestock feed (feed for swine, dairy cattle, beef cattle, horses, sheep, poultry, wild game {quail, pigeons}), soybean straw (feeding value, fertilizing value).

Soybeans processed for meal and oil: Processing methods, meal for livestock (for dairy cattle, beef cattle, poultry, swine, sheep, dogs {in dog-food industry}, rabbits, fur-bearing animals, quail and pheasants), meal as fertilizer, for industrial purposes, in food products, use of oil (in food products, industrial uses such as paints and varnishes). Soybeans and products for human consumption: Vegetable soybeans, dry soybeans ("Other uses of the dry soybean

{principally of oriental origin} are in the preparation of soybean milk, soybean curd, soybean sprouts, beverages, salted, roasted soybeans), soy flour, grits, and flakes, Oriental soybean foods, soy milk, soy curd, soy sauce, soy sprouts, soy beverages. Miscellaneous uses of the soybean: Honey production (the soybean as a honey plant, soy flour for honey bees), soy flour and grits in dog food, soy flakes in brewing beer, soy flour for insecticides.

Under "Soybean utilization," page 3 notes: (1) The roots and coarse stems are used as fuel in China, Manchuria, and Korea. (2) In many parts of China the plants, when 3 to 4 inches high, are used as greens. (3) In Manchuria and Korea, the leaves are cured and smoked as tobacco.

Under "Soy milk," page 38 states: "The ground soybean pulp or mash [okara] left after separating the liquid from the solid material is still of good nutritive quality, but it has very little flavor. It can be dried and made into flour for human food, combined with foods of more pronounced taste, or used for animal feed."

Under "Soy curd" [tofu], page 38 states: "Chinese and Japanese markets and restaurants in many cities in the United States sell fresh soy curd. Several firms in the United States can soy curd."

Under "Soy sprouts," page 40 states: "Soybeans and several other species of beans, especially the mung bean, are sprouted and used as a green vegetable in the Far East. Soy sprouts (fig. 18, D) can be produced successfully in the home, and a year-round fresh vegetable that may be used raw or cooked can be obtained by sprouting soybeans in a flower pot, a glass fruit jar, or a strainer.

"In producing sprouts, select a stock of clean, bright beans of the latest crop. Any of the field varieties may be used, but the yellow-seeded varieties have less conspicuous skins, though black-seeded varieties, such as the Cayuga, Peking, Wilson, and Otootan, seem to germinate more quickly and uniformly. Carefully hand-pick the seed, discarding everything except the clean, whole beans. Wash the beans thoroughly, cover with lukewarm water, and allow them to soak for a few hours (or at most overnight) until they are swollen. Place the beans in a container and cover them with dampened cheesecloth. Rustproof wire-mesh screening or cheesecloth can be used to cover the bottom of the container to allow for drainage. In using a glass fruit jar, cover the top with a piece of cheesecloth and tie it on securely. Invert the jar and place it in a dark spot at room temperature.

"Tilt it slightly so that excess water can drain away promptly. Pour plenty of water on the beans 3 to 4 times a day, thereby insuring thorough washing. The beans may be sprinkled each evening with chlorinated lime solution (1 teaspoon of calcium hypochlorite dissolved in 3 gallons of water) to keep down mold growth and spoilage. Chlorinated limewater is not needed to kill fungus growth if the seed is of good quality. In 3 to 4 days the sprouts will be 1 to 2 inches long and ready to use. Bean sprouts increase about six times their original volume. The commercial production of soy sprouts proceeds along the same, lines, except that larger sprouting tanks or trays are used and the process is more carefully controlled.

"Soybean sprouts can be used in many ways and are cooked and served with the bean attached. They are a fair source of thiamine, riboflavin, and ascorbic acid. The sprouts may be served raw in salads, cooked in various ways, and used in such dishes as omelets, stews, fricassees, and chop suey. They are very tender and lose their crispness if put into hot dishes more than a few minutes before serving.

"A few companies have successfully canned soy sprouts [in the USA]. The New York (Cornell) Agricultural Experiment Station found that sprouts lend themselves admirably to quick-freezing." Address: USDA.

1572. McCloud, J.L. 1952. Reminiscences: Bob Smith, Rex Diamond, and Delsoy Products (Document part). Dearborn, Michigan: Ford Motor Company Archives, Oral History Section. 423 p. See p. 162-64. Unpublished manuscript. 28 cm. Courtesy of Henry Ford Museum & Greenfield Village Archives. Acc. 65.

• ***Summary:*** Originally Bob Smith worked for Robert Boyer, then Mr. Ford had him operating a separate research laboratory. "Under Boyer they had worked up soybean milk and soybean cream which they found could whip quite well and from which the present product Delsoy is made. When Boyer was concentrating on soybean fiber, Smith was concentrating on milk and cream. Actually he was in a sense competing with Dr. Ruddiman, so you might say there were two food laboratories out there." Boyer's laboratory was focused on chemurgic applications. Dr. Ruddiman "was moved from the little rat house [where he kept is laboratory rats and did food experiments; it had previously been a private dining room] to the building that had been originally built for the Dearborn Water Works. This was empty and wasn't being used for anything else. I am quite sure, but I believe that Smith either went over to work in this laboratory under Ruddiman or about the time that Ruddiman retired...

A man by the name of Jack [sic, Holton W. "Rex"] Diamond claims that he developed this product which Smith sold and commercialized under the name Delsoy. I don't know very much about it, except that it was very confusing. There was a man from New York [probably Herbert Marshall Taylor] who came over here and told us a great long story about how Smith had stolen something from him, and he was going to sue Smith and the Ford Motor Company and so on. This man went out to see Frank Campsall, and I got assigned the job of interviewing him and trying to smooth his feathers."

At one time, Mr. Smith reported directly to Mr. Ford. "Mr. Ford went to see him regularly and was keenly interested in the work Bob Smith was doing. Later Bob

Smith left the Company and set up a business of his own, based on the Delsoy product, which was developed into quite a nice commercial affair.

"Jack [sic, "Rex"] Diamond left and I think he tried to set up competition to Bob Smith. Bob Smith had no prior technical training. I think he was another Trade School graduate. I would classify the Trade School not as a collegiate rank but as junior collegiate training that many of the boys acquired. Jack Diamond, however, was a trained chemist, and he may be right when he stated that he developed it" [soy-based whip topping]. Address: Chemist, in charge of the Chemical and Metallurgical Lab.

• ***Summary:*** Belo Horizonte is in the state of Minas Gerais. Address: Dietista–Orientadora Nutricionista das Escolas de Ensino Tecnico, Brazil.

1574. Melo, Maria de Lourdes. 1952. Feijao soja, o alimento que se impoe [Soybeans for the nourishment of nursing mothers, and pre-school and school children]. *Boletim de Agricultura, Departmento de Producao Vegetal* (*Belo Horizonte*)*–Brazil* 1(4):33-35. April. [Por]
Address: Dietista, Orientadora Nutricionista das Escolas de Ensino Técnico.

1575. Varela, J. Daniel. 1952. El frijol soya en Cundinamarca [The soybean in Cundinamarca]. *Agricultura Tropical* (*Colombia*) 8(4):9-11. April. [Spa]
• ***Summary:*** Cundinamarca is a department in Colombia, of which Bogota is the capital. Soybeans grow well in this inland valley and soy products could find many uses. Photos show: (1) A field of soybeans in the municipality of "La Mesa" (Cundinamarca). (2) Calves, of the normanda breed, standing in a field. They are fed with soymilk at the hacienda "El Dindal," owned by Messrs. Carreño and Terán in Zipaquirá. Address: Ing. Agr. (Agricultural Engineer), Colombia.

1576. *Vegetarian News Digest* (*Los Angeles*). 1952. "44": The new improved food beverage. 2(8):48. Spring.
• ***Summary:*** The main ingredient appears to be dehydrated powdered whole soy beans. A 14-oz can retails for $1.39.

1577. Kastens, M.L.; Baldauski, F.A. 1952. Chemicals from milk. *Industrial and Engineering Chemistry* 44(6):1257-68. June. [23 ref]
• ***Summary:*** In the USA, about 70% of the production total milk solids is used for human food, 20% is condensed or dried for animal feed, and the remaining 10%, as skim milk, buttermilk, or whey is either discarded or returned to the farms for animal feed. The recent average production of 20 million lb of casein, 40 million lb of lactose, and 154 million lb of powdered whey is miniscule compared with the total supply.

Continuous casein-making machines, introduced in the 1920s and 1930s, with improvements in evaporators and drying equipment, "have made the milk by-product industry truly a chemical process industry..." Uses for milk proteins has ranged from textile fibers to paint, from glue to bacterial nutrients. In most applications it must compete economically with vegetable proteins. Under a recent reorganization, Sheffield's Chemurgic Division has become the Chemical Division. The process and equipment at the Norwich plant for making casein, caseinates, whey proteins, milk sugar, protein hydrolyzates, and casein hydrolyzates are described. The largest volume product is lactose, used in medicinal capsule formulations and a nutrient in penicillin fermentations. Casein is most widely used as a paper coating.

Note: This is the earliest document seen (Aug. 2013) concerning casein. Address: 1. Assoc. editor. 2. Chemical Div., Sheffield Farms Co., Inc., Norwich, New York.

1578. Melo, Maria de Lourdes. 1952. O que é a soja [What is the soybean?]. *Boletim de Agricultura, Departmento de Producao Vegetal* (*Belo Horizonte*) 1(6):63-71. June. [Por]
• ***Summary:*** Gives recipes for and/or using soymilk, okara (*u-no-hana* in Japanese), soya croquettes (*croquete de soja*), soya with rice, salted, roasted soynuts (*soja torrada em graos, salgadinhos*), tofu (*ricota de soja*), and soy flour in bread, biscuits, cakes, and bolos.

Note 1. This is the earliest Portuguese-language document seen (June 2013) that mentions okara, which it calls *massa* and *flor de sabugueiro.* The okara is used to make Farofa, a popular Brazilian dish made of manioc meal browned in a frying pan with grease or butter. Sometimes mixed with bits of meat, crisp fat, chopped eggs, etc. it is much used as a stuffing for roast turkey.

Note 2. This is the earliest Portuguese-language document seen (Dec. 2012) that mentions salted, dried roasted soybeans / soynuts which it calls *soja torrada em graos, salgadinhos.* Address: Dietista de Secretaria de Saude e Assistencia, Brazil.

1579. Glaser, Jerome; Johnstone, D.E. 1952. Soy bean milk as a substitute for mammalian milk in early infancy: With special reference to prevention of allergy to cow's milk. *Annals of Allergy* 10(4):433-39. July/Aug. [19 ref]
• ***Summary:*** The authors assume that the soybean is hypoallergenic and therefore an ideal food for the allergic child. Address: Dep. of Pediatrics of the Univ. of Rochester School of Medicine and Dentistry, the Genesee Hospital, and the Strong Memorial Hospital, Rochester, New York.

1580. Dabadghao, P.M.; Gandhi, R.T. 1952. Grassland

research. I. Some promising grasses and legumes at the Indian Agricultural Research Institute, New Delhi. *Indian J. of Agricultural Science* 22(III):279-91. Sept. See p. 289-90. [3 ref]
• ***Summary:*** In the section on "Kharif legumes" is a subsection titled "American soybeans–Glycine max," which states that "Soybeans are growing in importance both as a human and cattle food. The plants show very high content of protein. A very highly nutritive product of soybean known as Soya milk is prepared out of the seeds... The American varieties of soybeans at Delhi, are very early maturing and are ready for grain in about 2 months time and in about 45 days for fodder. Thus when sown in August, the crop can be harvested for grain in early October. Out of 24 varieties in the collection 5 have been found to possess better growth and are under study. These are Palmetto, Clemson, Monetta, Creole and Charlee. The grain is bolder than the local varieties and grain yield of about 10 md. [maunds] per acre can be had. If cut for fodder, about 150 md. of very highly nutritious fodder could be obtained.

"The earliness of these varieties is a character which can be used very profitably. For example, in the rainfed tracts where wheat is taken, the farmers generally keep the land fallow during the kharif season. These early maturing soybeans can very profitably be used as a catch crop in rotation with wheat."

The Kudzu vine (*Pueraria hirsuta* Scheid Syn. *P. thunbergiana*) is discussed on p. 290. "The plant was first introduced in India at Pusa in 1925 and has shown good promise as a fodder." Address: Indian Agricultural Research Inst., New Delhi.

1581. Dean, R.F.A. 1952. The treatment of kwashiorkor with milk and vegetable proteins. *British Medical Journal.* ii(4788):791-96. Oct. 11. [16 ref]
• ***Summary:*** Two soya preparations were used in feeding children and animals. One was a spray-dried soya milk made in England. The other was made in the laboratory from soya beans grown in the vicinity of Kampala, Uganda. They were soaked overnight in water, dehulled, ground, and packed into glass jars leaving 4-5 cm at the top. The jars were filled with water, covered loosely, immersed in water, and boiled for 3-4 hours. The soy products, were mixed with cooked banana, maize, and sucrose or glucose, were substituted for skim milk. A child on this diet was successfully treated for serious (but not the most severe) kwashiorkor. If soybeans can be used in the treatment of kwashiorkor, they can also presumably be used in its prevention.

Note: The next article (p. 796) gives a history of kwashiorkor. Address: Makerere College, Kampala, Uganda.

1582. Forstmann, Walther Georg Heinrich; Hillmann, Guenther; Radde, Erich M.H. 1952. Recovering valuable components from oil bearing seeds, and products therefrom. *U.S. Patent* 2,615,905. Oct. 28. 4 p. Application filed 30 Oct. 1950. Application also filed in Germany on 31 Oct. 1949. [8 ref]
Address: 1. Berlin-Templehof, Germany; 2. Tuebingen, Germany; 3. New York, NY.

1583. Miller, Harry W. 1952. Re: Infant feeding. Letter to Miss Dorothea VanGundy at 11784 Bonita Ave., Arlington, California, Dec. 14. 1 p. Typed, with signature. [1 ref]
• ***Summary:*** "Under separate cover I have mailed you a copy of the book 'Infant Feeding.' I am sure that you will be very interested in reading it through from cover to cover. It is written in very simple language and well within your vocabulary as a dietitian... It is a resume of the latest on infant feeding and familiarizes one with all of these various infants' foods. It also makes a very ready reference book in case any questions come up.

"I plan that you will have to do with a good deal of correspondence that comes in regarding infant feeding in the future... You will gradually get familiar with our Soyalac and its use... Of course, our scope of work goes way beyond infant feeding because we are working on the feeding of the masses of people, obtaining our nutrition from vegetable sources... Yours very sincerely, H.W. Miller, M.D., Research Director, International Nutrition Research Foundation."

Note 1. This letter is typed on the letterhead of the International Nutrition Laboratory, Inc. Above the Laboratory's name are printed: "Miller's Soya Foods. Soyalac–Sandwich Spread–Vegetable Cheese–Green Soya Beans–Cutletburger–Cutlets." Above that is hand-stamped: "International Nutrition Research Foundation, P.O. Box 388, Mt. Vernon, Ohio."

Note 2. In November 1952 Miss Dorothea Van Gundy began to work for Loma Linda Foods in Arlington, California, as a dietitian and food demonstrator. In August 1960 she was married (her first marriage) to Ed Jones, a health food salesman and distributor, who was 13 years older than she. Ed had previously been married to Mildred Lager. Address: M.D., International Nutrition Lab., Inc., P.O. Box 388, Mt. Vernon, Ohio. Phone: 1195.

1584. *Times* (*London*). 1952. U.N. work for children: Substitutes for milk. Dec. 16. p. 7, col. 2.
• ***Summary:*** From a correspondent in Rome, Italy. The United Nations International Children's Emergency Fund (Unicef) has just finished a meeting at the Food and Agriculture Organization [FAO] headquarters in Rome to consider methods by which to improve child nutrition. Mr. Pate, Unicef's executive director, emphasized at a press conference, "that children suffer severely where animal milk is not available. which is the case in most countries in southern Europe, the Near East, and Asia, where there is not enough milk to supply 1 per cent. of the real needs of the children. Malnutrition was, in fact, the primary problem

facing Unicef."

Since Unicef was created 6 years ago, Unicef has assisted more than 60 million children and expectant mothers throughout the world. Since taking over the work among children previously done by Unrra (United Nations Relief and Rehabilitation Administration) it has helped to feed 6 million children in Europe alone, 1.3 million of them in Italy.

One problem facing Unicef is how to increase supplies of local protein-rich foods that could serve as a substitute for milk where local livestock were insufficient. FAO "had been considering what assistance could be given to increase the production of pulses, including the soya bean, and progress had been made toward establishing a plant in an unspecified country in south-east Asia for the production of milk from soya bean flour."

Note: In 1957, Saridele, a dried nondairy milk based on soybeans, was introduced. Made in Yogyakarta, Indonesia, it was the result of a joint program by FAO and UNICEF.

1585. **Product Name:** Allerteen (Canned Dry Soy-Based Non-Dairy Infant Formula).
Manufacturer's Name: Charles Kilgore Co.
Manufacturer's Address: Yonkers 2, New York.
Date of Introduction: 1952.
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable.
New Product–Documentation: H.F. Meyer. 1952. *Essentials of infant feeding for physicians.* p. 105-05. This product (probably reconstituted) contains 4.2% fat, 3.2% protein, 5.3% carbohydrate, and 20.5 calories per ounce. It is "A palatable hypo-allergenic milk substitute made with soybeans and processed with moist heat to denature the protein."

1586. De, S.S. 1952. Report to FAO on trials conducted in Indonesia with a milk prepared from soya, groundnut, and malt. Rome, Italy: FAO. *
Address: Dr., FAO.

1587. Harmsen, L. 1952. Betreffende melk in Indonesia [On milk in Indonesia]. *Hemera Zoa* (*Bogor, Indonesia*) 59:514-16. [Dut]*
• ***Summary:*** Preceding Title: Nederlandsch-Indische bladen voor diergeneeskunde en dierenteelt.

1588. **Product Name:** Sobee Powder (Soy-Based Non-Dairy Infant Formula).
Manufacturer's Name: Mead Johnson Co.
Manufacturer's Address: 2404 W. Pennsylvania St., Evansville 21, Indiana.
Date of Introduction: 1952.
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable.
Nutrition: Protein 22%, fat 18%, carbohydrate 53%, crude fiber 1%, ash 4%, moisture 2%.
New Product–Documentation: H.F. Meyer. 1952. *Essentials of infant feeding for physicians.* p. 105-05. Sobee is now a dry product. Page 197 states that a 4 lb can retails for $3.69.

Ad in American Journal of Diseases of Children. 1956. 91(5):Inside front cover. May. "In the management of your food-sensitive patients, specify liquid Sobee, hypoallergenic soya formula (milk-free). A soybean protein food for sound nutrition."

H.F. Meyer. 1960. Infant foods and feeding practices. A photo (p. 82) shows this canned product. A photo of a baby's face appears on the front panel. See also p. 88 and 90. Page 121 gives a detailed analysis of the product. The liquid, after being reconstituted, contains: Fat 2.6%, protein 3.2%, carbohydrates 7.7%. Calories per ounce: 20. Tablespoons per ounce: 6. Added vitamins and minerals: none added. Curd tension (grams): zero. Affected by terminal sterilization: No. How formulated or reconstituted: 6 tablespoons to 7 oz. water. Chemical definition and essential clinical uses: "Hypoallergenic balanced soya formula designed for infants actually or probably sensitive to milk, and as a diagnostic measure to confirm or rule out milk sensitivity." Meyer gives the manufacturer's address as 2404 W. Pennsylvania St., Evansville, Indiana.

Orr and Adair. 1967. Tropical Products Institute Report G-31. "The production of protein foods and concentrates from oilseeds." p. 72. They call the product Soybee. Full fat soybean flour is cooked thoroughly, then incorporated with dextrimaltose carbohydrate modifier, sucrose, soya oil, coconut oil, chondrus extract [from Irish moss, a sea vegetable], minerals, and vitamins. An analysis of powdered Sobee (it is also sold as a liquid) is given. Harkins & Sarett. 1967. Journal of Nutrition. 91(2):213-18.

• ***Summary:*** The authors report that they are satisfied with the results obtained by supplementing the diet of young soldiers in India with soybean milk. Address: Food Technology Lab., Biochemistry Dep., Indian Inst. of Science, Bangalore 3, India.

1590. Allen, Ida Bailey. 1952. Solving the cost of high eating: A cookbook to live by. New York, NY: Farrar, Straus & Young, Inc. viii + 545 p. Index. 22 cm.
• ***Summary:*** Chapter 10, "Good bread is good food," discusses enriched white bread, and Cornell Bread (developed by Dr. Clive McCay of Cornell Univ., New York; it contains soy flour and no adulterating chemicals, p. 94), and gives recipes for: Soy yeast bread (with soy flour, p. 99-100). Soy muffins (p. 100). Also: Gravy thickened with soy

flour (p. 352).

Chapter 31, titled "Legumes, nuts and brewers' yeast" contains a section on "Soybeans" (p. 386-92) with the following contents: Introduction. Plain-cooked soybeans (boiled, or pressure cooked if possible). Soybean entrees (from home-cooked soybeans): Baked soybeans, Savory soybeans, Baked vegetables stuffed with soybeans, green peppers, tomatoes, turban squash. Soybean salads. Soy grits. Soybean curry (glamor dish). Soy products: Soy flour, Corn Soya cereal, soy macaroni, soy egg noodles (plain or containing carrots, tomato, or spinach), soy spaghetti, "canned meat alternatives based on soybeans," soy cookies, soybean milk powder, soybean curd or cheese, suggestions for using soybean curd or cheese. Soybean sprouts. Soy flour and how to use it. To use soy flour instead of wheat flour: In baking, as thickening, in meat and fish loaves, in spoon bread. Multi-Purpose Food: Pioneer in nutrition ("a spectacular and inexpensive pioneer food containing soy, developed at California Institute of Technology to be used in mass feeding in war stricken countries. It is also on sale in this country at health stores. It is 100 percent vegetable, violates no religious or dietary precept, comes in dry form, and keeps indefinitely"). The Introduction to soybeans (p. 386) begins: "This legume really deserves to be called a 'miracle' food. Soybeans are the only perfect vegetable alternate for meat." Also contains a section on peanuts and peanut butter (p. 392-96).

Note 1. This is the earliest English-language document seen (Jan. 2013) that contains the term "meat alternatives" (or "meat alternative"–with any combination of quotation marks).

Note 2. The author is well known for her 40+ books on food, cooking and the home that have sold 14 million copies, and her syndicated daily food column which is followed by 35 million readers. This book contains "1,300 taste-tested recipes–With glamour foods at budget prices for everyone." A photo on the inside rear dust jacket shows Ida Bailey Allen.

• ***Summary:*** A vegetable milk was compared using 56% soyabean, 24% groundnut, and 20% ragi malt. Vanslyke and Bosworth Salt mixture was added. The composition of the resultant milk was found to be similar to that of cow's milk. The overall nutritive value of this vegetable milk as determined by rat feeding was found to be 88% as good as that of cow's milk. Address: Dep. of Bio-chemistry, Indian Inst. of Science, Bangalore, India.

1599. Nandi, D.K.; Rajagopalan, R.; De, S.S. 1953. Studies on the vegetable milk. II. Availability of calcium and phosphorus. *Indian J. of Physiology and Allied Sciences* 7(1):6-9. Jan. [6 ref]
• ***Summary:*** The vegetable milk described in Part I of this study compares favourably with cow's milk for the availability of these 2 mineral elements. Address: Dep. of Bio-chemistry, Indian Inst. of Science, Bangalore, India.

1600. Dean, R.F.A. 1953. Plant proteins in child feeding. *Medical Research Council* (*London*), *Special Report Series* No. 279. viii + 163 p. (Her Majesty's Stationery Office, London). [307 ref]
• ***Summary:*** Contains extensive information on the use of soya in feeding infants and children, including: The direct improvement of proteins by heat. Removal of the trypsin inhibitor. The trypsin inhibitor in human nutrition. Milk substitutes based on the soya bean. Disadvantages of soya preparations. The preparation of soya for food. The supplementation of plant proteins–Isolated proteins–The effects of supplementing whole foods. Human experiments in protein supplementation. Recommendations for future work.

Dean investigated diets in post-war Germany. He found that as much as 50% of the total protein in diets of children of roughly 1-2 years of age were derived from soya. His conclusions are (a) that cereal and soya bean mixtures can probably be prepared which would take the place of most of the milk in children's diets and might even replace it entirely; (b) that for children from one to two years old, at least two of the mixtures (used in feeding German children) may be almost perfect substitutes for *all* the milk in the diet there were, however, a number of mixtures that had to be discarded. Dean's work in Germany was done in 1946 to 1949. Address: Medical Research Council, 38 Old Queen St., London S.W.1, England.

1601. Glaser, Jerome. 1953. Substitutes for cow's milk in infant feeding. *J. of Pediatrics* 42(6):734-38. June. *
Address: Brazil.

1602. Martinez, Margarita C.B. de. 1953. Derivados de la leche de soya [Products made from soymilk]. *Tierra* (*Mexico*) 8(6):482-83. June. [Spa]
• ***Summary:*** Gives a number of recipes for using soymilk, including tofu (queso de leche de soya, coagulated with vinegar or lemon juice), vanilla ice cream. Also contains recipes using whole soybeans and soy flour.

Note: This is the earliest Spanish-language document seen (March 2007) that mentions soy ice cream, which it calls *Helados de leche de soya.*

The preparation of synthetic milk from whey and soy-bean. *International Dairy Congress, Proceedings* 13(4):602-05. June. Proceedings of the 13th International Dairy Congress, held 22-26 June 1953 at The Hague, Netherlands. [2 ref. Eng; fre; ger]
• ***Summary:*** Although there are many ways of using whey, in Japan only a small percentage of it is used as raw material for the manufacture of lactose; most of it is mixed with skim milk [nonfat milk] for the feeding of calves, or is discarded.

The preferred process was: Soak soybeans in water overnight, then grind finely. Add whey to the ground soybeans. Heat the mixture. Remove the insoluble residue [okara] by press filtering. A powder can be prepared from the resulting liquid soy & whey milk.

When lactic acid whey was used the resulting product had a much better flavor than soy-bean milk itself. Address: Faculty of Agriculture, Univ. of Tokyo, Japan.

1604. Sasaki, R.; Tsugo, T. 1953. The manufacture of synthetic milk powder from whey and soy-bean. II. The manufacture and nutritive value of synthetic milk powder. *International Dairy Congress, Proceedings* 13(4):606-10. June. [5 ref. Eng; fre; ger]
• ***Summary:*** Using the process developed in the previous report, a manufacturing experiment was conducted semi-industrially at a milk powder factory. Various chemical properties of the product were determined and its nutritive value compared with that of regular whole milk powder. Address: Faculty of Agriculture, Univ. of Tokyo, Japan.

1607. Johnstone, D.E.; Glaser, J. 1953. Use of soybean milk as an aid in prophylaxis of allergic disease in children. *J. of Allergy* 24(5):434-36. Sept. *

1608. L.W.H. 1953. Soybean as a milk substitute for potentially allergic infants. *J. of Allergy* 24(5):474. Sept. See Johnstone and Glaser 1953. [1 ref]
• ***Summary:*** "The two soybean foods which are most commonly used [for infants who are allergic to milk] (Mull Soy and Sobee) will nourish an infant as well as milk provided they are well tolerated. The trouble with these foods, however, has always been that there is something in soybean flour, at present unknown, which often causes loose bowel movements and sore buttocks, sometimes to the point of a severe diarrhea, and the younger the infant the more likely this is to take place."

"Allergy to milk is certainly not uncommon in infants and can be responsible for a variety of symptoms. At present it is being overemphasized, and while the milk-free infant foods have a definite and a valuable place in the treatment of some allergic infants, they are being used altogether too much in many situations which have nothing whatever to do with milk allergy." Address: Editor, this journal.

1609. *British Medical Journal.* 1953. Feeding children without milk. ii(4841):874. Oct. 17. [2 ref]
• ***Summary:*** "In many Oriental and tropical countries, however, cows' milk in any form is either scarce or absent. In order to bridge the gap between the end of breast-feeding and the development of digestive powers strong enough to cope with the normal local diet, vegetable substitutes for cows' milk are urgently needed. Countless lives are being lost because in many areas no suitable alternative is available."

"In 1944 Italian workers in Rome found that foods made from mixtures of malted cereals were useful for infant feeding at a time of acute food shortage." The quality of these foods could be increased by the inclusion of soya flour. Research work by Dr. Harriette Chick (*Lancet* 1946) and by Dr. R.F.A. Dean (in German orphanages and schools, 1953) has shown that mixtures of soya and cereals can be used as effective yet imperfect substitutes for cow's milk.

"The results seem hopeful, although it is clear that a perfect vegetable substitute for milk has still to be devised. For infants up to 1 year old about half of the milk in the diet could be replaced by some of the mixtures. For children from 1 to 2 years old at least two mixtures seemed nearly perfect substitutes for all the milk in the diet. For children aged between 2 and 11 years almost all the mixtures gave good results, but for optimum growth a small allowance of [cow's] milk was necessary."

Care must be taken to inactivate trypsin inhibitors and to minimize carbohydrates that cause flatulence.

1610. Glaser, Jerome; Johnstone, Douglas E. 1953. Prophylaxis of allergic disease in the newborn. *J. of the American Medical Association* 153(7):620-22. Oct. 17. [7 ref]
• ***Summary:*** Soy formula was used in the treatment of allergic diseases. The authors claim that babies fed soy instead of cow's milk have less subsequent allergy. The authors also withheld cow's milk feeding from 96 infants who had parents or siblings with allergic diseases and compared the later development of allergic manifestations in this group with a sibling-control group. Four times as many infants in the two control groups as in the experimental group displayed 'major' allergies. The cause of this significant data is not clear... Milk allergies constituted 50, 50 and 55% of the total allergies in the experimental and each control group respectively. Address: M.D., Dep. of Pediatrics, Univ. of Rochester School of Medicine and Dentistry, and the pediatric services of the Genesee, Strong Memorial, and Rochester Municipal hospitals, Rochester, New York.

1611. Lo, K.S. 1953. The story of soybean milk. *Far Eastern Economic Review.* Oct. 29. p. 568-69.
• ***Summary:*** In 1936 the author, a resident of Hong Kong, happened to be in Shanghai, where he read a newspaper article about a talk given by a Dr. Webb [actually by Julean Arnold; see letter from K.S. Lo, 3 Nov. 1989] on the nutritional value of the soybean. He was very impressed. A year later, the invasion of China by Japan brought a steady flow of refugees into Hong Kong, and with them problems of food supply and malnutrition. Lo recalled the article he had read about soybeans and began to think about the idea of making soybean milk to be sold to the working classes at the lowest possible price. He took his idea to Hong Kong's new director of Medical Services, Dr. P.S. Selwyn-Clarke, who was known for his progressive ideas, his untiring energy for work, and his concern for the poor. "He at once offered me his moral support were I to embark on this scheme. It was through his personal encouragement and moral support that eventually I was able to bring it to fruition. He was also later to become my strongest supporter and advocate of soybean milk. A modest factory was built at Causeway Bay and it was opened for business in March, 1949 [actually 7 March 1940]. The equipment used was simple and crude and the method adopted for the making of this milk was modeled after the dairy industry. On the day of its opening, I can still remember that the total business done was 9 bottles sold."

"After two years of hard struggle, we were beginning to make some headway in our sales. At this point the Pacific War intervened and brought our activities to a stop. The factory was occupied by the Japanese, and what little equipment we had in it was lost. After the war was over we tried to restart it, and once again Dr. Selwyn-Clarke came to our rescue."

"Much to our surprise, the post-war public took to soybean milk without being coaxed. All of a sudden it became very popular, especially among the working classes." A larger and more modern factory was built at Aberdeen, and completed in 1950. After this a product that did not require refrigeration was developed; sales increased ten-fold. "Today we are able to produce from 3000-5000 cases (24 bottles each) of soybean milk a day; distributed over the territories of Hongkong, Kowloon, New Territories and Macao with a fleet of 18 trucks."

The company has "succeeded in producing a nutritious and wholesome food and putting it within the reach of the masses." The price has been kept down to 20 cents (H.K.) per bottle. The soybean milk is also extremely high in vitamin B, and because of the large amount consumed by the public daily, this has a beneficial nutritional effect. The company is now also working actively with UNICEF [United Nations International Children's Emergency Fund] in promoting similar projects in Asia. "Already we know for certain that a factory similar to ours has been put up in Djakarta by the Indonesian Government in conjunction with UNICEF."

"We are, however, not resting on our laurels. Our technicians have been busy experimenting on condensed soybean milk, which we hope to put on the market sometime next year. Then we will move onto soybean milk powder, and other forms of soya food products."

Note 1. This is the earliest document seen (April 2004) that describes UNICEF's awareness of the attractions of Vitasoy as a high protein soy beverage for use in developing countries, and joint efforts by UNICEF and Vitasoy to promote similar products in Asia. Note 2. When Vitasoy was launched in March 1940, it was fortified with vitamins, calcium, and cod liver oil. Now, in 1953, it appears not to be fortified at all.

• ***Summary:*** "When soybean milk was mixed with cow's milk and the mixture was condensed, the viscosity of the concentrate became higher due to the protein of the soybean milk." Address: Faculty of Agriculture, Univ. of Tokyo, Tokyo, Japan.

1614. *New York Times.* 1953. F.A.O. sees gains in 52 countries: Report for 1952-53 tells how experts gave help in varied projects. Nov. 2. p. 16.
• ***Summary:*** The United Nations Food and Agriculture Organization is at work on projects totaling $6,700,000 in 52 countries. In Indonesia, through the work of an FAO nutrition specialist, children are starting to get soybean milk to improve their diets; it is a substitute for dried dairy milk supplied by UNICEF. Trials in orphanages and schools over 3 months proved its acceptability. Now the Indonesian government has asked UNICEF to help in establishing a plant for large-scale production.

In Bombay, India, a revolution in dairy methods has produced cleaner milk for a population of 3 million. In the Thana district, where cows used to roam the streets, a colony of 13,000 buffaloes has been established. The milk is bottled and distributed in hygienic form.

1615. Delvaux, Edgar. 1953. Les protéines de coton et de soya dans l'alimentation humaine au Congo Belge et au Ruanda Urundi: Relation d'une enquête aux E.U. [The proteins of cottonseed and soya in human foods in the Belgian Congo and in Ruanda Urundi: Report of an investigation in the USA]. Louvain: U.S. Foreign Operations Administration. Operations Mission to Belgium and Luxembourg. 26 p. No. TA 32-101. Aug/Sept. 53. [68* ref. Fre]
• ***Summary:*** Contents: 1. Current state of food and nutrition of the indigenous people of the Belgian Congo and of Ruanda Urundi–Results of an investigation by FAO, OMS, and UNICEF. 2. Vegetable protein and animal protein in human nutrition. 3. Vegetable material rich in protein and available in the Belgian Congo–Cotton and soya. 4. Acceptability of a food. Conclusions.

Substituting vegetable protein for animal protein could help alleviate the shortage of animal protein that exists for certain categories of infants and adults, and that can lead to kwashiorkor. Cassava, the main food of these countries, is rich in carbohydrates but low in protein. The use of soy flour or cottonseed flour could add valuable protein to the diet. The soy flour could be used, as it has been elsewhere, to make soymilk for infants, tempeh, tofu, breads (add 35), or Multi-Purpose Food (Meals for Millions). Address: U.S. Foreign Operations Administration. Operations Mission to Belgium and Lexembourg.

Manufacturing methods of milky foodstuffs by using bean milk]. *Eiyogaku Zasshi* (*Japanese J. of Nutrition*) 11(3):68-69. Dec. [1 ref. Jap; eng]
• ***Summary:*** As Japan has little available land for dairy farming, sufficient milk production cannot be expected. Bean milk, which is one of Japan's own soybean products, is rich in nutrients and is sold very cheaply as a by-product of the manufacture of Japanese tofu. For this reason, attempts have been made to use bean milk as a substitute for dairy products.

However, bean milk tastes of what is called "aokusai" (green and unripened). It is also impossible to sterilize it enough without coagulating it with the heat, so it can easily spoil, especially in the summer. Because of these weaknesses, it is hard to supply this bean milk to consumers, especially in summer. If these shortcomings could be eliminated, bean milk would become a very valuable high-protein nutritious food which could serve as a substitute for dairy products. Address: Aichi-ken Eisei Kenkyusho (Sanitary Inst. of Achi prefecture).

1617. **Product Name:** Willow Run Oleomargarine–Soy Bean Spread.
Manufacturer's Name: Shedd-Bartush Foods, Inc.
Manufacturer's Address: 14401 Dexter Blvd., Detroit, MI 48238.
Date of Introduction: 1953. December.
New Product–Documentation: Spot in *Soybean Digest.* 1953. Dec. p. 9. "Market new all-soy margarine." This product is made completely from the soybean (soybean oil and soy milk) except for added salt and vitamin A. A photo shows the carton.

Midwest Natural Foods Distributors, Inc. 1975. Catalog #7. Nov. Ann Arbor, Michigan. 108 p. See p. 19. "Willow Run Margarine, soybean spread, 1 lb.

Ad (full page, green, black, and white) in Natural Foods Merchandiser. 1989. Feb. "Shedd's Willow Run Soybean Margarine. Guaranteed all vegetable. No artificial flavors or preservatives. Pareve. Lactose free. Kosher and pareve. A natural part of a healthy lifestyle. Copyright 1989 by Lever Brothers Co. For more information contact Shedd's Baltimore: 301-644-4900."

1618. *Soybean Digest.* 1953. Market all new soy margarine [Willow Run]. Dec. p. 9.
• ***Summary:*** This product is made completely from the soybean (soybean oil and soy milk) except for added salt and vitamin A. Manufactured by Shedd-Bartush Foods, Inc. of Detroit, Michigan, it is "made for those who want a product free of cow's milk or other animal foods. The present Willow Run Margarine is the outgrowth of a product [Soya Butter, developed and sold by Butler Food Products of Cedar Lake, Michigan, and introduced in Aug. 1944] which at one time was made exclusively for sale in Michigan through health food stores. It was not shipped interstate because the then existing standard of identity for margarine made no provision for a margarine made with soybean milk in place of cow's milk.

"With the lifting of coloring restrictions from margarine, and the change in the standard of identity to allow the use of soy milk, Willow Run Soy Bean Spread Margarine came into being. It is shipped everywhere in the U.S. and the carton has been designed to comply with various state laws."

A photo shows a carton of "Willow Run Oleomargarine."

• ***Summary:*** In this long chapter, the development of non-dairy infant foods is not mentioned.

1621. **Product Name:** Vitasoy Soya Bean Drink (Sterilized in Narrow-Necked Soft Drink Bottles; Previously named Vita Milk, and Sunspot Soya Milk since 1940) [Plain].
Foreign Name: Wai-ta-nai.
Manufacturer's Name: Hong Kong Soya Bean Products Co. Ltd.
Manufacturer's Address: Aberdeen, Hong Kong.
Date of Introduction: 1953.
Ingredients: Plain/sweetened: Water, soybean solids, soy oil, cane sugar (5.5%), salt, vitamins A, B-1, B-2, and niacinamide.
Wt/Vol., Packaging, Price: 6.25 oz soft drink bottle, sealed with a metal crown cap and sterilized.
How Stored: Shelf stable.
Nutrition: Per 6.25 oz.: Protein 5.9 gm, plus vitamins for 3.2 cents (US) in 1968.
New Product–Documentation: K.S. Lo. 1947. *Soybean Digest.* April. p. 8, 10; K.S. Lo. 1953. Far Eastern Economic Review. Oct. 29. p. 568-69; K.S. Lo. 1964. *Soybean Digest.* May. p. 18, 20.

E. Orr. 1972. Tropical Products Inst. Monograph G73. The use of protein-rich foods for the relief of malnutrition. Aguilera and Lusas. 1981. *Journal of the American Oil Chemists' Society.* March. p. 519. "A good example of a commercial soy beverage is Vitasoy. Originally developed in Hong Kong as a milk substitute and made by the traditional Oriental process, it was almost a complete failure. After World War II, the company sought to enter the soft drink market and the product was reformulated so that its taste was refreshing and appealing to consumers. Although it was marketed as a soft drink, its advertising emphasized that Vitasoy was also nutritious ('... will make you grow taller, stronger, and prettier'). In 1968, Vitasoy had captured 24% of the retail soft drink market; by 1970, plant capacity had trebled and ca. 120 million bottles were being produced. Vitasoy contains 2.5-3.0% protein (from soybeans), 1.5% fat and 5.7% carbohydrates (on wet basis)." K.S. Lo. 1982. History of Vitasoy; Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 99-100, 130-53. Vitasoy was the first modern soymilk in East Asia made on a large scale. It was first sold like a soft drink in sterilized bottles in 1953, and in Tetra Pak (250 ml) from 1976. Soya Bluebook. 1986. p. 103. Their first listing! Boi. 1986. Sunday Times (Singapore). Sept. 7. "Soya Bean Milk Packs More Water than Flavor." Vitasoy sells for 35 cents per 250 ml. Comments: Contains artificial flavour, carries consumption deadline, milky taste but not of soya bean, thick, no bean flavour.

Letter from K.S. Lo. 1989. Nov. 3. Gives details on name changes in this product.

1622. Nandi, D.K.; Rajagopalan, R.; De, S.S. 1953. Availability of calcium and phosphorus from vegetable milk. *Indian J. of Physiology and Allied Sciences* 7:1. *
• ***Summary:*** Vegetable milk prepared from a blend of soybean (56 parts), groundnut, and ragi malt, and containing 0.11% calcium and 0.075% phosphorus, compares favorably with cow's milk for the availability of calcium and phosphorus.

1624. **Product Name:** Neolac (Soymilk Powder).
Manufacturer's Name: Soya & Protein Products Ltd.
Manufacturer's Address: 8/9 Great Pulterey Str., Piccadilly, London, W.1., England.
Date of Introduction: 1953.
New Product–Documentation: Soybean Blue Book. 1953. p. 103.

1625. **Product Name:** Soymilk.
Manufacturer's Name: Taiwan Sanitarium.
Manufacturer's Address: Taiwan.
Date of Introduction: 1953.

1626. Bush, Maxine Conwell; Fewer, Edward Patrick. 1953. Magic recipes for the Bush & Fewer Liqua-dizer: Consisting entirely of original recipes created by the authors. 3rd ed., revised and enlarged. Mehoopany, Pennsylvania: Published by the authors. 108 p. Portrait. Illust. 22 cm.
• ***Summary:*** A vegetarian cookbook that uses a sort of blender. The 1st ed. was copyrighted in 1950. Pages 53-56 give 24 recipes for Nut Milks, including almond milk, cashew milk, walnut milk, pecan milk, peanut-banana milk, almond-peach milk, etc. Pages 57-62 give 31 dairy-free recipes for Soy Milks, each containing 1-4 tablespoons of soybean powder [flour], including pineapple-strawberry-soy

milk, banana-strawberry milk shake, blackberry-soy milk, casaba-soy milk, fresh peach-soy milk, peach-pecan-soy milk, raisin-soy drink, plain soy milk, cocoanut-soy milk, vanilla-banana-soy milk, etc.

The section titled "Eggless Dressings," makes abundant use of soybean powder in mayonnaise-like recipes such as lemon-aise, orange-aise, apricot-peanut butter-aise, olive oil mayonnaise, thousand island soy, and soy tartar sauce. Address: 1. D.C., PhD, N.D., nationwide lecturer for more than 25 years on practical psychology, physiology, pathlogy and nutriton, chiropractic and naturopathic philosophies; 2. D.C., PhC, N.D., national lecturer on bio-chemistry and nutrition, formerly Prof. of Anatomy and Physiology, Dean and Clinical Director of the Standard Chiropractic School. Both: Mehoopany, Pennsylvania.

1627. Pritchard, Florence; Pritchard, Edgar W. 1953. A scientific meatless diet: Being the principles and practice of lacto-vegetarianism based on the latest scientific discoveries, with original recipes. 4th ed. Marryatville, South Australia: Published by the authors. 19 p. 22 cm.
• ***Summary:*** Discusses the advantages of a lacto-vegetarian diet, with recipes.

Concerning soya beans, page 7 contains a paragraph which states: "These beans deserve much more attention than they have hitherto received... In China and Japan they are a staple food, being made into innumerable dishes including soya bean milk and cheese [tofu]." There are also recipes for Boiled soya beans (p. 9), and Soya bean rissoles (p. 11). Address: 31 Yeronga Ave., North Kensington Park, Marryatville P.O., South Australia.

1628. Vest, M. 1953. Nahrungsmittelallergie, insbesondere Kuhmilchallergie bei Saeuglingen [Food allergies, especially allergies to cow's milk in infants]. *Annales Paediatrici* (*Basel*) 181:277-94. [91 ref. Ger; eng; fre]
• ***Summary:*** In Europe and North America, up until now, soymilk (*Sojamilch*, which was usually a water extract of soybeans or an emulsion of soy flour), has been used mainly for treating intestinal allergies (cow's milk allergies) and eczema. Here, the writer reports a very complicated case of an infant who went into anaphylactic shock after ingestion of cow's milk and again after soybean milk. This was apparently an example of allergy to soya protein in addition to cow's milk allergy. While generally the transition to soya feeding was carried out easily and successfully, it was necessary in the one case noted above, to feed the child wheat germ, oats, vegetables, fruit, and Ossopan as a source of calcium. The child made excellent progress until the disappearance of the allergy. Address: From the Kinderspital Basel [University Children's Clinic, Basel], Switzerland.

1629. **Product Name:** Beanvit (Soya Milk).
Manufacturer's Name: Yeo Hiap Seng Ltd. (Malaysian Subsidiary).
Manufacturer's Address: Malaysia.
Date of Introduction: 1953?
Wt/Vol., Packaging, Price: Sterilized bottles.
New Product–Documentation: E. Orr. 1972. Tropical Products Inst. G73. The use of protein-rich foods for the relief of malnutrition in developing countries: an analysis of experience. p. 15. "A soya milk, Beanvit, has been produced in Singapore and Malaysia since the early 1950s by Yeo Hiap Seng Ltd. of Singapore and its Malaysian subsidiary. The company's main business is in the soft drink, food processing (canned meat) business. More recently a form of Beanvit, with vitamin and mineral additives, called Vitabean has been on sale along with Beanvit. The trend of sales is said to be satisfactory and the company has plans to expand production."

1630. Almeda, Alberto Fontana. 1954. [Condensed milk of corrected composition]. *Spanish Patent* 217,451. Jan. 12. (Chem. Abst. 50:3673fg). [Spa]*
• ***Summary:*** Soybean and other oils are emulsified in skim milk by an agitation process which forms globules of similar size to those of cream in milk. Sugar is then added and the mixture is condensed before hermetic packaging. Cholesterol is thus eliminated.

1631. Chatfield, Charlotte. 1954. Food composition tables: Mineral and vitamins, for international use. *FAO Nutritional Studies* No. 11. 117 p. March. [539* ref]
• ***Summary:*** Table 1 gives "Food composition in terms of the retail weight, ("As purchased"). The section on "Pulses, nuts and seeds" (p. 13-14) includes values for: Groundnuts, peanuts. Soybeans (*Glycine max*) and soybean products– Whole seeds, dry. Flour, full fat (seed coat removed). Flour, low fat; grits, flakes (partially defatted). Curd, tofu. Fermented beans, Japanese natto. Fermented beans, Chinese tsiang [jiang]. Soybean milk. Paste, miso (made with small amounts of rice and other starchy materials). Shoyu sauce. Sprouts: See No. 86a.

Also: Broad beans. Common beans. Hyacinth, lablab, and twinflower beans. Jack beans and sword beans. Lima beans. Mung beans and urd beans. Voandzeia (without shell). Chickpeas. Cowpeas. Lentils. Peas. Pigeonpeas (*Cajanus* spp.).

Table 2 gives "Composition of the edible portion (E.P.) and refuse in the material as purchased (A.P.)." The section on "Pulses, nuts and seeds" (p. 31-33) gives values for the same foods listed in Table 2.

These tables contain corrections to the Food Composition Tables of Oct. 1949. On pages 52+ is an index to the scientific names of plants in the tables. Address: Nutrition Div., FAO, Rome, Italy.

• ***Summary:*** Discusses the use of the soybean for green forage, silage, hay, seed, and soymilk in raising livestock in Algeria. Soymilk is especially important for rearing calves. Address: Ingenieur Agronome, Chef de Travaux au Service de l'Experimentation Agricole en Algerie, Maison-Carrée.

1635. McBride Products Co. 1954. Mary McBride's Soya Malt (Ad). *Let's Live* 22(5):42. May.
• ***Summary:*** This ad (2¼ by 5 inches) has a prominent logo of a triangle piercing a ring. On the former is written "Mary McBride's." On the latter "Modern nutrition." The text reads: During the hot summer months, keep your vitality up. Drink Mary McBride's Soya Malt. It is a highly nutritious, easily digested food drink. Rich in the 'complete protein' of the soya bean and low in starch. A scientifically blended drink that tastes delicious, and a hot soya malt before retiring is soothing to the nerves and an aid to restful sleep." Packaged in 12½-ounce and 5-pound glass jars. Comes in four flavors: almond, banana, chocolate, and vanilla. Send for your free copy of 'Eating your way to better health.'" This ad also appears in the July 1954 issue (p. 19) of this magazine. Address: Box 19, South Pasadena, California.

1636. Stein, J.F.; Knodt, C.B. 1954. Further studies on the use of soybean flour and whey solubles in milk replacement formulas for young dairy calves. *J. of Dairy Science* 37(6):655-56. June. [21 ref]*
• ***Summary:*** This is not a full-length article. It appears in the section of this journal titled "Abstracts of Papers Presented at the Forty-Ninth Annual Meeting: Pennsylvania State University, State College, June 20-24, 1954." It is Abstract P. 26 on pages 655-56 of this journal.

The abstract begins: "Soybean flour and whey solubles when fed in a 7:1 ratio in dried processed form are more effective in replacing oat flour, dextrose, and dried brewers' yeast in the basic formula studied than the individual components per se." Address: The Pennsylvania Univ., State College, Pennsylvania.

1637. Balu, V. 1954. There need be no shortage of lactic foods in India now that scientists & research workers have succeeded in milking the ground-nut. *Times of India* (*The*) (*Bombay*). Aug. 1. p. 5.
• ***Summary:*** "Milk is a perfect and satisfying food." Dr. E.V. McCollum, the famous U.S. nutritionist of Johns Hopkins University, said in the early 1920s: "The people who have achieved, who have become large, strong, vigorous people, who have reduced their infant mortality, who have the best trades in the world, who have an appreciation of art, literature, and music, who are progressive in science and in every activity of the human intellect, are the people who have used liberal amounts of milk and it's products."

But there is an acute shortage of cow and buffalo milk in India, and it is unequally distributed.

Vegetable milk has been part of the diet in Far Eastern countries for thousands of years. The soya bean had attracted public attention in India by the early 1930s. "Even Mahatma Gandhi, the Father of the Nation, experimented with it for a brief period during the early days of the Gramodyog Sangh (Village Industries Association), since it is one of the most concentrated and nutritive of foods known to man."

As early as 1945, Dr. V. Subrahmanyan and co-workers in Bangalore found that the quality and digestibility of soya bean are greatly improved when it is soaked in water, drained, germinated [sprouted], made into a paste and then processed to make soya milk. They also found that if it is suitably fortified with calcium, soya milk is about 90% as good as cow's milk in its over-all nutritional value.

The smell and taste of the curd [tofu] and butter-milk prepared from soya milk resemble those of animal milk products.

Scientists at the Central Food Technological Research Institute [CFTRI], Mysore, after more than 3 years of intense research, have also developed a good, fortified vegetable milk from ground-nut. While the soya bean is new to India and not grown extensively, India is the world's largest producer of ground-nuts–3.5 million tons a year.

Since 1951 CFTRI in Mysore has been making vegetable milk from ground-nuts on a semi-large scale and distributing it to locally to the public through hotels and catering services. It has been well accepted.

In early 1954 CFTRI set up a vegetable [ground-nut] milk plant for a private firm in Mysore. During his election tour, Mr. Nehru visited the plant, tasted the curds and butter-milk prepared there, and expressed his appreciation of them.

1638. Tung, Golo. 1954. Two Indonesian soya bean experts

study production methods [at Hongkong soya bean factory]. *Hongkong Standard.* Aug. 23. [Eng]

• ***Summary:*** "Thousands of children and expectant mothers in Indonesia are awaiting the return of two of their countrymen who are here on a one-week research work at a soya bean milk factory as part of their survey tour of soya bean production methods in Europe and United States.

"The two persons are Messrs. Soeroengan Nasoetion and Suwardi Wirratmadja. They will not only transform their native resource of soya bean into nutrition-concentrated food but will provide their young generation and other needy persons free soya bean milk powders... UNICEF decided to set up a soya bean milk plant in Indonesia after seeing the local plant."

This research is funded by the FAO Expanded Technical Assistance Programme. A photo shows K.S. Lo, Managing Director of the Hongkong Soya Bean Products Company Ltd. with the two Indonesian men plus two other men. Address: Hong Kong.

1639. *Times of India* (*The*) (*Bombay*). 1954. Dr. Radhakrishnan meets hosts of old friends: London causerie. Oct. 17. p. 7.

• ***Summary:*** The United Nations Association recently held a reception which opened their autumn campaign to raise funds for the U.N. Children's Fund [UNICEF]. The press was invited to hear a host of distinguished speakers support the campaign, "and then to watch and photograph a group of children, some of them from Indian and Indonesian diplomatic families and others from film studios, cut the UNICEF birthday cake and then eat scones made of fish flour and drink fortified soya bean milk."

A photo shows two little children each drinking a glass of soya bean milk.

Note 1. This fortified soya bean milk was probably a forerunner of Saridele. In 1957, the United Nations (UNICEF and FAO) constructed a plant to manufacture spray dried Saridele soymilk (with sesame) in Yogyakarta, Indonesia. in 1957.

Note 2. Dr. Sarvepalli Radhakrishnan (5 September 1888–17 April 1975) was an Indian philosopher and statesman. He was the first Vice-President of India (1952-1962) and subsequently the second President of India (1962-1967). He was one of India's most influential scholars of comparative religion and philosophy. He was knighted (1931) and was Spalding Professor of Eastern Religions and Ethics at Oxford University (1936-1952).

1640. Autret, Marcel; Behar, Moisé. 1954. Síndrome policarencial infantil (kwashiorkor) and its prevention in Central America. *FAO Nutritional Studies* No. 13. 81 p. Oct. Also published as "Le Syndrome de Polycarence de l'Enfance en Amérique Centrale (Kwashiorkor)" in Bulletin de l'Organisation Mondiale de la Sante No. 11, p. 891-966. [108 ref. Eng]

• ***Summary:*** This was one of the surveys made by United Nations agencies in the late 1940s and early 1950s which showed the prevalence of protein-calorie malnutrition. Pages 61-63 discuss the soybean as a rich source of protein that may be prepared in a variety of ways. A brief review is given of work with soy in Uganda, Mexico City, India, El Salvador, and Guatemala.

"Acceptability tests with soybean milk were carried out successfully in 1951 in schools and community dining rooms in Mexico City, under the supervision of the Institute of Nutrition (according to a 1951 personal communication from J. Calvo de la Torre and J. Diaz Barriga). The milk was prepared from non-bitter varieties of soybeans developed by the Agricultural Research Department of the Ministry of Agriculture, with the assistance of the Rockefeller Foundation, and cultivated in Mexico under the direction of the Maize Commission, which plans to grow soybeans in rotation with maize" (p. 62)

"The Government of Indonesia, with the financial aid of UNICEF and the technical assistance of FAO, plans to construct a plant for the preparation of an infant food made from dried soybean milk. Other countries, such as Thailand and the Philippines, are now considering similar projects" (p. 62).

The fortification of tortillas with soybeans or soy flour looks very promising. "In an attempt to modernize tortilla making, the Industrial Research Department of the Bank of Mexico has set up a pilot plant to make powdered dried *nixtamal* from suitably treated maize. When this powder is reconstituted with water, it gives the *masa* or dough which can then be rolled out into cakes and baked at home. In addition to several economic and hygienic advantages, the new technique makes it possible to incorporate either whole or partly fat-free soy flour in the *nixtamal* powder. Experiments carried out on this product have been seen by one of the authors; the *tortilla* with 10% soy flour added was still excellent.

"In towns, where *tortillas* are the staple food, there will be no difficulty in introducing soybean once the preparation of *nixtamal* is concentrated in a few large industrial plants instead of scattered among thousands of mills. However, if the Government were to make soybean-maize mixture obligatory now, control would be difficult. In the rural areas the preparation of *tortillas* is a family operation, and it will be necessary to teach the women to add soybeans to the maize grains in the preparation of the *tortillas* by giving practical demonstrations. This will be a long-term and exacting task, but it must be undertaken because mature soybeans cannot be used in the same way as other beans, as they require prolonged cooking.

"The use of the classic fresh soybean curds [tofu] calls for long education of the public, as does that of certain special preparations such as *tempeh* (fungus-fermented

soybean cheese), the preparation and nutritive value of which have been studied by Van Veen" (p. 63).

"This Study is being published in French in the Bulletin of the World Health Organization for November/December 1954, and in Spanish in the Bulletin of the Pan-American Sanitary Bureau."

Note: This is the earliest document seen (Nov. 2002) concerning world protein shortages. Address: 1. D.Pharm., Senior Nutrition Officer, Nutrition Div., FAO, Rome, Italy; 2. M.D., Assoc. Member of INCAP.

1641. Worthington Foods, Inc. 1954. Wholesale price list and order blank. P.O. Box 190, Worthington, Ohio. 1 p. Nov. 15.
• ***Summary:*** New products include: Soyamel–soy milk. Entree (in tomato sauce or mushroom gravy). Veja-links.

Note: This is the earliest English-language document seen (Aug. 2003) that uses the term "links" or "Veja-links" to refer to meatless soy sausages. Address: Worthington, Ohio. Phone: 2-5359.

1642. **Product Name:** Sobee Liquid (Soy-Based Non-Dairy Infant Formula).
Manufacturer's Name: Mead Johnson and Co.
Manufacturer's Address: 2404 W. Pennsylvania St., Evansville 21, Indiana.
Date of Introduction: 1954.
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable; refrigerate after opening.
New Product–Documentation: H.F. Meyer. 1960. Infant foods and feeding practices. A photo (p. 82) shows this canned product. A photo of a baby's face appears on the front panel. See also p. 88 and 90. Page 121 gives a detailed analysis of the product. The liquid, after being reconstituted, contains: Fat 2.6%, protein 3.2%, carbohydrates 7.7%. Calories per ounce: 20. Added vitamins and minerals: none added. Curd tension (grams): zero. Affected by terminal sterilization: No. How formulated or reconstituted: 1 oz. per 1 oz. of water. Chemical definition and essential clinical uses: "Hypoallergenic balanced soya formula designed for infants actually or probably sensitive to milk, and as a diagnostic measure to confirm or rule out milk sensitivity." Meyer gives the manufacturer's address as 2404 W. Pennsylvania St., Evansville, Indiana.

Sarett. 1976. World Soybean Research Conference. p. 840-49; Shurtleff & Aoyagi. 1979. Soymilk Industry and Market. p. 25.

1643. **Product Name:** Soyamel (Powdered Soy Milk).
Manufacturer's Name: Worthington Foods, Inc.
Manufacturer's Address: 900 Proprietors Rd., Worthington, Ohio. Phone: 2-2539.
Date of Introduction: 1954.
Wt/Vol., Packaging, Price: 1 lb can.
New Product–Documentation: Wholesale price list. 1954. Nov. 15.

Ad (1/3 page) in *Let's Live.* 1955. Jan. p. 7. "New. Better tasting, all-purpose, all-vegetable soy milk." A photo shows a can of "Worthington Soyamel–All purpose." "Mix and use like milk." The text continues: It "is the perfect 'food beverage' for everyone who prefers or needs an all vegetable milk. You'll like its clean, white appearance and its clean fresh flavor. Better tasting. Keeps longer. Improved mixing. Not only does Soyamel taste better but it also remains completely in solution after mixing. There is no disagreeable raw bean flavor! No separation of solids from liquid to be stirred up from the bottom of the bottle!" A proximate analysis is given. "One ounce of Soyamel powder makes one 8 oz glass of soy milk containing 132 calories. Ask for Soyamel at your local health food store."

Chopletter (Worthington Foods, Ohio). 1960. "What you should know about Worthington Foods." April, p. 3. The Kosher certification on 11 Worthington products has been in effect since 1 July 1959. These products are both Kosher and Pareve (neutral). Foods bearing the Kosher label include Soyamel.

Soybean Digest Blue Book. 1972. p. 110. "Subsidiary of Miles Laboratories Inc. Processing and packing powdered soy milk called Soyamel." Leaflet (4 panels each side. Each panel: 21.6 x 10 cm. Blue and tan on white). 1972? "Worthington Soyamel: Facts & recipes."

Letter from Allan Buller. 1981. April 29; Shurtleff & Aoyagi. 1984. Soymilk Industry and Market. p. 28. This was not an infant formula. It was sold in liquid form in 1 lb cans.

1644. **Product Name:** Beanvit (Soyabean Milk. Later Renamed Yeo's Soyabean Drink).
Manufacturer's Name: Yeo Hiap Seng Ltd.
Manufacturer's Address: 23, 7 M.S. Bukit Timah Rd., Singapore.
Date of Introduction: 1954.
Wt/Vol., Packaging, Price: Sterilized bottles.
New Product–Documentation: U.S. Foreign Agricultural Service. FAS-M126. Feb. p. 22. "Southeast Asia as a market for U.S. soybeans and vegetable oils." In Singapore 2 companies are engaged in the production of pasteurized soybean milk, which is sold as a soft drink. They use about 100 tons of soybeans a month for this purpose. One product is marketed as "Beanvit" soybean milk. Page 37 states that the address of Yeo Hiap Seng is 23, 7 M.S. Bukit Timah Rd. The manager is Alan Yeo. The company uses about one ton of Mainland Chinese soybeans daily.

Soybean Digest. 1970. Nov. p. 3. "A Southeast Asia soy food firm." In 1952 Yeo Hiap Send Ltd. successfully launched its first soy milk in bottles. "This is marketed as a food beverage known as 'Beanvit' and retailed at the same price as other soft drinks." In 1968 Yeo Hiap Seng Ltd. successfully introduced a modern, one-way, tetrahedron-shaped container to pack its soy milk. The container is lined

with Kraft paper and polyethylene coated aluminum foil. The product is sterilized before filling, being heated to 142ºC for 4 seconds.

E. Orr. 1972. Tropical Products Inst. G73. The use of protein-rich foods for the relief of malnutrition in developing countries: an analysis of experience. p. 15. "A soya milk, Beanvit, has been produced in Singapore and Malaysia since the early 1950s by Yeo Hiap Seng Ltd. of Singapore and its Malaysian subsidiary. The company's main business is in the soft drink, food processing (canned meat) business. More recently a form of Beanvit, with vitamin and mineral additives, called Vitabean has been on sale along with Beanvit. The trend of sales is said to be satisfactory and the company has plans to expand production."

Soya Bluebook. 1981. p. 61. No brand name given; Soyfoods magazine. 1981. Winter. p. 29. A photo shows a Tetra-Pak carton (tetrahedronal in shape) labeled Beanvit (Soya Bean Milk), with Chinese characters above it.

Letter from Alan Yeo of Yeo Hiap Seng. 1982. April "1. Our Company first introduced commercial soybean milk in bottle in Singapore in the year 1954.

"2. The name of the product was 'Beanvit.' Subsequently we changed it to "Yeo's Soybean Drink.

"3. It started as a sterilized bottle product."

Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 101. This rather sweet soymilk, introduced in Singapore in 1954 and sold like a soft drink in sterilized bottles, was marketed in Singapore and Malaysia, where it was the first product of its type. The address is now 950 Dunearn Rd., Singapore.

• ***Summary:*** Soy related words:

aburaage: see aburage.

aburage: fried beancurd.

age: a piece of fried bean-curd.

ama-miso: slightly salted bean paste.

atsuage: not listed.

Daitokuji natto: not listed.

daizu: a soya (= soy) bean. daizu kasu: a [soy] bean cake [a co-product of soy bean oil]. daizu abura: [soy] bean oil.

dengaku: bean curd baked and daubed with miso. dengaku-zashi ni sareru: to be transfixed; to be pierced through (as with a spear).

edamame: green soybeans.

ganmo: not listed.

ganmodoki: not listed. Hamananatto: not mentioned. Hamanatto: not mentioned.

inarizushi: fried bean-curd stuffed with boiled rice.

kogoridôfu = kôyadôfu.

Note 2. This is the earliest English-language document seen (April 2013) that contains the term *kogoridôfu* (written as one word, with diacritics) which it says is the same as kôyadôfu [dried-frozen tofu].

Note 3. This is also the earliest English-language document seen (April 2013) that uses the term *kôyadôfu* to refer to dried-frozen tofu.

koikuchi: not listed.

koikoku: a carp cooked in bean (= miso) soup.

kôji: malt (mugi); yeast; leaven (kôbo); kôji-ya: a maltster [a maker of kôji]. kôji ni suru: to malt something.

kôridôfu: a frozen bean curd.

kuromame: a black soy bean.

miso (chomiryô = seasoning): bean paste; miso. miso o suru: to mash the miso [as in a suribachi]. miso kakeru: to put miso on something (as food). (2) (tokui to ten) sore ga kare no miso da: that is what he takes pride in [that is what he is good at]. (3) (hikakuteki-ni) miso o kakeru (shuppai suru): to make a mess (=sad work) of something; to make a miserable (=poor) showing. miso o suru (hetsurau): to flatter [someone, as one's superiors]. [Modern is goma suru; kare, shatcho ni goma shitte-iru: he is flattering his boss. A grinding gesture goes with it. goma-suri: a person who flatters]. kuso miso ni iu: to speak meanly of a person; to speak of a person in the most disparaging terms. miso mo kuso mo isshoni suru: to mix up good and bad things. miso no miso kusaki wa, jô miso ni arazu: The secret of art lies in concealing art [Akiko never heard this saying]. soko ga miso

darô: perhaps that's the point he takes pride in [=the key point].

misokoshi: a *miso* strainer. [misokoshi de mizu o sukuu]: weave a rope of sand; attempt impossibilities [literally, to try to scoop up water with a miso strainer].

miso-mame: soy (= soya) beans.

misuzu-dofu: not listed.

momen: no meaning related to tofu is listed.

nama-age: fried bean curd.

Note 4. This is the earliest English-language document seen (April 2013) that contains the term *nama-age* which refers "fried bean curd."

nattô: fermented soybeans. nattô uri: a vendor of fermented soybeans. nattô-jiru: miso soup with ground fermented soybeans.

nigari, nigashio: bittern; brine.

nimame: boiled beans [typically boiled soybeans served as part of *osechi* at New Year's].

nori [no tsukudani]: laver boiled down in soy [sauce].

oboro: not listed.

okabe: = tofu.

okara: bean curd refuse.

shimidôfu = kôridôfu [frozen tofu].

Note 5. This is the earliest English-language document seen (April 2013) that contains the term *shimidôfu* (written as one word, with diacritics) which it says is the same as kôridôfu.

shitaji (7): soy [sauce].

shôyu: soy [sauce].

tamari: [a kind of] soy; soy sauce; sauce from refined soy.

tôfu: beans curds (=cheese); tôfu. [tôfu itcho; in characters]: a piece (=cake) of bean-curds. [tôfu-ya]: a bean-curds dealer (=seller). [yaki-dôfu]: roasted bean-curd. kare ni iken shita totte, tôfu ni kasugai da: advice to him is like water sliding off a duck's back = It's a mere waste of words (=It is like pouring water into a sieve) to advise him. [tofu-ya e ni ri, saka-ya e san ri to iu tokoro da]: there is no human habitation within five miles of the place. [It's out in the boondocks].

tônyû: bean soup; soya-bean juice [sic, soymilk].

u-no-hana: (1) flowers of the *Deutzia scabra.* (2) [tôfu no kara] bean-curd refuse.

tsukudani: preserved food boiled down in soy.

yuba: dried bean curds [sic, the film that forms atop soymilk when it is dried]. Address: General editor, Japan.

1649. Malnutrition in African Mothers, Infants and Young Children: Report of the Second Inter-African Conference on Nutrition. Held under the auspices of the Commission for Technical Co-operation in Africa South of the Sahara (C.C.T.A.). 1954. London: Her Majesty's Stationery Office. 398 p. Held 19-27 Nov. 1952 at Fajara, Gambia. Illust. Index. 25 cm.

• ***Summary:*** Contains 5 papers about food uses of soya in Africa, each cited separately. Address: Gambia and London.

1650. Platt, B.S. 1954. Some nutritional implications of the mother-infant relationship. In: Malnutrition in African Mothers, Infants and Young Children: Report of the Second Inter-African Conference on Nutrition. London: Her Majesty's Stationery Office. 398 p. See p. 285-89. Held 19-27 Nov. 1952 at Fajara, Gambia, under the auspices of the Commission for Technical Cooperation in Africa South of the Sahara (CCTA). [8 ref]

• ***Summary:*** "Most workers engaged in nutritional or paediatric studies in tropical countries have early in their careers an urge to produce a substitute for human or cow's milk. It would, in my view, be much more desirable to devote attention to two other problems: firstly, the study of how the mother should be fed so as to enable her to feed her infant adequately from her breasts, and secondly, the determination of the value of foods suitable for continuing the practice of mixed feeding." On the latter subject, the author favors the use of soya bean curd [tofu] rather than of the "milk" [soya milk] made from these beans. Address: Prof., Director of Medical Research Council's Human Nutrition Research Unit and of the Applied Nutrition Unit, and Head of the Dep. of Human Nutrition, London School of Hygiene and Tropical Medicine, London, W.C.1., England.

1651. Thorpe, Jocelyn Field; Whiteley, M.A. 1954. Soya bean. In: J.F. Thorpe and M.A. Whiteley. 1937-1956. Thorpe's Dictionary of Applied Chemistry. 12 vols. 4th ed. London, New York, Toronto: Longmans, Green & Co. See vol. XI, p. 46-48. 23 cm. [15 ref]

• ***Summary:*** The section titled "Soya Bean" has the following contents: Introduction. Composition of soya beans. Soya-bean products: Oil, cake and meal, flour, milk, soy sauce ("known in Japan as 'Shoyu' and in the west under such names as 'Worcester Sauce,'..."), miso, tofu, immature soya beans, roasted soya beans (eaten like peanuts), coffee substitute, chocolate substitute. Agricultural uses (green fodder, hay, silage, bean pods and straw). Sir Jocelyn Field Thorpe lived 1872-1940.

1652. Vollmer, Marion W. 1954. Food: Health and efficiency. Lessons in nutrition and healthful food preparation. Prepared for use in Home health education classes under the direction of the Medical Dept. of the General Conference of Seventh-day Adventists. Nashville, Tennessee: Southern Publishing Assoc. 111 p. 24 cm.

• ***Summary:*** This Seventh-day Adventist book on vegetarian nutrition (with recipes) mentions soy in several places. To help make breakfast a hearty meal, waffles may be "reinforced with soy" (p. 19). When cooking processed breakfast cereals, "they can be made more nutritious by adding wheat germ, rice bran, soy flour, etc." Soybeans are

given as the first example of a high-protein food that should be eaten daily (p. 26), and soybeans, soybean products, and gluten are listed as good sources of protein (p. 31). A table showing the protein content of common foods includes Soyalac (dry soy milk), meat substitutes (commercial gluten steaks, Proteena or dark meat substitutes, Nuteena or light-meat substitutes), and soybeans (p. 32).

The following recipes are given: Baked soybeans (p. 34). Gluten (how to prepare and serve at home, p. 35-36). Gluten, mushroom, and potato pot pie (p. 36). Holiday loaf (with Vegemeat Burger or other ground gluten, p. 37). Mushroom dressing with gluten slices (p. 37).

A second edition was published in 1964.

1653. *Soybean Digest.* 1955. Saving lives with soy. Jan. p. 18.
• ***Summary:*** A photo of Danny Kaye and S.S. De has this caption: "Film star Danny Kaye drank a glass of soybean milk on a recent trip to Bangkok [Thailand]. It was presented to him by Food and Agriculture organization's Dr. S.S. De, regional nutrition officer for Asia and the Far East. Danny, who was on tour as ambassador at large for UNICEF, was told how soybean milk is helping to improve the diets of many people who do not otherwise get enough protein."

1654. Ratner, Bret; Untracht, S.; Crawford, L.V.; Malone, H.J.; Retsina, Mary. 1955. Allergenicity of modified and processed foodstuffs. V. Soybean; Influence of heat on its allergenicity; Use of soybean preparations as milk substitutes. *American J. of Diseases of Children* 89(2):187-93. Feb. [7 ref]
• ***Summary:*** Soybean is innately a weak allergen. It only rarely causes allergic manifestations. Address: Depts. of Pediatrics and Immunology, New York Medical College and Flower and Fifth Ave. Hospitals, and the Pediatric Div. of Sea View Hospital, New York.

1655. *Soybean Digest.* 1955. Borden Dept. head. Feb. p. 28.
• ***Summary:*** "Dr. J.F. Muller has been named general manager of the prescription products department of the Borden Company's special products division. He succeeds Harry McNeilly who has resigned.

"Dr. Muller, a chemist and bacteriologist, has been with the prescription products department since 1941. He is the discoverer of MullSoy, a soy-base food for children and adults who are allergic to cow's milk. Before joining Borden's he was owner and director of Muller Laboratories which he founded in Baltimore" [Maryland].

A portrait photo shows Dr. Muller.

Note: This is the earliest English-language document seen (Aug. 2013) that uses the term "soy-base" (or "soy-based") as an adjective to refer to a product made primarily from soy rather than from the substance (in this case cow's milk) from which it is typically made.

1656. *New York Times.* 1955. Deaths: Mrs. Edwin C. Cort, Missionary in East. March 18. p. 27.
• ***Summary:*** Mrs. Mabel Gilson Court died on 15 March 1955 in Oakmont, Pennsylvania, at age 83–the widow of Dr. Edwin C. Court, who died in 1950. She had been a Presbyterian missionary in Siam (later called Thailand) from 1903 to 1949. Her husband was a physician and fellow missionary. Mrs. Cort was born in about 1872 in Zanesville, Ohio. She was married in 1910. In 1915 Dr. Cort took charge of McCormick Hospital in Chiengmai. Following a furlough of study at Johns Hopkins University, Mrs. Cort took charge of dietetics at McCormick Hospital. She developed a formula for "soybean milk that became standard in Thailand." In 1949, when they retired, Dr. and Mrs. Cort received high honors from Thailand.

1657. Wood, Alice L. 1955. The history of artificial feeding of infants. *J. of the American Dietetic Association* 31(5):474-82. May. [96 ref]
• ***Summary:*** "Artificial feeding has been defined as 'feeding an infant with other than breast-milk. Artificial feeding has perplexed every society." Milk from a wet-nurse was not artificial.

Discusses: Early records of wet nursing and artificial feeding. Science replaces superstition [in the late 19th century] ("Abraham Jacobi established the first pediatric clinic in America in 1860"). Evolution of the feeding bottle. Sanitary milk supply (success came in the late 19th century, as the germ theory came to be widely known and accepted. In 1857 Gail Borden started the first sanitary inspection of milk. In 1886 Jacobi recommended sterilizing milk). Deficiency diseases ("Rickets and scurvy have been the two outstanding hazards in the life of the young child throughout history,.."). Recent trends ("The modern era of feeding might be said to date from 1930." The baby food industry began in 1929).

In this long chapter, the development of non-dairy infant foods is not mentioned. However it is alluded to: "Allergy, too, can be dealt with more effectively" (of the 17 references cited, a few deal with soy formulas). Address: Graduate student, Teachers College, Columbia Univ., New York City.

1658. Autret, M.; van Veen, A.G. 1955. Possible sources of protein for child feeding in underdeveloped countries. *American J. of Clinical Nutrition* 3(3):234-43. May/June. [7 ref]
• ***Summary:*** Soybeans can help fill protein needs but must be processed in well-controlled processing plants. FAO has long been associated with the "saridele" "soy milk" project in Indonesia. After the "saridele" project had been extensively discussed in the National Nutrition Council of Indonesia, the Indonesian government asked UNICEF and FAO to assist in establishing a "saridele" plant for the manufacture of this

product for "mother and child welfare centers and hospitals." Why did the Government choose centralized manufacture rather than local manufacture in villages and households? "The reply is that whereas in many villages 'soy milk' is not unknown, 'saridele' from soybean and groundnut certainly is. Introducing a new, hardly known food or food mixture in a country like Indonesia is a difficult and slow process; demonstration through feeding schemes is one of the best ways. Processing on a village scale or locally for hospitals, etc. would certainly lead to numerous difficulties, such as unhygienic manufacture and distribution, lack of suitable containers, and adulteration of the product with water, etc.

"The total capital investment of the Government and UNICEF (who will supply the plant) is about 6 or 7 million Rupiahs (about &700,000); the plant will produce at least 300 tons of the dry product a year" (p. 235-36). Note: This is the earliest document seen (Sept. 2000) that mentions "saridele."

"Another well-known soybean product from Indonesia, *tempeh,* prepared by treating the cooked soybeans with a certain fungus, has drawn the attention of workers in Southern Rhodesia where soybeans are cultivated, but the local population is not much interested in consuming them. Tempeh has a high nutritive value and is highly digestible, but the manufacture is somewhat difficult to control when the product is manufactured under simple conditions. This and other considerations were the basis in Indonesia of the conclusion that soy milk would be preferred to tempeh in the manufacture of a soy product for infants, and children.

"FAO has been giving technical advice on the manufacture of tempeh in Southern Rhodesia, and it seems that the results of the large-scale experiments are very promising. It is to be hoped that these will be published, not only in connection with acceptability, but also concerning the technical problems, data on production costs, and so on." Address: 1. Pharm. D.; 2. PhD.

1659. Ratner, Bret; Crawford, Lloyd V. 1955. Soybean: Anaphylactogenic properties. *Annals of Allergy* 13(3):289-95. June. [11 ref]

• ***Summary:*** In 1934 Duke aroused interest in the "question of the allergenicity of soybean" when he reported one case of a person who was "exquisitely sensitive to soybean." His patient lived and worked near a soybean mill. Yet despite "Duke's warning that soybean might become a source of allergy, there has been practically no evidence in the literature in the intervening twenty years that soybean is an important factor in this disease." In 1942 Hill deduced that "soybean is a poor antigen." Many soy products are now on the market.

"Because of the use of soybean as a milk substitute in infant feeding, we undertook to investigate it from the standpoint of its allergenicity."

The materials used were raw dried soybean [whole dry], soybean flour (Special X Brand, made by Spencer Kellogg and Sons, Inc.) and soybean extract (SBE). Each is described in detail (p. 290).

"Summary and conclusions: Soybean was demonstrated to be a weak anaphylactogen when tested in the guinea pig. 2. The weak antigenicity is moderately enhanced when adjuvants are incorporated into the soybean antigen. 3. Sensitization was not materially increased by multiple sensitizing injections" or "through inhalation of soybean flour." "6. The reduced amount of methionine present in the soybean protein might in part account for the lowered antigenic activity of soybean."

Note: *Webster's Dictionary* defines anaphylaxis (a word first used in 1907) as "1: hypersensitivity (as to foreign proteins or drugs) resulting from sensitization following prior contact with the causative agent. 2: anaphylactic shock."

It defines an antigen (a word first used in 1908) as "a usually protein or carbohydrate substance (as a toxin or enzyme) capable of stimulating an immune response." Note: This is the earliest document seen (Jan. 2006) that uses the word "antigen" or "antigens" in connection with soybeans. Address: 1. M.D., F.A.C.A., 50 East 78th St., New York, NY.

1660. *Soybean Digest.* 1955. Soy plant in Indonesia. July. p. 20.

• ***Summary:*** "Establishment of a soybean milk plant in Djakarta [Jakarta], Indonesia, is under way, and may be the first of a number in that part of the world, reports the American Embassy, Djakarta. The project is one of the activities of the Food and Agriculture Organization of the United Nations (FAO)."

1661. Peoples Drug Stores, Inc. 1955. Fresh stocks, priced low (Ad). *Washington Post and Times Herald.* Aug. 5. p. 23.

• ***Summary:*** The section titled "Baby foods" includes: "Mull Soy Liquid, 15½ ounces–38¢. Soyalac Infant Food, pound–$1.18. Mull Soy Powder, pound–$1.14."

1662. McLaughlin, Kathleen. 1955. Soy milk plant to aid Indonesia: Factory in Jogjakarta may build up nutritional values for all Southeast Asia. *New York Times.* Sept. 18. p. 21.

• ***Summary:*** Harry Miller, Jr., an American technician for the United Nations Food and Agriculture Organization, is supervising construction of a plant to produce soybean milk–in both liquid and powdered form, in Jogjakarta, Indonesia. The plant is expected to be in production by Feb. 1956, and by mid-year the dehydrated form should be available for domestic shipment.

More than 20 years ago, Mr. Miller's father, an American medical missionary in China, developed a good-tasting soybean milk there. By hard work, persistence, and ingenuity, he developed the equipment that is now being instaled in the Jogjakarta plant.

"By 1936, Dr. Miller had returned to Shanghai with his family, erected and equipped a factory, and was turning out 3,000 quarts of bottled soybean milk a day, at 7 cents (U.S.) a quart. Cow's milk cost 30 cents.

"Then the war with Japan erupted. In 1937, Japanese forces completely destroyed his plant and in 1938 the Millers left China for their home in the United States." In 1947 they returned briefly to China, then in 1948 they left again before the Communist advance.

Dr. Miller's patents have long since been relinquished to the public domain, with the exception of an interest retained in one soybean milk plant in California. As an F.A.O. expert, Harry Miller Jr. hopes to make his father's soymilk processing system as widely available as possible, especially in places like Indonesia, where it can offer the greatest benefits.

The United Nations Children's Fund [UNICEF], which has provided $350,000 worth of the Miller type equipment for the Jogjakarta plant, has agreed that half of the annual output of 600 tons of soybean milk, powdered or liquid, from this plant, will be distributed free of charge to Indonesians for the first 3 years.

1663. Blue, Johnny A. 1955. Folklore remedy (Canada fleabane) for soybean diarrhea. *J. of Allergy* 26(5):425-28. Sept. [9 ref]
• ***Summary:*** Children allergic to cow's milk who use soybean milk may develop diarrhea from soybean milk. "Most of us have heard the complaints of mothers about the foul odor of soybean milk while boiling it in an attempt to prevent the diarrhea." Describes a cure for "soybean diarrhea" using Canada fleabane, also called "mule tail tea." The remedy was used on 25 infants and young children who had moderate to severe diarrhea from the consumption of soybean milk (Mull-soy) after the usual methods of treating it had failed. A pinch of the dried leaves were steeped in hot water then strained and added to the soybean formula. "There were no ill effects noted from the treatment." Address: Oklahoma City, OK.

1664. *J. of Agricultural and Food Chemistry.* 1955. Soy milk in Indonesia. 3(10):807. Oct.
• ***Summary:*** "A soybean milk plant is going up in Jogjakarta, Indonesia and should be in production by February. The product, already tested with mothers and children, is expected to get enthusiastic response. Not only is it palatable, but it is more easily assimilated by the underfed than is cow's milk. It is also higher in protein. The UN Children's Fund has furnished $350,000 worth of equipment for the 600 annual ton plant being built under direction of Harry Miller, FAO technician whose father, a medical missionary, developed the process."

Note: The soy milk is named Saridele.

1665. Melo, Maria de Lourdes. 1955. [Soy bean in diet therapy of nutrition diseases]. *Revista Brasileira de Medicina* 12(10):712-16. Oct. [Por]*
Address: Brazil.

1666. Lager, Mildred. 1955. Nutritional news and recipes: The power of gratitude. *Let's Live* 23(11):22-23, 53. Nov.
• ***Summary:*** "We all have so much to be grateful for, as there is an abundance of wonder and loveliness in the world if we will but look at it. Gratitude brings both healing and comfort. Start your day with gratitude..."

Discusses nuts as food, with recipes, including: Almond breakfast with "raw almond butter." Almond milk. Peanut butter mayonnaise. Vegetables in nut gravy (with "raw or toasted cashew butter"). Almond hamburgers [meatless] (seasoned with soy sauce). Address: Los Angeles, California.

1667. Thompson, M.D. 1955. Comparison of milk and soya beans in the treatment of kwashiorkor in Uganda. *British Medical Journal*. ii(4952):1366-69. Dec. 3. [5 ref]
• ***Summary:*** Soy-banana mixtures were used successfully for treating kwashiorkor. But the author warned: "Failures with soya are attributable at the practical difficulty of feeding the mixtures, which was so great, even in many cases in which treatment was eventually successful, that it would seem to make routine use of soya-bean feeds impracticable outside specialized centres." Address: M.D., M.R.C.P., Mulago Hospital, Kampala; Dep. of Medicine, Makerere College; Lab. of the Colonial Research Scheme.

1668. **Product Name:** [Wood-lit-nai soymilk].
Foreign Name: Wood-lit-nai.
Manufacturer's Name: A.S. Watson.
Manufacturer's Address: Hong Kong.
Date of Introduction: 1955.
New Product–Documentation: Letter from K.S. Lo. 1984. March 2. There have been many competitors in the Hong Kong soymilk market throughout the years. The first was A.S. Watson's "Wood-lit-nai" which was launched in about 1955. It was withdrawn a couple of years later.

1669. Henselwerk GmbH. 1955. Das Problem der milchfreien Saeuglingsernaehrung, insbesondere bei Milchschorf [The problem of raising infants on a milk-free diet, especially because of dermatitis caused by milk]. Magstadt bei Stuttgart, West Germany. [Ger]*
• ***Summary:*** This is the earliest document seen (May 2008) concerning a major European soyfoods company that was active in the 1990s. Address: Magstadt bei Stuttgart, West Germany.

1670. *Indian Council of Medical Research, Special Report Series.* 1955. Milk substitutes of vegetable origin. No. 31. 48 p. (New Delhi). [216 ref]

• ***Summary:*** Contents: Importance of milk in human dietary. Soya bean research in India. Vegetable milk from groundnut. Preparation of milk substitutes–soya bean milk. Groundnut milk and related products. Other milk substitutes. Summary and conclusions. References.

"During the Bengal Famine of 1943, Guha and Saha prepared a mixture of soya-bean, groundnut and malted barley from which a milk was prepared, which fortified with calcium and shark liver oil, was fed to a large number of infants and children who liked this feed and responded well to it. Experiments with rats showed that this milk gave better growth than ordinary bazaar milk but slightly less than genuine cow's milk."

"During the past 3 decades, several attempts were made in India to popularise the use of soya-bean as an article of human food... Experiments carried out at Coonoor by Aykroyd and Krishnan (1937), showed that the pulse did not have any advantage over the commoner pulses as already consumed in the country. Subsequently a more intensive programme was carried out in 4 Laboratories (Dacca [in today's Bangladesh], Bombay, Lahore and Coonoor) in accordance with a plan drawn up by the Soya-bean Sub-Committee of the Nutrition Advisory Committee. The report of that Sub-Committee (1946), generally confirmed the earlier Coonoor results and showed that, in spite of its higher protein content, soya-bean did not reveal any superiority over the commoner Indian pulses as a supplement to the typical Indian diets. The Sub-Committee stated, therefore, that it was 'not in a position to advocate *immediately* the encouragement of the production of soya-bean on a wide scale in India for use as a substitute for Indian pulses. The question should, however, be reconsidered if and when further evidence on the nutritive value of soya-bean becomes available.'

"When preparing the above report, the Sub-Committee had before them the results of the Dacca experiments which showed that while the bean itself, cooked as a pulse, had no supplementary value to the simplified rice diet, the milk prepared out of the bean had a definite supplementary value which was only slightly inferior to that of cow's milk. There was also a detailed report from the Indian Institute of Science, Bangalore, which indicated that the digestibility and the biological value of the fraction of soya-bean protein which was in stable emulsion as a result of processing were considerably higher than the corresponding values for the whole soya-bean protein. The latter report also outlined an improved method of preparing a stable and adequately fortified soya-milk which had already been used for trials in Bangalore.

"As the above observations were rather suggestive, a fresh programme of investigations was initiated at Bangalore under the auspices of (i) the then Indian Research Fund Association (now Indian Council of Medical Research), for assessing the nutritive value of processed soya-bean milk as compared with cow's milk at different levels in the case of both experimental animals and human subjects, (ii) the then Food Department, (now Ministry of Food & Agriculture) for pilot plant trials on the production of soya-milk and related products, and (iii) the then civil and Military Station, Bangalore, for mid-day school feeding of about 6,000 school children with rice and soya milk curd as compared with rice and skimmed milk curd. In these programmes the Indian Institute of Science conducted the preparatory studies and the animal experiments, while the Nutrition Research Laboratories collaborated in the field studies and made the necessary health observations. The trials which were conducted over a period of 3 years (1945-48) showed that, unlike the whole soya-bean, the milk or curd prepared out of it was acceptable, had a high digestibility and a definite supplementary value to the poor cereal diet as consumed in South India." Address: ICMR, New Delhi, India.

1671. Jelliffe, D.B. 1955. Infant nutrition in the subtropics and tropics. *World Health Organization Monograph Series* (*Geneva*) No. 29. 237 p. [313 ref]

• ***Summary:*** Contents: Introduction. 1. Evolution of infant feeding in the Western world. 2. Present infant-feeding practices in the subtropics and tropics. 3. Present status of nutritional disease among infants in the subtropics and tropics. 4. Methods of improving infant feeding in the subtropics and tropics. 5. Prevention of kwashiorkor. Acknowledgements. Annexes: 1. Summary of suggested methods of infant feeding in the subtropics and tropics. 2. Questionnaire for use in investigating methods of infant feeding. Illustrations. References. Index.

Soya-bean products are mentioned on pages 47 (tempeh and "tahu" [tofu]) and 49 (soya curd [tofu] and tempeh).

In the chapter titled "Prevention of kwashiorkor," pages 160-62 review and discuss the use of the soya bean to prevent protein deficiency in infant nutrition: (1) Soya-bean emulsion is "also known as soya 'milk.'" Work in the USA, Philippines, Hong Kong, Thailand, and Indonesia is discussed. (2) Soya-bean curd, "also known as soya 'cheese'" [tofu], is rich in calcium but is lacking in the vitamin-B complex. "Nevertheless, it can be an extremely valuable food, and, according to Platt (personal communication) is far superior to other soya products in infant feeding." (3) Fungus-digested soya beans or tempeh from Indonesia contains vitamin B-12 and is not expensive. It is very digestible and can be ground up and added to steamed rice for feeding older infants. (4) "Miscellaneous. Various other prepared soya products are of great nutritional value, but are probably unsuitable for infants." These include miso and soy sauce. "A simple method of preparation which requires further investigation is that of grinding the roasted beans into a flour, which can be added to gruels or soups. The roasted bean is certainly palatable but its digestibility for children is unknown, as is the effect of roasting on the trypsin inhibitor and on the amino-acid composition."

Address: WHO Visiting Prof. of Paediatrics, All-India Inst. of Hygiene and Public Health, Calcutta. Formerly, Senior Lecturer in Pediatrics, University College of the West Indies, Jamaica. Nutrition Consultant, World Health Organization.

1672. Lager, Mildred. 1955. How to use the soybean: A plus factor in modern nutrition. Burbank, California: Published by the author. Printed at La Sierra College Press, Arlington, California. 115 p. Index. 23 cm. Lay-flat comb bound.
• ***Summary:*** Contents: Preface. Nutritional nuggets–food value of soybeans. The versatile soybean. Soup to nuts–soybeans and soy products. Recipes: Green soybeans. Dry soybeans. Sprouted soybeans. Roasted or toasted soybeans. Meat-substitute dishes. Soy-enriched meat dishes. Soy noodles, macaroni, spaghetti. Sauces and gravies. Soups. Salads. Dressings. Soy spreads. Soy milk. Tofu or soy cheese. Soy butter (made from finely ground soybeans or soy flour, it may be raw or roasted, and resembles peanut butter; p. 73-74). Soy cereals. Soy desserts. Soy candies. Soy beverages. Soy-flour recipes. Breads and muffins. Pancakes and waffles. Soy gluten recipes. Baking-powder biscuits. Pastry. Cookies and doughnuts. Cakes. Contains 350 recipes.

A so-called "second edition" of this book was published in 1959, but it was identical to this first edition.

Ad in *Let's Live.* 1960. April. p. 39. Mildred Lager Publications [perhaps her home] is now located at 4118 Warner Blvd., Burbank, California. Mildred died in Aug. 1960. Address: Burbank, California.

1673. Rawson, Rulon W.; Rall, J.E. 1955. The endocrinology of neoplastic disease. *Recent Progress in Hormone Research* 11:257-90. See p. 273. Presented at a conference held 5-10 Sept. 1954 at Mont Tremblant, Quebec, Canada. [96* ref]
• ***Summary:*** Many "studies have demonstrated that certain tumors can be induced, inhibited, or even prevented in experimental animals by altering the hormonal environment. In other studies it has been demonstrated that the rate of growth of certain tumors can be significantly influenced, i.e., accelerated or inhibited, by altering the host's endocrinologic environment. Indeed these studies make it possible to foster hope for eventual control of these diseases by physiologic means."

Concerning tumors of the thyroid: "Recently we have had opportunity to examine the thyroid of a one-year old child whose thyroid had rapidly enlarged to the extent that a tracheostomy had to be done to prevent asphyxiation. A biopsy taken at the time of the tracheostomy was reported to be a Hürthle cell cancer of the thyroid. We suggested that the extreme and unusual hyperplasia seen in this goiter was benign and that it was due to a goitrogen. We asked if the child had been taking soybean milk, a source of protein relatively free of allergic reactions which in animals is goitrogenic. The child had been fed soybean milk since immediately after its birth, and the goiter disappeared on stopping this dietary item (see Fig. 6)."

Note: This is the earliest document seen (Oct. 2003) in which a soy product apparently caused goiter in a human subject. Address: Memorial Center for Cancer & Allied Diseases, New York, NY.

1674. Springer, Gertrude Anders. 1955. Natural food cookery: Nature's sweets, herbs and wholegrain flours. Milwaukee, Wisconsin: Lee Foundation for Nutritional Research. 71 p. No index. 23 cm.
• ***Summary:*** An early natural-foods cookbook. Contents: 1. Foreword. 2. Fundamental food concepts ("The way to build this vibrantly alive soil is by practicing the Science of Organiculture, or the organic method"). 3. Wholegrain flours. 4. Wholegrain meals and grits. 5. Other valuable foods. 6. Herb cookery. 7. Pies. 8. Cookies. 9. Cakes. 10. Cake frostings. 11. Doughnuts. 12. Confections. 13. Fruits. 14. Health beverages. 15. Salads. 16. Salad dressings. 17. Breads, rolls and muffins. 18. Meat, fish and eggs. 19. Vegetable dishes. 20. Soups and stews. 21. Pancakes and waffles. 22. Jams and preserves. 23. Quick desserts. 24. Article "Sesame seed–An important food." 25. Practical methods in preparing health-building foods. Note 1. Chapters 24 and 25 (on unnumbered pages) are written by Royal Lee, D.S.S. [dentist].

Soy-related recipes: Chapter 3, "Wholegrain flours," contains a photo of bags of five such flours, including "Soya flour." A paragraph (p. 5) explains: "Soya flour can be a full fat flour (all of the fat left in) which many consider nutritionally superior, or it can be a low fat flour (part of the fat removed) for low calorie diets." Note 2. This is the earliest English-language document seen (Nov. 2003) that uses the term "low calorie" or "low calorie diets" positively in connection with soybeans for human diets. Throughout most of human history, people wanted calories, which provide energy.

Unleavened Indian chapatis (with ½ cup soy flour, p. 52). Basic muffin recipe–Soya muffins variation ("Substitute ½ cup soya flour for ½ cup of the pastry [flour]. Gradually increase the soya and decrease the pastry until you are using half and half after several batches have been made." p. 54). Chinese chow mein (with up to ½ cup "Show You sauce," p. 62). Japanese sukiyaki (with about ½ cup "Show You sauce," p. 63). Egg white leavened waffles (with a bit of soya flour, p. 67). In Chapter 25, the section on "Vegetables" contains brief instructions for making soy bean milk, and using soaked, "liquefied beans direct from the blender" in making bread. The Chinese never eat soy bean products without first soaking the beans. "It is the secret of successful soy cookery." The chapter on sesame seeds notes: "Sesame seed ground into a butter like peanut butter is used in some countries–Turkey in particular–like our dairy butter is here, and is used in almost every food in some degree. It makes first-class salad dressing when mixed with vinegar and

prepared mustard. With honey and milk powder a very tasty cream candy can be made... In Roman times the emergency ration for soldiers was a candy made from sesame seed and honey. A very tasty and nutritious ice cream can be made from sesame butter, honey and milk powder. The sesame seed can be used for these purposes instead of the sesame butter if the seed is liquefied with the honey in a blender or Osterizer. Sesame butter is an ideal shortening for bread and cookies." Note 3. This is the earliest English-language document seen (May 2011) that contains the term "sesame butter"–a smooth paste of ground sesame seeds.

This book also discusses: Carob brownies, peanut butter, sunflower seeds, how to sprout mung beans, herbs, etc.

Note 4. This is the earliest English-language book seen (June 2003), published after World War II, with the term "natural food" in the title.

Note 5. This is not a vegetarian cookbook. Recipes (p. 55-58) call for steak, pork, ground beef, spare ribs, lamb chops, ham, chicken, tuna, and salmon.

1675. Williamson, Jessie. 1955. Useful plants of Nyasaland. Zomba, Nyasaland: Government Printer. 168 p. See p. 60-62. Edited by P.J. Greenway. Illust. by G. Jackson. 25 cm. [2 ref]
• ***Summary:*** *Glycine javanica* L. (called *Yembe* in ciCewa), is a perennial herb with slender climbing stems that are thinly pubescent. The leaves are frequently cooked as a side dish in Nyasaland [named Malawi after 1964]; they are not slimy and are much used.

The soybean (*Glycine max.*) is grown in considerable amounts in the southern province of Nyasaland. "The beans contain a saponin, which is poisonous and which is found in varying amounts in the different kinds." Among the many varieties suitable for eating are Herman, Easy Cook [Easycook], and some of the non-shattering Hernon varieties.

Methods of cooking soy soya beans: 1. Boiled as a side dish. 2. Boiled and mashed beans with skins removed as a side dish (called *cipere*). 3. The use of soya bean meal [soy flour] to improve the food value of porridge (*nsima*)*:* Introduction, use of roasted meal [roasted soy flour], use of unroasted meal [soy flour]. 4. Roasted soya [soynuts] as a substitute for groundnuts in side-dishes. 5. Soya bean milk and curd [tofu; a method is described for making soya bean milk from pounded soya beans that was in use at the Jeanes Training Centre in 1942; a method for making tofu from this milk is also described]. 6. Fresh [green] soya beans as an extra food [snack]. 7. Roast soya beans as an extra food.

Concerning the "Use of roasted meal: The beans should be roasted for some minutes and then ground or pounded. The resulting flour is palatable and also stores well. It may be used in amounts of up to 20 per cent. (10 per cent. is recommended) to mix with any other kind of flour. It makes a very palatable product with cassava flour, the latter is of such poor nutritive value on its own, as it consists almost entirely of starch, that the addition to it of protein-rich meal is important." Address: Member of Nutritional Survey and Nutritional Investigator, Nyasaland.

1676. Battle Creek Food Co. 1955? Pointers: On Battle Creek Sanitarium health foods. Battle Creek, Michigan. 16 p. Undated. Illust. No index. 16 cm.
• ***Summary:*** Contents: The story of Battle Creek Foods (The Battle Creek Food Company was established nearly 50 years ago). Agar–The laxative from the sea. Bran Biscuit–A crisp wafer. Dormi–Promotes sound, restful sleep (this is one of the newest Battle Creek Health Foods). Fig & Bran–The regulating breakfast food. Fig & Bran Cookies–Pure, tasty, wholesome. Food Ferrin–A pleasant way to get the iron you need. Battle Creek gluten products–for special diets (Toasted Bran Gluten Flakes, Gluten Bread, Gluten Meal, Sanitarium Gluten Flour, Pure Gluten Biscuit). Health Chocolates–Delicious health candy. Lacto-Dextrin–An internal cleansing food. Laxa–The laxative biscuit. Malted Nuts–A powdered nut milk (A "palatable vegetable substitute for cow's milk, it is a splendid food for babies and growing children"). Meltose–A syrup from grains ("It is a well-known fact that cane sugar does not agree with many persons." It may cause acid stomach. In appearance, Meltose "resembles strained honey"). Meltose sugar (a powdered form of Meltose; it is "much more easily assimilated than ordinary sugar, and is a better source of energy"). Minute Brew–A bracing cereal beverage ("resembles coffee but contains no caffeine"). Paralax with agar–An efficient regulator ("...a most effective remedy for constipation. No laxative drug of any kind has been added. A highly refined mineral oil using Agar as an emulsifying agent"). Paramels–The candy-like constipation remedy ("cubes of pure mineral oil... sweetened with Meltose sugar"). Protose–A vegetable meat that satisfies ("made entirely from nuts and grains"). Psylla (dark or white)–A seed that fights constipation [psyllium]. Sanitarium Cooked Bran–a bran cereal (serve with cream and sugar for constipation). Sanitarium Fig & Bran Flakes–A new flavor in breakfast flakes (Vitaminized, enriched with food iron and vitamin B; combines "Two of Nature's best laxative foods"). Savita–a rich, vitamin B flavoring extract ("concentrated yeast extract in paste form..." Rich in Vitamin B). Whole wheat flour–Stone ground. Cooked whole wheat–A ready-to-eat breakfast food. Zo–A Vitamin B breakfast food (crisp, crunchy). Sanitarium canned fruits and vegetables (in 20 oz cans). On the rear cover, with order form: Send for these valuable booklets free!: "Healthful Living." "Modern Health Recipes and Menus." Address: Battle Creek, Michigan.

1677. Fearn Soya Foods. 1955? Money saving recipes for using Dr. Fearn's Pure Soya Bean Powder (Leaflet). Melrose Park, Illinois. 3 panels each side. Each panel: 22 x 9 cm. Undated.
• ***Summary:*** On the front panel of this leaflet (black ink on yellow) is an illustration of woman holding up a glass

of (probably) soya milk. Below that is written: "Meatless. No starch. No salt. 42% complete protein. For vegetarians, athletes, restricted diets." When we open the leaflet, across the top is written: "How to use Dr. Fearn's Pure Soya Bean Powder." Below that are about 20 recipes and suggestions for use. On the back 3 panels are 15 more recipes.

One other front panel is titled "New recipes to try." It includes: Tiger's milk–homemade. Baby formula. Soy yogurt. Soy cheese–Tofu. The bottom half of this panel lists seven pamphlets from Fearn Soya Foods "available at your health food store (see Foods, Health in the Yellow Pages). Send us a self addressed stamped envelope if your store does not handle them." They are: "(1) The Fearn Chart–Lists all the vitamins and minerals of most common foods. (2) How to Get Slim and Stay Slim–Describes a satisfying 22 cent per day reducing diet. (3) About the Soya Bean–Describes its nutritive values and the hexane solvent menace. (4) You Cannot Live Without Protein–Tells function and importance of protein. Of special interest to vegetarians and body builders. (5) Recipe Folder: Soya Powders–Includes bread, soy milk, puddings, etc. for restricted diets. (6) Recipe Folder: Soya Granules–Lists many money saving recipes based on this high protein food. (7) Recipe Folder: Soybeans–Tells how to use our cooking and sprouting organic soybeans."

The third front panel is titled "Try these Dr. Fearn's Foods.

"Dr. Fearn's High Protein Food–47% protein. Makes pleasant tasting drinks with cold water. Vanilla or root bear flavors. 1 lb.

"Dr. Fearn's Wholewheat & Soya Pancake Mix contains the finest stone ground wholewheat with soya powder. It is quite digestible, higher in protein and lower in starch than the usual run of similar products. 1 lb.

"Dr. Fearn's Regular Pancake Mix is the same as above except that unbleached white flour is used. 1 lb.

"Dr. Fearn's Wheat Cereal & Soya is a cooked type cereal, made with the finely chopped Northern wheat and soya granules. It contains over 30% complete protein and less than 55% starch. A satisfying breakfast for the entire family and usually keeps hunger away until the noon meal. 1 lb.

"Dr. Fearn's Pure Soya Bean Powder for making soya milk. Contains 42% complete protein and no starch. Can be used for enriching various drinks, baked foods and meat dishes. 10 oz. and 2 lbs.

"Dr. Fearn's Soya Granules, contain 52% complete protein, no starch, 5% fat. Can be eaten as is, cooked, or added to meats, soups and other foods. 1 lb.

"Dr. Fearn's High Lecithin Soya Powder same as regular Soya Powder except 15% Lecithin has been added. 10 oz.

"Dr. Fearn's Low Fat Soya Powder. Same as regular Soya Powder except fat has been reduced to 5%. 10 oz.

"Dr. Fearn's Corn Bread & Muffin Mix with soya, makes light muffins and corn bread, very tasty and nutritious. Excellent for a surprising change. 1 lb.

"Dr. Fearn's Organic Soybeans. Organically grown without chemical fertilizers and poisonous insecticides. 1 lb.

"Dr. Fearn's Wheat Germ Powder. A fine toasted powder with most oil removed. Excellent added to drinks. Readily blends with most any other food."

Note 1. This leaflet was found inserted in *Mrs. Hauser's Recipe Book* (1938), purchased by Soyfoods Center from a used book store in Spokane, Washington. This booklet seems to show that Mrs. Hauser's Food Products Company (4617 Melrose Ave., Los Angeles, California) purchased Soya Bean Flour (and probably some other soy products) from Fearn Soya Foods.

Note 2. This is the earliest English-language document seen (Sept. 2012) that contains the term "Soy yogurt." Address: 1206 North 31st Ave., Melrose Park, Illinois.

1678. Fearn Soya Foods. 1955? Dr. Fearn's Soya Bean Granules: Money saving recipes (Leaflet). Melrose Park, Illinois. 3 panels each side. Each panel: 22 x 9 cm. Undated.
• ***Summary:*** On the front panel of this leaflet (black ink on white) is an illustration of woman holding up one finger. Below that is written: "Meatless. No starch. No salt. 52% complete protein. For vegetarians, athletes, restricted diets." When we open the leaflet, across the top is written: "Add high grade protein to your diet and save money, too." Below that is a long description of soya granules plus about 19 recipes. On the back 3 panels are 15 more recipes.

One other front panel contains 5 more recipes. The third front panel is titled "Other Dr. Fearn Foods.

"Dr. Fearn's Wholewheat & Soya Pancake Mix contains the finest stone ground wholewheat with soya powder. It is quite digestible, higher in protein and lower in starch than the usual run of similar products. 1 lb.

"Dr. Fearn's Regular Pancake Mix is the same as above except that unbleached white flour is used. 1 lb.

"Dr. Fearn's Wheat Cereal & Soya is a cooked type cereal, made with the finely chopped Northern wheat and soya granules. It contains over 30% complete protein and less than 55% starch. A satisfying breakfast for the entire family and usually keeps hunger away until the noon meal. 1 lb.

"Dr. Fearn's Pure Soya Bean Powder for making soya milk. Contains 42% complete protein and no starch. Can be used for enriching various drinks, baked foods and meat dishes. 10 oz. and 2 lbs.

"Dr. Fearn's Soya Granules, contain 52% complete protein, no starch, 5% fat. Can be eaten as is, cooked, or added to meats, soups and other foods. 1 lb.

"Dr. Fearn's High Lecithin Soya Powder same as regular Soya Powder except 15% Lecithin has been added. 10 oz.

"Dr. Fearn's Low Fat Soya Powder. Same as regular Soya Powder except fat has been reduced to 5%. 10 oz.

"Dr. Fearn's Corn Bread & Muffin Mix with soya, makes light muffins and corn bread, very tasty and nutritious. Excellent for a surprising change. 1 lb.

"Dr. Fearn's Organic Soybeans. Organically grown without chemical fertilizers and poisonous insecticides. 1 lb.

"Dr. Fearn's Wheat Germ Powder. A fine toasted powder with most oil removed. Excellent added to drinks. Readily blends with most any other food."

1679. Nadkarni, Krishnarao Mangeshrao. 1955? Indian materia medica: With Ayurvedic, Unani-tibbi, Siddha, allopathic, homeopathic, naturopathic & home remedies. 3rd ed. revised & enlarged by A.K. Nadkarni. 2 vols. Bombay, India: Popular Book Depot. Vol. 1, xxii + 1319 p. 22 cm. Undated. Foreword by Colonel R.N. Chopra. [10+* ref]
• ***Summary:*** This book was first published in 1908 under the title "Indian Plants and Drugs." The author was born in 1864. Page 462 lists: "876. Dolichos soja. See Glycine soja. English: Soya bean. German: Soja bohne. Bengali: Gari kulaj. Hindi: Bhatwan. Kumaon: Bhut. Is a species cultivated in some parts of India for its seeds which are eaten and which contain high percentages of protein and fat."

Page 581 lists: "1135. Glycine soja, Sieb. & Zucc, G. Hispida Maxim. (N.O. Papilionaceae). English: Soya bean. Hindi: Bhat, Bhatwan. Bengali: Gari kulay. Punjabi & Kumaon: Bhut. Eastern Terai: Khajuwa. Habitat: Met with on the tropical Himalayas from Kumaon to Sikkim, and Kassia and Naga Hills. The nutritional composition (from Voorhees) is given.

Pages 1145-48 have a long section from the *Calcutta Municipal Gazette* (31 May 1941, p. 49) titled "Uses: ABC of Soya-bean." The title of each paragraph starts with a different letter of the alphabet. Soybean milk, flour, oil, and lecithin are mentioned.

1680. Alvarez, Walter C. 1956. Dr. Alvarez says: Black moles' removal should not be delayed. *Los Angeles Times.* Feb. 12. p. 12.
• ***Summary:*** The section titled "About treatment of children's allergies" summarizes a "splendid article" in *Modern Medicine* by Dr. Normal W. Clein of Seattle [Washington]. For an infant having problems with cow's milk formula, the first thing to do is to change to "goat's milk, soy bean milk, meat milk or some other proprietary milklike preparation."

Mixed cereals should not be given to allergic children; the safest single cereal is rice. The allergic child should be kept away from animals, birds, furs, kapok, and feathers in pillows.

Note: This is the earliest English-language document seen (Aug. 2013) that uses the word "milklike" in connection with soy bean milk. Address: M.D., Emeritus Consultant in Medicine, Mayo Clinic.

1681. Melo, Maria de Lourdes. 1956. [Nutritional value of soy bean and importance of its cultivation in North and Northeast Brazil]. *Revista Brasileira de Medicina* 13(2):105-09. Feb. [Por]*
Address: Brazil.

1682. Rodale, J.I. 1956. Don't drink milk (Editorial). *Prevention* (*Emmaus, Pennsylvania*). Feb. p. 11-22. [1 ref]
• ***Summary:*** The entire July 1955 issue of this magazine (*Prevention*) was devoted to the subject of milk. In it Mr. Rodale argued that the preponderance of the evidence weighed heavily against its use, and the use of all dairy products, as an aid to nutrition. Most "of the evidence was against pasteurized milk, but where can one secure a safe supply of raw milk?" And even in the case of raw milk, the breeding of cows for overproduction and artificial insemination should warn the health-conscious person against it.

Since July 1955 Mr. Rodale has done some additional study of the subject, which he reports here. Antibiotic drugs are increasingly used on cows.

"Remember that half the world, the eastern half, does not drink milk. I was talking to a Chinese professor the other day and he confirmed this fact to me and more. He stated that the average Chinese student who comes to this country, and hears about the supposed health-giving qualities of milk, begins to drink it, and as a result, he gets gas on the stomach and many other digestive ills." Address: Editor of Prevention, Emmaus, Pennsylvania.

1683. Cross, Leslie J. 1956. A Veganmilk Association. *Vegan* (*The*) (*England*) 9(8):2. Spring. [1 ref]
• ***Summary:*** "Provided sufficient support is forthcoming, an effort will be made as early in 1956 as possible to form an organization with the above suggested title, for the following purpose: To produce and make available to the general public in Great Britain a milk. the ingredients of which would be of plant origin; which would satisfy nutritional requirements; and which would be palatable, attractive, and simple to use for the purposes of which dairy milk s now used.

"The Association would probably function in three main stages: (1) It would conduct an enquiry into progress made in this and other countries in the manufacture of non-animal milks [Note: see Harry W. Miller, 1944. "The Story of Milk from the Soya Bean," 37 p.]. (2) Based upon information thus collected and collated, it would consider the problems connected with the successful manufacture and sale of such

a milk upon the general market in this country, including the question of scientific research and experiment. (3) Upon the successful manufacture on a small scale of an acceptable, the association would consider the question of large-scale manufacture and sale, including the organization required to promote such manufacture and sale; such, for example, as the formation of a Limited Company.

"While the work of the Association would be largely motivated by the ideals of vegetarianism and veganism, it would nevertheless function as a body with a precise practical job to do, and membership would be open to anyone prepared to support its work.

"The work would take a number of years and require considerable financial support. It would call for sustained and high endeavour, and though difficult, would be by no means impossible to achieve. Its successful outcome would be of immense value in many ways.

"Any persons interested in the proposal should send their name and address to Leslie J. Cross, Uxbridge, Middx. [Middlesex], who will, if support is sufficient act as convener of an inaugural meeting."

Note: This is the earliest document seen (Aug. 2013) that uses the word "Veganmilk" to refer to plantmilk. Address: Vice-President, The Vegan Society.

1684. Melo, Maria de Lourdes. 1956. [Soya in diet therapy for nutritional disorders: soya in diet therapy of other diseases]. *Revista Brasileira de Medicina* 13(3):198-201. March. [Por]*
Address: Brazil.

1685. Waterlow, J.; Vergara, A. 1956. Protein malnutrition in Brazil. *FAO Nutritional Studies* No. 14. 40 p. March. Also published as "La Malnutrition Protéique au Brésil" in *Bulletin de l'Organisation Mondiale de la Santé* (Bulletin W.H.O.) No. 15, p. 165-201. [58 ref]
• ***Summary:*** This was one of the surveys made by United Nations agencies in the late 1940s and early 1950s which showed the prevalence of protein calorie malnutrition. Discusses the difference between this condition (also called kwashiorkor) and marasmus. In the treatment of this condition, dried skimmed milk gives the best results since it also cures the dermatosis–but it is relatively expensive.

Contents: Prefatory note. 1. Medical aspects of the problem. 2. Natural history of *distrofia pluricarencial* in Brazil. 3. Prevention. 4. Proposals for further investigations. 5. Summary and conclusions.

Page 29 notes: "Soybean is a rich source of protein and may be prepared in a variety of ways. It has been shown that soybean preparations of various kinds are effective in treating kwashiorkor. The possibility of extending its use in Brazil and of making available preparation of soymilk, particularly for use in the Amazon region, is receiving attention."

Note: This is the 4th earliest English-language document seen (Aug. 2013) that contains the word "soymilk" (one of two documents). Address: 1. Dr., University College of the West Indies, Kingston, Jamaica, and WHO Consultant; 2. Dr., FAO Regional Officer for Latin America, Santiago, Chile.

1686. Howard, H.W.; Block, R.J.; Anderson, D.W.; Bauer, C.D. 1956. The effect of long time feeding of a soybean infant food diet to white rats. *Annals of Allergy* 14:166-71. March/April. [18 ref]
• ***Summary:*** Reproduction and lactation were adequately supported in several generations of rats fed an infant formula based on soy-flour. Address: Special Products Div., The Borden Co., New York, NY.

1687. Heron, John. 1956. Editorial: Vegetable milk. *Vegan* (*The*) (*England*) 9(8):1. Spring. [1 ref]
• ***Summary:*** "There can be few vegans, particularly vegan parents, who would not welcome the appearance of a nourishing and workable vegetable milk, ready-made and suitable for a wide variety of uses. Yet no such product is at present marketed in this country.

The use of a vegetable milk is not to be disparaged on the grounds that it is an aping of the animal milk habit. Like the compound solid vegan protein savoury, a compound liquid vegan protein food would be a valuable adjunct in broadening the scope and range of vegan catering. And it would undoubtedly have its place in providing quickly and conveniently for the needs of the growing vegan family.

"Such a product would also prove helpful and attractive to vegetarians and others wishing to make the change over to a vegan diet with the minimum of difficulty.

"Those with electric mixers can certainly make highly nutritious milks from nut creams, raw nuts, or soya flour, etc. But there is still room for a compound product of standardized vitamin, mineral and amino acid content. It is not that it is essential: but it would certainly be highly convenient.

"Is the time and are circumstances ripe for the marketing of such a product? Mr. Leslie J. Cross intends to find out. He has proposed an entirely independent body, the Veganmilk Association, in no way connected with any existing organisation, to determine the response of vegans, vegetarians, food reformers and those of orthodox dietary habits to the idea of getting a good non-animal milk on to the market. His announcement appears in this magazine. What is your response?" Address: Editor, The Vegan: Journal of the Vegan Society.

1688. **Product Name:** Nutribean (Soybean cocoa).
Manufacturer's Name: Manufacturer unknown.
Manufacturer's Address: Philippines.
Date of Introduction: 1956. July.

Wt/Vol., Packaging, Price: Can.
New Product–Documentation: Felix A. Pineda. 1956. Agricultural and Industrial Life (Manila) 18(July):8. "The economic value of soybeans and its manufacture for food products." The author is apparently a sugar agronomist, apparently in the Philippines. On page 8 he states: "The soybean cocoa is commercially sold in tin cans as Nutribean. One spoonful of nutribean dissolved in one cup of soyalac, or hot water and milk makes a nutritious and delicious drink in the morning and afternoon."

1689. Noller, C.H.; Huffman, C.F.; Ward, G.M.; Duncan, C.W. 1956. Dried whey and lactose as supplements to a vegetable milk replacer. *J. of Dairy Science* 39(7):992-97. July. [19 ref]
Address: Depts. of Dairy and Agricultural Chemistry, Michigan State Univ., East Lansing, Michigan.

1690. Pineda, Felix A. 1956. The economic value of soybeans and its manufacture for food products. *Agricultural and Industrial Life* (*Manila*) 18(June):8-9, 30; 18(July):8-9, 37.
• ***Summary:*** Contents: Introduction. Economic food value of soybeans. The manufactured food products from soybeans and their utilization. Methods of food preparation from soybeans: Soybean-rice, Soyalac or soybean milk, soybean cheese [fermented] or cheap meat, soybean cocoa or Nutribean, soybean coffee, toyo sauce or toyo [includes detailed instructions for making this Philippine-style soy sauce], salted beans or tau-si [fermented black soybeans], "soybean flour or soyaflour," soybean sprouts, dried and green beans ("The green soybeans with pods can be used for gulay, like the green mongo."). Conclusion and recommendation.

"Soybean milk" is suitable for the diabetic. Its food value approaches cow's milk.

Note: This is the earliest English-language document seen (Oct. 2001) that uses the word "soyaflour." Address: Sugar Agronomist, Philippines.

1691. Coates, M.E. 1956. Soya in animal nutrition. *Chemistry and Industry* (*London*) No. 32. p. 833-34. Aug. 18. [3 ref]
• ***Summary:*** Soy proteins supplemented with vitamin B-12 and methionine used as a major ingredient in synthetic milk.

"Soya is not widely used in animal foods in Great Britain because in normal times ample stocks of fish meal are available."

"In considering the substitution of animal proteins by soya, it must be remembered that the latter is deficient in certain essential growth factors that normally accompany proteins of animal origin... It is now generally accepted that the 'animal protein factor' (APF) is a complex and that although vitamin B-12 is an important member of it there are further components still to be identified." Address: Great Britain.

1692. Platt, B.S. 1956. The soya bean in human nutrition. *Chemistry and Industry* (*London*) No. 32. p. 834-37. Aug. 18. [25 ref]
• ***Summary:*** The author worked in China during the period in 1933-37, and there had "some experience of preparations made from the soya bean in infant feeding; also rarely a day passed in that period when I did not eat something of one or more of the Chinese soya bean food products–sauce, oil, bean curd or sprouts."

The author gives figures to refute the common misconception that "millions of Chinese have lived for centuries on a diet of rice and soya beans. For example (according to Buck 1938) in northeast China (Manchuria) where soya beans were used most, "very little rice was eaten, 25% of the calories in the diet came from wheat, and 5% from the soya bean... Only 2% of the calories in the Chinese farm diet were derived from vegetable oils which included oils from groundnuts, rape seed, sesame, and soya bean; the first three together occupy rather more than the acreage under soya bean crops. Learmonth (1956, p. 360) has stated that the soya bean has only been grown as an oil-bearing crop since the 19th century. There is, however, a Chinese work dated A.D. 1637 called 'The exploitation of the works of nature,' the second volume of which is devoted to oils and fats. From this work it may be deduced (according to information supplied by Dr. G.D. Lu) that the soya bean was grown for its oil as early as the third century A.D. According to Buck's data on most frequent yields, broad beans and field peas yield on average 18 bushels per acre compared with 14 bu/acre for soya beans. Peanuts or groundnuts give 64 bu/acre but it is not clear whether they are shelled or not.

"Anyone who, at a Buddhist feast, has eaten the delectable dishes made from the soya bean cannot but agree that, gastronomically, the merits of a wide range of soya bean products are outstanding. The 'vegetable' varieties of soya bean are, in fact, often simply immature ones. They are green and look like young lima beans but they have a richer and a distinctive and more delicious flavour... Soya bean curd (tou fu) is used in a variety of dishes. It is prepared from the mature beans, not usually in the home, but by the village 'specialist.'... With appropriate culinary treatment, it can be made to imitate a variety of meat dishes; traditionally it is given to young Chinese children."

The author also discusses soy sauce, tempeh, soy oil, and soya "milk".

"I recently had a visit from a professor of pediatrics at a hospital in Djakarta [Jakarta], Indonesia, who reported that about 50 infants put on a soya milk preparation, *all*, after two months, had some gastro-intestinal disturbances; none of them was thriving. In my view, it is still too early to replace human milk for infants and certainly not by a vegetable

substitute for animal milk...

"In my own experience soya bean curd is a suitable product for feeding young children and I suggest that its superiority over soya milk may be the separation in the 'whey' of substances that have been shown to be toxic for animals.

The contents of this paper were first presented as a contribution to the discussion on "Soya in the Field of Nutrition" by E.M. Learmonth, published in *Chemistry and Industry* on 12 May 1956. The author mentions an ad for "Sun Spot" soya milk.

The article begins with a poem written by "a medical nutritionist and his wife": "'Little Soybean who are you / From far off China where you grew?' / I am wheels to steer your cars, / I make cups that hold cigars. / I make doggies nice and fat / And glue the feathers on your hat. / I am very good to eat, / I am cheese and milk and meat. / I am soap to wash your dishes, / I am oil to fry your fishes, / I am paint to trim your houses, / I am buttons on your blouses. / You can eat me from the pod, / I put pep back in the sod. / If by chance you're diabetic / The things I do are just prophetic. / I'm most everything you've seen / And still I'm just a little bean.'"

Note: This poem, written by Dr. and Mrs. J.W. Hayward, was first published in the *Proceedings of the American Soybean Assoc.* 1940. Aug. p. 6. Address: C.M.G., Ph.D., M.B., Ch.B., Human Nutrition Research Unit, Medical Research Council Laboratories, Holly Hill, London, N.W. 3.

1693. Block, R.J.; Anderson, D.W.; Howard, H.W.; Bauer, C.D. 1956. Effect of supplementing soybean proteins with lysine and other amino acids. *American J. of Diseases of Children* 92:126-30. Aug. [3 ref]
• ***Summary:*** The addition of L-lysine to a soybean protein diet (Borden's spray-dried Mull-Soy infant food) did not improve the nutritive value of the soy proteins as measured by the growth of young rats. Address: PhD, Prescription Products Div., Borden Company.

1694. Borden Company (The), Prescription Products Division. 1956. Mull-Soy in milk-free diets: Tasty recipes. Hypoallergenic food for infants, children, adults allergic to milk. New York, NY: The Borden Co. 18 p. Sept. Illust. 15 cm.
• ***Summary:*** On the cover of this color booklet is a photo showing four prepared dishes and two drinks made using Mull-Soy. Contents: Photo of a can of Borden's Mull-Soy: Liquid Hypoallergenic Food (15½ fl. oz). Date and time of your next allergy and diet-check-up. What is allergy: Introduction, at what age level do food allergies develop?, how does food allergy develop?, do some foods cause allergy more than others? (yes, milk, chocolate, eggs, shellfish, etc.), must food offenders be removed completely from the diet? (yes), are alternatives readily available? (yes). What is Mull-Soy (a concentrated liquid soy food, to be diluted with an equal volume of water). How can Mull-Soy be used in milk-free diets? (just like milk. "If Mull-Soy is to be used as an infant formula, dip the can top, before opening, in boiling water for 15 minutes to sterilize it"). Mull-Soy recipes for good eating: Milk-free beverages. Milk-free hot breads. Milk-free soups and sauces. Milk-free desserts. Miscellaneous milk-free recipes. Foods you are not to eat (those checked by doctor; lists 42 foods in six categories). Address: Prescription Products Div., 350 Madison Ave., New York 17, New York.

1695. Noller, C.H.; Ward, G.M.; McGilliard, A.D.; Huffman, C.F.; Duncan, C.W. 1956. The effect of age of the calf on the availability of nutrients in vegetable milk-replacer rations. *J. of Dairy Science* 39(9):1288-98. Sept. [22 ref]
• ***Summary:*** This article begins: "There is a scarcity of data relevant to the digestion of vegetable milk replacers by the young calf, particularly with respect to the effect of age."

"The calves remained with their dams [mothers] for the first 48 hours after birth. They were then weighed, placed in individual pens, bedded with wood shavings, and usually fasted for the next 48 hours. Whole milk was fed on the fourth day of life and continued with decreasing amounts through the 21st day."

Table 2 (p. 993) gives the composition of the 3 milk replacers used. The main ingredient in each is "fine ground corn," followed by "soybean flour (52.4% [protein])." The percentage of soybean flour used in the 3 milk replacers is 33.0%, 32.5%, and 34.0%.

Conclusion: "The milk replacers were not satisfactorily utilized until the calf was approximately 25 days of age."

Note: This is the earliest English-language document seen (Aug. 2013) with the term "milk-replacers" (or "milk replacer" or "milk replacers") in the title. The term "milk replacers" is also used (as a noun) in the body of the text. Address: Depts. of Dairy and Agricultural Chemistry, Michigan State Univ., East Lansing, Michigan.

1696. *New York Times.* 1956. Food: Two foreign restaurants. Oct. 31. p. 38.
• ***Summary:*** It is a welcome sign that New Yorkers are becoming interested in Chinese dishes other than sweet and sour spareribs. Sun Luk, an exciting Chinese restaurant at 143 West Forty-ninth Street, offers an original and delicious dessert: "soy bean curd sweetened and flavored with almond."

Note: This well-known Chinese dessert, called "Almond bean curd" in some Chinese cookbooks, typically contains no soy; it is made with almond milk, gelled with agar, then refrigerated. It is cubed and served with a sweetened sauce flavored with almond extract (see Mei and Adams 1963, p. 121).

1697. Collins-Williams, C. 1956. Clinical studies with powdered Sobee, a new milk substitute. *Canadian Medical Association Journal* 75(11):934. Dec.
• ***Summary:*** Powdered Sobee was tested and found to be acceptable as a milk substitute in the feeding of allergic infants. The composition of the product is given. It was tested on 25 infants whose average age was 7½ months, and was well accepted by 23 of these infants. One infant took it only if it was mixed with cereal. One refused it. Weight gain and stools were normal. Address: M.D., Allergy Clinic. Hospital for Sick Children, Toronto, and Dep. of Pediatrics, Univ. of Toronto, Canada.

1698. *Vegan* (*The*) (*England*). 1956. The Plantmilk Society. 10(3):14-16. Winter. [1 ref]
• ***Summary:*** "Editor's Note: We have great pleasure in including in this issue the full text of the Report of the first Annual General Meeting of the Plantmilk Society, held at Friends House, Euston Road, London, N.W.1, on October 6th, 1956. The aims and endeavours of this new Society are held by the Vegan Society in high esteem; the manufacture and sale of a first-grade plantmilk in this country would greatly assist in a practical way an increased adoption of the vegan diet. We are glad also to announce that three members of the Vegan Society Committee–Mrs. M. Drake. Miss C. Harvey and Mr. J. Sanderson–have been appointed to the Committee of the Plantmilk Society. We take this opportunity to wish the new Society an early and fruitful harvest to its labours, and to assure it of our wholehearted support.

"Mr. C.A. Ling (Chairman) was in the chair. After his opening remarks he called upon the Secretary for his report on progress since the inauguration, on June 23rd this year.

"The Secretary stated that the Society was now well established and was served by a number of persons whose qualifications would prove of considerable value. In addition, the general support and interest which the Society was attracting was a source of considerable encouragement.

"As an example of the interest being shown, the Secretary stated that almost every post continued to bring inquiries or other matters to be dealt with. He had kept in fairly regular contact with the Society's Chairman, and with the Chairman and Secretary of the Research Committee, and some other members, both by correspondence and by personal visits.

"The Society welcomed and was grateful for publicity which it was receiving in the Press. The vegetarian magazines and an animal welfare magazine had published good notices of the inaugural meeting. A report which appeared in the *London Evening News* ("Now your milk may come from a plant") had resulted in a number of inquiries for information, following which the Society had gained several new members, some with valuable qualifications. Inquiries for information were also received from journals which cater for the dairy trade, and from one which caters for the food trade in general. Two national weekly publications. with large circulations, had also made inquiries. Reports had appeared in the foreign Press, following which inquiries had been received from business firms in Spain and Portugal concerning the possibility of manufacturing plantmilk in those countries. An organisation on the Gold Coast had ordered from the Society a supply of plantmilk–but they had had to be informed (regretfully!) that their order was a little premature.

"Further correspondence had taken place with the Californian company [Loma Linda Foods, Riverside, Calif.] which manufactured and sold plantmilk in America. This company had sent a gift of two tins of one of their general-purpose plantmilks. This particular kind was a double-strength plantmilk, being mixed with an equal amount of water before use. In appearance, it is not unlike dairy milk, and it has a pleasant taste. It is suitable for use in tea, coffee and other beverages and for general domestic uses. It conforms to American standards of nutrition and hygiene.

"The Secretary continued by saying that an application to the Board of Trade made on behalf of a British company, for a licence to import this plantmilk had been refused on the grounds of the government's balance of payments policy. An application was to be made for an import licence for the special type of soya bean which is the basis of the American plantmilk. Should this be granted, the company concerned would consider the possibility of erecting a pilot factory for the manufacture of plantmilk in this country upon an experimental scale. The company would have available to it both the formula and the details of the manufacturing process involved in the production of the American milk. Knowledge gained during many years of research and experience in America would thus be available as the starting point for the production of plantmilk in Britain. The plan, however, depended upon certain preliminary factors, such as the import licence, and for these reasons optimism must for the moment be restrained.

"With regard to the function of the Society now and in the future, the Secretary said that it had brought together several qualified persons, who would not otherwise have come together, who would give the Society the scientific and practical backing which was necessary for the success of its work. In a general sense, the Society had acted as a focus, and had injected life into an idea which had existed theoretically in a number of places for a number of years. With regard to the future, the Society would, of course, pursue by every means available to it the object for which it was formed. It would co-operate with manufacturers interested in the plantmilk project and give them every possible encouragement. It would also keep alive the underlying humanitarian motive which had been the main cause of its formation.

"The Secretary concluded by saying that the future might see the growth of a quite novel partnership–that of the

manufacturers on the one hand and the Society on the other, each working in their own way for a common end. Such a partnership would indeed be a partnership of principle and practice, and an effective instrument for the achievement of the Society's aim.

"The meeting appointed the following Officers and Committee to serve until the next Annual General Meeting:– Chairman: Mr. C.A. Ling; Secretary and Treasurer: Mr. L.I. Cross; Committee: Dr. B.P. Allinson, M.R.C.S., L.R.C.P., Mr. E.T. Banks, Mrs. J. van Brugen, Mr. D. Fairclough, Mr. W.S. James, M.Sc., Dr. D. Latto. M.B., Ch.B.. M.R.O.G., Mrs. Claire Lowenfeld, Mr. W. Ninniss, Mr. G.E. Norris. Dr. C.V. Pink, M.R.C.S., L.R.C.P., Mr. J. Sanderson, Dr. F. Wokes, Ph.D., B.Sc., F.P.S., etc., Mrs. M. Drake, Miss C. Harvey, Mr. W. Holttum. (The first twelve Committee members mentioned constitute the Research Committee, of which Dr. Wokes and Mr. Norris were re-elected as Chairman and Secretary.)

"It was also agreed that Dr. Franklin be approached with an invitation to serve upon the committee.

"A financial statement presented to the meeting showed that income up to October 6th was £227, with a balance at the Bank of £208. The majority of those who had originally expressed interest in the formation of the Society had now paid their subscriptions for the year ending September 1st, 1957. The amount of the balance at the Bank now made it possible for a number of matters to be considered by the Committee, notably the drafting and printing of literature, the need for which was becoming increasingly apparent.

"At the conclusion of the general meeting, a meeting of the Committee was held. Consideration was given in detail to the draft of a statement concerning the Plantmilk Society for issue to a food trade magazine which had requested such a statement for possible publication. The draft was finally approved. (In addition to the journal concerned, the statement has been supplied to two other trade journals whose Editors have applied to the Secretary for information.) A Literature sub-Committee was appointed by the Committee to consider the drafting of general literature. The sub-Committee consists of Mr. Fairclough, Mr. Ling, Dr. Wokes and the Secretary.

"At both the General meeting and the Committee meeting, several members expressed the view that the progress made during the few months since the Society's inauguration was encouraging. This view was endorsed by the Chairman, who also pointed out that the need for the Society would continue for some time even after a plantmilk industry had been established in this country. He asked members to continue to give the Society the sustained support which it would need in order to achieve the task it had set itself.

"The object of the Plantmilk Society is to promote the manufacture and sale of a satisfactory alternative to dairy or other animal milk used for human consumption, the ingredients of such alternative to be of exclusively plant origin. Any person willing to support the object of the Society is eligible for membership on payment of an annual subscription of not less than five shillings payable on September lst of each year. Subscription,... to be sent to the Secretary, Mr. Leslie J. Cross, Uxbridge, Middlesex."

Note 1. This is the earliest document seen (Aug. 2013) concerning Plantmilk News or The Plantmilk Society.

Note 2. This is the earliest English-language document seen (July 2013) that contains the word "plantmilk" (regardless of capitalization) or that uses that word to refer to soymilk.

Note 3. This is the earliest document seen (Aug. 2013) that mentions C.A. Ling [Arthur Ling] in connection with plantmilk. "Ling" is an old English surname.

1699. **Product Name:** Loma Linda Soy Milk (Powdered, and Liquid).
Manufacturer's Name: Loma Linda Food Co., Eastern Div.
Manufacturer's Address: P.O. Box 388 (Wooster Road), Mount Vernon, Ohio.
Date of Introduction: 1956.
New Product–Documentation: Soybean Blue Book. 1956. p. 99. No brand name is given, but the product includes Soyalac. This is right after Loma Linda bought Dr. Harry Miller's International Nutrition Laboratory. *Soybean Digest Blue Book.* 1970. p. 117. "Powdered and liquid soy milk in five flavors."

1700. **Product Name:** Instant Soyamel (Soy Milk. Based on Isolated Soy Protein) [Powdered, or Liquid, in Plain, or Malt Flavors].
Manufacturer's Name: Worthington Foods, Inc.
Manufacturer's Address: 900 Proprietors Rd., Worthington, Ohio.
Date of Introduction: 1956.
New Product–Documentation: Soybean Blue Book. 1958. p. 88. "Processing and packing powdered soy milk." No brand name given. Wholesale price list. 1957. April 1; Letter from Allan Buller. 1981. April 29. Shurtleff & Aoyagi. 1984. Soymilk Industry and Market. p. 28. This was the "world's first soymilk to be made from soy protein isolate; the isolate was manufactured by Gunther Products in Illinois. This was not an infant formula." Sold in 12 oz, 3 lb, or 15 lb sizes.

1701. Chen, Philip S.; Chen, Helen D. 1956. Soybeans for health, longevity, and economy. South Lancaster, Massachusetts: The Chemical Elements. xii + 241 p. Illust. Index. 21 cm. 2nd ed. Jan., 1962, 242 p. [24 ref]
• ***Summary:*** A comprehensive review of the subject. Contents: Preface, by the author (South Lancaster, Massachusetts, July 1956). Foreword, by Geo. M. Strayer, Vice-President and Secretary-Treasurer, American Soybean

Association. Introduction. Part I: Nutritive value of the soybean. 1. Protein (incl. Dr. Wolfgang Tiling of Hamburg, Germany; Dr. Harry Miller). 2. Fat (incl. phosphatides, sterols and hormones). 3. Carbohydrates and caloric value. 4. Minerals. 5. Vitamins. 6. Soybeans and world population. 7. Soybeans and disease (incl. Dr. Wolfgang Tiling of Germany).

Part II: Soy products. 8. Soybean oil: Composition and properties, processing and refining, reversion, uses, phosphatides, margarine, mellorine (vegetable frozen dessert). 9. Soybean oil meal: Heat treatment, Gelsoy, Multi-purpose Food. 10. Soy flour: Uses, soy bread vs. enriched white bread. 11. Soy milk. 12. Soy cheese (or soybean curd, "aptly described by the Chinese as 'the meat without bones'"–incl. pressed tofu sheets and yuba). 13. Soy sauce: Preparation of kojis, brine fermentation, production yields, microorganisms are available. 14. Soybean sprouts.

Part III: Soybean culture and preservation. 15. Soybean culture: Two types of soybeans (commercial field vs. edible or vegetable varieties), inoculation, fertilizer, cultivation, harvest. 16. Preservation of soybeans: Shelling, canning, freezing, dehydration, harvesting dry mature soybeans.

Part IV: Recipes. 17. Soybeans and soybean pulp: Green or fresh soybeans, dry soybeans, soybean pulp ("prepared by pressing cooked soybeans through a coarse sieve or by grinding them in a food grinder"), recipes (incl. Soyburger, Scalloped green soybeans, and Roasted soybeans–dry roasted or deep-fried (p. 151). Describes how to make wheat gluten at home and praises monosodium glutamate for its ability to improve the flavor of recipes–though its use is called for only in the recipe for Soyburger). 18. Soy flour: Breads, cakes, cookies, pies, soups, other recipes (A recipe for Wafers, p. 180, calls for "½ cup roasted soybeans, finely chopped").

19. Soy grits and soy flakes. 20. Soy milk. 21. Soy cheese. 22. Soybean sprouts.

Appendices: A. Soybean utilization (chart). B. Manufacturers and handlers of soy foods (Source: 1956 *Soybean Blue Book*). C. References.

Chapter 1, "Protein," begins: "The soybean is best known for its high protein content (p. 7). It then discusses the work of Dr. Harry Miller (p. 14-15).

Chapter 15, "Soybean Culture," describes how to grow soybeans in a garden. Pages 126-27 discuss the two types of soybeans: the commercial field type and the edible vegetable type. Five major differences between the two types are discussed (p. 126). The edible varieties are larger in size, do not yield as heavily (though they yield more heavily than snap beans or lima beans), are more prone to shatter as they near maturity in the field, are superior in flavor, texture, and ease of cooking, and some edible varieties are also superior in the manufacture of soybean flour, soybean milk, roasted beans and other products. Table 31 (p. 130) lists eleven varieties of edible soybeans: Very early–Giant Green. Early–Bansei, Fuji. Midseason–Hokkaido, Jogun, Willomi. Late: Illington, Imperial, Funk Delicious, Emperor, Higan. Commercial–Illini.

Chapter 16, "Preservation of Soybeans," describes how to preserve "green soybeans" by canning, freezing, and dehydration.

Photos show: (1) A sack of Lincoln soybeans (facing p. 1). (2) Soybean plants, showing pods and leaves (p. 3 and 4). (3) A beam balance with a small amount of soy flour balancing many animal products. "The protein value of soy flour: 1 lb. of soy flour contains protein values equal to 2 lbs. beef, or 34 eggs, or 6 quarts milk." Source: Health and Character Education Institute (p. 6). A similar photo (p. 24) states: "1 lb of soy flour contains food calories equal to 3½ lbs beef, or 3 quarts milk, or 29 eggs. (4) Two views of a child. Left, suffering from marasmus. Right, after six months on a soy milk diet. Courtesy Dr. Wolfgang Tiling (p. 62). (5) A machine at the Northern Utilization Research Branch of USDA treating soybean oil with alkali (p. 72). (6) The distribution of MPF [Multi-Purpose Food] to starving Indian children (p. 91; Courtesy Meals for Millions Foundation). (7) Quaker City No. F4 grinding mill (p. 102; Courtesy Straub Co., 4059 Ridge Ave., Philadelphia, Pennsylvania). (8) Early soy cheese (tofu) production in the United States (p. 108; perhaps at Madison Foods). (9) The Northern Utilization Research Branch, Agricultural Research Service, USDA–shows outside of the huge building (p. 113). (10). How to grow soy sprouts in a glass jar at home (p. 119). (11) Well nodulated soybean roots (p. 129; Courtesy The Nitragin Co.). (12) Baked soybeans in a crock (p. 144). (13) Soy flour used in numerous baked products (p. 159; Courtesy ADM). (14) Griddle cakes [pancakes] made with soy flour brown quickly (p. 173). (15) Soy peanut butter cookies (incl. peanut butter and soy flour; p. 185). (16) Soy grits in a glass jar (p. 198). (17) Freshly-cooked crisp soybean sprouts in a raw vegetable salad (p. 219).

Note 1. The first printing of this book (1956) was dedicated "To Li Yu Ying and William J. Morse, *The Soybean Champions of the Eastern and Western Hemispheres,"* but by the second printing (April 1957) the dedication had changed "To William J. Morse and Harry W. Miller, *The Soybean and Soy Milk Champions of Our Time."*

The publisher of this third printing was unable to sell all the books printed, so Chen apparently arranged for a company named "Outdoor Pictures" (Box 1326, Escondido, California) to sell them. On the title page, Outdoor Pictures pasted their name and address over that of "The Chemical Elements."

Note 2. According to the *National Union Catalog*, Philip Stanley Chen was born in 1903. The rear cover states that he was born in China and is now a naturalized U.S. citizen. He is a graduate of Emmanuel Missionary College [in Berrien Springs, Michigan] and Michigan State University. Before writing this, his first book on diet, health, or soybeans, he wrote several books on chemistry: (1) The

Chloro Derivatives of *m*-cresol. 1933. Easton, Pennsylvania: Mack Printing Co. 7 p. (Abstract of his PhD thesis, Michigan State College of Agriculture and Applied Science); (2) *The Chemical Elements, Rev. ed.* 1948. South Lancaster, Massachusetts: Chemical Elements (fold chart). (3) 500 Syntan Patent Abstracts, 1911-1950. 1950. South Lancaster, Massachusetts: Chemical Elements. 125 leaves. (4) Syntans and Newer Methods of Tanning. 1950. South Lancaster, Massachusetts: Chemical Elements. 128 p.

In 1962 Chen wrote *A New Look at God,* published by Chemical Elements (288 p.). Address: 1. Prof. of Chemistry, Atlantic Union College, South Lancaster, Massachusetts; 2. National Science Foundation Fellow, Cornell Univ.

1702. Chen, Philip S.; Chen, Helen D. 1956. Tables (Document part). In: P.S. Chen and H.D. Chen. 1956. Soybeans for Health, Longevity, and Economy. South Lancaster, Massachusetts: The Chemical Elements. 241 p. [24 ref]

• ***Summary:*** Tables show: (1) Soybean production in the United States, 1924-1958 (p. 2). (2) Essential amino acid content of some foods (calculated as percent of amino acid in sample). Foods include: Extracted soybean oil meal, whole milk, whole eggs, beef loin, patent wheat flour (p. 8). (3) Protein efficiency of a number of proteins (incl. whole milk 2.9, cottonseed flour 2.0, peanuts 1.9, soybean flour 1.8, casein 1.7, patent flour 1.00) (p. 11). (4) Biological value of food proteins for human adults (incl. whole eggs 78, milk 74, meat 72, soy flour 65, peanut flour 42, white flour 41) (p. 11). (5) Supplemental values of soy flour and milk for wheat flour (p. 12). (6) Nutritional quality of soy flour and milk solids in bread (p. 13). (7) Fat content of several common foods (p. 16). (7A) Chemical composition of vegetable oils (in per cent) (p. 18). (8) Carbohydrate content of soybeans (Street & Bailey) (p. 21). (9) Caloric values of various cereals and legumes (p. 22). (10) Mineral content of soybeans (p. 25). (11) Calcium, phosphorus and iron content of soybeans (p. 26). (12) Availability of iron in different foods (p. 27). (13) Availability of iron in several Hawaiian foods (p. 28). (14) Alkalinity of various foods (p. 29). (15) Vitamin content of soybeans and soybean oil meal (p. 32). (16) The vitamin B-1 content of some common foods (milligrams per 100 grams) (p. 34). (17) The vitamin B-complex content of soy flour as compared with wheat flour (per 100 grams of flour) (p. 35). (18) Choline content (dry weight basis) (p. 37). (19) Production of fats and oil in the United States in 1953 (p. 67). (20) Physical and chemical characteristics of soybean oil (p. 68). (21) Chemical composition of soybean oil (p. 69). (22) Protein concentrates used for feed in the United States, 1954-1955 preliminary (p. 83). (23) Correlation of volume of loaf and urease content of soy flour used in making bread (p. 86). (24) Analysis of nutritive elements (p. 92). (25) Soy flour standards (p. 94). (26) The growth-promoting values of the proteins of soybean flour, peanut flour, and cottonseed flour and their values as supplements to the proteins of patent wheat flour (p. 99). (27) Composition of soy milk and cow's milk (p. 103). (28) Some precipitating agents for soy milk (p. 107). (29) Composition of soybean curd (p. 109). (30) Composition of soy bean sprouts vs. mung bean sprouts (p. 122). (31) Eleven varieties of edible soybeans (p. 130). Address: 1. Prof. of Chemistry, Atlantic Union College, South Lancaster, Massachusetts; 2. National Science Foundation Fellow, Cornell Univ.

1703. Chen, Philip S.; Chen, Helen D. 1956. The work of Dr. Harry Miller with soy milk (Document part). In: P.S. Chen and H.D. Chen. 1956. Soybeans for Health, Longevity, and Economy. South Lancaster, Massachusetts: The Chemical Elements. 241 p. See p. 14-15. [24 ref]

• ***Summary:*** Chapter 1, "Protein," begins: "The soybean is best known for its high protein content (p. 7). It then discusses the work of Dr. Harry Miller (p. 14-15): "The one who has done more with soy milk than any one else is Dr. Harry W. Miller, Director of Research, International Nutrition Research Foundation. He began his work with soy milk shortly after 1925 when he was in China as a medical missionary and saw the need of making a preparation for the feeding of babies and children. Referring to his work with soy milk, he said,'I regarded that work as of far greater importance than the building up of the sanitarium because it had to do with the preservation of thousands of lives that otherwise would be lost if they did not have a proper substitute for mother's breast milk, because cow's milk is beyond the economic level of the Chinese people and almost all the Oriental races. We used this milk extensively and a long period of experimental work was carried on. Studies were made of the development of babies and children as to their weight gains, their height gains, their disposition, their skin texture, their hair development, their dentition and bone development. We finally published the article in the Chinese Medical Journal in 1937.'

"Dr. Miller was the first to put out a true soy milk, one that is homogenized and built to any formula. Finally he made it into a powdered milk by spray drying. Both 'Soyagen' and 'Soyalac,' which he perfected according to his patented process, are now widely used by infants and children who are allergic to cow's milk, as well as by grown-ups who prefer a vegetarian diet.

"Besides his factory in this country, Dr. Miller has established soy milk plants in Japan and Formosa [Taiwan], and has helped the United Nations build a plant in Indonesia. His formula is used by three large soy milk companies in Hong Kong, one of which puts out 75,000 bottles a day." Address: 1. Prof. of Chemistry, Atlantic Union College, South Lancaster, Massachusetts; 2. National Science Foundation Fellow, Cornell Univ.

1704. Chiu, Y.T. 1956. Meditations of a Christian Chinese.

New York, NY: Pageant Press. [5] + 101 p. No Index.
• ***Summary:*** The author says that he has previously written 24 books in Chinese. This, his first English-language book, includes a compilation of much of his best material in Chinese. Soy is mentioned in two chapters.

Chapter 7, titled "Child welfare in China," states (p. 22-26): "Very few mothers [in China] know how to feed their babies. If the infant were fed with mother's milk, it would be better for the child." Cow's milk is so expensive in South China that very few mothers can afford to buy it for their children. "The writer has analyzed several kinds of milk substitutes made locally and sold in the stores in Canton and found that they consist of starch and a little sugar (less than one-half of one per cent of this substituted milk is protein). In North China soya bean milk is used in feeding babies. This is much cheaper than cow's milk." A brief description is given of how this soya milk is made. "One pound of soya beans would make seven or eight pounds of bean milk. As soya bean milk is deficient in fat, sugar, and calcium, the latter should be added to the bean milk to increase its food value. Dr. Siddall [1931] used this milk to feed a baby in the Canton hospital and got pretty good results. If soya bean milk is prepared in a sanitary condition, it should be a good and cheap food for poorer babies."

Superstitions are widespread in South China. "Some people think that bean curd, a product made from soya bean, should not be given to infants lest they have an offensive odor on their breath."

Chapter 18, titled "Feeding a hungry world," states (p. 57-61) that the price of food in South China is now 5 to 10 times higher than before the war, while wages and salaries have not increased proportionally. "The increase in food prices is so great that the average family in China does not have enough to eat and many of them suffer malnutrition" and nutritional deficiency diseases. "As milk is so expensive in Hong Kong and China, children have to be contented with soya bean milk which has been used to feed babies in China for two thousand years." In times of famine, some parents have "had to sell their children in order to have money to buy food. Because of poverty, ninety percent of the parents in China cannot afford to send their children to school and these youngsters must either stay home to work or work as servants in the homes of the rich or in the factories."

"Poorer people in China and Hong Kong eat rice, soya beans, [mung] bean sprouts, bean curds and salt fish or green vegetables. The poorest people have only rice, sweet potatoes, which are cheaper than rice, and soy sauce made from soya beans."

Talk with Luke Fetters of Huntington College, Indiana. 2005. May 23. Luke is writing a biography of the author for this PhD thesis. Chiu wrote this book at about the same time he graduated from the seminary at Huntington College. "He was a Renaissance man. He was an educator, a scientist, a theologian." Luke's field is missiology, the study of missions. He believes that too much mission history has been written about the missionaries; not enough has been written about the heroes and hard-working people within the host culture. Address: Rev., Dr. (PhD.), Assoc. Prof. of Chemistry, Huntington College, Huntington, Indiana.

1705. Council of Scientific and Industrial Research. 1956. The wealth of India: A dictionary of Indian raw materials and industrial products. Raw materials. Vol. IV: F-G. New Delhi, India: CSIR. See p. 142-50 (Glycine), plus p. XIII-XXI (bibliography). [51 ref]
• ***Summary:*** "Attempts to popularise and extend soybean cultivation in India have not met with much success so far. Various reasons have been assigned to this. The market demand for the seeds is not steady and there are few indigenous industries based on soybean. Further, there are other pulse and oilseed crops adapted to varied climatic and soil conditions in India which satisfy the dietetic habits of the people. It is considered, therefore, suitable for introduction only in regions where pulses are not grown at present, e.g. regions at elevations about 5,000 ft. This view has been considered by some to be based on incomplete data."

Table 2, titled "Estimated acreage and production of soybean in some Indian states," gives statistics for 1948-1952. The leading state is Jammu and Kashmir (India's northernmost state). In 1948-49 (the latest year for which complete data is available) Jammu and Kashmir produced 502 tons of soybeans on 1,757 acres. Corresponding figures for other states, ranked in descending order of acreage, are Assam (208 tons/1,230 acres), Orissa (147/988), West Bengal (147/800), Madhya Pradesh (12/67), and Uttar Pradesh (1/33).

Note 1. This is the earliest document seen (Jan. 2009) that gives soybean production or area statistics for South Asia.

"Soybean is grown in India mainly for food and forage. It is generally raised as a *kharif* crop, sown at the outbreak of the monsoon in June or July and harvested in December-January... Soybean is raised either pure or in mixture with maize; in some parts of Assam it is grown along with *aus* paddy. Being a legume, soybean can be cultivated with advantage as a rotation crop with potato, as in Assam, or with sugarcane, as in Bihar. It is grown as a green manure or cover crop in tea estates...

"Uses: Soybean ranks high among the leguminous crops of the world. It is grown mainly as a food crop in China, Japan and other countries of east Asia. The seeds are consumed green, dry or sprouted, whole or split. Green seeds are used as vegetable; roasted and salted seeds are used in cakes and candies. The seeds are ground into flour and used for bakery products. They are also processed to give a milk-like product, curd or cheese. A variety of fermented products is prepared, including sauces which furnish the basic flavouring in Chinese and Japanese dishes. Soybean has been

used as a raw material in a variety of processing industries in U.S.A. The fatty oil extracted from the seeds is used for edible and industrial purposes...

"In India, soybean has not attained much importance as a food crop. The seeds are consumed locally after splitting as *dal*. They are also parched and used as *bhunja* or ground into a meal (*sattu*) and used in food preparations; a fermented product is prepared from soybean in Manipur. Soybean possesses a characteristic nutty or beany flavour which is not much favoured in India. Efforts have been made to select types devoid of the flavour and to popularise the use of soybean in non-cereal catering organizations for such preparations as porridge and biscuits. Considerable work has also been done to popularise the use of soybean 'milk'."

A detailed discussion is given of each of the following "soybean products: Soyflour, soysprouts (Sprouted soybean is used as a green vegetable [but not in India] and is reported to possess high nutritive value), soymilk, soybean oil, soybean lecithin, soybean meal." Table 5 (p. 148) gives the "composition of some soybean products," based on earlier publications: "Soyflour (defatted or full fat), soysprouts, soycurd."

Note 2. This is the 4th earliest English-language document seen (Aug. 2013) that contains the word "soymilk" (one of two documents).

Note 3. This is one of the earliest English-language documents seen (Sept. 2006) that uses the term "soy bean" in a new way–as a singular noun, like corn or wheat, not preceded by "the." Examples: "... there are few indigenous industries based on soybean." "Estimated acreage and production of soybean in some Indian states." "Soybean is grown in India mainly for food and forage." This usage originated in developing countries. Address: India.

1707. Shefferman, Maurice. 1956. Foods for longer living. New York, NY: Whittier Books, Inc. 181 p. No index. 22 cm.
• ***Summary:*** This is a book about diet and nutrition by one of the founders (in New York City) of Balanced Foods, the major health food distributor. Although it contains few original ideas, it helped to introduce soybeans as a healthy food, and meatless meals, during the late 1950s.

Contents: Preface. 1. Living a balanced life. 2. How well nourished are we? 3. Who gets our best food? 4. Your bloodstream is your lifeline. 5. Vim, vigor and vitamins. 6. A vitamin primer. 7. Minerals in your diet. 8. Cook, spare those nutrients. 9. Natural seasonings. 10. Fresh juices are staple foods. 11. The five basic foods. 12. Everybody needs more vitamin C. 13. Overweight–Our national health problem. 14. Don't live on your nerves! 15. Are you tired? 16. Relax and invite your health. 17. "Having a wonderful time!" 18. Your summer diet. 19. Design for winter living. 20. Recipes.

Shefferman wrote this book so it "would make sense to a lot of people who have a very hazy idea that right food has any direct relationship to their health." The "eating habits of the average American family, or individual, are not good." Many foods "have been depleted of much of their valuable nutrients; we eat too much," too many hot and highly spiced foods, and too much meat. The "vegetarians eat entirely too much starchy foods and are usually, as a result, on an unbalanced diet. As a nation we have retrogressed from the days when our forbears lived on natural, live, whole foods." "I believe that my viewpoint on 'natural' foods will find ready acceptance by intelligent people who are genuinely interested in helping themselves to maintain sound health all the days of their life" (Preface, p. 5).

Also discusses: The growing interest in the practice of organic gardening in the USA (p. 25). "Acid conditions of the soil are as unhealthy as acidity in the human system" (p. 26). "Under ideal conditions we can obtain all the vitamins and minerals we need through natural foods and correct eating." Yet today our soils are depleted of minerals and excessive processing further reduces the nutritional value of our foods (p. 35).

The human body is composed of about 66% oxygen, 18% carbon, 10% hydrogen, 2% nitrogen, and the remaining 4-5% is made up of minerals and trace elements. "Under ideal conditions, a perfect diet which includes the four main minerals–calcium, phosphorus, iron, and iodine– in abundance, will furnish all the other trace elements in sufficient amounts. The lesser minerals are sodium, potassium, magnesium, manganese, chlorine, and sulphur (p. 38, 52). Soy beans are a good source of thiamin (vitamin B-1, p. 42), riboflavin (B-2, p. 43), folic acid (p. 46), and choline (p. 46).

There "is always the possibility of getting too much of the proteins in the diet, especially proteins of meat, and that is one of the best reasons in the world why all persons should change over to meatless meals as often as possible. Now this is not an appeal for the reader to become a vegetarian, for it is the writer's form belief that meat and fish foods are vitally necessary to complete the diet. On the other hand, it is an appeal to meat eaters not to eat an excess of animal foods, for this may throw too much of a burden upon the system,... Among the better known protein foods are soy beans, dried beans, lentils, nuts, cheese, eggs, milk, mushrooms... All of these are less costly than animal foods and certain varieties of fish and other sea foods" (p. 61).

Brown rice is an excellent food. It was used in an 1897 experiment "which was to mark a high point in modern nutritional history." It proved that beri-beri could be cured by substituting whole rice for polished rice (p. 62-63). One of the best sources of lecithin in the soy bean. Its benefits

are discussed. Realize that "proteins of all kinds are being made from this alkaline-producing soy bean..." It cultivation has been promoted by the USDA, thereby making it a major crop. Soy beans are discussed at length. "The protein of soy beans is used in meat replacement dishes," Soy cheese [tofu] and "soy bean drinks" [soy milk] are good protein sources. For lunch, use "soy sandwich spreads" and "soy bean and wheat germ bread..." The main body of your meatless dinners can be made up of various combinations, including "soy bean loaf, "gluten steak," "green soy beans," "whole wheat or soy bean macaroni or spaghetti, or eggs "on soya toast." Use soya flour as a binder or serve baked soy beans with tomato sauce (p. 64-67).

Natural seasonings include "soy seasonings and natural herbs and spices." Use herb teas and herbs in cookery (p. 68-69). The five basic foods are blackstrap molasses, brewer's yeast, skim milk powder, wheat germ, and yogourt. They are "wonder foods" (p. 81). The Metropolitan Life Insurance Company's ideal weight chart shows, for example, that a man 6 feet tall should weigh 152-164 lb (small frame), 161-173 lb (medium frame), or 169-185 lb (large frame) (p. 97).

Shorter working days and modern labor-savings devices have transformed most Americans into a new "leisure" class (p. 108). Scientific experiments by Dr. Fisher at Yale University [New Haven, Connecticut] have shown that a meatless diet can provide sufficient protein for the body's needs. "Vegetable protein such as almonds and soybeans are excellent protein foods. Soybean products supply essential amino acids without creating the toxic end-products of the meat diet. The residue from the digestion of meats is acid and toxic forming. Vegetable proteins leave a neutral or alkaline ash. Vegetable entrees are wonderful meat replacements for the summer menu. A savory vegetable steak or roast is just as hearty, just as satisfying as meat and a good deal easier on the digestive system. The deliciously rich flavor of meat substitutes is particularly appealing when appetites need tempting during the summer months" (p. 125-26).

People with a definite allergy to cow's milk–as is quite common among children and adults–"can use soy bean milk or goat's milk." Soy bean milk is "an excellent substitute for milk products of animal origin. Crushed soy beans have been used as a source of milk by the Chinese for centuries. Soy milk is approximately the same chemical composition as dairy milk. It resembles cow's milk in consistency and appearance, and its calcium content is about equal to human milk. For infant feeding, in cases of special diets, digestive ailments and malnutrition, soy milk has proven highly beneficial. Soy bean milk is definitely alkaline and easily digested. The soy curd prepared from the milk is eaten as a soft, cottage-cheese -like food" (p. 128).

"Far too many individuals eat too much starch and not enough of the fresh fruit and vegetables." The "one man who should know better–the strict vegetarian–is often the worst offender" (p. 129). Recipes (p. 135-81) include: Soy casserole (meatless main dish, with cooked soy beans, p. 134). Cheese-bean casserole roast (p. 139). Baked soy beans (p. 151). Soy bean salad (with 2 cups "drained green canned soy beans," p. 158).

1708. U.S.I.S. (United States Information Service). 1957. Le soya et ses multiples usages [The soybean and its multiple uses] (Black and white motion picture). USA: All-Scope Pictures, Inc. 35 mm. 15 min and 50 seconds. *
• ***Summary:*** As of 10 Sept. 2010 this silent film was available on the Web at http://www.ina.fr/ economie-et-societe/ vie-economique/ video/VDD09016158/ le -soya-et-ses- multiples-usages. fr.html. It shows an American farmer growing soybeans and his wife cooking with them, making soy sprouts, soymilk, biscuits and cake with soy flour. It also shows various industrial uses of soybeans such as paint, soap, and plastics.

1709. *Medical Science.* 1957. Report of recent work on soybean preparations. 1(1):30. Jan. 10.
• ***Summary:*** A study by Dr. Sidney Kane of Philadelphia with 102 infants fed a liquid soybean formula (Sobee) showed that it was effective. "Of the 76 infants with eczema, 75 improved markedly. Symptoms other than dermatological, present in 62 of the infants were alleviated in 53" [85%]. Of these 62 infants, 21 had gastrointestinal disorders, 38 were irritable and given to colic and constant crying, 1 had asthma, and 2 had chronic nasal discharge. No other publication is cited. Address: Jnl. and Dr. Kane are from Philadelphia.

1711. *Plantmilk News* (*England*). 1957. Serial/periodical. England. No. 1 is Feb. 1957 *
• ***Summary:*** The Vegan, 1957 spring, p. 16. An article titled "Plantmilk News" (p. 15-16) ends by citing its source: "From 'Plantmilk News,' No. 1, February 1957. The Plantmilk Society is an organisation to promote the manufacture and sale for human consumption of a satisfactory non-animal alternative to dairy milk. General Secretary: 39 Willow Crescent, Uxbridge, Middlesex" [England]. Address: England.

1712. Miller, R.A. 1957. Medical memoranda: Treatment of ammoniacal dermatitis with folic acid and soya-bean. *British Medical Journal* i(5017):503. March 2.
• ***Summary:*** Five infants aged between 3 and 16 months, who had suffered from severe ammoniacal dermatitis, were fed folic acid. After an unsatisfactory response, folic acid was withheld and soya-bean milk was given. "The milk consisted of 1½ oz. (42 gm) of soya-bean flour added to

a pint (570 ml) of water. This was used to replace half the quantity of cow's milk normally taken daily, so that patients consumed 10 to 20 oz. (285 to 570 ml.) of soya-bean milk each day."

Within 5 days of starting treatment, all the infants had shown some improvement. "Within two weeks the appearance of the skin was normal in all cases. During the third and fourth weeks of treatment there was no deterioration, though very transitory erythema of the skin in the napkin area was sometimes noted."

In view of these promising results, further research would be useful. "Soya-bean flour can be obtained from Soya Foods, Ltd., London, E.C.3, and possibly from grocers." Its food value compares favourably with that of cow's milk, so that it is possible to rear infants from birth on this food. The cost of soya-bean milk is approximately twopence a pint.

Note: F.R.C.P.Ed stands for Fellow of the Royal College of Physicians Edinburgh. It was established in the 17th century. Address: M.D., Ph.D., F.R.C.P.Ed., Consultant Paediatrician, Royal Hospital for Sick Children, Edinburgh.

Coagulation of the soybean milk]. *Osaka Furitsu Kogyo Shoreikan Hokoku* (*Reports of the Industrial Research Institute, Osaka Prefecture*) 17:78-84. March. [3 ref. Jap; eng]

• ***Summary:*** The effect of temperature, time, and stirring speed on the coagulation of soymilk were studied, and the quantity of calcium chloride required to coagulate the milk was determined. Each of these variables is critical. If the temperature is too high when the coagulant is added, there is danger of having a "crust" due to the rapid coagulation. If too little coagulant is added, some of the soymilk will remain uncoagulated and the whey will be milky in appearance. When just the right amount of coagulant is added, the whey or supernatant will become transparent–but this correct amount may differ from one soybean variety to the next. The required amount of calcium chloride can be determined from the specific gravity of the soymilk. The rate at which the coagulant is added and the rate of stirring while it is added affect the final quality and yield of the tofu–as well as the size of the curds. Thus, for a given soybean variety, both the rate of adding and the speed of stirring should, ideally, be mechanized.

1714. *Vegan* (*The*) (*England*). 1957. Plantmilk News. 10(4):15-16. Spring. [1 ref]

• ***Summary:*** Plantmilk tests. In the Western hemisphere at least three, possibly more, companies produce plantmilk commercially, One in Spain bases its product upon almonds, the other two (in America) use soya as a base. One of the American companies has recently made a gift to the Society of a small supply of various types of its plantmilk. Some are for general purposes and some for infant feeding, and both types are available either as a powder or a liquid. The gift was made so that we could test their qualities. For domestic purposes they have been found to be satisfactory. An advantage which they possess over plantmilks produced in England some years ago is that they may be successfully heated and brought to the boil. They are excellent for use in making white coffee, and entirely satisfactory for use in tea. For successful use in tea, the powder variety needs thorough emulsification, and for this an electric mixer is desirable. We understand that the manufacturers are considering processing the powder variety to make it instantly soluble. The liquid varieties require no preparation, except for the double-strength variety, which merely needs mixing with an amount of water equal to the amount of milk in the sealed tin. These plantmilks have also been tested for other domestic uses, and have been found to be satisfactory for making rice puddings, custard and blancmange. On the question of nutritional qualities, one sample of liquid plantmilk has been assayed and found to contain the amount of vitamin B-12 which was claimed. Further tests will be necessary to establish uniformity of the vitamin B-12 content throughout a series of samples, also the stability of the vitamin under different storage conditions. The question of assimilation of the vitamin in the liquid plantmilk, from the intestinal tract, will, of course, have to be settled before the plantmilk can be accepted as being equivalent to animal milk in this respect.

"Production. A British company was refused a license to import American plantmilk on the grounds of dollar policy. Since then, the company has given consideration to the question of plantmilk production on an experimental scale in this country. The board of directors has now decided not to proceed with this proposal, and the position so far as the Society is concerned is now therefore an open one. It will be necessary for the committee to consider what action the Society should now take to further its object, and a meeting will be called in the near future. Meanwhile, the Society has been going into the question of the special type of soya bean used as a plantmilk base, and again we are indebted to the American company for valuable advice. It should be stated that this company has no pecuniary interests at stake, but its directors are in agreement with the principles that led to the formation of the Society. It may be possible to arrange for experiments to be made in this country in growing some of the suitable types of bean. The proprietor of a small site in France, north-east of Paris, states that during the war [World War II] he successfully grew one type of soya bean on the site.

1719. *Vegan* (*The*) (*England*). 1957. Plantmilk News. 10(6):15. Autumn. [1 ref]
• ***Summary:*** "An extract from "Plantmilk News," No. 2, September, 1957, published by the Plantmilk Society. "A small but possibly significant factor has occupied the attention of the Society's officers in recent months: a limited but definite medical need for plantmilk in this country. A few inquiries have been received for a supply of plantmilk for infants suffering from a disease which prevents them from being able to metabolise lactose. These infants are therefore unable to utilise either animal or human milk, and a satisfactory plantmilk might thus result in saving the lives of some babies, One baby was given some of the American plantmilk donated by the American company for this purpose. Other babies have received an experimental plantmilk made by another British company. Although in its present form this experimental plantmilk is not sufficiently attractive for general use, it may prove suitable for medical requirements. This is a development which if pursued could possibly lead to plantmilk being prescribed also in cases of allergy and near-allergy to animal milk found among certain infants, who may amount to some thousands in this country, and who are particularly liable to be found among the babies of vegetarian parents..."

"The Plantmilk Society: The second Annual General Meeting will be held at Friends House, Euston Road, London, N.W.1, at 2.30 p.m., on Saturday, October 12th, 1957, at which meeting members and others interested will be welcome. The Plantmilk Society is an organisation recently formed to promote the manufacture and sale for human consumption of a satisfactory non-animal alternative to dairy milk. General Secretary: Mr. Leslie I. Cross, Uxbridge, Middlesex [England].

1720. Walley, Ersel. 1957. Soybeans around the world. It would take 400 million bushels of soybeans to meet minimum needs of babies and growing children alone in the Orient. *Soybean Digest.* Sept. p. 30-32.
• ***Summary:*** The author made a world tour studying soybeans, including visits to Hawaii, Japan and other parts of Asia, and Italy. He studied production of soy milk in Taiwan, Hong Kong, and Bangkok (Thailand). In Taiwan he visited a soya milk plant which was established "by our good friend and American Soybean Association pioneer, Dr. H.W. Miller. In Hong Kong, the 'peek hole' and gap in the Bamboo Curtain, we found many small soya food producers and no doubt the largest and most successful soya milk plant to be found anywhere [Hong Kong Soya Bean Products Co. Ltd., makers of Vitasoy]." Hong Kong is the place where competition between soybeans from Red China and the USA is said to meet head-on. "May I voice my conclusion that Red China needs in its domestic economy more soybeans than it can possibly produce.

"A trip to southeastern and south Asia included good and sufficient visits to Thailand (Siam), Burma, India, and Pakistan. Of these countries, Pakistan is the only one that has soybean production of mention and here the total production is less than 1 million bushels per year."

A photo shows Walley. Address: Part president and chairman of Market Development Committee, American Soybean Assoc.

1721. Sinclair, H.M. 1957. Food and health. *British Medical Journal.* ii(5058):1424-26. Dec. 14. [2 ref]
• ***Summary:*** Dr. Sinclair believes that there are serious defects in cow's milk as a food for infants. It is definitely inferior to human milk. The main problem is that its fat is a poor source of essential fatty acids. Address: D.M., M.R.C.P., Vice-President, Magdalen College, Oxford [England].

1722. Orr, M.L.; Watt, B.K. 1957. Amino acid content of foods. *USDA Home Economics Research Report* No. 4. 82 p. Dec. [27 ref]
• ***Summary:*** Lists the amino acid content per gram of

total nitrogen in edible portion (average, maximum, and minimum, and number of samples) for soybeans and soy flour, soybean curd, and soybean milk. Address: Household Economics Research Div., Inst. of Home Economics, ARS, USDA, Washington, DC.

Address: Brazil.

1725. **Product Name:** Saridele (Spray-Dried Soymilk with Sesame).
Manufacturer's Name: Saridele Ltd. (Sarihusada Co. after 1964).
Manufacturer's Address: Yogyakarta, Java, Indonesia.
Date of Introduction: 1957.
Ingredients: Soybeans (made into soymilk), dehulled sesame seeds, cane sugar and/or corn malt, vitamin A, calcium carbonate, ascorbic acid, vitamin B-12, vanilla and/or chocolate.
Wt/Vol., Packaging, Price: 10 kg or 1 lb cans, or 250 gm polyethylene bags.
How Stored: Shelf stable.
Nutrition: Per 100 gm.: Protein 30 gm, fat 22 gm, carbohydrate 40 gm, ash 5 gm, moisture 3 gm, calcium 450 mg, iron 3.7 mg, vitamin A 2000 I.U., thiamine 0.7 mg, riboflavin 1 mg, ascorbic acid 15 mg, vitamin B-12 1 mcg. The PER is 2.48 versus 2.80 for cow's milk.
New Product–Documentation: Indian Council of Medical Research, Special Report Series No. 31. 1955. p. 3. "Recently, the F.A.O. and the UNICEF have jointly initiated a programme in Indonesia for the large-scale production of a properly fortified soya milk chiefly for use in feeding infants and growing children. This project is largely based on a process developed under the auspices of the Food Ministry and the Indian Council of Medical Research in India."

Saridele Ltd. 1958. Saridele leaflet. FAO Nutrition Meetings Report Series. 1959. No. 22. Report on the FAO-UNICEF Regional School Feeding Seminar for Asia and the Far East.

G.C. Mustakas et al. 1964. "Production and nutritional evaluation of extrusion-cooked full-fat soybean flour." *J. of the American Oil Chemists' Soc.* Sept. p. 613. "Proposed Clinical Testing. A 1,000-lb lot of the milled soy flour has been forwarded to the P.N. Sarihusada Co., Jogjakarta, Indonesia, where it will be formulated and packaged for acceptability testing in the areas now supplied by the plant with the dried water-extracted soya milk formulation. Clinical and acceptability

Belden, et al. 1964. The Protein Paradox. "The other approach is the Saridele project in Indonesia, which we include primarily because it is frequently mentioned when protein-rich food projects are discussed, being one of the older projects" (p. 53). "One of the longest developing projects has been that of Saridele, a soy-flour based product in Indonesia... After the Second World War, the Indonesian government became interested in the manufacture of soymilk on a more efficient basis, since soybeans were available in the country and cow's milk supplies were very limited. In 1952 FAO sent to Indonesia Dr. S.S. De, who had been working in India on a more palatable soymilk product that incorporated peanut and malt. Dr. De recommended testing a mixture of soymilk, peanut milk, and malt in Indonesia. To avoid the association with milk, the name Saridele (meaning 'essence of the bean') was selected for the mixture in Indonesia.

"After testing a mixture made from 60% soybeans, 20% peanuts, and 20% malt on 240 children, Dr. De suggested that FAO and UNICEF provide assistance for a Saridele plant in Indonesia, with UNICEF supplying the equipment. The FAO sent experts to Indonesia for further study of the problem and pilot plant experiments were undertaken in Holland and the United States to develop the spray-drying manufacturing process. A plant was finally built in Indonesia with UNICEF's assistance and it went on-stream in the middle of 1957. Since then there has been continual study of the process along with development of new formulations.

"The process produces a fairly expensive product of high nutritive value... Unfortunately, the retail price is too high for those needing it most" (p. 57). This comment presumably refers to the original process and ingredients. The new dry process and reduction of sesame may lead to a decrease in price. "Saridele has been developed in Indonesia using the traditional method of water extraction... It sells for about 50 cents a pound, a rather expensive product. The Indonesian plant, which has a capacity of about 1 ton per day, used sesame seed along with the soy initially. Only soy is used today because the sesame seed's contribution to the biological value of the product was not worth its additional cost. The process does not appear suited for broad application because of its high cost" (p. 70).

Orr and Adair. 1967. Tropical Products Institute Report G-31. "The production of protein foods and concentrates from oilseeds." p. 69. Manufacturer: P.N. Sarihusada, Jogjakarta, Indonesia. "Date of Start of Production: 1957. Form of Product: Soya 'milk,' spray dried. Sold unflavoured for use by infants and young children, and flavoured with vanilla and chocolate for use by adults. Intended to be used as a beverage, after reconstituting with water, as a replacement for conventional soft drinks. Can also be used

in powder form as a replacement for 'sagon,' a local foodstuff."

"Form of Packaging: (a) Originally packed in cans of 10 kg and 1 lb capacity but now part of the production is sold in 250 gm capacity polyethylene bags. (b) Shelf-life of product: 2½ years in cans and 3-4 months in bags. Channels of Distribution: 75 per cent retail trade; 25 per cent institutions. Assistance from Government/International Agencies: (a) The Government supplied the land and buildings for the factory and has undertaken to buy 300 tons of the product per year and distribute it free through institutions. (b) International agencies have been closely associated with the project from its inception. UNICEF donated some of the machinery and equipment and FAO provided technical experts to put the plant into operation and train staff. Promotion: There has been a considerable promotional effort over the years, particular emphasis being placed on offering samples at reduced prices to the public at exhibitions, etc. Promotion is estimated to cost about 3 per cent of total annual sales value. Trend in Consumption: Rising: arrangements have been made to expand production. Profitability: Satisfactory. Problems: Processing problems (see below): initially consumer prejudice, which the practice of giving low-priced samples has helped to rectify; and the high cost of cans which are made from imported tin plate and which were said at one time to account for 25 per cent of the retail price.

"The process used originally for making the product was basically the traditional Oriental one, although the product was spray dried and sold as a powder, not in liquid form. It is understood that the process has now been altered... to a 40 per cent increase in the utilisation of the bean and to the elimination of the 'beany' taste, it may be that the Oriental process is no longer used. It is also said that the new process reduces equipment requirements considerably... 'Saridele' was originally made from 4 parts soya bean and one part sesame seed, but the latter was found to be too expensive. 'Saridele' appears to have 2 distinct markets: as a food for infants and young children and as a soft drink for adults. The chocolate flavoured product is the more popular and it is believed that this is partly due to the high prestige value of chocolate in Indonesia where its high price limits its use by low income groups."

De 1971; E. Orr. 1972. Tropical Products Inst. G73. The use of protein-rich foods for the relief of malnutrition in developing countries: an analysis of experience. p. 13; Steinkraus 1976;

Shurtleff & Aoyagi. 1979. Tofu & Soymilk Production. p. 197-98, 228. "Production was discontinued in 1966 because of the irregularity of soybean supply and marketing and equipment problems." Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 108.

Note: This is the earliest known commercial soy product made in Indonesia. However tofu, tempeh, soy sauce, and other soyfoods had been made and sold by cottage industries in Indonesia for many centuries prior to this time.

1726. **Product Name:** [Soymilk].
Foreign Name: Tônyû.
Manufacturer's Name: Ueda Tofu Shop.
Manufacturer's Address: Hachioji, Tokyo, Japan.
Date of Introduction: 1957.
Wt/Vol., Packaging, Price: 180 ml bottles.
How Stored: Refrigerated.
New Product–Documentation: William Shurtleff. 1981. Soyfoods. p. 35. "Dr. Harry Miller: Taking soymilk around the world." "Starting in about 1955 Dr. Miller started to recommend that the Adventist-run Japan San-iku School serve soymilk instead of cow's milk to the students; however the staff hesitated because of its nutritional value and flavor. In 1957 two Japanese Adventists, Mr. Hidekazu Watanabe and Mr. Hanzo Ueda (who ran Ueda Tofu Shop at the time), started making Japan's first soymilk on a small scale in Hachioji, Tokyo, bottling it is 180-ml milk bottles, and selling it locally. Mr. Watanabe later described the great value to them of Dr. Miller's ongoing technical, nutritional, and spiritual guidance. After some time, directors of the San-iku School visited the small soymilk plant, liked the soymilk flavor, and understood its nutritional value. In 1959 they bought similar equipment, set up a small plant in the school, and started to produce soymilk, which was bottled in 180-ml bottles and served to the students at every meal. In 1969 the San-iku School set up an independent food production company called College Health Foods (which later became today's San-iku Foods) and through it, with the help of Loma Linda Foods in America, began to produce Soyalac soymilk infant formula."

Letter (in Japanese) from Hidekazu Watanabe. 1981. July 19. Discusses the early history of this product. "The Ueda Tofu Shop in Hachioji helped with the product development; I was there at the time. In those days our name was *San-iku Gakuin Shokuhin-bu*, not San-iku Foods. The purpose was to provide a place of labor for the students and opportunities to learn food processing. It was not a business. Dr. Perry Webber was the principal of our school at the time. I think that our company did not make commercial soymilk before 1957. The food company is said to have been founded in 1928 in connection with the school, but legally it did not become an independent company until December 1970."

Note 1. This is the earliest known commercial soymilk product made in Japan.

Note 2. This product was the predecessor of Soyalac made by San-iku Foods.

Letter from Mr. Ichiro Tabuchi of San-Iku Foods. 1990. July 4. In 1948 Mr. Tabuchi visited Dr. Harry W. Miller and studied at his soymilk plant in Mt. Vernon, Ohio. During this period, Dr. Miller visited Nihon San-iku Gakuin (located at Chiba prefecture, Sodegaura-cho) almost every year and earnestly advised the people there to make soymilk. In about

1957-58 they started to make soymilk at a tofu plant that was owned by Mr. Ueda. They bottled it in 180 ml dairy milk bottles, which they sold with their tofu. It was a small scale operation and it didn't last long.

Note 3. This is the earliest document seen (Aug. 2013) concerning major soymilk manufacturing companies in Japan.

1727. K.S. Lo., Chairman, The Hong Kong Soya Bean Products Co., Ltd. in Hong Kong with Mr. Don Kendall and Tony Rump of Pepsi-Cola (Photograph). 1957.

• ***Summary:***

K.S. Lo, founder and chairman of HKSBP, standing in the company's factory in Hong Kong with cases of Vitasoy soymilk piled next to a Pepsi vending machine.

1728. Miller, Harry W. 1957. Review of literature on the nutritional value of soy milk. WHO/FAO/UNICEF Nutr. Panel R.1/Add.4. 18 p. 21 cm. International Nutrition Research Foundation. [102 ref]

• ***Summary:*** "In China where the infant mortality ranges as high as 250 per 1000 live births and malnutrition so evident amidst surviving infants, there is a problem of finding suitable available food for the nourishment of infants and growing children. Dr. Harry W. Miller, Medical Director of the Shanghai Sanitarium and Clinic, and Consultant to a large group of Seventh-day Adventist hospitals in China and the Far East, determined to produce a completely formulated milk beverage from the soybean to meet this need.

"Beginning his research in 1928, a milk called Soyalac was manufactured and granted exclusive patent rights in 1937 by the United States Patent Office. The product had all the characteristics of animal milk, was a true colloid liquid, and could be make to any desired formula. This milk, in contrast to the gruel formulas made from soy flour, was a fiber-free liquid which would not plug the nipples. Its processing resulted in a milk that was both palatable and readily digestible. It could be manufactured either as a canned liquid or dehydrated in powder form. The powder could readily be reconstituted to a liquid. Both the sterilized bottled milk and the powder would not require refrigeration. In the original soybean dairy in Shanghai, China, soy milk was boiled in bottles, and distributed daily.

"In a paper by Miller and Wen published in the April

1936 *Chinese Medical Journal* appears the results of extensive feeding on premature, new-born and growing infants on Miller's formulated soy milk. This feeding was carried out in the Shanghai Clinic where a 20 bed ward of new-born babies, and a 24 bed ward for older children, where Miller's soy milk was their routine diet. This report covered a record of two years of supervised feeding."

"This early work on infant feeding with Miller's soy milk was the first and most far reaching use of soy milk feeding, as the entire city of Shanghai had a soy milk route, with many thousands of families using it, until the soy milk plant was destroyed by Japanese bombing in 1937."

1729. Nevins, Allan; Hill, Frank Ernest. 1957. Ford: Expansion and challenge 1915-1933. Vol. 2. New York, NY: Charles Scribner's Sons. 714 p. Illust. Index. 24 cm. [350+* footnotes]

• ***Summary:*** By 1923 Henry Ford's company stores and commissaries were very efficient, had low prices, and "did a tremendous business... The Highland Park store alone, crowded every day, had a staff reaching 100 persons. Some of the food stuffs came from Ford farms–wheat grown on Ford land, with such rarities to gladden the heart of food faddists as soya bean flour bread, unbleached flour bread, 100 per cent whole wheat flour, and canned green soya beans."

Ford was strongly opposed to smoking and drinking, especially by his workers. His interest in diet came later. "He believed firmly that only one or several 'harmonious' types of food should be eaten at each meal, that tea and coffee should be avoided, and that sound diet should comprise mostly vegetables and very little meat. (This was related to his prejudice against animal husbandry, an activity he thought unworthy of man... He pointed out on one occasion that the automobile would do away with the horse, while 'we could make milk commercially and get by without eating meat, and so cut out these wasteful animals.')

"In 1929 Ford began experiments at Dearborn to discover a farm crop that would have both food value and possibilities for industrial use. After an extended exploration, he chose the soybean [in Dec. 1931], the value of which, particularly for nutritive purposes, was later to be confirmed scientifically. In this activity he was seeking once again to relate farming to manufacturing. Michigan farmers were soon urged to plant [soy] beans with the assurance that the Ford Motor Company would do everything possible to provide a market." Address: Columbia Univ., New York.

1730. Zerfing, Sally D. 1957. Sally's recipes. Glendale, California: Published by the author. vi + 221 p. Illust. No index. 25 cm.

• ***Summary:*** A remarkable vegetarian cookbook with a Christian message and references to many Biblical passages. It would be vegan, except for the use of honey. The author is a devout Christian and is probably a Seventh-day Adventist since (1) Ellen G. White is quoted on several pages (p. 2, 214-17, etc.), (2) it contains so many soy recipes at a relatively early date, and (3) it mentions some brands of soy products (e.g. Madison Health Food Company's Cheze-O-Soy = tofu) made by Adventist companies. Page 14 has a short section on soy oil and page 14 a long section on soy beans, including soy milk. Soy-related recipes include: Soy beans (p. 44). Soy paste (with soy milk powder, p. 50). Soy-whole wheat noodles (with soy flour, p. 62). All purpose soy milk no. 1, no. 2, and no. 4 (made with El Molino Soya Milk Powder, p. 66-67). All purpose soy bean milk no. 3 (made from whole soy beans). Hot carob drink (with soy milk, p. 66). Almond milk. Cashew nut milk. Sesame milk (p. 67. "Liquefy together: 1 cup sesame seeds and 2 cups water. Then strain the milk through a fine cloth; squeeze to get out all the milk. Then liquefy with a little honey, salt, oil, or liquid lecithin").

Note: This is the earliest English-language document seen (Aug. 2013) that contains the term "sesame milk"–or a recipe for making it at home.

Scrambled tofu (with Chef Bonneaus Aminotone, p. 73). French toast (with soy milk, p. 73). No. 2 health burgers (with tofu, p. 79). Scrambled tofu sandwich (p. 80). Creamed tofu and nut spread. Soy cream and olive sandwich on Boston bread (with soy creamed cheese, p. 80). Cheze-O-Soy sandwich (p. 81). Sesame tahini cheese spread (with Sally's Soy Mayonnaise, p. 81). For other tahini recipes, see p. 82 and 111. For other sesame seed recipes: Sesame cream cheese (p. 82). Sesame salad dressing (p. 85). Sesame wheat germ candy (p. 148).

Soy creamed cheese (p. 82). Soy mayonnaise. Thousand island dressing (with soy mayonnaise, p. 83). Cucumbers with tofu cream dressing (p. 90). Homemade tofu cottage cheese (p. 91). Tofu cottage cheese (p. 91). Tofu vegetable jello-salad (p. 92). Tofu and rice croquettes (p. 100). Soy and rice patties (with ground soybeans, p. 101). Soy and eggplant patties (with ground soybeans, p. 101). Tartar sauce (with Sally's Soy Mayonnaise, p. 104). Baked macaroni and soy cheese (with tofu). Cheze-O-Soy and millet hash. Baked soy beans (p. 104). Soy and millet loaf (p. 105). Thanksgiving loaf–Wheat, tofu and nut combination (p. 107). Cheze-O-Soy patties (p. 108). Spanish-style scrambled tofu (p. 115).

Note: This is the earliest document seen (Feb. 2012) that contains the term "Scrambled tofu" or that contains a recipe for "Scrambled tofu." The book actually gives 3 recipes for scrambled tofu (pages 73, 80, and 115).

Ravioli (noodles made with soy flour and filling made with Cheze-O-Soy, p. 116). Bean sprout entree (with Cheze-O-Soy, p. 117). Scalloped corn (with tofu). Tofu Chick Pea Foo Young (p. 117). Wonder of the sea loaf (baked, with tofu, p. 118). Chew mein vegetarian style (with soy sprouts, p. 119). Tofu and Sally's homemade tofu (p. 118-19; curded with lemon juice and sea salt). Homemade soy cheese (made

with El Molino Soya Powder, p. 119). Tofu gravy (p. 120). Non-dairy ice creams (p. 149-53; most recipes call for 2 tablespoons El Molino soya milk powder). Banana split, Maple nut sundae, Fruit Sundae (each topped with "soy whipped cream," p. 151).

Note: We are unable to find a recipe or definition for "soy whipped cream" anywhere in this book.

Date shake (with "2 cups soy milk No. 3 or No. 1," p. 152). Carob soy malt (with "2 cups all purpose soy milk No. 3," p. 152). Ice cream pie (topped with soy whipped cream, p. 153). Carob-wheat germ banana shake (with soy milk, p. 153). Soy pie crust (with "¼ cup stirred soy flour," p. 154). Pineapple soy cheese pie (with "1¼ cups tofu and "¼ cup soy milk powder," p. 156). Baby's soybean formula (p. 196). Composition of ¼ cup soy powder (p. 196). Tofu for babies (p. 200).

Chapter 18, "Grandma's remedies" is about fasting, including "A week or fourteen day fast" (p. 204). A large portrait photo on the front cover shows Sally Zerfing. Address: 24629 N. Arch St., Newhall, California.

1731. Singh, Gursham; Singh, K.; Bedwa, H.C. 1958. Soyabean–Now going up into the Punjab Hills. *Indian Farming* 7(10):32-34. Jan. Series 2. Summarized in Soybean Digest, April 1959, p. 30.

• ***Summary:*** "Soybean, before long, is destined to play an important part in the dietary of the people of Punjab, especially the hill population. The Punjab Department of Agriculture has not only developed an improved soybean type suited to Punjab conditions, but has also determined the best method of growing and handling the crop... In India, its importance is yet to be fully recognized and its cultivation is very limited. As our people are mostly vegetarian and the nutritional standards extremely poor, it is very essential that their diet is supplemented with some protein-rich food. Soyabean fits into this picture very well."

The new variety, named Punjab Soyabean No. 1, is particularly suited to the agro-climatic conditions of the Kangra Valley. It is an edible variety, containing 43.9% protein and only 9.2% fat. The chief merit of this variety is that its seeds are free from the general drawbacks of bitter taste and pungent, beany smell. It does well when cultivated with maize. Note 1. Kangra is a town in Himachal Pradesh, northwest India, about 40 miles east-southeast of Pathankot. Pathankot is located in India about 10 miles east of the border with Pakistan.

Note 2. This is the earliest English-language document seen (Aug. 2010) that contains the term "agro-climatic" or the term "agro-climatic conditions."

"Soyabean flour: As the seeds of Punjab Soyabean No. 1 are free from the general drawbacks of bitter taste and pungent beany smell, soyabean flour can be extensively used for human consumption under local conditions. It can be mixed with wheat or maize flour up to 25 per cent, without any perceptibility, for making *chapaties*, leavened bread (*dabal roti*), sweetmeats, and bakery products like biscuits and cakes. The *chapaties* made from this combination are easy to cook and are very tasty. Soyabean green seed could be used as a vegetable like peas. It can be used for preparing artificial milk which compares favourably with cow's milk in chemical composition." It also makes a good cattle feed. Address: Dep. of Agriculture, Punjab [India].

1732. Dimond, Albert. 1958. Former ASA secretary in Japan mission [American Soybean Assoc. secretary Dr. P.A. Webber]. *Soybean Digest.* March. p. 7.

• ***Summary:*** Albert Dimond, past president of the American Soybean Association (ASA). wrote this account of Dr. P.A. Webber, a former ASA secretary, after visiting him and Mrs. Webber while in Japan recently. The Webbers live and work 10 miles north of Maebashi City, and a third the way up towering Mount Takagi.

"Dr. Webber, who did his graduate work at the University of Michigan, and his wife, also a graduate of the same school, are well on their way toward building and establishing the Mount Akagi Rest Home and Rural School. This is a non-profit Christian, medical and educational center, dedicated to furnishing self-help education and a rehabilitation center for handicapped children. The center is on a mountainside farm of 125 acres.

"Dr. Webber has spent much of his life alternating between Japan and the United States, and has been in Japan since 1948.

"During the early part of his career in Japan he became thoroughly acquainted with the valuable properties of soybeans. On one of his sojourns in the United States he served as secretary of the American Soybean Association, in 1931-32.

"Among his other activities in the United States were serving on the faculties of Berea College in Kentucky and Madison College in Tennessee. He headed the latter for a time. These are both well-known self-help educational institutions. Madison College manufactures and sells soybean foods.

"Dr. Weber also did much of the research and development work on soy milk done in this country [Japan].

During World War II the U.S. government drafted him for "liaison work in Japanese concentration [internment] camps in the western" USA. He "speaks of this interval in his life with sadness. There is no mistaking his love of the Japanese people.

"Asked what was the most pressing need of the Japanese people, Dr. Webber replied, 'Nutrition.' What food? "Soybeans.' Of course it is not as simple as that, but he pointed out that Japan now consumes ½ bushel of soybeans per capita per year. The people need 3 bushels and could use 5 bushels for each person every year. Other forms of protein are beyond their pocketbooks. It is either soybeans or no

protein.

"In Japan the government provides 6 years of school. The thirst for knowledge beyond that by these industrious and intense people is impossible to comprehend unless you have seen and talked with them.

"Dr. and Mrs. Webber in offering self-help educational advantages to this agricultural community are doing a wonderful service. It is an example of what can be done by a combination of science and devotion."

1733. *Vegan* (*The*) (*England*). 1958. Plantmilk for infant feeding. 10(8):17-18. Spring. [1 ref]
• ***Summary:*** "Plantmilks of different kinds have been used during the last few months for the treatment of a number of infants suffering from galactosæmia, which has been receiving some publicity in the medical and national Press.

In this disease there is lack of an enzyme needed for one stage of the metabolic pathway by which galactose is converted into glucose. If the baby's diet contains lactose (sugar of milk), which is a source of galactose, there is an accumulation in its tissues of a toxic substance. In severe cases this results in rapid wasting, with damage to the kidneys and especially to the liver, which can rapidly lead to death."

"In one instance, an American manufacturer of plantmilk kindly donated, through the Plantmilk Society, twelve pounds of plantmilk powder to meet an emergency. The Society has also been able to make available some further supplies as the result of a gift from one of its American sympathisers.

"The staff at one hospital considers that plantmilk has helped to save the life of a particular baby."

1734. Diamond, Holton W. 1958. Re: Update on his life and work. Letter to Dr. O.F. Boyd, Prof. of Chemistry, Emeritus, Wilmington College, Wilmington, Ohio, April 15. 2 p. Typed, without signature (carbon copy).
• ***Summary:*** Prof. Boyd apparently taught Rex Diamond chemistry at Wilmington College in Wilmington, Ohio. "Following my graduation in 1936, I roved among a number of jobs and activities, never quite satisfied. This orientation period included a term in the Methodist ministry, at Drew University Graduate School of Theology. You may recall my interest in YMCA and Gospel Team Work while I was a student at Wilmington College."

"During 1942, while working in Detroit [Michigan], I enrolled in night school at Wayne State University [in Detroit], taking courses, among others, in Advanced Organic and High Polymers. From the University I obtained a position in the Research Department of the Ford Motor Company, in the synthetic rubber development department, supervising a project group on butadiene synthesis. When the entire synthetic rubber research program at Ford was abandoned, I was given a choice of three other jobs in the Company's technical organizations, and chose to go to the George Washington Carver Laboratory in Dearborn, where I became acquainted with soy bean foods and the late Henry Ford, who maintained the laboratory as a sort of personal hobby, officially as a memorial to his good friend, Dr. Carver. Mr. Ford spent a great deal of time at the laboratory, usually dropping in two or three times a week to visit, and often spending the entire day with us. Working for him and sharing his ideas, as you can imagine, was a stimulating and interesting experience.

"I also became acquainted at the George Washington Carver Laboratory with a girl whom I interviewed for a job in the laboratory, Florence Barbier, a graduate of Stephens College, and with whom I have since become much better acquainted. Before we were married, *she* washed the dishes for *me.*

"I have been interested in soy foods, particularly 'soy cream', and the phenomenon involved in the 'whipping' or phase-reversal, of such emulsions, for the past fifteen years.

"Rich Products Corporation is America's oldest and largest manufacturer of frozen whippable emulsions, and the oldest specialty packer in the entire frozen food industry. We carry inventories in over one hundred public warehouses across the country, and number the world's largest users among our customers. We manufacture a variety of these emulsions, some for fountain use, some for household use, and others for bakery applications. Most people are a little surprised to learn of the large quantities of these materials used; as for example, a customer of ours in New England whips 700 to 1000 gallons of our emulsion per day, to cover the tops of 'soft' pies, chocolate, coconut cream, and the like. I have enjoyed very much being associated with such a new and growing technology, and being a part of a dynamic and thriving business. In January of this year I was elected to the Board of Directors of Rich Products Corporation, and appointed a vice-president.

"We have no children, and Flo and I are conveniently cliff dwellers at the address shown above, on the top floor of Buffalo's tallest apartment building." Address: 800 West Ferry St., Buffalo, New York.

1735. Black, H. 1958. Die Sojabohne–Ein Hauptnahrungsmittel der Zukunft [The soybean–A major food for the future]. *Ernaehrungs-Umschau* 5(2):33-34. March/April. [Ger]
Address: Bonn, West Germany.

• ***Summary:*** "The intolerance of 15% of the infants [in one study; Glaser & Johnstone 1953] to soya bean milk is higher than intolerance of infants to cow's milk generally."
Address: Dep. of Pediatrics, Univ. of Texas Southwestern

Medical School, the Children's Medical Center, and Parkland Memorial Hospital, Dallas, Texas.

1737. Smith, Allan K. 1958. Use of United States soybeans in Japan. *USDA Agricultural Research Service.* ARS-71-12. iii + 36 p. April. April. Illust. 28 cm. Typewritten.
• ***Summary:*** An extremely well researched, interesting document based on a survey conducted in 1957 in Japan. Contents: Definitions of Japanese food products. Introduction. 1. Problems of Japanese food processors in using U.S. soybeans: Food production problems, foreign material, broken and dark-colored soybeans in exports. 2. Analysis of the problems. 3. Research proposals. 4. Miso: Processing, uses, production, composition. 5. Tofu and its modifications: Processing fresh tofu and frozen tofu, aburage. 6. Natto. 7. Hamanatto. 8. Kinako. 9. New products research: Soybean "milk," fermented cheese, soybean flour and isolated protein for foods, isolated soybean protein. Acknowledgments.

A graph on the front cover (and on p. 6) shows soybean production in the USA from 1938 to 1957 (in millions of acres harvested). Photos show: (1) Drying soybeans before threshing in Japan. (2) Manually operated threshing machine. (3) Power operated threshing machine. (4) Modern small-scale equipment for cleaning soybeans and grading for size. (5) Straw weaving equipment. Straw bags are used for soybeans, rice, and other farm products. (6) Cooling roasted soybeans and hand cleaning for making kinako. (7) Soybean varieties: Lincoln, White Hilum Iwate, and Acadian (six photos, showing each variety wet and dry). (8) Wooden vats used for fermenting miso; each stands a little taller than a man, and is bound with 4 bamboo hoops. (9) Miso in wooden tubs [kegs] ready for market. (10) Hand assembly of wooden tubs for shipping miso and shoyu. (11) Stone mill for wet grinding of soybeans to make tofu. (12) A modern tofu shop, with boiler, pressure cooker, filter, and precipitation vat. Photos 11 and 12 courtesy of Sugiyama Chemical Research Inst., Tokyo. (13) Deep fat frying of tofu for making aburage. (14) Wooden kegs used for fermenting hamanatto. Stone weights are used to compact the beans during fermentation.

Other figures: (1) Flow diagram of the miso manufacturing process (incl. koji). (2) Table showing total production of miso in Japan (about 1957) as reported by All Japan Miso Industrial Association. Factory made miso consists of: Rice miso 379,000 tonnes (metric tons), barley miso 146,000 tonnes, soybean miso 58,000 tonnes, total factory made 583,000 tonnes. Homemade miso of all types is 391,000 tonnes (67% of factory made). Total factory and home made: 974,000 tonnes. Ingredients used in this grand total: Soybeans 361,000 tonnes, rice 115,000 tonnes, barley 58,000 tonnes, salt 159,000 tonnes. (3) Table showing nutritional composition of rice miso, barley miso, and soybean miso. (4) Table showing composition of sweet miso, salty miso, and enriched miso. (5) Diagrammatic sketch of equipment used in making fresh tofu. (6) Flow diagram of a frozen tofu factory.

Note: The author was in Japan from Oct. 24 to Dec. 24, 1957. The principal localities visited were: Tokyo, Yokohama, Tochigi City, Nagano, Matsumoto, Suwa, Hamamatsu, Nagoya, Kyoto, Osaka, Fukuoka, Kumamoto, Nagasaki, and Sendai. His trip was sponsored by the Agricultural Research Service and the Foreign Agricultural Service of the USDA, and the American Soybean Association (Hudson, Iowa).

Note: This is the earliest document seen (July 2000) that mentions "barley miso"–a type of miso made with barley koji, soybeans, and salt. Address: Head of Meal Products Investigations, Oilseed Crops Lab., NRRL, Peoria, Illinois.

1738. Subrahmanyan, V.; Bhagavan, R.K.; Swaminathan, M. 1958. The place of processed foods in the treatment and prevention of protein malnutrition in children. *Indian J. of Pediatrics* 25(123):216-27. May. [57 ref]
• ***Summary:*** Contents: Introduction. Treatment of kwashiorkor: Vitamin therapy, the use of dried stomach preparations (e.g., hog's stomach), the use of protein hydrolysate, human serum, plasma and blood, treatment with skim milk powder and proprietary casein foods, treatment with plant protein diets, soybean-banana mixture (Dean 1952), Bengal gram and banana diet mixture, low-fat groundnut flour–Bengal gram–skim milk diet mixture, possible sources of processed protein rich foods for the prevention of protein malnutrition, better utilization of soya and groundnut products, soya and groundnut milks (7 studies are summarized briefly), low-fat oilseed flours, balanced malt food containing soya flour and groundnut flour, Multipurpose food based on low-fat soya flour and groundnut flour, predigested foods, fish flour. Conclusion.

"Introduction: It is now well recognized that protein malnutrition is widely prevalent among children in many tropical and subtropical countries (Trowell et al. 1954) (p. 216).

"The foods that have been most extensively used in the treatment of kwashiorkor, are skimmed milk powder and calcium caseinate" (p. 217).

"Treatment with plant protein diets: Of late it is being increasingly recognised that skim milk powder, though the cheapest protein food available so far for the treatment of protein malnutrition, cannot provide the basis for a large scale solution of the problem in underdeveloped countries, where skim milk powder is not available in sufficient quantities and has to be imported" (p. 218).

"Better utilization of soya and groundnut products:... Both these foods are by themselves highly concentrated and difficult to be cooked properly. Consequently children may experience difficulty in digesting cooked [whole] soyabean or roasted groundnut (Aykroyd and Krishnan 1937). Recent investigations carried out in India and other countries have

shown that both soyabean and groundnut could be suitably processed into milk which is highly nutritious and can be readily digested by young children (Dean 1953; Indian Council of Medical Research 1955). Low-fat flours obtained from soyabean and groundnut are also highly nutritious and can be incorporated in various ways in the diet of children (Autret and Van Veen 1955).

"Predigested foods" [fermented]: Mentions soy sauce, and tempeh in Southern Rhodesia.

"Conclusion: It is evident from the foregoing account that besides cereals and pulses which form important sources of protein in the diet of the low income groups in tropical countries, oilseeds and oilseed meals represent an abundant and a most important source of proteins which have not been fully utilised so far for supplementing human diet." Address: Central Food Technological Research Inst. (CFTRI), Mysore, India.

Address: Eng. agronomo do Departamento de Producao Vegetal.

1740. *Vegan* (*The*) (*England*). 1958. Plantmilk News. 11(1):16-17. Summer. [1 ref]
• ***Summary:*** "Reprinted, by kind permission, from Bulletin No. 5 (May, 1958) of the Plantmilk Society.

"The first British infant plantmilk: By the time of the next Annual General Meeting of the Plantmilk Society on October 4th, a pioneer British plantmilk may be on the market."

1741. Almeda, Alberto Fontana. 1958. [Improved milk]. *Spanish Patent* 243,371. July 30. (Chem. Abst. 54:11327g). [Spa]*
• ***Summary:*** To make this "filled milk" product, a concentrated emulsion of mixtures of soybean oil and other oils is added to nonfat milk, and the fat mixture is fortified with vitamin A. No soymilk is used in the product.

1742. Bieringer, Otto R. 1958. [Soybean milk]. *German Patent* 1,037,245. Aug. 21. (Chem. Abst. 55:846c). [Ger]*
• ***Summary:*** Soybeans are soaked, ground to a slurry, and mixed with an aqueous solution of chlorophyllin. The soymilk is filtered off and the bitter substances are removed by filtration through a mixture of natural bleaching earth and yeast. The chlorophyllin absorbs bitter materials and deodorizes sulphur-containing compounds. The soybean milk can be used in foods.

1743. Fries, G.F.; Lassiter, C.A.; Huffman, C.F. 1958. Effect of enzyme supplementation of milk replacers on the growth of calves. *J. of Dairy Science* 41(8):1081-87. Aug. [21 ref]
• ***Summary:*** "Two experiments were carried out to determine the effect of supplementing milk replacers with enzymes." "In previous investigations, milk replacers consisting largely of vegetable products did not support satisfactory growth until calves were about 25 days of age." In the first experiment, a vegetable milk replacer was predigested with various enzymes. Table 2 (p. 1082) gives the composition of three different milk replacers. Soybean flour is a major ingredient in the first two, and is the leading ingredient in No. 2. Other major ingredients are "fine ground corn" and "dried skimmilk." The use of the enzyme papain in the 1st experiment, and of the enzyme pepsin in the 2nd experiment each produced deleterious effects. Address: Dep. of Dairy, Michigan State Univ., East Lansing.

1744. *Soybean Digest.* 1958. Nationwide cycle trip on soy diet: Will attend convention. Aug. p. 9.
• ***Summary:*** Carl Urban, age 40, plans to cycle across the USA in the summer heat on a 40-day diet costing only $10. His "only food on the bicycle ride from Los Angeles to New York will be Multi-Purpose Food (95% soy grits) filling for soy bread sandwiches. Margarine from soybean oil will provide the needed extra calories. In case he needs added low-cost energy he may drink some soybean milk." He plans to supplement his diet with vitamin C.

His wife and two children plan to pace him in the family car "and have family reunions each night in friendly motels and motor courts. Urban plans to do 100 miles a day." He left Los Angeles on July 26. He plans to attend the ASA convention (of which he is a member) at Des Moines, Iowa, on Aug. 19.

"Urban thinks many Americans, as well as restaurants and food service institutions, could provide better nutrition at lower cost by proper use of soy products."

1745. Miller, Harry W. 1958. Soybeans meeting nutritional needs in undeveloped countries. *Soybean Digest.* Sept. p. 68-73.
• ***Summary:*** "It was at the Dearborn, Michigan, meeting of the American Soybean Association held Aug. 18-20, 1940, that I presented a paper on 'Soybeans in Human Nutrition." In this paper I ventured the statement that while soybeans and the interest in them were chiefly valued for their oil content, I foresaw the day would come when soybeans in some form or other would become a regular item in the American diet for humans. The bean flakes and cake were discarded as fertilizer, except to a slight extent they were beginning to be used as stock feed, with a certain amount of credulity.

"At that time we were buying soybeans for a penny a pound, largely as a result of the fact that the value of their high biologic protein was not fully appreciated in animal

feeds. Today it is being strongly emphasized and well authenticated that the soybean is one of the world's greatest protein yielders, and protein, as its name indicates, is of prime importance in maintaining the life and nutrition of mankind."

In countries where meat and dairy products as suppliers or protein are unavailable, or form a very small amount of the dietary, there is noted a predominantly high incidence of infections, as also a low life expectancy averaging from 25-30 years. This is directly related to a low intake of high quality protein. In these countries the most noticeable and severely injured classes are those of the newly weaned infant, the growing child, and expectant and nursing mothers. During these ages and conditions the demand for the ratio of protein in the diet is double that of the average adult man and woman. The impact of protein deficiency is more than any other factor the cause of deterioration healthwise in nations where this lack exists."

In the United States: "One-half of the products of cultivated land is fed to animals..."

"E.J. DeCastro, in his book *The Geography of Hunger* comparing animal and vegetable sources of protein states, 'The conversion of vegetable calories into animal tissue has long been known to be inefficient. Only 15% of vegetable calories is recovered in producing milk, 7% in eggs, and only 4% in beef.'"

Three tables (p. 70) show "that the value of food obtained from an acre of soybeans is three times that of wheat and twice that of corn. The reason we do not appreciate these values in this country is that we overproduce corn and wheat for edible purposes, but scarcely use any soybeans for human consumption."

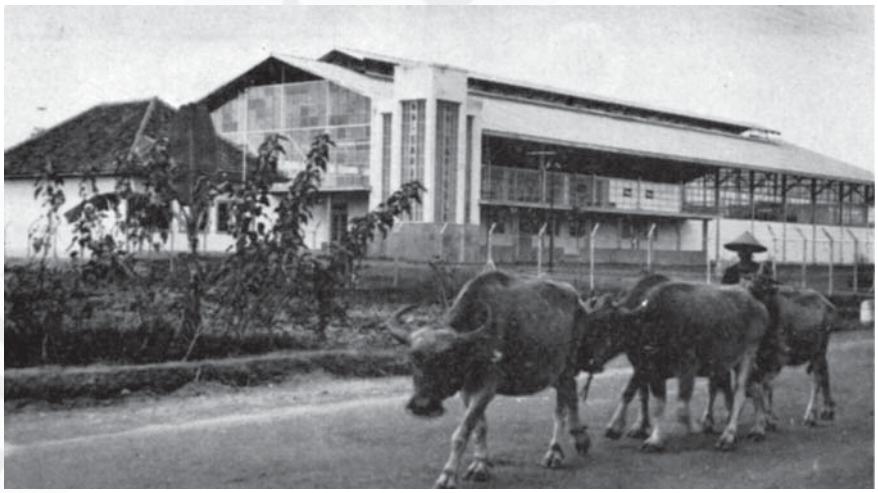
"Up to this time the only agricultural product that has given any promise of being a replacement for animal milk is found in the soybean."

"The Japanese are perhaps the best per capita nourished people of the Asiatic races. Imagine them as maintaining a population that is more than half that of the United States on tillable soil no more than that found in the state of California. Through intensive farming and heavy use of fertilizers to the soil they have raised the yield per acre of land to a production of 13,000 calories per day. And on their land they are able to supply the nutritional requirements for a person on 0.2 acre, as contrasted to 1.8 acres in America. One-half of the calories of farm products in the United States go to animal feed. But in Japan only 5% of their calories come from meat, milk and eggs. Their annual consumption of the soybean as their main protein supplier is 50 pounds per capita,..."

"Milk Plant in Shanghai: After 1945 it looked as though we had a little open time for the development. The Chinese government put in a million-dollar soybean plant in Shanghai. It was completed and ready for operation just prior to the takeover of Shanghai by the Communists in 1949 which ended this.

"But the soy milk business has been spreading to other parts of Asia, first to the Philippines then Hong Kong, and now it has been taken up by the United Nations who are pushing the use of soy milk in Indonesia. The Indonesian people have used Tempe [tempeh], which is a form of boiled soybeans that have been inoculated with the aspergillus [sic, Rhizopus]. In that way they have consumed a considerable amount of soybeans. But here the bean was not in a form Where babies or young children could make use of it."

"Now with the ability to install practical soy milk and soy cheese [tofu] plants in countries, especially the tropics, where soybeans do not grow well and the need of protein is so great, there is opened to the soybean industry a tremendous field of opportunity. This field should also receive a liberal apportionment of funds for research. Some research has been given to this subject, but it's infinitesimal with what is required."



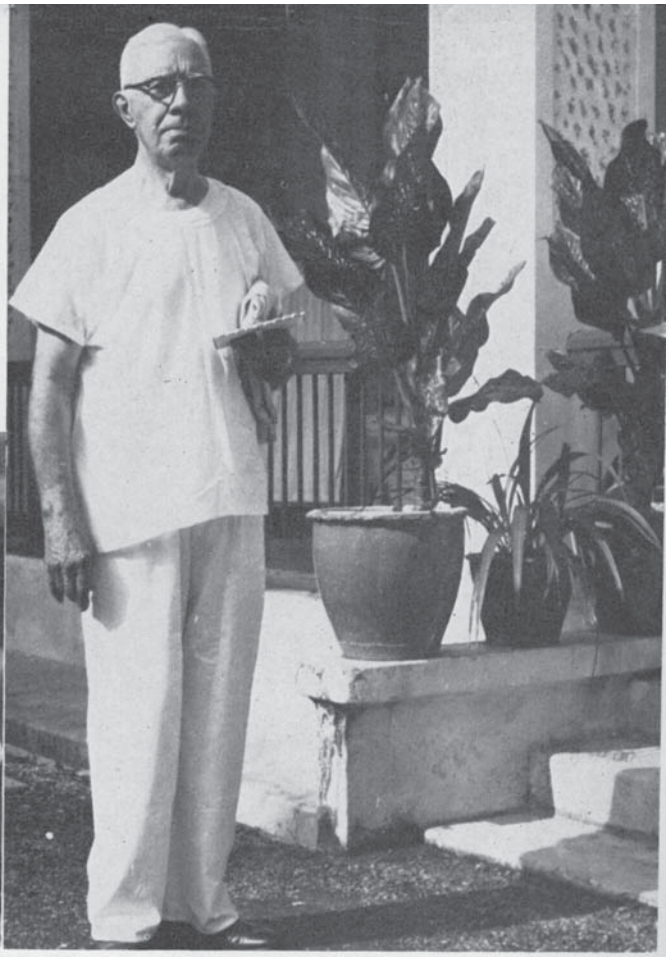
Photos show: (1) Portrait of Dr. Miller. (2) A "factory at Jogjakarta in central Java that produces a ton of soy milk [Saridele] every 7 hours. It is a cooperative venture between FAO, UNICEF, and the Indonesian government. Construction was supervised by H.W. (Bill) [Willis] Miller, son of the author." Water buffaloes are pulling a cart on a street in the foreground. Address: M.D., Director, International Nutrition Research Foundation, Arlington, California.

1746. *Soybean Digest.* 1958. Harry Willis Miller honorary life member [of American Soybean Association] 1958. Sept. p. 10-11.

• ***Summary:*** "Dr. Harry Willis Miller, director of the international Nutrition Research Foundation [INRF],

HARRY WILLIS MILLER HONORARY LIFE MEMBER 1958

Dr. and Mrs. Miller and Madam and Generalissimo Chiang Kai-shek.



Dr. H. W. Miller in Libya, 1957.

Arlington, California, was born 79 years ago in Ludlow Falls, Ohio. Although renowned as one of the world's leading thyroid surgeons, he also has spent many years in soybean research and has done much to perfect and promote soybean food products on the American market.

"As a medical missionary sent to pioneer the work of Seventh-Day Adventists in China from 1903 to 1911, he wondered how he could aid the millions of undernourished Chinese children–hundreds of infants dying daily from malnutrition.

"After years of investigation and practical experimentation with one of the most staple foods in China, he discovered a method of 'milking' soybeans and perfected a palatable formula suitable for both infants and adults.

"The response to the product was spectacular. To meet the immediate demand machinery was shipped to China, and under Dr. Miller's management the first modern vegetable milk plant in the world was put into operation. Until the outbreak of war in Shanghai in 1937, fresh soybean milk was delivered daily to hundreds of homes in Shanghai.

"For the service he rendered to the people of Free China in saving the lives of countless thousands of infants with the use of soybean milk and for his untiring efforts in establishing a dozen or so sanitariums-hospital clinics in the Orient, he has received National China's highest honor. In 1956 Dr. Miller was decorated with the Brilliant Blue Star by Generalissimo Chiang Kai-shek himself.

"Although Dr. Miller has certificates to practice medicine in nine of the 49 states and 11 foreign countries, and even at his age retains a steady hand for surgery cases, he continues to devote much time to the development and perfection of soybean foods.

"Despite his full life as a general medical practitioner, and many years spent superintending numerous Chinese sanitarium-hospitals, serving as president of the Seventh-Day Adventist mission in prewar China, managing and editing the Chinese Signs of the Times, authoring many medical books and articles and lecturing around the world, he has managed to continue his soybean research and experimentation whatever his location.

"From 1939 to 1950, while medical director of the Mount Vernon, Ohio, sanitarium and hospital, he opened a research laboratory where he developed a new improved soy milk, soy-olive sandwich spread, and numerous other

nutritious foods made from soybeans and grains, and initiated the International Nutrition Laboratory of America which later became the INRF which he has heavily endowed.

"In 1951 he sold his growing soybean food industry to the Loma Linda Food Co. and came to Arlington, California, where he now makes his home and spends as much time as possible in the new laboratory placed at his disposal by Loma Linda. Two years ago, the World Health Organization became interested in Dr. Miller's progress in developing a superior soy milk and modeled a million-dollar factory in Indonesia after the Loma Linda food factory which he had pioneered in Mount Vernon, Ohio. At the present time WHO is also providing $30,000 for an intensive 2-year infant nutrition research program at a leading U.S. hospital using his soy milk formula.

"Since his appointment as director of the INRF, has laboratory and experimental work have been frequently interrupted to answer please for help from his medical colleagues in foreign lands. From 1954-1956 he went to Penang [Malaysia] and Formosa to serve as medical director and surgeon for the hospitals there, took a similar post for 2 months in Trinidad in 1956, another in Libya in 1957, and he is now filling the post of medical director and surgeon at the Tokyo Sanitarium-Hospital in Japan during a 6-month leave of absence by an SDA medical-missionary.

"Despite his present busy daily routine at the sanitarium he is continuing his work with soybeans and has a nearby tofu shop deliver soy milk daily to the sanitarium in 5-gallon containers. Since his arrival he has introduced soy whipping cream for daily use at the sanitarium and routinely prescribes soy milk to allergic Chinese infants. He writes that he was surprised to find that the soy milk he helped perfect for the Loma Linda Food Co. is now obtainable by military personnel at the U.S. army post exchanges in Japan.

"While other men have rightly taken up golf, fishing, or other hobbies, Dr. Miller has devoted most of his spare time to research and development of vegetable foods. 'Soybeans have been my lifetime hobby,' he declares. Small wonder he is known from East to West as the man who gets 'milk from an iron cow.'

"Over the years Dr. Miller has been among the most active supporters of the American Soybean Association. He was chosen an honorary life member of the Association at the Des Moines convention. The award was made in his absence in Tokyo during the annual banquet."

Photos show: (1) Dr. and Mrs. Miller with Madam and Generalissimo Chiang Kai-shek. (2) Dr. Miller in Libya in 1957–standing outdoors and dressed in his plain white doctor's outfit. (3) "C.G. Simcox presents honorary life membership award to C.P. Miles, manager Loma Linda Food Co., Mt. Vernon, Ohio, in behalf of Dr. H.W. Miller. Award will be formally presented to Dr. Miller in Tokyo by Shizuko Hayashi, managing director of the Japanese American Soybean Institute."

1751. **Product Name:** Vitamilk (Soymilk).
Manufacturer's Name: Green Spot (Thailand) Ltd.
Manufacturer's Address: 79 Mu 4 Patanakarn 3 Rd., Bangkok 10240, Thailand. Phone: 3775-088-91.
Date of Introduction: 1958.
Ingredients: Soymilk, 25-30% whole dried cow's milk, coconut fat.
Wt/Vol., Packaging, Price: 200 ml or 210 ml bottles.
How Stored: Shelf stable.
New Product–Documentation: Soya Bluebook. 1981. p. 61. 79 Mu 4 Klongton-Hua Mark Rd., Bangkok. Soy beverage; Brian Fitzpatrick. 1982. Soya Milk in Asia. p.

261. States that Green Spot Bangkok launched this soymilk in 1960; Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 105. Thailand's earliest commercial soymilk. "By 1973 the company was producing 33 million 200-ml bottles of Vitamilk a year, by 1978 about 120 million bottles."

Letter from Anders Lindner of STS. 1984. March 9. "Green Spot (Thailand) is partly owned by Mr. C.C. Cheung (Executive director–General manager, business card enclosed) and partly by 'Hong Kong Investors.' Cheung also bottles Green Spot orange soft drink but Green Spot California has nothing to do with the soymilk product 'Vitamilk' and does not have ownership in the Thailand operation." An enclosed photocopy of a page from a market study of unknown origin states that Vitamilk, a bottled beverage, is marketed as a soft drink product. "Producers tone their products with SMP to more closely approximate natural milk flavour. The best available estimate of current soymilk production in Thailand is 18.7 million 210 cc bottles per month, equivalent to 47,000 metric tons per year, with Vitamilk holding by far the largest market share, probably 85% of the total produced. We have been unable to verify these figures. Channels of distribution for soyabean milk are the same as for UHT milk. Vitamilk (210 cc) wholesales for 2.29 bhat/bottle and retails for 3,00 bhat." Business card lists Green Spot, F&N [probably Fraser & Neave], and Vitamilk as company brands.

• ***Summary:*** One of the chapters in this book is titled *Le soya coopératif* [The soya cooperative] (p. 135+), which was in Rabat, Morocco.

A footnote states that this article was first published in the French magazine *Le Figaro*, issue of 20 March 1946.

The same article, but under the title "Le Soya" appears in the *Ouvres Complétes de Paul Claudel* [Complete works of Paul Claudel], in the section on *Proses Diverses* [Various writings in prose] on pages 447-451. At the end is written "[P. 24 janvier 1946]." Address: France.

1758. Ford, Herbert P. 1958. The life story of Dr. Harry W. Miller. Unpublished manuscript. 169 p. Unpublished manuscript. 28 cm.

• ***Summary:*** This manuscript is the slightly edited second draft of the transcript of a single 7-8 hour interview that Mr. Ford did with Dr. Miller in 1958 in Chicago. According to Mr. Ford, Dr. Miller later gave a copy of the manuscript to Raymond S. Moore PhD, a Seventh-day Adventist educator, with the understanding that Moore would use it as the basis for a book. The book, titled *China Doctor*, was published in 1961. Dr. Miller was not very happy with the way the book turned out.

Pages 122-35 give a much more detailed account and history of Dr. Miller's work with soy milk, tofu, yuba, other soyfoods, meatlike products, and wheat gluten than is found in the finished book, *China Doctor.*

Concerning wheat gluten: Dr. Miller's company in Mt. Vernon, Ohio, International Nutrition Laboratory, "had protein foods in which they used wheat gluten and made meat patties and various kinds of stews, sprouted the green soybeans and made a chili with them and wheat gluten." They also developed a vegetarian wiener [Veja Links] containing raw vital wheat gluten, soy flour, seasonings, and flavors. They stuffed these into wiener casings, submitted them to a smoke house and to cooking, then peeled off the casings/skins and canned the wieners. He developed these at the Mt. Vernon slaughterhouse.

"Soy milk manufacture in the U.S.A. (p. 131). In 1939 Dr. Miller returned to the United States having been so thoroughly convinced that soy milk was destined to have world-wide acceptance... His son, Harry Willis Miller, Jr. had returned preceding his father and had started a small soy milk plant in Utica, New York, where he made and bottled soy milk and also made and canned some of the protein foods out of wheat gluten for which they had developed recipes. This plant was later moved to Mt. Vernon, Ohio, after they started the soybean plant at Mt. Vernon. The plant was rather small at first as their capital was very limited. They had to build up the food plant out of his surgery earnings. As these products were mostly for export, the firm was called the International Nutrition Laboratory. It was called International because they didn't think of having any particular market for soy milk in the United States but anticipated making and packing soy powder which they could ship over to China, Japan, Korea, and other fields. Since the United States is a dairy country, they just thought they would have all kinds of difficulty getting it introduced over in America. They gave their attention largely in the early part of the work to making some products that went over quite well, which could be sold locally such as meat patties–vegaburgers. They would take the wheat flour, wash the starch from it, and make gluten patties. They actually built up a very fine product that was netting them earnings. The earnings of that, together with Dr. Miller's medical and surgery fees, to finally get together a spray dryer which they built with the aid of the know-how assistance of the Rogers Company, who sold these spray dryers... and through this home-made outfit they daily spray dried considerable powdered soy milk and placed it on the market. They made some ice cream mixes and they shipped out in barrels to the Philippines soy milk powder and also shipped consignments of the powder to Shanghai where they had formerly introduced a soy milk to the Shanghai Settlement. Thus they kept soy milk going up until the time of the world war in 1941 which cut them off from shipping to the Orient."

In the United States they found "an interest on the part of doctors in feeding babies that were covered with various kinds of rashes which they called atopic dermatitis. Many of these babies had asthma, diarrhea, projectal vomiting, nervous irritability and were unhappy babies, all because of the allergy to cow's milk formula." Doctors began to realize that babies with allergies and other sicknesses responded well to soybean milk; the market soon increased. Eggs and milk are the chief causes of allergy, but some vegetable proteins like wheat, corn, and some legumes also cause allergic reactions in some cases. Then doctors began to ask for evidence that the milk was safe. They suggested that it be submitted to the American Medical Association [AMA]. So at once Dr. Miller contacted Dr. Earl Baxter, Professor of Pediatrics at the Ohio State University Medical School, and he agreed to conduct some feeding experiments with soy milk. These studies showed that "babies could be nourished as well on soy milk." In Tokyo, Dr. Choei Ishibashi (later

president of the Japan Medical Society) also did meticulous feeding tests with infants, using the powdered soy milk Dr. Miller had sent after World War II. Over a period of many months, he compared the blood, measurement, and growth records of babies fed soy milk with those fed animal milk [cow's milk]. Then Dr. Miller took the results of the studies in Japan and at Ohio State and submitted them to the Council on Food and Nutrition of the American Medical Association. The Council has 15 members, the very best scientists on food and nutrition. "They examined the [soy] milk, examined the claims for it, looked over the research, and then gave the seal of approval which was placed on every can of soymilk thereafter."

"Now that they had this seal of approval, they went to medical conventions and canvassed the doctors; the sale of soy milk grew very rapidly." The plant began to get larger; it made great demands and there were many details to look after. These facts and his lack of capital to carry on this work adequately made Dr. Miller realize that he must do one of two things. He must either organize a corporation, issue stock, and enlarge the company greatly, or he must dispose of the plant and give his time and attention to research.

During this time, Dr. Miller received valuable help from the U.S. Department of Agriculture [USDA]. Dr. J.A. LeClerc (Senior Chemist, Agricultural Chemical Research Division) and Mr. L.H. Bailey, who investigated the use of "soybean milk in making breads" and made the results and analyses available to Dr. Miller. "Thus they got themselves very well established in this country as having a milk for people who did get along with cow's milk."

However the secretary of the AMA told Dr. Miller that he should not claim or advertise that his soy milk was a good alternative to cow's milk for all babies, but only "for those babies who do not do well on cow's milk." However he added: "If you can take care of babies that cow's milk does not take care of, there is no reason why you could not take care of the other babies that cow's milk does agree with too." This was his diplomatic way of counseling them not to make unfriendly comparisons with cow's in a dairy country–even if those claims are valid. By following his advice, Dr. Miller was able to work well with the dairy industry without any conflicts.

The Loma Linda Food Company in California showed an interest in acquiring Dr. Miller's company in Ohio. "They had been making some soy milk in the liquid form, but they were interested in getting an Eastern branch." So in 1950 they purchased the [soy] milk plant in Mt. Vernon and have been operating since that time. This took a great burden off Dr. Miller's shoulders and left him free to do medical and nutritional research work. "It was then decided to start the International Nutrition Research Foundation and Dr. Miller was asked to be the Director of this Foundation. He placed a larger part of the purchase price of the factory into this Foundation, which would be devoted to food research only. From the day this research institution was started it has attracted a great deal of attention from all parts of the world; among those interested parties has been the World Health Organization of the United Nations. They came to the conclusion that soy milk had great possibilities in countries of low economic conditions where they could not afford to buy imported [cow's] milk," and in protein-deficient countries. They came to Mt. Vernon to investigate both the soy milk plant and the experimental research. Dr. Miller educated them on the many benefits of using protein from soybeans instead of from animals. As a result, the United Nations constructed a large soy milk plant in Djojakarta [Jogjakarta / Yogyakarta] Indonesia. It was built with the advice of Dr. S.S. De (who has headquarters in Bangkok, Thailand) and the support of the Government of Indonesia, FAO, UNICEF, and WHO.

1759. Motoyama, Tekishu. 1958. Inshoku jiten [Encyclopedia of food and drink]. Tokyo: Heibonsha. 604 p. Illust. 27 cm. [Jap]

• ***Summary:*** Includes listings for the following soy-related terms: Aburage (deep-fried tofu pouches), aemono (Japanese-style salads), agedashi-dofu, daizu (soybeans), dengaku, fu (wheat gluten; but the term "seitan" is not listed in this book), ganmodoki (tofu burgers), gisei-dofu, goma-dofu (sesame tofu), goma-miso (sesame miso), inari-zushi, iri-dofu (scrambled tofu), kenchin-jiru, miso, namemiso, natto, oboro-dofu (soymilk curds), oden (stew), okara, shira-ae (tofu salad), shoyu, sukiyaki, tekka, teriyaki, tofu, tonyu (soymilk), tsuto-dofu, unohana (okara), yakimiso (broiled miso), yuba.

Separate entries, with detailed information, are given for some of the above words or terms.

1760. Richards, Janet; Richards, Charles. 1958. Basic Chinese and Japanese recipes. 3rd ed. rev. and expanded. San Francisco, California: City Lights Books. 75 p. Index of recipes. 17 cm.

• ***Summary:*** Contents: Introduction (General. For epicures, vegetarians, and dieters). Chinese recipes. Japanese recipes. General information: Buffet, party foods & hors d'oeuvres. To brew tea. Special imported ingredients. Where to get ingredients & equipment.

Introduction: "Most of the recipes in this book appear constantly on the menus of the Chinese and Japanese restaurants of San Francisco, New York, and a few other cities that have a population segment with Chinese or Japanese ancestry." Many recipes call for "soy sauce" and up to 1 teaspoon "MSG powder."

The section "For epicures, vegetarians, and dieters" states: "Of the special foods of the Orient, the most versatile is the soy bean. The number of widely differing foods made from soy beans is very large, including bean thread, noodles, soy sauce, soy milk with its derivatives such as dofu, the

fermented nam yu and fu yu of China and miso of Japan. Western food technology has also added to the list."

Soy-related recipes–Chinese: Lo han chai (with dofu and seaweed, p. 19-21). Dofu with oyster sauce ("1 block of Japanese tofu, or 2 cakes of Chinese tofu," p. 22). Steamed fish with dofu (p. 29-30). Chicken in soy (with 1 cup soy sauce, p. 31-32). Chinese sauce [commercial]: Foo yü (sharp thick sauce [fermented tofu]). Jeung yow (soy sauce).

Note: This is the earliest English-language document seen (Oct. 2011) that uses the terms "nam yu" or "fermented nam yu" or "Foo yü" to refer to fermented tofu.

Japanese recipes: Miso soup (with tofu. Miso is "fermented soy beans," p. 48). Konbu salad (with soy sauce, p. 49). Egg plant with miso (p. 50). Turnips in soy (soy sauce, p. 50). Misoyaki (p. 54-55). Joints of chicken teriyaki (with Teriyaki sauce, p. 56). Beef sukiyaki (with tofu, p. 59-60). Beef teriyaki (cook on a hibachi, p. 60). Teriyaki sauce (p. 61; Ingredients: ½ cup table syrup {light cane molasses}, 1 quart shoyu {high quality Japanese soy sauce}, 3/4 lb. sugar, 2 pieces dashi konbu {dried kelp} 6 inches long, ½ teaspoon MSG powder, 2 tablespoons sake). Quick teriyaki sauce (p. 61; Ingredients: 3/4 cup soy sauce, 3 tablespoons sake {or sherry}, ¼ cup sugar, 1 teaspoon grated ginger, ½ tsp. MSG powder). Buta dofu (with "soy bean curd," p. 63).

Special imported ingredients (p. 68-71): Japanese–Canned foods: Bean curd, prepared black soy beans. Packaged foods: Miso (the light variety, fermented soy bean paste). Bottled foods: Fuyü (Chinese bean cake; Order top quality such as Quong Hop brand). Shoyu (soy sauce; Order top quality such as Kikkoman, Higeta, or Marukin). Chinese–Bottled foods: Soy sauce. Black beans (Dow Shee; for black bean sauce).

1761. Tan, Boe Han. 1958. Technology of soymilk and some derivatives. PhD thesis, Agricultural University of Wageningen, Netherlands. 132 p. [10+ ref]*
• ***Summary:*** Includes soymilk, evaporated soymilk, soy curd, soy yogurt. Maps, tables, and statistics for 1955 are given. Address: Proefschrift–Wageningen.

1764. Dowding, Lady. 1959. Challenges. *British Vegetarian.* Jan/Feb. p. 13-14.
• ***Summary:*** "Becoming a vegetarian is a step in the right direction from three angles, humanitarian, spiritual and physical, but it is not the end of the road. Already I can see the next challenge awaiting us, for to supply milk, butter and cheese nearly all the young bullocks must be slaughtered. There is a plant milk, I hope shortly coming on the market which should ease the next step for many of us."

A photo shows the lovely Lady Dowding, seated, holding a dog by her side. Address: Wife of Air Chief Marshal Lord Dowding.

1765. Rudd, Geoffrey L. 1959. Vegetarianism must be recognized: The British Vegetarian editorial. *British Vegetarian.* Jan/Feb. p. 1-6.
• ***Summary:*** Contents: Introduction. The point of crisis. Facts which are ignored. Points which indicate vegetarianism. Summary and suggestions.

"That the development of plant-milks should be actively encouraged, since these can be more closely adapted to human needs than animal milks, will have a longer shelf life, and be free from several health hazards inseparable from animal milk" (p. 5-6).

Note: This is the earliest English-language document seen (Aug. 2013) that contains the term "plant-milks" (or "plant-milk"–hyphenated). Address: Secretary of the Vegetarian Society.

1766. Johnson, Dale W.; Circle, Sidney J. 1959. Multipurpose quality protein offers "plus" factors. *Food Processing* (*Chicago*) 20(3):36-38, 53-55. March. Reprinted for Central Soya Co., Inc.
• ***Summary:*** Promine isolated soybean protein contains 92% protein, is free of undesirable flavor characteristics, and has no indigestible carbohydrates. Gives a list of almost 100 products in which Promine may be used, including bakery products, cereal products, confections, "dairy type products (Cheddar-type cheese, 'cream', all vegetable,' 'cream cheese,' 'cottage cheese,' flavored drinks, fortified 'milk,' frozen desserts, 'ice cream,' margarine, sour 'cream,' spreads, whipped toppings, 'whipped cream,' 'yogurt'), egg type products, edible coatings, macaroni type products, meat and meat type products, oriental type food products (incl. tofu and yuba), specialty foods, and animal feeds.

Note: This is the earliest English-language document seen (March 2007) that uses the term "Cheddar-type cheese" to refer to a Western-style soy cheese. Address: 1. Manager, Edible Protein Products; 2. Research Associate, Chemurgy Div., Central Soya Co., Inc.

1767. *Vegan* (*The*). 1959. Plantmilk News. 11(4):19. Spring.
• ***Summary:*** "No. 8, February, 1959, reprinted by kind permission of the Plantmilk Society.

"*Plantmilk News* takes pleasure in announcing that retail distribution of the first British plantmilk is planned to begin within a few weeks. Details of this product, which has been conceived and developed since the formation of the Plantmilk Society in June, 1956, are given below."

1768. *Vegan* (*The*). 1959. Soya-based plantmilk. 11(4):19-20. Spring.
• ***Summary:*** "The successful results obtained on a number of babies who have been receiving this plantmilk during the last year have encouraged the manufacturers to make arrangements for large-scale production.

"It is hoped that the product will be put on the market in a few weeks' time under the name 'Wanderlac,' although this is not yet finally decided. The cost will be 6*s.* 8*d.* [6 shillings, 8 pence] for a tin containing one pound of the powder.

"When re-constituted with water, this will make about six pints of a liquid food closely resembling cows' milk in appearance, flavour, and nutritive value.

"The content of nutrients will in general closely resemble that of cows' milk, but in certain respects will be superior to cows' milk and more closely resemble that of human milk.

"Wanderlac can be used as a drink or as an ingredient in puddings and other dishes, replacing cows' milk for infants, children and adults. It should be available from health food stores in a few weeks' time.

"Further details can be obtained from A. Wander Limited, 42 Upper Grosvenor St., Grosvenor Square, London, W.1., who are already supplying Wanderlac to babies urgently needing it: or from Dr. Frank Wokes, King's Langley, Herts.

"The Plantmilk Society has taken a keen interest in the development of Wanderlac from its first conception. In the early days, the Society was able to give some practical assistance to meet an emergency, in a case of a baby who was unable to tolerate cow's milk. Supplies of American plantmilk were made available by the Society to supplement Wanderlac, then without any name and in its first experimental form

"Considerable credit is due to Dr. Frank Wokes for his skilful, persistent, and painstaking work on this piece of original research and development. In his turn, Dr. Wokes has acknowledged the value of the moral support and interest which the Society has been more than glad to afford him in his work.

"To date Wanderlac has been available only in cases of special need, for the feeding of infants unable to tolerate animal milk. There is evidence that in one case at least its use resulted in the saving of a baby's life. Once the product becomes available more generally, the reactions of consumers will be awaited with interest. Wanderlac is primarily intended to meet the nutritional needs of those who for various reasons would prefer not to include animal milk in their diet.

"The Plantmilk Society will retain considerable interest in the future development of Wanderlac. It is pointed out, however, that in future all enquiries concerning this product should be directed as overleaf, and not to the Plantmilk Society.

"It merely remains to wish Wanderlac every success, and to express the pleasure which every member of the society must feel in the fact that this product, so much in line with the Society's object, is about to become generally available."

The next article, titled "Leaf protein research," explains that the Plantmilk Society has been involved in this work since October of this year, when it granted Dr. Franklin a commission to proceed with research.

young dairy calves fed various milk-replacer rations. *J. of Dairy Science* 42(4):666-70. April. [9 ref]
• ***Summary:*** "Data presented in this study support an earlier observation that the feeding of a pepsin-supplemented plant protein milk replacer does not improve the performance of calves." Address: Depts. of Dairy and Agricultural Chemistry, Michigan State Univ., East Lansing.

1772. Miller, Harry W. 1959. Why Japan needs soy milk. *Soybean Digest.* April. p. 16-17.
• ***Summary:*** "It was an opportunity greatly appreciated to study the needs of the Japanese people nutritionally during my 7 months' responsibilities as surgeon and physician at the Tokyo Sanitarium and Hospital... The idea of a soybean beverage and milk from the soybean for soups and cooking was something altogether new... We set us a small pilot plant where we made soy milk, soy cream, soy ice cream, and soy spread... After seeing the ready acceptance by the nursing staff and patients of the Tokyo Sanitarium and Hospital of soy milk and soy cream made daily from a small fabricated plant of equipment procurable in Japan, we conceived the idea of such additions to be made to the tofu plants... We fitted up a small tofu plant out in a rural district with a homogenizer and a few utensils for milk handling. The milk is being bottled and capped there, and the local community is most appreciative. Since it sells at half the cost of fresh dairy milk it leaves a modest profit for the local shop."

1773. *Soybean Digest.* 1959. Soy milk study published in Netherlands [by Tan Boe Han]. April. p. 30.
• ***Summary:*** A review of the work titled *Technology of Soymilk and Some Derivatives* (140 p.). Tan published it for his doctoral thesis at the Agricultural Univ. of Wageningen, Netherlands.

1774. Holzel, A.; Schwarz, V.; Sutcliffe, K.W. 1959. Defective lactose absorption causing malnutrition in infancy. *Lancet* i(7083):1126-28. May 30. [3 ref]
• ***Summary:*** Weight charts and sugar absorption tests showed that two siblings were unable to metabolize / utilize the lactose in mother's milk. The two infants experienced a large number of stools, flatulence, and colic. Since lactose, a disaccharide (complex sugar), is not normally absorbed as such, but is hydrolyzed into its component hexoses [sugars] by the intestinal enzyme, lactase, it seems reasonable to assume that the problem is a failure to hydrolyze lactose. This may be due to a deficiency of lactase or to its inhibition. Neither parent had this problem. When we realize that lactose is the only carbohydrate present in any quantity in milk and normally accounts for about 40% of its total calories, it is not surprising that a failure to utilize this sugar results in a failure to gain weight.

Note: This is the earliest document seen (Oct. 1999) concerning "lactose intolerance"–although that term is not used and the milk is mother's breast milk. Soy is not mentioned. Address: 1. Child Health; 2. Chemical Pathology, Depts. of Child Health and Pathology; 3. Biochemist, Booth Hall Hospital for Sick Children. All: Univ. of Manchester.

1775. **Product Name:** Wanderlac. Renamed Velactin by 1961.
Manufacturer's Name: A. Wander Ltd.
Manufacturer's Address: 42 Upper Grosvenor St., Grosvenor Square, London, England.
Date of Introduction: 1959. May.
Ingredients: Incl. soybeans.
New Product–Documentation: *Plantmilk News.* 1958. May. No. 5. The "makers have decided to give it a trial on the market in powder form."

Plantmilk News. 1959. Feb. A number of babies have been receiving this plantmilk during the past year with good results. The manufacturers hope to launch the product as a powder in a few weeks under the name Wanderlac, although the name has not yet been finalized. A tin containing 1 pound of the powder will retail for about 6 shillings, 8 pence. When reconstituted with water, this will make about 6 pints of a "liquid food closely resembling cow's milk in appearance, flavour, and nutritive value." For details contact A. Wander Ltd., 42 Upper Grosvenor St., Grosvenor Square, London, W.1. (the company is already supplying Wanderlac to babies who need it urgently), or contact Dr. Frank Wokes, King's Langley, Herts.

The British Vegetarian. 1959. July/Aug. p. 139. One outcome of the work of Dr. Frank Wokes with vitamin B-12 was the development of a new soymilk product, fortified with vitamin B-12 and launched recently under the name Wanderlac by A. Wander Ltd., which also makes Ovaltine.

The British Vegetarian. 1959. July/Aug. p. 153. "Plantmilk is here!" This product, made by A. Wander Ltd., has been in existence for some months, but only limited quantities are available, solely for the treatment of sick children.

Note 1. When exactly was Wanderlac first sold commercially?

Note 2. Was the soymilk made from whole soybeans or from soy protein isolates?

Note 3. It is hard to say if Wanderlac was conceived to be purely an infant feed, but that is certainly how it was initially used before being launched commercially, and how it was referred to by third parties (i.e., The Plantmilk Society).

1776. **Product Name:** Dr. Fearn's Pure Soya Bean Powder: For Making Soya Milk.
Manufacturer's Name: Fearn Soya Foods.
Manufacturer's Address: 1206 N. 31st Ave., Melrose Park, Illinois.
Date of Introduction: 1959. May.

Wt/Vol., Packaging, Price: Bag.
How Stored: Shelf stable.
New Product–Documentation: Francis Kalnay. 1959. House Beautiful. May. p. 174-75. "Soybean has all the answers." Photo of the label. At the top of the bag is an illustration (line drawing) a lady holding up a glass of soymilk. The front panel text reads: "A pure vegetable product. Pleasant, nut-like flavor. Rich in high grade protein, vitamins, and minerals. Contains no starch. Definitely alkaline. Low sodium. Use as regular milk."

1777. Davis, R.N. 1959. The soyabean deserves to be grown. *Indian Farming* 9(3):35, 37, 38. June. Series 2.
• ***Summary:*** Contents: Introduction. Food value. Many uses (soyabean flour, milk, and sauce). Dependable crop. Yeotmal trials. Nine [maturity] groups. Soyabean vs. groundnut.

Trials with 28 varieties of soyabeans were conducted at Yeotmal, Vidarbha, in eastern Maharashtra state in central India, from 1953 to 1958, under the direction of Dr. Jackson Cartter of the University of Illinois. Of the 28 varieties, 23 were from the USA and 5 were from India. He also sent soyabean inoculum.

A table shows the results of the trials. Five columns show variety name, number of years raised, seed spacing in rows (in inches), percentage of germination, average yield per acre in maunds (1 maund = 37.3242 kg). The best yields by far came from Mamotan (24.19), followed by Acadian (19.31) Improved Pelican (16.32), and Biloxi (16.50).

Address: Dep. of Pediatrics, College of Medicine, State Univ. of Iowa.

1781. Fomon, Samuel J.; May, Charles D. 1959. The adequacy of soya bean protein in promoting nitrogen retention in infancy: Preliminary study. *American J. of Diseases of Children* 98(1):6-10. July. [5 ref]
Address: Dep. of Pediatrics, College of Medicine, State Univ. of Iowa, Iowa City.

1782. *British Vegetarian.* 1959. A vegetarian research centre. July/Aug. p. 138-40.
• ***Summary:*** A vegetarian research laboratory is being established in the Science Department of Stanborough School, Watford, Herts., England. Seventh-Day Adventists, who administer the Stanborough School, are making great efforts to raise funds to support the research. The laboratory will conduct nutritional investigations, focusing particularly on vegetarianism. Dr. Frank Wokes has been invited by the school board to organize the research. A life-long vegetarian, he is well known for his nutritional research during the last 18 years at the Ovaltine Research Laboratories. He has been a pioneer in showing the importance of vitamin B-12 in vegetarian diets and in improving the quality of vegetable protein. One outcome of this work was the development of a new soyamilk product, fortified with vitamin B-12 and launched recently under the name Wanderlac by A. Wander Ltd., which also makes Ovaltine. "This first British plantmilk has been used with success to replace milk in various allergic conditions, including the disease galactosaemia" [galactosemia].

Note. This is the earliest English-language document seen (Aug. 2013) that contains the term "replace milk" in connection with soyamilk.

Stanborough School provides a particularly suitable site for the research center, in part because it was the site, 27 years ago, of the first Experiments in Great Britain on the basal metabolism of vegetarians. The results were published in the *Journal of Biological Chemistry* (1932).

A photo shows the new laboratory at Stanborough Park.

Note: *Webster's Dictionary* defines galactosemia (a term first used in 1934) as "an inherited metabolic disorder in which galactose accumulates in the blood due to deficiency of an enzyme catalyzing its conversion to glucose."

1783. *British Vegetarian.* 1959. Plantmilk is here! July/Aug. p. 153.
• ***Summary:*** Vegetarians in Britain will be glad to know that "the first step towards overcoming dependence on dairy produce has been achieved with the of 'Wanderlac' to the market, to take the place of cow's milk." This product is made by A. Wander Ltd., manufacturers of the well-known Ovaltine. Though it was introduced some months ago, only very limited quantities have been available, solely for the treatment of sick children, "with such marked success in certain cases that the medical profession has become very interested indeed in its remedial uses."

The protein in Wanderlac is derived entirely from soyabeans, and its amino acid pattern is said to be similar to that of cow's milk. D.L.-Methionine, a limiting essential amino acid, and vitamin B-12 are added to increase the protein quality.

A table compares the nutritional composition of Wanderlac (reconstituted), cow's milk, and human milk. Wanderlac and cow's milk both contain 3.3% protein, vs. only 1.0% in human milk. Wanderlac contains 2.6% fat vs. 3.7% in cow's milk and 3.8% in human milk. Appreciation is expressed to the Plantmilk Society, to Dr. Frank Wokes, and to Messrs. A. Wander Ltd. "whose concerted efforts have resulted in this achievement, which brings vegetarians another step nearer to their final goal of a completely humane way of life."

Note. This is the earliest English-language document seen (Aug. 2013) that contains the term "Plantmilk Society."

• ***Summary:*** This articles focus on soya at Yangambi in the Belgian Congo. Content: Introduction. 1. Historical and worldwide distribution. 2. Climatic adaptation: Comparison of the climates in Harbin (central Manchuria) and Yangambi (near the equator), photoperiodic and thermal characteristics of soybeans, comparative study of the behavior of soya at Yangambi and its main zones of cultivation, eco-climatic chart of soya, classification of soybeans (*des sojas*) into fundamental climatic types and directives for the realization of their introduction to Yangambi.

3. Selection: Classification of the soybean varieties, genetics, and selection. 4. The cultivation of soya. 6. Characteristics of the seed and its utilization: Composition of the seed, Oriental preparations based on soya (soy sprouts, soymilk, tofu, natto, Hamanatto, yuba, miso, soy sauce or shoyu), soy oil and by-products, soybean cake, use of soya in the West. 7. A glance at soybean production. 8. The situation in the Belgian Congo.

The author identified a number of soybean varieties adapted to different ecological zones in the tropics, which helped soybeans spread to tropical countries, especially in Africa. Address: Assistant à la Division des Plantes Vivrières de l'INÉAC, à Yangambi [Belgian Congo].

1787. Chhabra, Arun K. 1959. The scope of soybeans in India. *Soybean Digest.* Sept. p. 26-27.
• ***Summary:*** Mr. Chhabra, who helped the Soybean Council of America (SCA) at two fairs, in New Delhi (with Howard Roach, president of SCA) and Calcutta (with Fred Hafner of General Mills), will enter Iowa State University this fall. "A little less than 2 million people attended the fair at each place," from poor peasants to Prime Minister Nehru.

"At Calcutta alone we distributed 200,000 pamphlets, mainly among adults. At our booth we had hung up some signs, notably, 'Soybeans for Healthy and Strong Bodies,' and 'Soybean Story–A Possible Solution to India's Food Problem.' Scores of people would gather around the booth and ask for an explanation.

We had kept the soybean oil, soy flour, and toasted soy proteins side by side on a table and we would explain to the people the importance and use of each of them. Particularly we told them that 2 ounces of soy proteins when mixed with a pound of rice double the protein content of the food and cost only 1½¢ in India. Many people took coins from their pockets and asked for the vials. Needless to say they felt disappointed when we told them we did not sell them."

The many women visitors "were interested in soybean oil, soy flour, soy milk, and various other baby foods."

"In collaboration with the wheat people we prepared large quantities of doughnuts daily and distributed then freely among children, students, special invitees," etc.

The fair was just one of the SCA's activities in India. "In order to create a market in another country you have to have (a) a genuine demand by the general public, (b) cooperation of the local business and industry, dealing in the same kind of article, and (c) approval by the government."

"Most of the population is vegetarian and though the number of cattle is larger than anywhere in the world, religious proscriptions, both Buddhist and Brahmanist, help keep down the consumption of animal protein. Thus the diet in the North mainly consists of whole wheat bread and vegetables, while in the greater part of the country rice is eaten with vegetables and with small quantities of vegetable oils and fish. However, as there is comparatively more consumption of milk and its derivatives in the North, the people are healthier than their brethren living in the South." A small photo shows Arun K. Chhabra. Address: Nagal Township, India.

1788. Wokes, Frank. 1959. Vegetable diets and nutrition (Letter to the editor). *New Scientist* 6(150):595-96. Oct. 1. [1 ref]

• ***Summary:*** "Plantmilks based on soya are being used in America to treat milk allergies in infants. The first British plantmilk, Wanderlac, has just been put on the market, after two years' trial on infants suffering from such allergies, especially galactosaemia..." (p. 596, col. 1). Address: Vegetarian Nutritional Research Centre, Stanborough Park, Watford, Herts. [England].

1789. Fomon, Samuel J. 1959. Comparative study of human milk and a soya bean formula in promoting growth and nitrogen retention by infants. *Pediatrics* 24:577-84. Oct. [15 ref]

• ***Summary:*** Four infants (4-6.5 months of age) were fed a diet based on a full-fat soya extract, which was "made from full fat flour from the whole bean." Their mean protein intake was 1.7 g/kg body wt./day. All children gained as much weight as normal infants fed on human milk. Address: M.D., Dep. of Pediatrics, College of Medicine, State Univ. of Iowa, Iowa City.

1790. *FAO Nutrition Meetings Report Series.* 1959. Report of the FAO/UNICEF Regional School Feeding Seminar for Asia and the Far East. No. 22. 53 p. Held 10-19 Nov. 1958 at Tokyo, Japan. [5 soy ref]

• ***Summary:*** UNICEF stands for the United Nations International Children's Emergency Fund. Appendix 3 (p. 48-51) titled "Data on some nutritious food products that have been developed in Asia and the Far East," discusses Saridele, groundnut extract curd [tofu made from peanut milk], Indian Multipurpose Food (MPF, developed by CFTRI), miso, natto, and tempeh.

"'Saridele' is the name that has been given to a spray-dried soybean extract combined with an extract of sesame, or peanut, with or without the addition of malt. Vitamins and calcium are added to saridele in order to make its nutritive value similar to that of cow's milk or to enhance its nutritive value. Flavorings such as vanilla or chocolate are also used, which make the product highly acceptable.

"A plant having a capacity of about 800 kg./day has been erected in Indonesia with the financial assistance of UNICEF and the technical assistance of FAO. Saridele is manufactured from a mixture of soybeans and decorticated sesame in the proportion of 4:1. Malt extract from maize may be used to replace 50% of the cane sugar used. Soybean and sesame are soaked for about six hours and then disintegrated finely, together with 7 volumes of hot water. The slurry is stirred vigorously and then filtered. The filtered liquid is heated under pressure for 10 minutes at 120ºC., then flashcooled and formulated with Vitamin A, in oil solution, and malt, if desired. The formulated liquid is homogenized, concentrated in a vacuum evaporator to about 22% solids, then spray-dried. The powder finally is sifted and blended with finely ground cane sugar, and calcium carbonate, riboflavin, ascorbic acid and Vitamin B_{12} added; the mixture may be flavored with vanilla or chocolate." A table compares the nutritional composition of whole dried cow's milk and Saridele (based on a leaflet from Saridele Ltd., Indonesia). Address: FAO, Rome.

1791. Shurpalekar, S.R.; Lahiry, N.L.; Chandrasekhara, M.R.; Swaminathan, M.; Indiramma, K.; Subrahmanyan, V. 1959. Studies on milk substitutes of vegetable origin. I. The nutritive value of milk substitutes prepared from soyabean and groundnut. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 19(11):269-74. Nov. [8 ref]

• ***Summary:*** Albino rats showed good growth with "soyabean milk" fortified with calcium and vitamins. The soybean milk was stabilized by the addition of disodium phosphate and sodium citrate, and fortified by the addition of calcium phosphate, vitamins A and D, and riboflavin. Table 1 shows the composition of the fortified soyabean milk, groundnut milk, 2:1 blend of soybean and groundnut milk, blend of vegetable and cows milks, and modified reconstituted cow's milk. Address: Central Food Technological Research Inst. (CFTRI), Mysore, India.

1792. Van Wyk, Judson J.; Arnold, M.B.; Wynn, J.; Pepper, F. 1959. The effects of a soybean product on thyroid function in humans. *Pediatrics* 24(5):752-60. Nov. [17 ref]

• ***Summary:*** A 10-month old infant reared from birth on Mull-Soy, a soy-based infant formula, developed a goiter and hypothyroidism, which was cured by the administration of 4

drops of Lugol's solution and the replacement of the soybean product by whole cow's milk.

Studies in normal adults showed that this soybean product did not interfere with the absorption of iodine, iodine uptake by the thyroid, oxidation of iodide to iodine, or the release of PBI-131 in most subjects. However two subjects who had a high plasma level of PBI-131 while receiving whole cow's milk, had a significant suppression in the PBI-131 while receiving this soybean product.

"These studies suggest that a goitrogenic agent was present in this particular soybean product, which interfered with thyroid hormone synthesis in susceptible individuals, and which raised the daily requirement for iodine."

Footnote: This work was supported in part by a grant from the Borden Company [makers of Mull-Soy]. Address: 1. Manufacturer's Name: Mountain View College.
Manufacturer's Address: Mindanao, Philippines.
Date of Introduction: 1959.
New Product–Documentation: Letter from Eric C. Fehlberg, Director, International Health Food Assoc. 1990. May 24. This organization no longer makes foods.

1799. Soedarmo, Poorwo. 1959. Vegetable protein as cow's milk substitute. In: Proceedings of the 15th General Assembly, Japan Medical Congress. See vol. 1, p. 492. *
• ***Summary:*** Orr and Adair (1967) state that the author presented an undated paper by this title at the "Symposium on Problems of Nutrition in Asian Countries." Includes a discussion of Saridele, a spray-dried soy milk made in Indonesia. "The equipments are highly technical, the receiving country is technically not well-developed, and this arouses problems in the selection and the ordering, the transportation, the installation and the exploitation of the equipment."

Tempeh is an Indonesian preparation. It may be eaten on its own, after roasting or frying, or used in soups. It is also used in a dry form. It is said that about 60 million of the 90 million inhabitants of Indonesia include tempeh in their daily menu.

1800. Figueiredo Paz, Ataliba de. 1959. Uma planta cuja cultura deve ser estimulada [A plant whose cultivation should be encouraged]. In: 1959. Soja no Rio Grande do Sul. Secretaria da Agricultura (Companha da Produtividade Agricola): Porto Alegre. See p. 63-76. Chap. 7. [Por]
• ***Summary:*** Thirty years ago Professor Ataliba de Figuerido

Paz conducted many soybean experiments at the Escola de Agronomia e Veterinaria da Universidade do Rio Grande do Sul, Brazil. A table shows imports of soybeans in 1919, 1920, and 1921 from China (the main supplier), Japan, the USA, and other countries. Discusses the main varieties grown in Brazil, medium- and late varieties, soybean pests, soya in human nutrition, how soymilk is made from soybeans, soya–an excellent forage. Address: Escola de Agronomia e Veterinaria da Universidade do Rio Grande do Sul, Brazil.

1801. Kon, S.K. 1959. Milk and milk products in human nutrition. *FAO Nutritional Studies* No. 17. 75 p. [14 ref]
• ***Summary:*** The author wisely points out: "It stands to reason that milk, which only for a limited time and with certain reservations is the ideal food for the young of any one species, is further restricted in value when used by another species, and the limitations of milks of domesticated animals in human nutrition must be frankly accepted and understood."

Fomon and Filer (1974, p. 359) add: "In this respect, it is worth noting that growth rates of the human infant and the calf are quite different, the human infant requiring about twice as long as the calf to double his birth weight (100 versus 50 days). Thus, the ratio of nutrient requirement for growth to that for maintenance will be greater for the calf than for the human infant. Furthermore, protein and minerals account for smaller percentages of weight gain in the human infant than in the calf. It is, therefore, not surprising that cow milk is richer in protein and minerals than is human milk."

Under soured and fermented milks, the author discusses: Sour milk (called *lait caillé* in France, *Dickmilch* in Germany, and *fiili* in Sweden), long milk (called *langmjölk* or *tättemjölk* in Sweden, *taette* in Norway, and *pitkäpiimä* in southwestern Finland), yoghurt, laban and dahi, cultured yoghurt, kefir (from the Caucasus), kumiss (prepared from mare's milk which contains more lactose than cow's milk; may contain up to 3% alcohol), kurunga, chal, and lassi (sour buttermilk remaining after the churning of butter from dahi in the manufacture of ghee), buttermilk (the acid by-product of the churning of butter into sour cream), cultured buttermilk, acidophilus milk (made with a pure culture of *Lactobacillus acidophilus* which has largely replaced *L. bulgaricus* for this purpose), and nutritive value.

Page 59 notes that in Europe, three different levels of milk consumption are found. It is highest in Scandinavia (excluding Denmark), Finland, and Switzerland, where it is in the order of 300 kg per person per year. In the rest of western Europe and in Denmark it ranges from 170 to 220 kg. In southern Europe, it is in the order of 100 kg, except in Portugal where it is only about 30 kg.

Note: Per capita consumption of margarine roughly follows the same pattern as that of milk.

All infants possess lactase, the enzyme needed to digest the sugar lactose–but most lose it after weaning.

Even if a woman is undernourished, the amounts and composition of the major nutrients in her milk change little, as shown in Nazi concentration camps, but the volume of her milk decreases, as do its content of riboflavin and thiamine.

There are two types of protein in milk, casein and the water soluble proteins [alpha and beta lactalbumins], which are obtained from whey and which dissolve in whey.

The bacterial vat or rumen is also called the "paunch." Here bacteria use simple nitrogenous compounds, such as ammonia or urea, to build up their own protein, which they then digest. So the value of the protein in an animal's food is not all that important. All the vitamins of the B group are also synthesized in the paunch. In young ruminants, the paunch activity does not develop until several weeks after birth. The mare [female horse] and ass [donkey and other members of the subgenus *Equus*] are the only nonruminant milk animals. Their milk is closest in composition to that of humans.

In the early days, animal proteins were thought to be superior to vegetable proteins. But progress in nutritional science has shown that some of the superiority was due to vitamins and minerals associated with the protein in animal products. Moreover, it is the amino acids, not the proteins, that count.

Milk has its best complementarity with cereals and potatoes.

Pasteurization of milk has several results: It kills bacteria, and it inactivates enzymes such as lipase, which cause bitter milk. It also destroys 10% of the thiamine, 10% of the vitamin B-12, and 20% of the vitamin C in milk.

UHT [ultra-high temperature] processing destroys 90% of the vitamin B-12 in milk.

Metchnikov's ideas gave fermented milks a good image, but it is probably not correct. "There is as yet very little evidence that the particular organisms of the fermented milks, even those specifically prepared for the purpose, can establish themselves and throve in the gut." So there are probably no healing effects of fermented milk products.

There are two types of butter: sweet butter is found in the USA, whereas that made from ripened soured milk is European. It has a prized flavor but short shelf life.

Some pastoral tribes in Africa [such as the semi-nomadic Maasai / Masai of Kenya and northern Tanzania] sometimes live exclusively on milk.

After World War II, governments and the United Nations' UNICEF took increasing responsibility for the nutritional welfare of children, especially those of the lower-income groups. Supplementary child feeding programs have taken two forms: school feeding programs and food distributed through maternal and child health centers. Address: National Inst. of Dairying, England.

• ***Summary:*** Contents: 1. How to extract soymilk from 250 gm of soybeans. Condensed soymilk. Soymilk made from whole soy flour. 2. Recipes based on soymilk: Yogurt, soy cheese [tofu], soymilk *batida* (milk shake), ambrosia, gelatin with fruits and soymilk, souffle with soymilk, soymilk pudding. 3. Recipes made with with soy residue (*com resíduos de soja):* Soya *docinhos* with condensed milk, croquettes, Adventist roast. 4. Dishes made with whole soy flour. Recipes excerpted from "A Soja" (Serviço Social da Industria, Departamento Regional do Rio Grande do Sul). Address: Porto Alegre, Brazil.

1804. Taira, Hirokadzu; Ebisawa, H.; Sugimura, K.; Sakurai, Y. 1959. Daizu kakô-hin no amino-san in kansuru kenkyû. II. Tôfu seizô kôtei ni okeru amino-san no suii [Studies on amino acid contents of processed soybeans. II. Transfer of amino acids during "tofu" processing]. *Eiyo to Shokuryo* (*J. of Japanese Society of Food and Nutrition*) 11(6):355-57. [1 ref. Jap; eng]
• ***Summary:*** The amino acid pattern of tofu was quite similar to that of the soybeans from which it was made, except that a significant amount of tyrosine ends up in the okara, as do smaller amounts of methionine and tryptophan. Address: National Food Research Inst., Tokyo.

1805. Thompson, Edna. 1959. The yoga cook book. New York, NY: Philosophical Library. 156 p. Index. 19 cm.
• ***Summary:*** The Yoga diet, as presented here, is not vegetarian. This book contains recipes for meat (liver, heart), fish, and shellfish. "Yogans" are said to eat at least some food each day which carries the life principle (fresh, raw food), to prefer whole foods in modest amounts, to avoid inert demineralized foods (such as white flour and white sugar), and alcohol. Yoga is not a religious movement; its followers practice self discipline in eating, without fasting. The rear dust jacket states: "This book banishes the idea that the modern Yogin as an ascetic with caveman dietary habits." The true Yogin regards his food as sacred and has heightened powers.

Soy-related recipes include: Soybean soup (p. 18). Shoyu sauce (soy sauce, p. 26). "Auxin" salad (freshly sprouted mung beans sprinkled with soy oil, etc., p. 48). Eggs foo yung (with bean sprouts, water chestnuts, green onion, celery, 4 beaten eggs, salt to taste. "Brown desired size patties of the mixture in soy oil." Serve with a brown sauce made with cornstarch, soy sauce, monosodium glutamate, sugar, and salt. p. 58-59). Vegetable sukiyaki (with Tofu {bean curd} and shoyu sauce, p. 65). Soyburgers (with mashed cooked soybeans, p. 66). Vegetable chop suey (with soy oil, bean sprouts, and soy sauce, p. 68). Korean soybean noodles (made with soybean flour, p. 72). Soy spoon bread (with soy flour and soy oil, p. 97-98). Making soy bean cheese (tofu, coagulated with vinegar, p. 104). Yoga puddings and desserts (white flour is replaced by soy flour and lard is replaced by soy oil, p. 114). Chinese sweet soy beans (p. 122). Manchurian soy bean milk drinks (p. 136).

Also discusses: Japan yokan cakes (with red beans [azuki], p. 116-17). Oat peanut butter wafers (p. 123). Red bean cake (Korea, with red kidney beans [azuki], p. 131-32).

Note: This is the earliest document seen (Jan. 2009) that describes the use of soy ingredients in Korean-style recipes outside Korea.

1806. Raheja, P.C. 1960. So many uses has the soybean. *Indian Farming* 9(10):18-19. Jan. Series 2.
• ***Summary:*** Contents: Introduction. Green manure. As fodder. Soybean oil and cake. As human food. Food include "the green pods," soybean flour, soy milk, and "soy curd" or tofu. "Soy curd is prepared out of soy milk by adding milk curd to it. You can also add acetic acid instead of milk curd." Address: Indian Agricultural Research Inst., New Delhi.

1807. Hydovitz, Jerrold D. 1960. Occurrence of goiter in an infant on a soy diet. *New England J. of Medicine* 262(7):351-53. Feb. [15 ref]
• ***Summary:*** A boy, age 4½ months, had an enlarged thyroid gland indicating possible goiter. His skim milk formula was "replaced by a popular soybean formula, which served as the sole nutrient except for vitamins A, C and D until the laboratory studies here reported were completed at 6 months of age." The soy formula was apparently made from soy flour, but the name of the manufacturer is not given. After substituting whole milk for the soy formula, the thyroid problem gradually disappeared. Address: Univ. of Pittsburg School of Medicine, Pennsylvania.

1808. McNaughton, Jean W. 1960. The soya-bean–Its properties and nutritive values. *Rural Missions* No. 112. p. 8. Winter. [1 ref]
• ***Summary:*** As human populations increase, animal populations decrease increasing the need for plant proteins. This article focuses on soya milk. "Details of the step by step processing of the soya-bean in its various uses may be obtained from FAO, 1325 C Street S.W., Washington 25, DC." Address: Regional Nutrition Officer, FAO, Washington, DC.

1809. American Soybean Association. 1960. Soybean Blue Book. Hudson, Iowa: American Soybean Assoc. 144 p Advertisers' index. 22 cm.

• ***Summary:*** Contents: American Soybean Association. Japanese American Soybean Institute. National Soybean Processors Association. Soybean Council of America. Midsouth Soybean and Grain Shippers Association. Ontario Soya-Bean Growers' Marketing Board. U.S. Department of Agriculture: Agronomic Research (ARS), Disease Research, Entomological Research, Utilization Research and Development (Northern Utilization Division [NRRL], Eastern, Southern, Western), Marketing Research.

Official standards for soybeans, Revised effective Sept. 1, 1955. Soy flour standards, for full-fat, low-fat, and defatted. Densities of various soybean products. Map of the USA showing the best adapted soybean varieties for each major soybean producing state. Directories: Processors of soybeans, by state, with address and names of officers (p. 56-74). Canadian soybean processors (p. 74). Manufacturers of 50% protein soybean meal (by state, p. 76). Foreign soybean processors, by country (p. 78-81). Refiners of soybean oil, by state (p. 82-84). Manufacturers and handlers of soy foods (p. 86-93): Beverages, breakfast foods, canners of green vegetable soybeans, canners of mature soybeans, cookies, crackers, toasts and wafers, frozen desserts (companies that make vegetable oils used in frozen desserts), health food store & supply houses, lecithin, macaroni, spaghetti & noodles, margarine, meat substitutes, proteins (Griffith Labs, Gunther, Worthington Foods), pudding powders (Brockville, Ontario, Canada), Salad and cooking oils, shortening, sausage binders, seasonings, soups, soybean oil, soybeans for cooking and sprouting, soy butter (Town Food Co., Riverside, California, makes "Town: soy lecithin spread; Shedd-Bartush Foods, Detroit, Michigan, makes "Willow Run" soy spread), soy cheese [tofu], soy flour, grits and flakes, soy flour mixes, soy milk, soy sauce, sprouts, vitamins, whipping agents.

Manufacturers of industrial products employing soybeans (p. 94-95): Caulking compounds & floor tile,

coated papers & leather dressing, fire-fighting foam, glues, plywood & adhesives, insecticides, laminating, lecithin, oilcloth and coated fabrics, paints and varnishes (13 companies), paper sizings, wallpaper and wallboard coatings, resins, soaps, soybean fatty acids (8 companies), soybean oil. Services for the industry (p. 96-109): Analysts, appraisals, brokers, commission merchants & jobbers, consultants, engineering services, export elevators, exporters & importers, export warehousing and handling, farm management, field warehousing, futures market, market analysis, mill construction contractors, milling service, miscellaneous services, oil transports, transportation.

Equipment and supplies for the soybean industry (p. 110-32): Aspirators, bagging equipment, belting, chains, conveyors, elevators, defoliants, drying and aeration equipment (farm driers, grain driers, meal driers), dust control systems & dust collectors, elevator buckets, fans, farm equipment, fertilizers, fumigants, fungicides, germinators, grain and seed cleaning and separation equipment, grain grading equipment & moisture testers, grain handling equipment, granulators, grinding & mixing equipment, herbicides, insecticides & pesticides, inoculants, laboratory equipment, man-lifts, material level indicators, materials handling equipment, miscellaneous equipment, packaging materials, pelleting machines, power transmission equipment, pumps, respirators, seed protectants, sifters, soil testing, soybean storage (elevator & processing units, farm units), spraying and irrigating equipment, temperature systems, transportation equipment, truck lifts, unloaders, waterproofing, weighing and packaging equipment.

Soybean processing [crushing] and oil refining equipment and supplies (p. 134-42): Bleaching and filtering equipment, catalysts, complete plants [for crushing], continuous counter-current solvent extractors, continuous screw presses, degumming, deodorization, fractionation, hydraulic pressing equipment, hydrogenation, margarine, miscellaneous equipment, neutralization, shortening, solvent recovery, solvents, soybean seed [suppliers and private breeders], vegetable soybean seed. Advertisers' index. Incl. Allied Mills, V.D. 1810. Wasserman, R.H.; Lengemann, F.W. 1960. Further observations on lactose stimulation of the gastrointestinal absorption of calcium and strontium in the rat. *J. of Nutrition* 70(3):377-84. March. [20 ref]
• ***Summary:*** Lactose is known to stimulate gastrointestinal absorption of calcium. The absence of lactose in soy-based infant formulae may theoretically impair growth or bone mineralization in infants fed such formulae. Address: Lab. of Radiation Biology, New York State Veterinary College, Cornell Univ., Ithaca, New York.

1811. Lee, Elinor. 1960. UNICEF develops protein sources: New foods for children. *Washington Post.* April 2. p. B5.
• ***Summary:*** The new foods include "milk [Saridele] made in Indonesia from soya powder."

1812. *Chopletter* (*Worthington Foods, Ohio*). 1960. What you should know about Worthington Foods. 13(2):3. April.
• ***Summary:*** Worthington makes both liquid and powdered Soyamel. Soy-based Kreem Chee has exactly the same fat (36.9%) and protein (9.0%) content as dairy cream cheese. The Kosher certification on 11 Worthington products has been in effect since 1 July 1959. These products are both Kosher and Pareve (neutral). Foods bearing the Kosher label are Choplets, Choplet Burger, Vegetarian Burger, Proast, Numete, Sandwich Spread, Soyamel, Veelets, Veja Links, VP, and Entree.

New and improved Vegetarian Patties are now available. A product named New Vegetable Burger is also available.

Note 1. This is the English-language document seen (Jan. 2007) that contains the term "Vegetarian Burger" (or "Vegetarian Burgers"), or the term "Vegetable Burger" (or "Vegetable Burgers").

Note 2. This is the earliest document seen (Jan. 2009) that uses the word "Kosher" or the word "Pareve" in connection with meat alternatives or with soy products. Address: Worthington, Ohio.

1813. Shurpalekar, S.R. 1960. Studies on the preparation and nutritive value of spray-dried vegetable milk powder. *Food Science* (*Mysore, India*) 9:176-77. May.
• ***Summary:*** Gives details on the preparation and nutritive value of spray-dried powder obtained from a blend of soyabean and groundnut milks.

1814. Shepard, Thomas H.; Pyne, G.E.; Kirschvink, J.F.; McLean, M. 1960. Soybean goiter: Report of three cases. *New England J. of Medicine* 262(22):1099-1103. June 2.

Abstracted in J. of the American Dietetic Assoc. 37(3):270. [21 ref]
• ***Summary:*** The article begins: Although goiters associated with soybean feeding have been produced experimentally in laboratory animals [5 references] we have been able to find only two similar reports in human beings (Rawson & Rall 1955; Van Wyk et al. 1959). Detailed case reports are given of three children who developed goiters after being on a diet including "soybean milk." In Case 1, a goiter developed in a female infant who was placed on a soybean formula (Mull-Soy, made by Borden Co., Pharmaceutical Div., New York City) at 3 months of age. At 11½ months, when cow's milk was substituted, the goiter subsided. In Case 2a goiter developed in a female infant after she had been placed on a soybean formula at birth. In Case 3, a mentally retarded girl was placed on a soybean formula at 3 months of age because of eczema.

The iodine-131 uptakes in all 3 children were high, and became normal when the soybean milk was discontinued. The goiters became much smaller or disappeared in 2 cases when the soybean milk was discontinued and in the other when iodine was added to the diet. Address: 1. Univ. of Washington School of Medicine & Children's Orthopedic Hospital.

The effect of fortification with DL-methionine on the nutritive value of spray dried powder obtained from a blend of soyabean and groundnut milks. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 20(6):145-56. June. [17 ref]
• ***Summary:*** Studies done with albino rats. Address: Central Food Technological Research Inst. (CFTRI), Mysore, India.

1816. A.P.; The Times of India New Service. 1960. Soya bean milk. *Times of India* (*The*) (*Bombay*). July 24. p. 5.
• ***Summary:*** Soy bean milk, called Saridele, is now made for children on Java, where there are so many people there is no room for cows. It is a soya bean extract flavoured with sesame and fortified with vitamins. It comes as a powder, but when mixed with water it looks like milk. It is designed as a nutritive, low-cost protein substitute for milk.

This plant, the first of its kind, was built with the joint assistance of the Food and Agricultural Organisation (FAO) and the U.N. Children's Emergency Fund (UNICEF). If the children of Java accept the new beverage, other plants will be built throughout the South-East Asia area.

1817. *Macrobiotic News* (*New York, NY*). 1960. Our activities in July. No. 4. July. p. 4.
• ***Summary:*** (1) Live with Mr. & Mrs. Ohsawa joyful and happy summer time at the New Horizon Camp, Southampton, L.I. [Long Island, New York City].

(2) Lecture on Macrobiotics by Mr. G. Ohsawa. Thurs, Fri, Sat, & Sun at 8:30 p.m. Fee: $2 for one. Macrobiotic meal cooked by Mrs. G. Ohsawa–Three meals a day.

Fee: special reduction has been done by Mr. G. Ohsawa. Lectures, meals:

$40.00 per week & other activities without sleeping accommodations.

$75.00 per week with sleeping accommodations.

$6 per day.

(3) Distribution of Macrobiotic Foods: (Unrefined Rice [Brown Rice], Yannoh [Ohsawa coffee], Kokko [Kokkoh; grain milk], Azuki, Goma [sesame seeds], Sea Salt, Miso, Tamari–Ohsawa Sauce, Mu-Tea, Sesame Oil, Tahin [Tahini] and Umeboshi, etc.): sold at Azuma Inc. & Ginza Inc.

(4) Presents to Mr. & Mrs. Ohsawa–Smith-Corona Portable Electric Typewriter–has been done by the attendants of the Welcome Party at Am. Buddhist Academy [American Buddhist Academy, founded in 1951, later renamed American Buddhist Study Center] on June 30.

Note 1. This is the earliest document seen (March 2012) that mentions "Tamari" in connection with macrobiotics.

Note 2. This is the earliest document seen (May 2011) that mentions "Kokko" (or "Kokkoh"), a milk alternative containing soy, developed and used by macrobiotics. Address: Ohsawa Foundation, 331 Riverside Dr., New York 25, NY.

1818. FAO/WHO/UNICEF Protein Advisory Group (PAG). 1960. Saridele plant–Indonesia. New York. R.2/Add.4. Aug. *

1819. *Food Science* (*Mysore, India*). 1960. Soyabean products. 9(8):289. Aug.
• ***Summary:*** In response to a letter from a person in Jubbalpore, the magazine gives a table showing the nutritional composition of soyabeans, then gives a brief description of each of 3 products than can be manufacture from soyabean: Soyabean flour, soyabean milk, and soyabean curd ("well known as 'Tofu' in Far Eastern countries").

1820. Kay, Jacob L.; Daeschner, C.W., Jr.; Desmond, M.M. 1960. Evaluation of infants fed soybean and evaporated milk formulae from birth to three months: A comparison of weight, length, hemoglobin, hematocrit, and plasma biochemical values. *American J. of Diseases of Children* 100:264-76. Aug. [38 ref]
• ***Summary:*** "This careful study leads one to the conclusion that there is little difference between the nutritive value of these two foods with respect to the parameters studied... Total plasma cholesterol increased significantly by the age of 3 months in infants fed ad libitum diets, but not in infants fed soybean milk." Supported in part by the Pharmaceutical Div. of the Borden Co., New York, makers of Mull-Soy, the

soybean milk used as a milk substitute in this study. Address: Dep. of Pediatrics, Baylor University College of Medicine, Houston, Texas.

1821. Farlow, David R. 1960. The Japanese American Soybean Institute. When Automatic Allocation goes into effect you will see the full impact of JASI's promotion work. *Soybean Digest.* Sept. p. 35-36.
• ***Summary:*** JASI is starting to get involved with soy milk in Japan. There are about 60,000 tofu makers in Japan and they can readily make both tofu and soy milk. Dr. Harry W. Miller "has long been a strong advocate of the utilization of soy milk to aid in the increased consumption of protein and fat by the Japanese people... K.S. Lo of the Hong Kong Soybean Co. showed me his plant last fall, and I saw huge amounts of soy milk being manufactured and bottled for the Hong Kong area alone. Pepsi Cola is bottled in the same plant and Mr. Lo informed me that soy milk was outselling Pepsi Cola by about two to one in the Hong Kong area. I drank a bottle and I have to admit that much to my surprise it was delicious."

The increase in exports of U.S. soybeans to Japan has been accomplished under a "controlled allocation system"–controlled by the Japanese government. "When the Automatic Allocation system goes into effect, and the consumer alone decides the amount of soybeans and soybean products that are consumed, you will see the full effect that the promotion work that we have done has had." A small portrait photo shows David Farlow. Address: Asst. to the Executive Vice President, American Soybean Assoc.

1822. Watanabe, Tokuji; Fukamachi, Chiharu; Nakayama, Osamu; Teramachi, Yayoi; Abe, Kazuyoshi; Suruga, Sachiko; Miyanaga, Setsuko. 1960. Tôfu seizô ni kansuru kenkyû. II. Bagged lactone silken tofu {GDL}]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 14B. p. 25-30. Sept. [Jap; eng+]
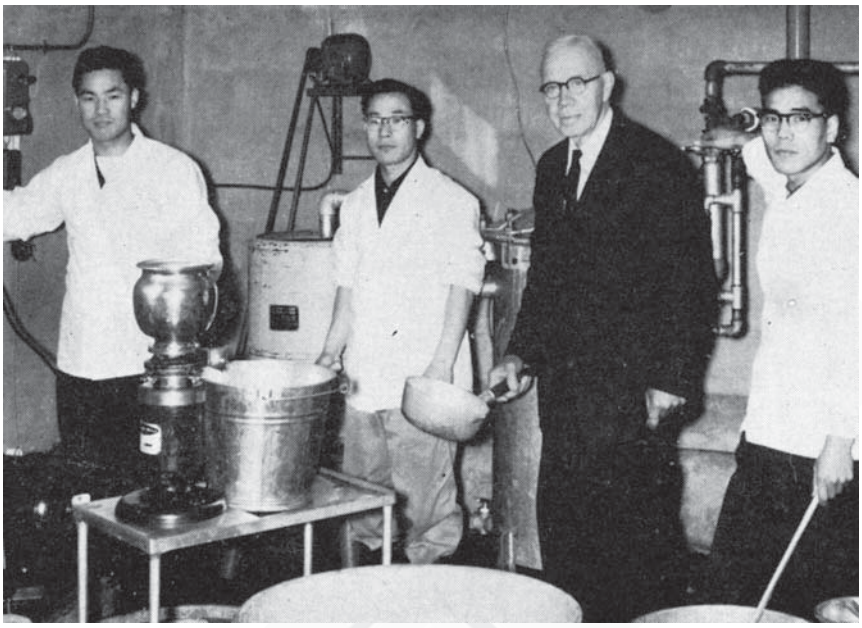
• ***Summary:*** The structure of this part (Bagged lactone silken tofu, 2.3) parallels that of part 2.1 (Regular momen tofu, pages 6-15). Bagged Lactone Silken Tofu is a packaging innovation. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

1825. Miller, Harry W. 1960. The package soy milk shop. *Soybean Digest.* Oct. p. 14-15.
• ***Summary:*** Soy milk is now widely marketed in the United States in both powdered and evaporated forms.

"The demand for the product has been mostly from those allergic to animal milk and through prescription to those who cannot tolerate dairy products. Its manufacture, however, has been by large factory establishments. This



is the case with Loma Linda's Soyalac, Borden's Mull-Soy, and Mead Johnson's Sobee. The latest soy milk is being put out by the Indonesian soy milk plant located at Djorgakarta [Yogyakarta, Jogjakarta] which began soy milk powder production in 1957. These plants have contributed much to the knowledge of soy milk, and emphasized its value as a dietary article."

A package soy milk plant can be installed for less than $2,000. It can start as a tofu shop to which is added a steam boiler or steam generator of 5 to 10 horsepower capacity, either a hand-operated stone mill, or better a small mill run by an electric motor with steel or carborundum buhr, and a 50-gallon pressure cooker. The soymilk is formulated by adding sugar, oil, salt, calcium, and vitamins. "These are placed in about one-fifth the desired quantity of extracted milk and run through a small homogenizer especially made for the package plant. When it is homogenized it is added to the other four-fifths of the milk, and we have it as a constituted milk of a nice color and good flavor.

"In most places this soy milk is used hot and marketed at once as hot milk. However, where it is bottled (as is customary with animal milk) it is run over a cooler and bottled which adds a little expense. The package soy milk plant has a capacity for 150 pounds of cheese curd, and 200 gallons of milk per day of operation, using three trained workers, also at a very minimum of cost.

"Plant 30 Years Ago: The practicability of such package soy milk and cheese plants has been amply demonstrated. In fact, my first beginning with soy milk was made in a rather crude package plant at the Shanghai Sanitarium some 30 years ago. This grew into the large soy milk factory later in Shanghai. The next one, which was more streamlined, was put in a school at Taipei, Taiwan, supplying the school, the Taiwan Hospital and community with soy milk daily.

"One year ago the writer had the satisfaction of arranging a flow line of the above described equipment in a village in the northern suburbs of Tokyo, where soy milk is made in a soy cheese [tofu] factory so both bottled soy milk and tofu are supplied to the community and also to a state institution. There are an estimated 3,000 soy curd plants in Japan. At little additional cost each of these can be transformed into soy milk producing shops.

"A soy milk package unit has been assembled at Mountain View College, located in central Mindanao, Philippine Islands. Here the college farm raises a good type of edible soybean. There 700 students get soy milk for breakfast every morning and at noon have soy cheese. In these rice eating and corn producing areas the soybean thus prepared has made a great contribution to the health and welfare of the student body and faculty members.

"A similar package soy milk shop is now being installed at a school in Hong Kong, another at a college and hospital at Bandung, Indonesia, and another at a college in Japan.

"Thus a partial solution of the all-important protein in the nutrition of the Orientals, within their economic reach, is now a possibility. No greater benefit can be visualized than nutrition adequate for infants and the growing school child."

Photos show: (1) Three Japanese workers standing behind a table on which are glasses of soy milk. The caption reads: "Soy milk, ready for customers, is made fresh every day." (2) Dr. Harry Miller and three Japanese workers in a "soy milk package plant," or compact soy milk shop, with several pieces of equipment. Address: M.D., Director Emeritus International Nutrition Research Foundation.

1826. Cook, Charles D. 1960. Probable gastrointestinal reaction to soybean. *New England J. of Medicine* 263(21):1076-77. Nov. 24. [8 ref]

• ***Summary:*** Describes an infant who had a severe

gastrointestinal reaction to soy-based infant formulae, first to Sobee (made by Mead Johnson) at the age of 11 days, and shortly thereafter to Mull-Soy (made by the Borden Co.). The infant was initially put on soybean formula because of an undiagnosed macular rash. It was discontinued promptly, then tried again at age 10 weeks, and again followed by explosive vomiting and diarrhea, indicating sensitivity to soy. Address: Asst. Prof. of Pediatrics, Harvard Medical School, and Dep. of Medicine, Children's Hospital Medical Center, Boston, Massachusetts.

1827. Aljat, -. 1960. Food & utilization of food resources (Indonesia). In: Proceedings of the Fourth Pan Indian Ocean Science Congress. Section G. Human Ecology. See p. 65-68. Held 14-24 Nov. 1960 at Karachi, Pakistan.
• ***Summary:*** Gives detailed instructions for making the following soybean products: tempeh (tempe, soya-cake, moulded), tofu (tahu, soya curd, coagulated with gypsum / sakow powder), miso (taotjo), and sweet Indonesian soy sauce (Ketjap [perhaps ketjap manis], made with black soybeans). Also describes how to make onchom (ontjom) from peanuts, plus krupuk, and lempers. Table 1 compares the nutritional composition of powdered Saridele and cow's milk. Table 2 compares the amino acid composition of various mixtures containing soy.

Note: This is the earliest English-language document seen (April 2012) that uses the term "sweet Indonesia soy sauce" to refer to what is probably *kecap manis.* Address: Nutritional Inst. Labs., Djakarta, Indonesia.

1828. Ohsawa, G. 1960 Zen macrobiotics: The art of longevity and rejuvenation. New York, NY: Ohsawa Foundation. Printed in Japan. 218 p. Undated. Index. 17 cm.
• ***Summary:*** This is the earliest known printed edition of Zen Macrobiotics. The cover is gray. The author is George Ohsawa. The content is basically the same as the original mimeograph edition, however it has been edited and several of the parts have been rearranged and renamed to create a Forward [sic] (p. 3-5), a Preface (p. 6-8), and Chapters 1-3 (p. 15-43). At the end are two appendixes: One, which was titled "The Case of Mr. E," appeared at the end of the mimeograph edition. The second, which has been added is titled "The Pro-Forma Death Certificate of the American World Empire and its Gold Dynasty."

Concerning the date of publication: Although the date is not given in or on the book, the periodical *Macrobiotic News* announced it as being available in November 1960.

Distinguishing marks of this printing: Page 3: "Forward" is misspelled. Page 7: "... hundreds of ways of cookin [sic] and eating. They are all aim [sic] to create..." Page 62: "The yellow part is most yound [sic, yang],..."

These four errors were corrected in the next printing.

Both printings have 218 pages. However, pages 217 and 218 are different in the two books.

At least two printings were done in Japan. As of April 2011, Carl Ferré, President, George Ohsawa Macrobiotic Foundation (Chico, California) has one original of each.

Carl adds (e-mail of 30 April 2011): "Page 218 of the book you have (*Macrobiotics: The Art of Longevity and Rejuvenation,* by G. Ohsawa) appears to be exactly the same as the second Japan printing. It seems to confirm my hypothesis of a first printing in Japan in 1960, a second printing in Japan around 1962, and a third printing of the same edition in the U.S. after the 1962 Japan printing (and might even be the 1964 book referred to in Yin Yang). I believe the first reference in Macrobiotic News to a printed book is November 1960. Because editions of *Zen Macrobiotics* may have been printed at the same time as *Philosophy of Oriental Medicine,* we may need to look into that title as well in order to determine the full story." Address: Ohsawa Foundation: 331 Riverside Dr., New York City. Secretary Aihara, 44 W. 96th St., New York City, U.S.A.

1829. Prawiranegara, Dradjat; Rawi, Ihsan el. 1960. Food & utilization of natural food resources (Indonesia). In: Proceedings of the Fourth Pan Indian Ocean Science Congress. Section G. Human Ecology. See p. 55-63. Held 14-24 Nov. 1960 at Karachi, Pakistan.
• ***Summary:*** This is a relatively early publication by an Indonesian author on soyfoods, especially tempeh. The first author's name is incorrectly listed on the document as simply Dradjat. "Protein rich food. Soya beans: In order to increase the protein consumption of the people more soya bean should be made available, and soya products should be popularized and manufactured on large scale." After praising the nutritional properties of soybeans, the authors continue: "In order to render soya protein utilizable, both destruction of the cell walls and heat treatment are necessary. Crushing the beans such as in the manufacture of soya milk and 'tahu' or the action of fungi which partly digest and break the cell wall such as the case with 'tempeh' are means of improving the nutritional value of soya. All these foods are heat treated both during the manufacture and on preparation for the table, and the enzyme inhibitors are destroyed. Tempeh, tahu [tofu], tautjo [Indonesian-style miso], ontjom, soya milk, etc. [are excellent foods. A meal] which gives the maximum biological value contains soya proteins and rice protein in the ratio of about 2.3. Therefore an adult who receives little or no animal food should get 15 or 20 gm soya protein with his rice. A medium size family should get 75 to 100 gm of soya protein. Unfortunately, soya preparations such as tempeh and tahu are comparatively expensive. For example 100 gm of soya protein in the form of tempeh costs about 5 rupiahs. This is why it is necessary to find a simple way of using unprocessed soya beans. The preparations of 'fried soya' is one such way. Fried soya is simply prepared as follows. Soya is soaked overnight in water with a little salt added, ground

to a paste. The stuff is pleasant smelling, and tastes good. It can be used in many different ways, both in adults and in children's food. It costs little, compared to tempeh or tahu, and its nutritional value is high, specially when mixed with rice or corn. It is certain that the introduction of fried soya to the Indonesian family's daily diet will appreciably improve the nutritional status of the people. Three times as much soya protein can be consumed for the price paid for tempeh or tahu. Recent work on tempeh (which is soya bean product subjected to the action of certain fungus) have shown that the product is of a higher nutritional quality than heat-treated soya bean. Apparently the fungus growth on the soya favourably alters the biological value of its protein. More work is needed on the subject in order to find out the reason for such improvement. It was suggested that tempeh should be investigated as infant food. (P. Gyorgy's recent report to W.H.O. Protein Advisory Group).

Note: This is the earliest English-language document seen (March. 2009) uses the word "tautjo" to refer to Indonesian-style miso.

"'Saridele' is an imitation milk of vegetable origin. It is made from soya sesame combination. It is available as spray-dried powder. The composition is similar to cow milk powder. Animal trials have shown that the protein of the product is somewhat inferior to cow milk, but the biological value improves considerably when mixed with rice. Trials with infants showed that Saridele is well tolerated by older infants and it is a valuable addition to the diet after the age of 6 months. In case of emergency, when no cow milk is available, saridele may be used as food for infants over 4 months of age (will be published by Children Dep. Medical School, Univ. Indonesia)." A table lists gives the nutritional composition of soybeans, tempeh, tofu, fish flour, fresh cassava leaf, and dry cassava leaf. Address: 1. M.D., M.P.H., Director, National Nutrition Inst., Dep. of Health, Djakarta; 2. FAO Food Chemist.

1830. USDA ARS Northern Utilization Research and Development Division, Peoria, Illinois. 1960. Definitions of foreign foods of current interest (Brochure). Peoria, Illinois. 4 p. Dec. 13. 28 cm.

• ***Summary:*** The first section, titled "Japanese foods from soybeans" (p. 1-2) includes: Aburage, frozen tofu, Hamanatto (Hamananatto), kinako (A form of full-fat soy flour made by grinding roasted soybeans), koji (A culture prepared by growing *Aspergillus oryzae* on cooked rice, wheat or other cereal for a few days. Serves as a source of enzymes for making miso, soy sauce, saki [saké, sake] and other fermented foods), kori tofu, miso, monosodium glutamate (a seasoning compound first isolated from soy sauce), nama-age, natto, satsumage [satsuma age], soybean milk or tonyu, soy sauce or shoyu, tofu, yaki-dofu, yuba.

The second section, titled "Indonesian fermented foods" (p. 3-4) includes: Arak, ketjap (soy sauce made with black soybeans), ontjom, ragi, sajur asin, tapé ketan (fermented glutinous rice), tapé katella (fermented arrowroot), tempeh (or témpé or témpé kedelé), tuwak. Address: Peoria, Illinois.

1831. Arnould, Francis. 1960. La vie et l'oeuvre du Dr. Berczeller et le soja alimentaire [The life and works of Dr. Berczeller and soyfoods (Continued–Document part II)]. *Revue d'Histoire de la Medecine Hebraique* 13(4):153-68. Dec. [Fre]

• ***Summary:*** Continued from page 159. Soy flour has numerous practical advantages. Its adds stability and shelf life to breads. Containing very little water, it is lightweight and easy to transport. It is extremely versatile, for use in many foods and dishes. It also has special uses, in war provisions and relief foods for refugees. Because of its light weight and nutritional density, it was used as a foodstuff by German skydivers / parachutists.

III. The big questions and projects: Berczeller was interested in the problem of world protein shortages. Germany had long had a serious deficiency of protein and fat, which could be corrected by soy. Germany imported about 1 million tons of soybeans before the war, and these soybeans were largely treated by the Berczeller process–which was a triumph. Russia experienced grave famines in about 1926, as well as at other times. So Russia turned to the soybean and cultivated it on large expanses of land. Dr. Berczeller traveled to Russia in about 1927 to create a modern soya industry there. North Africa and black Africa suffer from undernutrition and protein malnutrition. Soybean cultivation and a soyfoods industry would offer a solution to the problems of the entire continent.

In 1936 the Maharaja of Baroda [Maharaja Sayajirao Gaekwad III] well understood India's protein problem and had a book published on soya by Indian physicians. But they ignored the decisive progress made by Berczeller, so they were not able to develop utilization of soya that was properly treated. Berczeller was thinking as early as 1932 that introducing the food use of soya to India would be the main human goal of his life.

Even before 1932 Dr. Berczeller saw–at an early date–the great question of world protein supply and undernutrition. He studied the problem of the balance of nutrition and food in Germany scientifically. In 1932, Dr. Berczeller met F. Arnould because he took interest in the general econometric studies done by F. Arnould; this became the basis of their relationship [thus F. Arnould seems to have been an economist]. Thus Dr. Berczeller was a pioneer or precursor of in the field of agricultural and food econometrics.

He was very interested in various international organizations. He foresaw the need for an organization or international laboratory for the study of nutrition and food. From 1932 he told us that he would like to donate his fortune–which was very large–to such an organization.

His ideas and goals were a perfect match with those of existing organizations, the International Institute of Agriculture (Rome) before 1939, and the Food and Agriculture Organization [FAO] after World War II. Particular circumstances–and perhaps even occult occurrences–impeded the development of his works under this normal framework. He was interested in new protein sources, such as yeasts, and in the synthesis of amino acids and even poly-peptides.

IV. The life of Dr. Berczeller. We knew only a part of Dr. Berczeller's life and work. We would like to gather documents, testimonies, opinions, even criticisms from the many people who knew him. Dr. Berczeller explained to us that the idea of studying soya came to him in 1912 after attending a soyfoods dinner at the Japanese embassy in Berlin. He had been indisposed with a headache. So the slight toxicity of seemed to him to be a question of great importance. Already specializing in food questions, he had been an expert in the Austro-Hungarian government in this field during World War I (1914-1918). In about 1918-1920 he worked in the laboratory of Dr. Wasserman studying the proteins in blood. In 1921-22 he invented his process for treating soya. He was aided by the laboratories of the Skoda Foundation in Czechoslovakia.

In about 1924 Winston Churchill wrote a favorable article about food uses of soya in the London *Times.* A soyfoods dinner was given by the British Empire League in London; Winston Churchill attended.

In 1926 Dr. Berczeller went to Russia to organize a soya industry. He was considered to be named "Honorary General of the Red Army." He returned in 1930. In Germany his patents were used or exploited by Hansa Muehle of Hamburg, a huge milling enterprise. His products based on soya flour were sold by the Edel Soja Society in Berlin.

In England his soy flour was produced by the company named Soyolk in Rickmansworth near London. But a lawsuit (*procès*) opposed Soyolk to Dr. Berczeller. He later lost this lawsuit in about 1930.

A factory for making soy flour was also started in the Netherlands.

As early as 1929 Dr. Berczeller presented to the French government a proposal to introduce soy flour into human feeding. When we went to Quai d'Orsay [headquarters of the French government] in the company of Dr. Berczeller in 1932, we reminded our audience of our earlier proposal.

To discuss the introduction of soy flour in the food of large organizations, and of armies / militaries in particular, he went to see many important persons–Joseph Stalin, B. Mussolini, Miss Dorothy Thompson, secretary to President Franklin D. Roosevelt, etc. From 1929 to 1939 Dr. Berczeller travelled extensively in Europe to study on location the food of various countries: Romania, Bulgaria, Yugoslavia, Italy, Portugal, etc. He often traveled to Great Britain, where he studied the countries of the British Empire.

Dr. Berczeller in France: In 1932, when Dr. Berczeller asked us to present his work on soy in France, the agricultural situation in France was not favorable to the use of this progressive item, agriculture being then in the mist of a crisis of overproduction, with too much wheat, too much meat, too much milk, etc.

Those in charge were told to keep his ideas on file and reopen them when the next war broke out. This actually happened. In Oct. 1939 we asked CNRS, the National Center for Scientific Research, to invite Dr. Berczeller to come to France. He arrived in Paris via Geneva with an introduction from the secretary general of the League of Nations. We worked at Toulouse in 1939-40 on a program of soybean cultivation in southern France. During that time he stayed in Paris, at CNRS, working on introduction of soya into the army's food. But in June 1940 the defeat of France by Germany interrupted our work. Dr. Berczeller retreated to Toulouse.

After the armistice, soy flour could have been able to render a great service to France for feeding children. Some of it could have been imported from the United States, but human and political considerations impeded the realization of this.

Dr. Berczeller departed for Marseilles. We lost track of him, but we re-established contact after the Liberation (spring 1945). We tried to import some soy flour from the USA to feed undernourished people returning from the German camps. But incredible blunders on the part of the State's relevant departments caused our efforts to run aground. Several 'Liberty Ships' loaded with soja beans arrived in France but the knowledge as to what to do with these products was not on hand. Finally, they were given to... hogs.

Dr. Berczeller encountered difficulties of all types in France after the Liberation. Ruined, unknown, poorly received, old and sick, he finally lost his equilibrium and was no longer able to conduct his complex affairs and delicate studies. He was hospitalized at the hospital Lariboisière, then sent to various psychiatric hospitals. In this unfortunate evolution, CNRS has taken a very heavy responsibility by its incomprehension and by the false information that it gave. One could write an entire book recounting these misadventures of Dr. Berczeller in the French scientific milieux.

In 1940 Dr. Berczeller, working with a Quaker group near Toulouse, studied the importation of a soy-based infant formula made in the USA. The Quakers later helped him greatly in trying to rectify injustices, but without success. In 1952 Prof. Veznar of Zurich, Switzerland, helped arrange for Dr. Berczeller to be placed in the *Maison de Santé Nationale de Saint-Maurice.* The chief medical officer of this establishment, Prof. H. Baruk, cared for him with the greatest devotion. But he was not able to stop the development of an old heart malady. Dr. Berczeller died at Saint-Maurice on 14

Nov. 1955.

1832. Garruti, R. dos S.; de Barros, L.V.S.Q. 1960. Influencia da variedade, no sabor e aroma do leite de soja [Influence of soybean variety on the flavor and aroma of soymilk]. *Bragantia* (*Sao Paulo*) 19(64):1071-79. Dec. [10 ref. Por]*

1833. **Product Name:** Soymilk.
Manufacturer's Name: Bandung College.
Manufacturer's Address: Bandung, West Java, Indonesia.
Date of Introduction: 1960.
New Product–Documentation: Letter from Eric C. Fehlberg, Director, International Health Food Assoc. 1990. May 24. This organization no longer makes foods.

1834. **Product Name:** Presto Whip (All-Vegetable Soymilk-Based Non-Dairy Whip Topping in a Pressurized Can with Valve–Frozen).
Manufacturer's Name: Delsoy Products, Inc.
Manufacturer's Address: Livonia Dairy, 2001 S. Telegraph Rd. at Harvard, Dearborn, Michigan.
Date of Introduction: 1960.
Ingredients: Incl. soymilk, vegetable oil, sugar.
Wt/Vol., Packaging, Price: 10 oz pressurized can with valve.
How Stored: Frozen.
New Product–Documentation: Talk with David and Harvey Whitehouse. 1992. Feb. 4. In about 1960 Harvey Whitehouse began freezing Presto Whip, so that they could store the product frozen and ship it nationwide–but the product was never advertised as frozen.

1835. **Product Name:** Delsoy Topping (All-Vegetable Soymilk-Based Non-Dairy Whip Topping–Frozen).
Manufacturer's Name: Delsoy Products, Inc.
Manufacturer's Address: Livonia Dairy, 2001 S. Telegraph Rd. at Harvard, Dearborn, Michigan.
Date of Introduction: 1960.
Ingredients: Incl. soymilk, vegetable oil, sugar.
How Stored: Frozen.
New Product–Documentation: Talk with David and Harvey Whitehouse. 1992. Feb. 4. In about 1960 Harvey Whitehouse began freezing Delsoy Topping, so that they could store the product frozen and ship it nationwide–but the product was never advertised as frozen.

1836. **Product Name:** Soymilk.
Manufacturer's Name: Hong Kong Hospital and South China College.
Manufacturer's Address: Hong Kong.
Date of Introduction: 1960.
New Product–Documentation: Letter from Eric C. Fehlberg, Director, International Health Food Assoc. 1990. May 24. This organization no longer exists.

1838. Chiang, T'ien-chiang. 1960. Ta tou ying yang yu chia kung [Soybeans and soyfoods?]. China. 183 p. [10+ ref. Chi] Address: China.

1839. Hu, Chang-tu [Hu, Changdu]. 1960. China: Its people, its society, its culture. New Haven, Connecticut: HRAF Press. [xv] + 611 p. Maps. Index. 22 cm. Series: Survey of world cultures. [550+* ref]
• ***Summary:*** Chapter 16, titled "Agriculture," includes a discussion of major changes in Communist agricultural policy, especially during the 1950s: Land redistribution (1949-1952). Forms of progressive collectivization: (1) The Agrarian Reform Law of 1950 essentially preserved the institution of private land ownership while confiscating the landlords' holdings. (2) Decisions of Dec. 1951 and Feb. 1953 give details and methods for promoting mutual-aid organizations and producers' cooperatives. 1954-56: The transformation of mutual-aid organizations into producers' cooperatives is completed. The move to mechanized collective farms: The first one started in 1951 in northeast China, and by 1955 their formation was accelerating. Foods and industrial crops: "Aside from soybeans, rapeseed and peanuts are the principal sources of edible oils in China" (p. 348). Yet neither the acreage nor the production of soybeans in China is known. The Second Five Year Plan, announced in 1956, aimed to increase soybean production 12.5 million tons.

Chapter 19, "Health." A minority of well-to-do people have adopted the use of milk in the past few decades. "Soybean milk is often drunk in place of cow's milk" (p. 408).

Chapter 23, "Life in the villages." In North China the need to conserve water is critical. In April or May, following the harvest of winter wheat, this land was planted to soybeans and/or corn (p. 495).

Chapter 25. "National attitudes." Chinese had long believed in the greatness of their nation and culture. Chinese had a sense of national unity based on Chinas long historical tradition and the relative homogeneity of Chinese culture. Both led to great cultural pride. "However, as China experienced repeated humiliation at the hands of western powers in the late 19th century, there arose serious doubts regarding the validity of these traditional attitudes." Major adjustments would have to be made if China were to meet the modern western challenge. Two basic schools of thought arose: (1) Combine the desirable elements of traditional Chinese culture and modern western culture, especially its science and technology. (2) Repudiate all Chinese traditions, particularly Confucian doctrines and practices, "as

incompatible with the growth of science and democracy." This latter "view called for the introduction of new ideas, new principles, and new methods–in short, a new culture." "For a people who had for centuries believed in their superiority, a sudden realization of their backwardness was a painful awakening."

In their contacts with westerners, starting in the 19th century, "Chinese became aware that Europeans and Americans consider themselves superior not only technologically and culturally, but also racially." They treated Chinese as members of an inferior race. For Chinese, such racial discrimination has always been untenable, and with it came a strong desire to expel westerners from China–an idea that the Communists have consistently exploited very effectively. Chinese must "Throw off the imperialist yoke." The United States is the No. 1 enemy (p. 502-06).

Note: HRAF (The Human Relations Area Files) is a nonprofit research corporation affiliated with Yale University [New Haven, Connecticut] and sponsored and supported by its seventeen member universities.

1840. Meyer, Herman Frederic. 1960. Infant foods and feeding practice. Springfield, Illinois: Charles C. Thomas. xxviii + 332 p. Foreword by Philip L. White. Index. 24 cm. [199* ref]

• ***Summary:*** Chapter 5 is titled "Bottle-fed (artificial) infant foods." A photo (p. 82) shows all known available U.S. and Canadian bottle-fed infant foods. These are divided into 3 basic types: 1. Milk-base dilution mixtures. 2. One-formula (ready-modified) mixtures. 3. Preparations with special functions. The soy milk products are all listed under type 3, in the category "Hypo-allergic preparations (liquid or dry). The following are mentioned: Mull-Soy Liquid and Mull-Soy Powder (The Borden Co., Pharmaceutical Div., 350 Madison Ave., New York 17, NY). Sobee (dry) and Sobee Liquid (Mead Johnson & Co., 2404 W. Pennsylvania St., Evansville, Indiana). Soyalac Infant Powder, Soyagen (dry), and Soyalac Infant Concentrate (liquid) (International Nutrition Laboratories, 11503 Pierce Place, Arlington, California; or Box 388, Mt. Vernon, Ohio).

Soyola (made by Wyeth), a soy-based "Therapeutic adjunct and dietary supplement," has been discontinued since 1952. Almond Lac (made by Almond Lac Co.), a hypoallergenic preparation, was discontinued during 1952-59. Address: Assoc. Prof., Dep. of Pediatrics, Northwestern Univ. Medical School, Chicago, Illinois.

1841. Ouei, Mimie. 1960. The art of Chinese cooking. New York, NY: Random House. x + 242 p. Illust. by Jeanyee Wong. Index. 21 cm.

• ***Summary:*** The author was the daughter of a diplomat and she learned how to cook from the family's chief cook (*Ta Shih Fu*) who always traveled with them–and from whom she learned the recipes in this book.

"There were no recorded recipes of the Chinese cuisine until the twentieth century, and even then only in Western countries. In China, cooking was done by feel and taste, and its secrets were passed on from one generation to another" (p. 4).

One chapter titled "Soy beans and bean curd" (p. 171-83) begins: "The story of the soy bean: This miracle bean is a legume..." Tells the legend of how, 2,000 years ago a party of explorers sailing up the Yangtze in a flat-bottomed boat, discovered accidentally how to sprout soybeans, when they found that some beans in a damp bag in the bottom of the boat had sprouted. "The soy bean is so nutritious it is known as the cow of China."

The next brief section, "How to sprout the soy bean," begins: "Mung beans are used to grow bean sprouts." No instructions are given for soy beans! And only "bean sprouts" are called for in the following recipes. Recipes are given for: Roasted soy bean nuts (Ts'an tou). Beef with bean sprouts (Tou ya niu jo). Bean sprouts and celery. Bean sprouts and pork. Soy bean milk (homemade; To fu chiang). Soy bean curd (homemade; Tou fu). Fried bean curd (Cha tou fu). Bean curd cheese (homemade; Fu ju). Stuffed bean curd (Tou fu chen jo, with "3 squares bean curd"). Bean curd with sea bass. Bean curd with flounder. Stewed bean curd. Braised pork with bean curd. Bean curd with braised pork. Bean curd with shrimps. Bean curd with scallions. Bean curd with mushrooms. Bean curd with eggs. Bean curd soup. Mushrooms and bean curd soup. Pork with red bean curd cheese (Nan ju jo, with "2 tablespoons red bean curd cheese in sauce {nan yu}").

Note 1. This is the earliest English-language document seen (April 2013) that contains the term *Cha tou fu,* a type of deep-fried tofu.

Also: Soy paste noodles (Cha chiang mien, with "6 tablespoons vegetable paste (Hoisin), p. 189).

The Glossary (p. 223-30) includes entries for: Beans, black [black beans] (*Hei tou*). Beans, black, fermented [fermented black beans] [fermented black soybeans] (*Tou shih*). Bean, yellow paste [yellow bean paste] (*Tou chiang*). Bean curd (*Tou fu*). Bean curd cheese (*Tou fu ju*). Bean curd cheese in sauce (*Nan ju*). Beans, red [red beans] (*Tou sha; Hung dow;* "For making sweet black bean fillings"). Bean sprouts (*Tou ya; Da dow ngah;* "Specially grown soy bean sprouts, gold in color"). Monosodium glutamate (*Wei ching; Mei ching;* "Brings out food flavors"). Soy jam (*Chu yu;* "A thick sweet and salty soy paste. Residue of soy sauce"). Soy bean skin (*Fu tsu; Foo jook;* "Creamy-colored dried bean curd skin").

Note 2. This is the earliest English-language document seen (Nov. 2011) that uses the term "fermented black beans" to refer to fermented black soybeans.

Note 3. This is the earliest English-language document seen (July 2011) that uses the term "Soy bean skin" to refer to yuba, or to Dried yuba sticks or rolls.

Soy sauce, light (*Chiang yu; pronounced jeung yow;* Used for cooking). Soy sauce, thick [thick soy sauce] (*Chiang yu; pronounced jeung yow;* "Imported and suited for table condiment or for special cooking"). Vegetable paste (*Hai hsien chiang; pronounced hoi sin*). Address: New York City, New York.

1842. Sonnenberg, Lydia. ed. 1960. Everyday nutrition for your family. Los Angeles, California: Seventh-day Adventist Dietetic Assoc. 147 p. Illust. 4 tables on nutritional intake. 22 cm. [43 ref]
• ***Summary:*** Discusses the principles of a vegetarian diet for all age groups. Chapter 3, "The Basic Food Groups," lists five: Fruits, vegetables, bread and cereals, protein foods (including legumes, cottage cheese, eggs, soy cheese [tofu], prepared meat alternates, nuts and nut butters), and the milk group. A "soy cheese sandwich" is listed as "something hearty" in a month's suggestions for pack-it lunches. The chapter titled "Proteins on Parade" discusses soy milk as a good source of protein, "complete proteins," and the supplementary action of proteins (p. 46-47). It has a section titled "Soybeans Important" which praises soy flour and soy cheese [tofu].

Chapter 8, titled "Fats are Concentrated," has a table (p. 53) listing protein-rich foods of animal origin (with mostly saturated fat) and plant origin (mostly unsaturated): Soybeans, soybean milk, and soybean cheese are mentioned; they have 50-70% of their calories from fat. A "Gluten" type entree is low in fat. Chapter 21 is titled "The Vegetarian Diet." Address: Director, Dietary Dep., Loma Linda Sanitarium and Hospital and Assoc. Prof., School of Dietetics, College of Medical Evangelists.

1843. **Product Name:** Delwhip Topping (All-Vegetable Soymilk-Based Non-Dairy Whip Topping–Frozen), and Delwhip Topping Base.
Manufacturer's Name: Delsoy Products, Inc.
Manufacturer's Address: Livonia Dairy, 2001 S. Telegraph Rd. at Harvard, Dearborn, Michigan.
Date of Introduction: 1960?
Ingredients: Incl. soymilk, vegetable oil, sugar.
How Stored: Frozen.
New Product–Documentation: Talk with David and Harvey Whitehouse. 1992. Feb. 4. Most of the sales of Delsoy Topping were to bakers and restaurants–not to consumers. At some point prior to 1961 the name of their frozen product, Delsoy Topping, was changed to Delwhip Topping, and a new product named Delwhip Topping Base was introduced; it was a concentrate to which one had to add water to reconstitute it. The name of Presto Whip remained unchanged.

1844. **Product Name:** Loma Linda Soyagen Infant Powder (Soy-Based Infant Formula).
Manufacturer's Name: Loma Linda Food Co.
Manufacturer's Address: 11503 Pierce Place, Arlington, California. Phone: 714-687-7800 (3/88).
Date of Introduction: 1960?
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable.
New Product–Documentation: H.F. Meyer. 1960. Infant foods and feeding practices. A photo (p. 82) shows this canned product. A photo of a baby's face appears on the front panel. See also p. 88 and 90. Page 121 gives a detailed analysis of the product. The powder, after being reconstituted, contains: Fat 3.2%, protein 2.85%, carbohydrates 5.4%. Calories per ounce: 18. Tablespoons per oz.: 4. Added vitamins and minerals: ferrous sulphate, calcium carbonate, dibasic calcium phosphate. Affected by terminal sterilization: No. How formulated or reconstituted: 1 vol. milk to 7 vols. water. Chemical definition and essential clinical uses: Same as Soyalac Infant Powder but sold in grocery and health food stores. Soyalac Infant Powder and Infant Concentrate only sold in drug stores. Meyer gives the manufacturer as International Nutrition Laboratories, but with two addresses: 11503 Pierce Place, Arlington, California, and Box 388, Mt. Vernon, Ohio.

1845. Mortimer, Edna Z. 1961. Anaphylaxis following ingestion of soybean. *J. of Pediatrics* 58(1):90-92. Jan. [10 ref]
• ***Summary:*** "There are few reported cases of severe reaction following ingestion of soybean, and even fewer reports of shock or anaphylaxis."

"A case is presented of true soybean anaphylaxis in an allergic infant with asthma and eczema. The skin test for soybean was markedly positive, correlating with the clinical findings and with the subsequent prompt improvements, especially of the eczema." The child was a Negro male, age 3 months, who had severe eczema–which appeared 2 months ago. He the initial visit, he was given an soybean formula (Sobee). We must recognize that the soybean is antigenic and a sensitizer; that sensitivity is to be found once its use becomes widespread.

Note: *Webster's Dictionary* defines anaphylaxis (a term first used in 1907) as "1: hypersensitivity (as to foreign proteins or drugs) resulting from sensitization following prior contact with the causative agent." Address: M.D., The Children's Memorial Hospital, 707 W. Fullerton Ave., Chicago 14, Illinois.

1846. Cross, Leslie J. 1961. The Plantmilk Society. *British Vegetarian.* Jan/Feb. p. 37-38.
• ***Summary:*** The Secretary's report for 8 Oct. 1960 states that this meeting marks the 4th anniversary of the Plantmilk Society. The first year [Oct. 1957–Oct. 1958] was spent establishing the organization, collecting information, "and in abortive attempts to arrange for the manufacture in this

country of an American plantmilk." As a result of the failure of these attempts, the Society decided three years ago to try to develop a plantmilk from green leaves. This project is now at least three-fourths of the way toward a successful product at the laboratory level. The research is carried out under the direction of Dr. H.B. Franklin in London. He is now Director of Research and a small pilot plant has been established at his premises. Comfrey leaves are now being tested.

This year the society has established a plantmilk company, which (it is hoped) will eventually make and sell the product. Address: General Secretary.

1847. Cesconetto, Ecilda. 1961. A soja na alimentaçao [Soybeans in the diet]. *Boletim do Campo* (*Rio de Janeiro*) 17(140):15-16. March. [Por]
• ***Summary:*** Discusses the soybean's protein, carbohydrates, minerals, and vitamins. How to consume soybeans: As whole beans, as meat, or soymilk. Describes how to make soymilk. Address: Brazil.

1848. Diser, Gleason M. comp. 1961. Glossary of soybean terms. *Soybean Blue Book.* p. 61-64.
• ***Summary:*** This is the earliest known glossary with this title in the *Soybean Blue Book.* However in the first *Blue Book* (1947, p. 17-19) there was a somewhat similar section titled "Terminology: Definitions and product descriptions for the soybean industry."

The following terms are defined in this glossary: Soybean(s), soybean processor, soybean processing (solvent extraction, mechanical pressing, hydraulic pressing), soybean oil, crude soybean oil, edible crude soybean oil, refined soybean oil, edible refined soybean oil, hydrogenated soybean oil, degummed soybean oil, winterized oil, technical grade refined soybean oil, soybean fatty acids, soybean soapstock, acidulated soybean soapstock, soybean lecithin, break material, sludge.

Soybean products: Ground soybeans, soybean hay meal, soybean flakes, 44% protein soybean oil meal, dehulled soybean flakes, 50% protein solvent extracted soybean oil meal, soybean proteins, soy flour, soy grits, soybean oil meal, defatted soy flour, low-fat soy flour, high-fat soy flour, full-fat soy flour, lecithinated soy flour, protein, isolated protein, toasting. Oriental soy foods: Soy sauce (shoyu), soy milk, miso, frozen tofu, aburaage, kinako, namaage, ganmodoki, tempeh, natto, yuba, moyashi (soybean sprouts). Address: Archer-Daniels-Midland Co., Minneapolis, Minnesota.

1849. Scrimshaw, N.S.; Bressani, R. 1961. Vegetable protein mixtures for human consumption. *Federation Proceedings* (*FASEB*) 20:80-88. Part III (March), Supplement 7. Proceedings of the Fifth International Congress on Nutrition. Held 1-7 Sept. 1960 at Washington, DC. [44 ref]
• ***Summary:*** Contents: Introduction. Basic principles involved. Present scope of efforts to develop vegetable protein mixtures. Vegetable ingredients for protein-rich foods (especially legume seeds and oil seeds). Soy-based protein-rich foods (incl. whole soybeans, soy flour, soybean milk, tempeh). Mixtures using chick pea, cow peas, beans, peanut flour or sesame. INCAP Vegetable Mixtures 8 and 9 (based on corn; neither contains soy). Summary. Address: Inst. of Nutrition of Central America and Panama (INCAP), Guatemala City, Guatemala.

1850. Shurpalekar, S.R.; Chandrasekhara, M.R.; Swaminathan, M.; Subrahmanyan, V. 1961. Chemical composition and nutritive value of soyabean and soyabean products. *Food Science* (*Mysore, India*) 10(3):52-64. March. Published in 1961 as a 32-page book by the Soybean Council of America in Hamburg, Germany. [178 ref]
• ***Summary:*** Contents: Introduction. Chemical composition and nutritive value. Soyabean oil. Carbohydrate in soyabean. Minerals in soyabean. Vitamins in soyabean. Factors affecting nutritive value: Trypsin and growth inhibitors, heat processing, other factors. Digestibility and biological value: Animal experiments, supplementation with sulphur amino acids, human feeding experiments. Supplementary value to other food proteins. Processed foods from soyabean: Soyabean milk, dried milk substitutes from soyabean, malt foods containing soyabean, soyabean flour, multipurpose food (fortified soyaflour), dehydrated soup mixture, balanced food, soyabean protein isolate. Fermented soyabean products: Soy sauce, tofu or soyabean curd, miso, natto, tempeh. Conclusion.

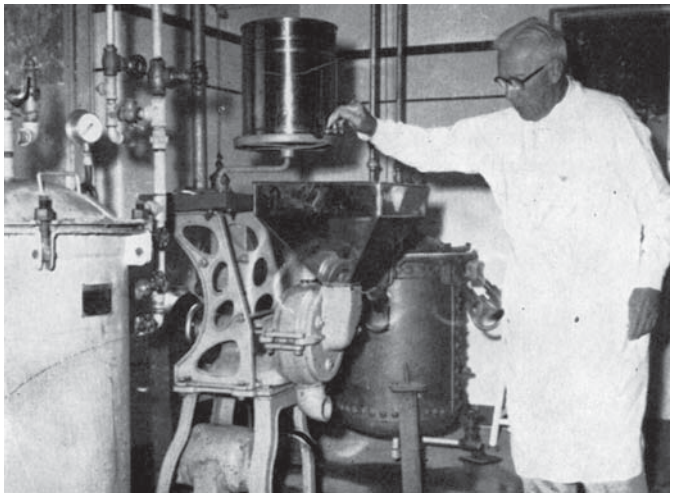
Note 1. This is the earliest document seen (Jan. 2001) from India that mentions tempeh.

Note 2. This is the earliest English-language document seen (Aug. 2003) that contains the term "soyabean protein" (or "soyabean proteins").

Note 3. This is the earliest English-language document seen (Aug. 2003) that contains the term "soyabean protein isolate" (or "soyabean protein isolates"). Address: Central Food Technological Research Inst. (CFTRI), Mysore, India.

1851. *British Vegetarian.* 1961. Soya milk for household use. March/April. p. 93.
• ***Summary:*** Granose Foods will soon be in a position to supply two varieties of spray-dried soya milk, Soyalac and Soyagen, made by one of their associated companies, Loma Linda Food Company in Arlington, California. Soyalac is specially prepared for infants, whereas Soyagen is for general use. A table compares the nutritional composition of the two products in both powdered and reconstituted forms. Reconstituted, Soyalac contains 2.85% protein and 3.39% fat vs. 2.80% and 2.80% for Soyagen. Sold in 16-oz. tins, Soyalac retails for 10 shillings 6 pence, and Granogen for 9 shillings 6 pence.

1852. Fact sheet: Harry Willis Miller, M.D., F.A.C.S. (News



release). 1961. n.p. 1 p. April. [1 ref]

• ***Summary:*** This one-page biographical sketch of Dr. Miller was released with the book *China Doctor,* by Raymond S. Moore, published this month by Harper & Brothers in New York. "Dr. Clarence Hall, *Reader's Digest,* says: 'Towering figure... Dr. Harry W. Miller... in the inspiring tradition of such all-time "greats" as Livingston, Judson and Paton [sic, Patton, General George]... restless creator of new traditions, a modern-day pioneer whose imaginative use of medicine has touched millions with the magic of new hope and health."

Concerning his work with soymilk and nutrition, this sketch states: "Proponent of preventive medicine, public health and nutrition as greatest challenge to America from world's needy (Consultant to United Nations). Out of this grew his research and development of fiber-free, potable soybean milk which is saving countless lives of infants and adults around the world (In Hong Kong more Miller soymilk sold than soda pop). Gives all royalties and fees back to research and building of hospitals (over $2,500,000). U.N. establishing overseas soymilk plants with Miller's counsel in areas where there are few cows (Indonesia, etc.). Recipient of gold medals for research."

Note: The soymilk made in Hong Kong that sold better than soda pop was not made by Harry Miller; he never made commercial soymilk in Hong Kong. Rather, it was Vitasoy, made by K.S. Lo of Hong Kong Soya Bean Products Co. Ltd.–with little or no influence from Dr. Miller.

1853. Moore, Raymond S. 1961. China Doctor: The life story of Harry Willis Miller. New York, NY: Harper & Brothers. xiv + 215 p. Illust. (8 pages of photos). Index. 21 cm. 2nd edition, 1969. Pacific Press, Mountain View, California.

• ***Summary:*** A key but sometimes inaccurate source of biographical information. Contains many excellent photos of Dr. Miller, including an especially good portrait on the inside rear cover.

Contents: Foreword by Hollington K. Tong. Preface. Map: The Far East. The opium cure. Hallway to service. The medical buff. Young surgeon at work. Slow boat to China. From mufti to mao tze and queue. The penniless VIP. Strange horizons. Pigtail honeymoon. Wife hunt. Picture section. Some close calls. A key decision. Operating on the Siamese elephant. Conquering new fields. Return to the Orient. No recipes in China. High finance. Facing the medical boards. A doctor's choice. Travel by presumption. To bow or not to bow. Kidnapping the generalissimo. "Mayor" Miller. An ounce of prevention. Shanghai again. China's greatest honor. Benghazi brink.

The rear cover of the book describes it as follows: "What happens when a man gives himself and his talents to the service of God? Here are a few of the things that Dr. Harry Willis Miller has done and is still doing! At 23 gave up a promising medical career and quarter-million dollar inheritance in America. Went to China as a medical missionary and lived among the poor and sick. Immediately began building the first of 15 hospitals throughout China. With inventive genius performed daring operations and made new discoveries in preventive medicine. Was responsible for many cures of the dread opium 'sickness,' including the cure of the famed 'Young Marshal' Chang. Became perhaps the most widely practiced surgeon in the world. Invented and developed soybean milk, which is responsible today for saving thousands of lives in undernourished areas of the world. Had many dramatic encounters with bandits, wars, famines. Was so well-known and respected that during World War II the Japanese invaders permitted Dr. Miller to give sanctuary to Chinese soldiers in the hospital compound. Returned to the U.S. for a time. Was consulting physician to 3 U.S. presidents and personal physician to national figures, senators, ambassadors, etc. Was awarded the coveted Blue Star of China by Generalissimo Chiang Kai-shek. At 81 is still healing and caring for the people of the Far East."

An ad for the book in *Soybean Digest* (Nov. 1935, p. 35) begins: "The incredible biography of the 'Schweitzer' of the Orient."

Pages 180-89 describe Dr. Miller's work with soy milk, Soyalac and Soyagen, and other soy foods. In the Shanghai Sanitarium kitchen he learned how to improve the flavor and digestibility of soy milk by running steam directly into the milk. From the Philippine Refining Co., which transformed bad-smelling copra into good-smelling coconut oil, he learned that steam distillation was the key to the transformation. From a Filipino company that refined stale and rancid butter into a product that tasted as fresh as new, he learned the secret of flash pasteurization–which effectively killed bacteria. Back in China, Dr. Miller, with his older son, Harry Willis Miller, Jr., worked to apply these new discoveries to soy milk. They worked! He expanded his experiments with infants and children, and in 1936 his results were published in the *Chinese Medical Journal.*

Photos (p. 81-89, unnumbered) show: (1) An excellent full-page portrait of Dr. Miller at age 81. (2) Harry and Maude Miller in China, wearing the Chinese dress they adopted after their arrival in 1903. Maude's tragic death two years later–caused by sprue, a vitamin deficiency disease–gave added personal meaning to Dr. Miller's nutritional research. (3) A group portrait showing a meeting of Adventist Missionaries at Shanghai, China, in 1907.

(4) Harry and Marie Iverson Miller at the time of their marriage in 1908. A trained nurse, she served with him through 42 years of missionary activity, and helped rear their 4 children. (5) Shanghai Sanitarium, opened 1 Jan. 1928, the first of 15 hospitals to be established in China under the leadership of Dr. Miller, who also founded numerous smaller clinics. (6) Members of the Shanghai Sanitarium staff in the mid-1930s, standing in front of a one-engine plane, as they see him off for a visit to outlying places.

(7) Dr. Miller and Marshall Chang Hsüeh-liang at Hankow airport in 1935, two years after Dr. Miller had cured the young Marshall's opium addiction. (8) Dr. Miller carried out more than 18,000 operations. Here he performs a thyroidectomy at one of his frequent visits to hospitals in Manila, Philippines. (9) Wuhan Sanitarium and Hospital at Wuchang, one of the medical units established through the generosity of the Young Marshal. Twenty thousand refugees moved into the Sanitarium compound when Hankow capitulated to the Japanese in 1938.

(10) The ruins of the Wuchang city dispensary, destroyed by Japanese bombs in 1938. (11) Dr. Miller examines a soybean plant grown on his farm at Mt. Vernon, Ohio. (12) Dr. Miller demonstrates his small-scale soymilk processing machine, which can be operated by one person. "The goal of Japan's Ministry of Health is to install one of these in each of the thirty thousand village tofu (soy cheese) factories in Japan."

(13) A baby and nurse with a large can of Soyalac in Japan. (14) A soymilk booth in Hong Kong, where more soymilk is sold than any kind of soft drink. The bottles in wooden cases are stacked four high. (15) A baby, little Mohammed Ali, a Bedouin child suffering from malnutrition bordering on starvation, at the Benghazi, Libya, hospital. In 1956 Dr. Miller nursed him back to health. He soon grew strong and healthy and began to take a lively interest in the world around him.

(16) "Generalissimo Chiang Kai-shek greets Mrs. Mary Greer Miller while Madame Chiang congratulates Dr. Miller following the ceremonies held March 26, 1956, in which Miller received the Blue Star of China, that country's highest award, similar to the Congressional Medal of Honor in the United States." Address: Vice President, College of Medical Evangelists, Loma Linda, California.

1854. Smith, Allan K.; Wolf, Walter J. 1961. Food uses and properties of soybean protein. I. Food uses. *Food Technology* 15(5):4-6, 8, 10. May. [34 ref]

• ***Summary:*** Contents: Summary. Introduction. Commercial soybean protein fractions. Soybean foods: Soybean varieties (garden varieties vs. field varieties, main differences between them, U.S. soybean breeding program). Trends in protein requirements (worldwide protein shortage). Soybeans and fractions used in food: Whole soybeans, defatted soybean meal, isolated proteins, protein concentrate (called "protein concentrate 70" in the summary), Gelsoy.

Whole soybeans may be baked or boiled, or used to make sprouts, fresh or dried tofu, vegetable milk (or "soybean milk"), yuba, and many fermented food products, including "miso or soy paste, natto, hamanatto, shoyu (soy sauce), tempeh, and some less important foods."

"Protein concentrate: Extraction of dehulled and defatted meal with dilute acid (pH 4.5) removes soluble sugars, nonprotein nitrogen, and other low-molecular weight components and a small amount of protein. The flavors are also mostly removed in the extract or in drying. The dried concentrate contains about 70% protein unless soybeans containing above-average protein are used.

"This product, having a manufacturing cost between that of soy flour and isolated protein, has been introduced recently into the food industry. This protein concentrate is a combination of the acid-precipitated protein plus the residue normally obtained in isolating the acid-precipitated protein... A protein concentrate can also be made by extraction of SOM [soybean oil meal] with about 70% ethanol at 50ºC or higher. This type of product is finding its place in the food industry."

Note: This is the earliest English-language document seen (Dec. 2005) that uses the term "protein concentrate 70" or the term "protein concentrate" to refer to a product containing 70% protein on a dry-weight basis. Address: NRRL, Peoria, Illinois.

1855. *Soybean Digest.* 1961. UNICEF grant steps up research on soy products. May. p. 29. [1 ref]

• ***Summary:*** "Research work on soybean food products is now being accelerated under a grant-in-aid from UNICEF [United Nations International Children's Emergency Fund] by the department of food science and technology at Cornell University...

"The work is being concentrated along two principal lines. The department is conducting pilot-plant experiments on the production of soybean milk with the hope of improving its yield and nutritive value. And the second line of work is the production of tempeh, also on a pilot-plant scale, in order to develop a suitable semi-commercial process."

1856. **Product Name:** Syn-klym ("Synthetic Milk" based on Soy Protein).
Manufacturer's Name: General Mills, Inc., Specialty

Products Div.
Manufacturer's Address: 9200 Wayzata Blvd., Minneapolis 26, Minnesota.
Date of Introduction: 1961. June.
New Product–Documentation: Ad (full page) in *Soybean Digest.* 1961. June. p. 23. "5 General Mills soy products help meet world protein needs." "Syn-klym: This 'synthetic milk' product, based on soy protein is available in both whole fat and non-fat forms. Syn-klym can be substituted in a wide variety of cooked food products for non-fat milk or whole milk; or used directly as a beverage."

1857. General Mills, Specialty Products Div. 1961. 5 General Mills soy products help meet world protein needs (Ad). *Soybean Digest.* June. p. 23.
• ***Summary:*** The five products are MPF (Multi-Purpose Food. "the vital backbone of a low-cost meal"), TSP-200 (micro-milled toasted soy protein), LSP-15 (a blend of TSP-200 and General Mills fluid natural lecithin), Genpro 200 (untoasted soy protein), and Syn-Klym (a "synthetic milk" product, based on soy protein, available in both whole fat and non-fat forms). Address: 9200 Wayzata Blvd., Minneapolis 26, Minnesota.

1858. Shurpalekar, S.R.; Chandrasekhara, M.R.; Lahiry, N.L.; Swaminathan, M.; Indiramma, K.; Subrahmanyan, V. 1961. Studies on milk substitutes of vegetable origin. III. The nutritive value of spray-dried soyabean milk fortified with DL-methionine and spray-dried powder from a 2:1 blend of soyabean milk and sesame milk. *Annals of Biochemistry and Experimental Medicine* (*Calcutta*) 21(6):143-50. June. [9 ref]
• ***Summary:*** Nutritive value of soybean and sesame milks. Address: Central Food Technological Research Inst. (CFTRI), Mysore, India.

1859. *Soybean Digest.* 1961. Aim is better, cheaper foods: Soybean Council of America–Italy. June. p. 35-36.
• ***Summary:*** The Soybean Council of America opened its quarters in Rome in Feb. 1958 with a staff of two. "While Italian imports of soybeans from the United States amounted to less than 1,000 metric tons in 1957, they reached the 100,000-metric-ton mark in 1960... Now two major Italian manufacturers have arrangements under way to produce soy milk in Italy... The Italian equivalent of Metrecal, called Melbamin which contains soy flour, is currently being produced and sold in Italy with success unforeseen even by its producers...

"The Italian office of the Soybean Council of America has printed and distributed three major publications: 'The Soybean Story'; 'Italy's Margarine Industry'; 'Italy's Mixed Feed Industry'. These are aimed at reaching the U.S. producer interests in developing a market for his products in Italy."

A photo shows boxes of Nabisco Triangolini (Triangle Thins; triangular crackers) in an Italian retail food store. The caption reads: "Italian stores offer foods containing soy flour."

1860. Watanabe, Tokuji. 1961. Intermediate report [on the progress of studies on "the manufacture of tofu from U.S. soybeans"]. Food Research Institute, Japan. 56 p. June. Typed, without signature (carbon copy). [2 ref]
• ***Summary:*** Stamped at the top right corner: "Japanese American Soybean Institute." Typed on the line below that: "R-578. July 4, 1961." Written in ink to the right of that: "Under Contract (1960–4)." A cover letter dated 3 Aug. 1961 from George Strayer to A.K. Smith explains that this is a copy of Mr. Hayashi's R-578, which is an intermediate report on the work being done on tofu by Mr. Tokuji Watanabe of the Food Research Institute, Japan. Contents: On gelation and coagulation of soy milk (incl. 11 graphs and photos). Defatted soybeans as a raw material for tofu (incl. 3 tables and 3 graphs). Studies on the manufacture of soy milk (No. 1) (incl. 15 tables). Spray-drying of soy milk (incl. 8 tables). Address: Japan.

1861. Nicholls, Lucius. 1961. Tropical nutrition and dietetics. 4th ed. Revised by H.M. Sinclair and D.B. Jelliffe. London: Baillière, Tindall and Cox. xii + 457 p. July. Illust. Index. 24 cm. [100+* ref]
• ***Summary:*** Preface to the fourth edition: Nutritional science has advanced at an accelerating rate since the last edition. The section on protein malnutrition in infants has had to be rewritten; it is "now the most immediately practical problem of tropical countries." "The advance of nutritional science emphasizes the urgent need to carry it into the field through public health measures and especially health education."

"Now problems of even greater magnitude are created by the growth of population. The world's population of 2,800 million [2.8 billion] is expanding at a rate that will double by the end of the century... The problem if an increasing population in a world where already two-thirds of the population is underfed is the greatest challenge facing mankind today" (Oxford, Jan. 1961).

Contents of Chapter II, "Proteins:" Introduction. Chemical nature of the proteins (hydrolysis of starches and proteins compared, classification of the amino-acids). Building the proteins. The proportion of amino-acids present in various proteins. Nutritive value of proteins: Complete proteins (including glicinin [sic, glycinin] of soya bean), partially incomplete, incomplete proteins (zein of maize and gelatin). Theoretical protein requirements for maintenance and growth (Biological value, Net utilization). Limiting amino-acids giving a relative chemical score. Supplementing. Theoretical protein requirement during pregnancy and lactation. The effect of cooking on proteins. Specific dynamic action of proteins. The amount of protein in diets (high, low, vegetarian, true vegetarianism [avoids all

foods of animal origin], lacto-vegetarians).

The contents of the section on "Pulses" (p. 227-43) is very similar to that in the 1951 edition:

A table from FAO (p. 260) shows that six oilseeds supply almost all of the world's vegetable oil: Soya bean 37.0%. Cottonseed 22.3%. Groundnut 20.2%. Rapeseed 9.8%. Sesame 2.7%. Sunflower 2.5%. The next section (p. 260-64) is "Palm nuts and oils."

Table 53 (p. 396-97) gives the botanical name and composition of cereals and bread. Table 54 (p. 398-99) gives the botanical name and composition of pulses, incl. soya bean, soya bean curd [tofu], soya bean milk, carob bean, Goa bean, tepary bean

Note: The title C.M.G. (Companion of St. Michael and St. George) is an honor conferred upon those for distinguished service in the British colonies or commonwealth. Address: C.M.G., B.A. (Cantab.), M.D., B.C. Late Director of Bacteriological and Pasteur Institutes, and Director of Div. of Nutrition, Ceylon; Lecturer in Nutrition, Ceylon Univ.; Late Lecturer on Tropical Medicine, Ceylon Medical College; Nutrition Adviser to Commissioner General, South East Asia.

1862. Ripp, John A. 1961. Soybean-induced goiter. *American J. of Diseases of Children* 102(1):106-09. July. [10 ref]
• ***Summary:*** "The goitrogenic effect of soybean diets in animals has been recognized for some 25 years" (McCarrison 1933). The fact that these effects can be modified by heat, etc., suggests that "a specific goitrogenic substance" is present in soybeans.

The author reports a case of human goiter caused apparently by Mull-Soy brand soybean milk. The white male infant had no history of thyroid disease in the family and his residence is not considered to be in a goiter area... He was first seen by Dr. Ripp at age 3½ months because of widespread, moderately severe eczema and constant spitting. The infant had been breast fed, then at age 1 month, placed on a modified cow's milk formula. His general condition was good, and he was placed on a limited diet plus Mull-Soy infant formula. There was an obvious enlargement of the thyroid gland, without clear decrease in the metabolic rate. Removal of the Mull-Soy from the diet after 15 months led to some decrease in the size of the gland but had no clear effect on the metabolic rate of the subject. Address: M.D., Pediatric Div., Community Hospital, Glen Cove, New York.

1863. Smith, Allan K. 1961. Oriental methods of using soybeans as food. With special attention to fermented products and notes on Oriental farming practices. *USDA Agricultural Research Service.* ARS-71-17. 65 p. July. Illust. 27 cm.
• ***Summary:*** Contents: Part I: China. Introduction. Farming conditions in China. Oilseed production. Soy sauce in China. Sweet flour paste–Tien mien chang [chiang]. Soybean or vegetable milk (incl. Willis Miller and the Henningsen Produce Co. in Shanghai). Yuba. Soybean curd or tofu. Soybean cheese [fermented tofu]: Chee-fan ("cheese" + "small cube"), tsüe-fan ("drunken cheese"), hon-fan ("red cheese"). Fen-T'iao from mung beans. Fermented soybeans [fermented black soybeans]. Vinegar fermentation process.

Note: This is the earliest document seen (Oct. 2011) that uses the term "tsüe-fan" ("drunken cheese") to refer to a type fermented tofu.

Part II. China–Chinese Institutions. Henry Lester Institute (in Shanghai; Dr. Bernard Read). Academia Sinica (headquarters in Nanking). China Vegetable Oil Corporation (CVOC, Shanghai). The China Oils and Fat Industries Ltd. (Shanghai). National Bureau of Industrial Research. Catholic University (Fu Jen, at Peiping). Yen Ching University (Peiping). Agriculture Experiment Station (Peiping).

Part III: Japan. Introduction. Production of miso in Japan. Soy sauce in Japan. Trends in soy sauce production. Part IV: With Raymond E. Culbertson. Korea. Introduction. Breeding work. Soybean varieties. Climatic relations. Soils of Korea. Topography. Land use. Cultural practices. Marketing. Soybeans as foodstuff. Soy sauce. Acknowledgment.

Page 19 states: "The China National Government has taken an active interest in soybean milk for use by its army. Mr. Willis Miller, with offices and business connections with the Henningsen Produce Company in the Dollar Building (7th Floor) at 51 Canton Road, Shanghai, had just completed, at the time of my visit, the building of a soybean milk plant for the Chinese Government. The process is patterned after that of the International Nutritional Laboratories at Mt. Vernon, Ohio, for making a powdered or spray-dried milk. Mr. Miller also was supervising the installation of a vegetable canning plant for the same purpose."

The text of this bulletin was previously published, serially, with slight revisions, in *Soybean Digest,* from Feb. to June 1949. Address: Northern Utilization Research and Development Div., Peoria, Illinois.

1864. Hayward, J.W.; Diser, G.M. 1961. Soy protein as soy flour and grits for improving dietary standards in many parts of the world. *Soybean Digest.* Aug. p. 14-18, 20, 22-23. [5 ref]
Address: Archer Daniels Midland (ADM).

1865. *Today's Food* (*Loma Linda Foods, Arlington, California*). 1961. [Commercial food products made by Loma Linda Foods]. 6(2):5-6, 8. Summer.
• ***Summary:*** Loma Linda food products include: Smokene. Savorex. Vegeburger. Nuteena.

Also mentioned as generic names are: Soy mayonnaise, and soy milk. Address: 11503 Pierce Place, Arlington, California.

1866. Clark, Linda A. 1961. Stay young longer: How to add years of enjoyment to your life. New York, NY: Devin-Adair Co. [xvi] + 364 p. Oct. Foreword by Adelle Davis. Preface by Beatrice Trum Hunter. 21 cm. [588* ref]

• ***Summary:*** This book is well researched and carefully documented. The author includes Clive M. McCay in her acknowledgments. Contents: Part I: How can you stay young? 2. How can correct nutrition help? 3. What makes you age? 4. How long will it take to slow down rapid aging? 5. What's wrong with us? 6. What's happened to our bread and cereal. 7. Is sugar harmful? 8. Are poisons making you old? 9. Is it safe to eat? 10. What else ages us? 11. How can you eat safely in a poisoned world? 12. What about vitamins? 13. What about minerals and enzymes? 14. What about fats and oils. 15. "Wonder" foods. 16. Are you a mirror of what you eat? 17. The great debate? 18. How can you eat for health and youth? a summary.

Part II: 19. How can exercise help? 20. Is there hope for sagging faces and figures? 21. How can you stay slim? 22. Are you proud of your skin, nails, and hair? 23. What about menopause, prostates, and male impotency? 24. How can you relieve stress?

Part III: 25. The art of loving. 26. The power of prayer. 27. The will to live.

Page 10: Most dog food is more nutritious than human food. A typical dog food contains soybean grits.

Page 12: The human body is replaced every year. Dr. Paul G. Aebersold of the Atomic Energy Commission, who has used radioactive tracers to study the body, states: "In a single year 98% of the old atoms will be replaced by new atoms which we take into our bodies from the air we breathe, the food we eat, and the water we drink."

Page 67: Home-sprouted soy beans are free from pesticide contaminants.

Page 139: Unsaturated fats are found in vegetable oils, including soybean oil.

Page 145-46. What raises our cholesterol level? One food that does is butter. When one-seventh of the ½ ounce of butter served at each meal was replaced by soy sterol (probably lecithin), the average cholesterol level of subjects dropped 11%.

Page 148: Tests by Dr. Lester Morrison (1958) found that "soy lecithin granules succeeded in lowering cholesterol and reversing atherosclerosis in thousands of his patients."

In the chapter on "Wonder foods" we read (p. 170): "Soy beans and products made from soy beans such as soy flakes, soy grits and soy flour, are rich in the only complete vegetable protein." In the same chapter, Dr. Clive M. McCay notes (p. 177) that many people "use soy milks. These soy milks are now very attractive to taste, They are also being sold in various modifications such as malted milk. With the growing interest in the consumption of unsaturated fatty acids which are rich in these soy milks, the future may see a real challenge to the dairy industry."

A long section titled "Meat-eating vs. vegetarianism" (p. 182-88) attempts to look at both sides of the issue from a nutritional viewpoint only. In "The case for the vegetarian" we read (p. 184): "A few nuts are complete protein. The soybean, a legume, is the only complete protein vegetable. In all other cases, some of the amino acids are missing. Because of the nature of the soybean, it is being recognized more and more, by vegetarians and others, for its high nutritional value. Other complete proteins include brewer's yeast, cottonseed, and cereal germs such as wheat germ."

Page 218-20: Beverages–Milk is also a problem since it may contain radioactive strontium 90, iodine 131, penicillin, wax, pesticides, etc. "Many nutritionists prefer raw certified milk." To offset the cost of raw milk, "powdered skim milk" can be used for cooking. Yogurt or kefir can be made from either kind of milk. "As a milk substitute, soy-bean milk (Lager 1955; Chen 1956), an oriental staple, has been suggested."

The section on healthy skin (p. 262) states: "Cold pressed soy oil, because it contains so many elements found to occur naturally in skin tissue, is excellent." Address: M.A.

1867. Spilsbury, Calvin A. 1961. Japan's oilseed and fats and oils industry. *USDA Foreign Agricultural Service.* FAS M-120. iv + 52 p. Oct. Illust. 28 cm. [9 ref]

• ***Summary:*** Contents: Introduction. Summary. The fats and oils industry: Total supply of fats and oils, edible fats and oils industries (oilseed crushing and refining industry, rice bran processing, margarine and shortening, oilseed food industries), industrial fats and oils (the soap industry, paint and protective coating industry). Domestic production of oilseeds and oil-bearing materials: Soybeans (farm income and management, research), rapeseed, other oilseeds, rice bran, marine oils, including whale, animal fats. Foreign trade: Soybeans, other oilseeds, marine oils, animal fats, oilcake and meal, trade controls. Demand and price: Price supports. Consumption. Marketing and market development: Marketing vegetable oils, marketing oilseeds (storage, inspection, soybeans, rapeseed), market development. Bibliography. No names of Asian crushers are given.

Japan's margarine and shortening production in 1960 was 88,600 metric tons, nearly 4½ times that of 1950... Margarine production in 1960 was 43,000 tons. Shortening production was only 41,600 tons in 1960. The margarine and shortening industry in Japan consists of 26 manufacturers, but a large percent of plant capacity is found in only a few plants: 4 plants have one-third of the industry capacity, which is around 400 metric tons per 8-hour day... 67% of the oils used to make margarine and shortening in Japan are animal and marine oils, with whale oil being the most widely used (26% of the total) followed by tallow and lard (21%), then fish oil (20.0%). Palm oils comprise 19.0% of the total and vegetable oils 14.0%.

Concerning oilseed food industries (p. 17-20), in 1960

some 532,218 tonnes (metric tons) of soybeans were used directly as foods or manufactured into foods in Japan. Substantial amounts of peanuts and sesame seeds were also so used. "The Japanese American Soybean Institute in Tokyo is actively promoting U.S. soybeans for food uses and has promoted soybeans as the meat of the field because of the excellence of their amino acids."

Note: This is the earliest document seen (Jan. 2005) containing the phrase "the meat of the field." Notice that it refers to soybeans and was apparently coined by an American organization in Japan.

"More soybeans are used directly for food than are grown in Japan, and the cake and meal from an additional 420,000 tons of soybeans are now used each year. The main soybean foods are: Miso, shoyu, tofu, aburaage (fried tofu), frozen tofu, natto, kinako, monosodium glutamate (extract of fermented soybeans and rice used as a seasoning compound; a low-grade shoyu is a by-product), tonyu (soybean milk, cooked water-extract of soybeans, not widely produced in Japan at the present time).

Miso: There are about 3,200 to 3,800 miso plants in Japan, and a large amount of home-made miso is also produced. "About 117,600 tons of soybeans and 52,300 tons of defatted soybean meal (expeller cake is thought to be the best) are required by this industry. Miso consumption is estimated at 28.9 grams per capita per day." Domestic Japanese soybeans, such as white hilum soybeans from Aomori are preferred to U.S. beans, which cook unevenly because of their hard seed coats.

Shoyu: There are about 5,000 producers; some have very large plants but many are small. Per capita consumption is about 3 gallons per year. This requires about 18,500 tonnes of soybeans and 155,000 tonnes of defatted soybean meal per year. A small amount of soybean oil (about 1,000 tonnes/year) is skimmed off the top of shoyu and used for a cutting oil. The cake that remains after pressing out the shoyu contains 4% salt, but it is an ideal hog feed as well as a fertilizer. Around 80,000 to 100,000 tonnes a year are produced. A taru (4½ gallons) of shoyu wholesales for about $3.60. A large volume of soy sauce is now being exported to the USA.

Tofu: There are around 50,000 small tofu plants in Japan. Their demand for soybeans is large and increasing. In 1960 production of tofu and aburaage required 254,800 tonnes of soybeans and 20,000 tonnes of defatted soybean meal. More soybeans and meal are used to make tofu than any other food in Japan, followed by shoyu, then miso. About three-fifths of the soybeans used are imported. In 1960 production of frozen tofu required 27,100 tonnes of soybeans.

In 1960 about 22,800 tonnes of soybeans were required to make natto, 6,200 tonnes to make kinako, 64,800 tones of defatted soybean meal were required to make monosodium glutamate, and 10,000 tonnes of soybeans plus 30,000 tonnes of defatted meal were required to make other soybean food products [such as whole soybeans, soybean milk, etc.]. Address: USDA Fats and Oils Div.

1868. Strother, Robert S. 1961. Henry Ford and his magic beanstalk. *Quest.* Autumn-Winter. p. 23-27. Condensed in *Reader's Digest.* Nov. 1961, p. 188-92.

• ***Summary:*** A colorful overview of Henry Ford's work with soybeans and soyfoods. "One day back in the 1930's, I was summoned, along with half a dozen other Detroit newsmen, to a special luncheon in Dearborn, Michigan. Our host was the first Henry Ford, then at one of the several pinnacles of his fabulous career. The luncheon, and the conversation that went with it in the pine-panelled dining room in the Ford Engineering Laboratory, consisted entirely of soybeans. The peppery old motor magnate, then a vigorous 71, held no convictions lightly, and soybeans were his current enthusiasm. From the moment he strode in and took his seat at the head of the long oval table we talked of nothing else...

"At the luncheon that day Ford saw to it that everyone gave the food a fair trial. His sharp blue eyes were on us as we politely worked our way through 16 soybean foods, starting with salted soybeans and ending with soybean ice cream and soybean cookies. There were buttered green soybeans, pineapple ring with soybean dressing, soybean butter, and apple pie with crust of soybean. For drinks the choice was soybean milk, cocoa made with soybean milk, or soybean coffee. The bread, made of soybean flour would keep fresh nine days, the magnate said, and he urged us to slip a slice in our pockets to prove the point.

"Though the Ford executives seemed to enjoy the luncheon, nothing we newsmen ate that day led us to foresee that soybeans were destined a few years later to become an ingredient in many popular food products, some of them delicious. We accepted as reasonable the possibility that the bean might become a leading cattle feed or industrial material, and we all felt Ford's chef had outdone himself in versatility for this occasion." Note: This document contains the earliest date seen for Henry Ford's work with soy ice cream (between July 1934 and July 1935, since Ford was born on 30 July 1863 and was age 71 at the time of this meal).

"After lunch, Mr. Ford led us through his vast, high-ceilinged laboratory. He walked steadily, putting his feet straight ahead as an Indian does. He wore old-fashioned shoes made for him by a cobbler he maintained in an antique shop in Greenfield Village. He was about average height, only slightly stooped, and as thin as Mahatma Gandhi. He could chin himself five times without drawing a deep breath, and as most of us knew, from previous visits, he liked to challenge reporters to a 50-yard race, especially if they were fat...

"The automobile king, who often fired predictions from the hip, had scored some wide misses in his role of

free-ranging prophet. But this one [concerning the future of soybeans] proved to be a spectacular hit... By 1959, soybeans had climbed to fifth place among all American crops...

"The Old Man's last connection with soybeans contains an ironic reverse twist. It came when he gave a barely perceptible nod that set bulldozers to work ploughing up a nourishing soybean crop. The time was April, 1941, and the place was Willow Run. Eleven months later the world's largest airplane factory stood on the soybean field and in it production rose to a war-time peak of one complete bomber an hour.

"The history books credit Ford with pioneering industrial mass production techniques. His role in promoting factory uses for farm products rates only a footnote. Yet it, too, brought changes felt everywhere today. And of all his great achievements this may well have pleased him most–his contribution to the proof that, indeed, there was industrial magic in a beanstalk."

1869. Tung, Ta-Cheng; Huang, P-C.; Li, H-C.; Chen, H-L. 1961. [Composition of foods used in Taiwan]. *J. of the Formosan Medical Association* 60(11):973-1005. Nov. 28. [27 ref. Chi; eng]

• ***Summary:*** Gives the nutritional composition (food calories, moisture, protein, fat, carbohydrate, fiber, ash, calcium, phosphorus, iron, vitamin A, thiamine, riboflavin, niacin, and ascorbic acid) of 384 foods commonly used in Taiwan. In the section on "Legumes, seeds, and nuts," the following soy products are included: Black bean (hei tou, black soybean; 37.1% protein, 15.2% fat), miso; soy bean (huang tou); soy bean curd (toufu); soy bean curd cake [pressed tofu] (toufu kan); soy bean curd cake, spiced (wu-hsiang toufu kan); soy bean curd cake, strip; soy bean curd, clot (toupi, yuba); soy bean curd, fermented (fermented tofu); soy bean curd, fried (yu toufu); soy bean curd, pickled (furu, hu-zu); soy bean, fermented (tou chi [fermented black soybeans]); soy bean milk (tou nai), soy bean extracted residue (okara). Address: 1-3. Dep. of Biochemistry, College of Medicine, National Taiwan Univ., Taipei, Taiwan, China; 4. Taiwan Provincial Hygienic Lab.

1870. Block, Richard J.; Mandl, R.H.; Howard, H.W.; Bauer, C.D.; Anderson, D.W. 1961. The curative action of iodine on soybean goiter and the changes in the distribution of iodoamino acids in the serum and in thyroid gland digests. *Archives of Biochemistry and Biophysics* 93(1):15-24. Nov. [29 ref]

• ***Summary:*** Rats were fed rations deficient in iodine (0.7-2.3 micrograms of iron per 100 grams of diet) based on raw soybeans, solvent-extracted soy flour, isolated soy proteins, or soybean infant formulas–with or without added iodine. "Significant enlargement of the thyroid gland occurred on the iodine-deficient rations in 1 or 2 weeks. The addition of 160 micrograms of iodine as KI [potassium iodide]/100 gm to the diet caused the hypertrophied gland to return to normal size in 2-3 weeks.

"Although the lack of iodine is the principal cause of soybean goiter, raw soybeans, which contain more iodine than either solvent-extracted soy flour or glycinin, produced greater thyroid hypertrophy. This observation suggests that raw soybeans have a goitrogenic activity (goitrogen?) which is removed or destroyed during processing." Address: 1-2. Boyce Thompson Inst. for Plant Research, Inc. Yonkers, New York; 3-5. Borden Special Products Co., New York, NY.

1871. *Soybean Digest.* 1961. A.K. Smith of Peoria Lab on trip to Asia. Nov. p. 7.

• ***Summary:*** Dr. A.K. Smith, head of meal products investigations, oilseed crops laboratory, Northern Regional Research Laboratory (Peoria, Illinois), left Oct. 15 on a 2½ month trip to India, Japan, and Indonesia. "Dr. Smith will survey research laboratories in the countries to determine those that are qualified to do food research and development on soybeans, soybean products, and related agricultural products under the P.L. 480 program." In Japan, he will visit trade associations to encourage the use of U.S. soybeans in Japanese foods.

Research is needed in six areas: Use of soy flour to supplement bread and cereal products. Manufacture of soybean protein. Use of tempeh. Production and nutritional value of soy milk. Production of low-salt miso for feeding babies. Comparison of U.S. soybean varieties in commercial production of tofu. A portrait photo shows Smith.

1872. *Soybean Digest.* 1961. 4-H club girl wins with Japanese meal. Nov. p. 18.

• ***Summary:*** Joan Ruths, a 17-year-old 4-H club girl from Waterville, Minnesota, won a blue ribbon at the Minnesota State Fair for her demonstration titled "Entree Tofu Steak." She prepared and served a complete Japanese meal. Among the many dishes on her menu made from soybeans were tofu, miso soup, aburaage [deep-fried tofu], and soy milk. Joan closed her presentation by saying: "Soybeans for our nation's economy, food for millions, and peace for the world."

1873. *Soybean Digest.* 1961. Build new soy milk factory at Hong Kong. Dec. p. 18. [14 ref]

• ***Summary:*** "A new soy milk factory is being built at Kowloon (Hong Kong) which is twice the size of the factory in Aberdeen, according to K.S. Lo, managing director of the Hong Kong Soya Bean Products Co., Ltd. Mr. Lo says he hopes to have the new plant in production by next March. Increase in sales of Vitasoy has been terrific, over 53% a year, with highest production 18,000 cases per day, according to Mr. Lo. 'When our Kowloon factory is in operation we hope to be able to meet all the demand on both sides of the harbor.'"

1874. **Product Name:** Velactin (Soy-Based Non-Dairy Infant Formula).
Manufacturer's Name: A. Wander Ltd. By 1967 made for Wander Pharmaceuticals by Promo Ltd. of Abergavenny, England.
Manufacturer's Address: England.
Date of Introduction: 1961.
Nutrition: Protein 21%, fat 18%, available carbohydrate 52%, ash 3%, moisture 5%.
New Product–Documentation: *The Vegan* magazine. 1961. Spring. "Wanderlac is soon to be changed to Velactin."

The British Vegetarian. 1963. March/April. p. 73. "New sources of protein in a hungry world." Velactin (A. Wander Ltd.) has already proved its worth in various clinical trials in America, Germany, and the UK.

The British Vegetarian. 1963. March/April. p. 89. "Stop press news." "The directors of A. Wander Ltd. have just generously offered to supply free of charge to the Vegetarian Nutritional Research Centre sufficient Velactin for a comprehensive study of the effect of using this vegetable milk as a sole dietary source of vitamin B-12 for vegans with B-12 deficiency."

Isabel James. 1964. *The British Vegetarian.* Jan/Feb. p. 39. "Domestic Science Bureau." "Velactin is now available from Health Food Stores, made by Messrs. A. Wander Ltd."

Orr and Adair. 1967. Tropical Products Institute Report G-31. "The production of protein foods and concentrates from oilseeds." p. 57, 71-72. Gives a description of the Promo Process, operated by Promo Ltd., Abergavenny, England, for producing a full-fat soya flour. "The Promo soya flour is made into a soya milk, marketed under the brand name of Velactin by the Wander company. The process used by Promo to make Velactin is a modification of that used to make full-fat soya flour in that dehulled soya beans are used and carbohydrates, groundnut oil, vitamins, minerals, and amino acids are added. Velactin is sold as a powder, to which water is added to make the beverage. A nutritional analysis is given (see above).

Leslie Cross. 1978. Alive. May. p. 6. "Free Plant Milk." Cross states (incorrectly) that Wander Pharmaceuticals made the first British plantmilk, Velactin.

1875. Sutedjo, -; Poey, S.H.; Rawi, I. el. 1961. Soya-milk trial on infants up to 6 months old. *Paediatrica Indonesiana* 1:57-87. Based on Proceedings, First All Asian Congress on Pediatrics (New Delhi). *
Address: 1-2. Pediatric Dep. Medical School, Univ. of Indonesia, Jakarta.

1876. **Product Name:** Fortified Instant Soyamel (Soymilk).
Manufacturer's Name: Worthington Foods, Inc.
Manufacturer's Address: 900 Proprietors Rd., Worthington, Ohio. Phone: Tuxedo 5-5359.
Date of Introduction: 1961.
Ingredients: 1985: Soy protein isolate, partially hydrogenated soybean oil, corn syrup solids, malt extract.
Wt/Vol., Packaging, Price: 2 lb can makes 2 gallons.
New Product–Documentation: Wholesale price list. 1961. May 1; Shurtleff & Aoyagi. 1984. Soymilk Industry and Market. p. 28. "The first fortified soymilk based on isolated soy protein, it was NOT thought of or marketed as an infant formula."

1877. DeMaeyer, E.M.; Vanderborght, H.L. 1961. Determination of the nutritive value of different protein foods in the feeding of African children. *National Academy of Sciences, National Research Council, Publication* No. 843. p. 143-55. Progress in Meeting Protein Needs of Infants and Preschool Children. [23 ref]
• ***Summary:*** "The incidence of protein malnutrition throughout the world has been widely publicized during the past 15 years. Attention of governments and international agencies has been focused on this important public health problem, and the prevention of malnutrition is being investigated at present in many parts of the world."

"The digestibility, BV and NPU of whole eggs, cow's milk, human milk, soy milk, fish flour, soybean flour, cottonseed flour, peanut flour and biscuits made of fish, peanut and millet flours have been investigated by the nitrogen balance technique" on 17 African children of the Bashi tribe which lives on the shores of Lake Kivu in the Kivu Province [formerly Costermansville] (Republic of the Congo–later Zaire). Address: 1. Head, Dep. of Nutrition, IRSAC, Lwiro, Bukavu, Republic of Congo [later Zaire].

Address: Faculdade de Medicina, Ribeirao Preto (Sao Paulo), Brazil.

1880. Fomon, S.J. 1961. Factors influencing retention of nitrogen by normal full-term infants. *National Academy of Sciences, National Research Council, Publication* No. 843. p. 343-53. Progress in Meeting Protein Needs of Infants and Preschool Children. [12 ref]*

1881. Hunter, Beatrice Trum. 1961. The natural foods cookbook. New York, NY: Simon and Schuster, and Pyramid Books. xvi + 296 p. Index. 22 cm. Pyramid Books pocketbook ed. published in 1967.

• ***Summary:*** This very early and important natural foods cookbook contains more than 2,000 recipes. The Introduction is written by Dr. Clive M. McCay, Professor of Nutrition, Cornell University, New York, and Dr. Jeanette B. McCay, nutritionist. The pages numbers are those in the original 1961 hardcover edition. The author calls tofu "soy cheese" and uses it in many recipes, including mashed in a recipe for "soy cheese sherbet" (p. 204). This book is not vegetarian (some recipes call for beef, chicken, fish, etc.), but was quite influential in the early days of the U.S. natural foods movement.

Soy-related recipes include: Soy spreads (p. 14-15): Soy flour spread. Soybean spread (in blender). Soy cheese [tofu] spread. Soy butter (made from soy flour, regular or roasted, and oil). Smoothies (p. 26-29). Soybean-cheese salad (p. 35). Soybean-vegetable salad. Soybean molded salad. Soy butter dressing (with soy butter, p. 41). Soy cheese dressing. Eggless mayonnaise (with soy flour). Soybean soup (p. 49). Cream of soy soup (with soybeans in blender). Soy-vegetable soup (with soy milk in blender, p. 54). Soy noodles (with soy flour, p. 59). Green soybeans in pods (p. 70). Steamed green soybeans. Soy grits stuffing (for fowl, p. 127). Homemade soy cheese (also known as soybean curd or *tofu;* from soy milk or soy flour, p. 137).

Soybeans (p. 142-44): Basic soybean filler. Broiled soyburgers. Soybean ring (in blender). Baked soybean croquettes. Soybean casserole. Baked soybeans. Soybean-lentil loaf. Stewed soybeans. Soybean soufflé. Soybean squares. Roasted soybeans (dry-roasted). Leftover soybeans. Soy-oatmeal porridge (with soy grits, p. 162). Soy-cornmeal porridge. Soy sprouts (p. 163). Soy breads (p. 179-80): Kneaded soy-wholewheat bread. No-knead soy-wholewheat bread. Soy spoon bread. Unraised soy biscuits (p. 184). Soy-gluten popovers (p. 189). All-soy pancakes (p. 192). Soy waffles (p. 195). Soy cheese sherbet (with tofu, honey, vanilla, and nutmeg, p. 204). Soy cookies (p. 238). Flourless soy cookies. Soy-wholewheat cookies. Soy-cheese piecrust (with soy flour). Spiced soybean pie (with boiled, pureed soybeans, p. 250).

The section titled "Smoothies" (p. 26-29) contains the following recipes (those followed by an asterisk {*} contain dairy products and no soy unless stated in recipe name; the directions for all recipes in this section is "Blend all ingredients"): Homemade soybean milk (from whole soybeans, or from soy flour). Spiced soy milk. Soy-fig shake (with soy milk). Milk-soy smoothie (with soy flour)*. Almond milk. Peanut milk. Cashew milk. Milk-wholewheat shake*. Orange-coconut milk*. Coconut milk. Milk fruit shrub*. Strawberry smoothie.* Apricot shake*. Anise milk*. Milk smoothie*. Fruit milk shake*. Banana smoothie*. Lemon egg nog*. Honey egg nog*. Carob milk*. Carob smoothie. The recipes followed by an asterisk contain 2-4 cups cow's milk and no soy. Note 1. This is the earliest document seen (July 2013) that mentions "smoothie" or "smoothies" in connection with soy. All of the 22 recipes in the category titled "Smoothies" contain some kind of milk (either cow's milk or milk made from a seed–soy milk, almond milk, peanut milk, cashew milk, coconut milk, anise milk). About half of the smoothies contain fruits or fruit juices (orange juice, fresh berries, strawberries). None of the smoothies contain ice cream, frozen yogurt, or any other frozen dessert or frozen food. Therefore a smoothie seems to be like a milk shake but without the ice cream.

The recipe for "Milk-Soy Smoothie" (p. 27) reads: 4 cups milk. ½ cup soy flour. 4 tablespoons molasses. 2 eggs, raw. ½ teaspoon pure vanilla extract. 3 tablespoons nutritional yeast. Blend all ingredients. Serves 4-6.

The section titled "Nut butters (p. 29-30) gives a recipe for homemade peanut butter with "Variations: Homemade nut butter may be made from raw almonds, filberts, pignolias, walnuts (English and black), cashews, Brazil nuts, etc. Most of these nuts have enough oil so that no extra oil need be added." On p. 30 is a recipe for "Homemade peanut-sunflower seed butter."

By the time of the 19th printing, in Jan. 1974, this book had sold over one million copies.

Note 2. This is the earliest document or book seen (Dec. 2001) after 1960 with the term "natural foods" in the title.

Note 3. An advertisement for this book appeared in the July 1965 issue of *Natural Food and Farming* (p. 40). Address: White Mountains, New Hampshire [by July 1965: Hillsboro, NH 03244].

1882. LaLanne, Jack. 1961. Foods for glamour. New York, NY: Prentice Hall, Inc. xii + 243 p. Index. 22 cm.

• ***Summary:*** Soy related items: Broiled potatoes brushed with soya oil (p. 106-07). Jack's brother Norman is treating his ulcer "with consideration and soy milk. Soy beans, of course, are one of the most versatile vegetables we have. From them we make auto steering wheels, paint and pharmaceuticals. As a food they're easy to take and easy to digest. They're doing wonders for my brother" (p. 122). Jacks bastes his Thanksgiving turkey with soya oil or safflower oil–instead of grease, and brushes his brussels sprouts with a "trickle of soy oil" (p. 132-33).

Jack is now living in Hollywood, has his own daily half-hour TV show (broadcast into most major cities of North America), and lectures across America. More than 25 years ago he opened his first conditioning studios in Oakland, California. He and Elaine Doyle were recently married. Jack believes that diet and exercise are the keys to glamour and vibrant good health. But Hollywood has taught him that real glamour comes from within, and radiates outward. When he asked his good friend Paul Bragg "Who is the

most glorious woman you've ever known?' Bragg answered without hesitation, "Gloria Swanson"–"a beautiful mind in a beautiful body." LaLanne agreed. Gloria "eats only those foods that nourish health and beauty and shuns those that don't... She reads and meditates..." Other glamorous people? President Franklin Delano Roosevelt, actress Debbie Reynolds, actress Barbara Stanwyck, and statesman Winston Churchill–despite his large girth and evil-looking cigar (p. 20-24).

LaLanne retells the story of how he went from a sickly child to a healthy young man, inspired by Paul Bragg (p. 82-91). He considers fruit to be Nature's "beauty food" a natural alkalizer which can balance the acid influence of meat and eggs (p. 113). Address: Hollywood, California.

1883. Maner, Jerome Herman. 1961. Studies of factors affecting the utilization of isolated soybean protein by young pigs and rats. PhD thesis, Cornell University. 120 p. Page 2537 in volume 22/08 of Dissertation Abstracts International. *

Address: Cornell Univ.

1884. Montagné, Prosper. 1961. Larousse gastronomique: The encyclopedia of food, wine & cookery. New York, NY: Crown Publishers, Inc. 1101 p. See p. 925. Illust. Index. 26 cm. [Eng]

• ***Summary:*** The following are defined under "Soya Bean. *Soja"* (p. 925): Introduction. The soya bean is "the richest and cheapest source of vegetable protein." 1. Soya bean curd. *Fromage de soja.* Gives a completely inaccurate and useless description of how to make tofu at home. 2. Soya meat. *Viande de soja.* This "vegetarian meat," which resembles cooked ham, is said to be too complicated to make at home, but requires industrial equipment. 3. Soya milk. *Lait de soja.* 4. Soya sauce or extract. *Sauce, Extrait de soja.*

Note: This English-language edition is a translation from the original 1938 French-language edition by Nina Froud, Patience Gray, Maud Murdoch, and Barbara Macrae Taylor. Address: France.

1885. *National Academy of Sciences, National Research Council, Publication.* 1961. Progress in meeting protein needs of infants and preschool children: Proceedings of an international conference held in Washington, D.C., August 21-24, 1960 under the auspices of The Committee on Protein Malnutrition, Food and Nutrition Board, and The Nutrition Study Section, National Institutes of Health. No. 843. 570 p. Reviewed by Soybean Digest, Nov. 1961, p. 23.

• ***Summary:*** The National Academy of Sciences was established in 1863, the National Research Council in 1916, and the Food and Nutrition Board in 1940.

In Aug. 1960, 33 researchers from 18 foreign countries joined with 42 researchers from the USA in a 4-day conference to review the results of a worldwide research program for the development of protein products suitable for infants and children from indigenous resources such as soybeans, cottonseed, peanuts, and similar products in countries where protein deficiency is most prevalent. This research program has been conducted by the Committee on Protein Malnutrition with funds provided by the Rockefeller Foundation in cooperation with UNICEF, FAO, and WHO. The researchers also met to survey the areas of greatest need for further research, and to evaluate the status of knowledge in protein nutrition.

The 45 research reports in this volume constitute a comprehensive summary of the status of protein nutrition around the world and the technological problems involved in the development of economical protein foods. The papers are divided into the following groups: Central and South America (7 papers). Africa and the Middle East (10). India and the Far East (10). Relevant research in the United States (6). Experimental protein malnutrition in animals (4). Basic principles of protein and amino acid evaluation and potential protein resources (10). Protein problems around the world (3). Summary of the conference. Nomenclature guide to plant products cited.

Autret (p. 537) stated "the No. 1 problem for F.A.O. and for national agricultural departments is the production of protein foods of good quality." Address: Washington, DC.

1886. Patwardhan, Vinayak Narayan. 1961. Nutrition in India. 2nd ed. Bombay, India: Indian Journal of Medical Sciences. 515 p. Illust. 23 cm. *

• ***Summary:*** Complete agreement has not been reached in India on the relative value of soybean milk and cow's milk. The author was born in 1905.

1887. Patwardhan, Vinayak Narayan. 1961. Nutrition in India. 2nd ed. Bombay, India: Indian Journal of Medical Sciences. 515 p. See p. 56, 57, 114. Illust. 23 cm. *

• ***Summary:*** Page 56: "They found that the biological value of soya bean milk approached 90 per cent of that of casein and about 80 per cent of that of milk proteins."

Complete agreement has not been reached in India on the relative value of soya bean milk and cow's milk. Soya bean milk is also mentioned on pages 57 and 114.

1888. Rodale, J.I. ed. 1961. How to grow vegetables and fruits by the organic method. Emmaus, Pennsylvania: Rodale Books, Inc. 926 p. See p. 507-09. Illust. Index. 23 cm. Reprinted in 1974.

• ***Summary:*** In the large Section 2, "Organic vegetable culture: A complete listing," is a subsection titled "Soybean" (p. 507-09) with the following contents: Introduction, brief history [inaccurate], and nutritional value. Range and soil. Seed. Planting. Enemies. Harvest. Focuses on how to grow "vegetable soybeans" using the organic method.

"Two types of soybeans are now cultivated in this

country, out of the hundred or more varieties of the Orient. Field soybeans are used to make hay, for seed, for green manure and in combination with sorghum, for silage. The seed is a rich source of oil which has industrial as well as culinary uses. Vegetable soybeans are used green like peas or lima beans; dried, like navy beans, or are sprouted like Mung beans. Soybean protein is more complete than the protein found in any other vegetable. Soy flour is a valuable protein additive to baked products and is used for diabetics because it is low in carbohydrates. Soy milk and cheese are useful for babies and children suffering from cow's milk allergies. Soy meal, like cottonseed meal, is a rich source of nitrogen when used as a fertilizer."

"Tests at Iowa State have shown that the best way to plant soybeans is to plant several varieties, maturing in different periods, at the same time. Judging by gustatory as well as horticultural standards, Iowa State recommends Sac, maturing in 9 weeks, Kanro, maturing in 10 weeks and Jogun, maturing in 12 weeks. These may be expected to supply green beans for the table during the late summer."

Photos show: (1) Wilbert Walker, a Pennsylvania organic gardener, with a sprawling vegetable soybean plant in his garden. (2) A close-up of soybean pods on a soybean plant. Address: Editor-in-Chief, Rodale Books Inc., Emmaus, Pennsylvania.

1889. Rodale, J.I. ed. 1961. The complete book of food and nutrition. Emmaus, Pennsylvania: Rodale Books. 1054 p. Index. 23 cm.

• ***Summary:*** J.I. Rodale recommends the consumption of natural meat and eggs. He discourages humans from consuming or using milk, chemicalized meats, added salt, sugar, chocolate, aluminium utensils, and heated or hydrogenated fats. Throughout this book, he uses scientific sources and cites them carefully.

Chapters 30-40 (p. 116-56) are a critique of cow's milk. Man has made the cow into a milk machine, with ever larger udders, which can produce 75 times as much milk per year as in Biblical times. For adults, milk may cause lactose intolerance, allergies and excessive tallness, and may contain undesirable antibiotics.

Chapter 40, titled "Nutritive substitutes for milk" (p. 154-55), mentions "soybean milk and Tahini milk which is a milk made from ground sesame seeds. Tahini milk appears to us to be an excellent substitute for milk in the diet because of its extremely high content of calcium" (p. 155).

Dr. Stefansson (p. 69-72) lived for one year in good health on meat alone. The discovery of cereal culture 2,000 years ago was the beginning of civilization and human degeneration. The human digestive tract has not had time to adjust to this change. It took humans 2 million years to adapt to the diet of the primitive human hunter (consisting mainly of proteins and animal fats) from the largely vegetarian diet of the anthropoids. "It is extremely difficult to plan a vegetarian diet in which the essential amino acids will all be represented in their proper proportion."

Chapter 127, "How to sprout beans" (p. 472-74), discusses mainly how to sprout soybeans, and their nutritional value. A table compares the vitamin and mineral content of soybean sprouts and mung bean sprouts; the former are much more nutritious.

Chapter 153, "Soybeans–The wonder food" (p. 536-41) has the following contents: Introduction. How nutritious are soybeans? ("Soybeans are one of the few non-animal proteins which are complete–that is, contain all of the essential amino acids in good proportion.") Sprouting beans for vitamin C. Soybeans are economical (says the best book on soybeans is *Soybeans for Health, Longevity and Economy,* by Philip S. Chen, Ph.D.). Soybean milk for infants. "Soybeans are richer in potassium than any other food except brewer's yeast which, of course, is eaten in much smaller quantities. They contain more pantothenic acid than any other food except egg yolk, brewer's yeast, liver, rice bran, and wheat bran. The iron in soybeans is 96 per cent 'available'–that is, digestible and used by the body." Chapter 154, "Soya milk and soya curds" (p. 541-42), by Dr. W. Kring, of Dusseldorf discusses: Use of soybeans in East Asia. Fresh soya milk for every household. Acidophilus soya milk–Soya curds. Making soya cheese or tofu [at home].

Note 1. This is the earliest English-language document seen (April 2013) that uses the term "soya curds" in connection with tofu.

Note 2. This is the earliest English-language document seen (Sept. 2012) that contains the term "Acidophilus soya milk" (or "Acidophilus soymilk") regardless of capitalization, hyphenation, or spaces.

Chapter 178, "Eggs, meat and soybeans" (p. 675-77) gives a nutritional comparison of these three high-protein foods. One section titled "Meat substitutes" begins: "Soybeans should be a part of your diet as a substitute for meat." It continues: "Even though you include plenty of meat in your diet, make use of soybean protein, too. If your family does not know soybeans, get some and begin to introduce them to a wonder food."

Chapter 169, "Are chemical fertilizers harming our food" (p. 618-24) is part of a statement made by J.I. Rodale on December 15, 1950, to a Congressional Committee formed to investigate chemical fertilizers. He argues that the organic method is "far superior to the present general practice with respect to fertilizer usage, not only from the human health standpoint but from the point of view of preventing soil erosion and giving higher yields at a lower cost." Also discusses: History of the organic method. What is the organic method? What is a chemical fertilizer? The health aspect (experiments showing a much higher survival rate in mice fed organically grown food). More vitamins in "organic" food. Physicians praise the organic method. Rejection by our government (and request that agricultural

experiment stations test and compare the two methods).

Chapter 173 titled "Investigating Primitive Diet" (p. 642-54) contains a detailed summary of the work of Weston A. Price. D.D.S., as described in his book *Nutrition and Physical Degeneration.* This book is available from the Lee Foundation for Nutritional Research, 2023 W. Wisconsin Ave., Milwaukee, Wisconsin.

Chapter 182, titled "When you use fats and oils" (p. 682-83) discusses margarine, which is made from vegetable fats which have been hydrogenated. Soybean oil is one of the oils use to make margarine. "As you know, we do not recommend using margarine, mostly because of the many chemical substances used in it, of which the synthetic vitamin A is only one. Artificial coloring, preservatives and so forth are also used. But, in addition, hydrogenating the oils to make them solid destroys most of the essential fatty acids which are the chief reason for eating vegetable oil. So margarine is no better than butter as a spread, in spite of the fact that it is made from substances that do not contain cholesterol." "Soybean oil is another popular vegetable oil." Rodale especially recommends "our old friend, sunflower seed oil"–which is rich in vitamin E and linoleic acid.

Chapter 183 titled "Heated fats can cause cancer" (p. 686-90) summarizes several scientific studies and notes that "Hydrogenated fats are everywhere" in our food supply. "Finally, don't buy hydrogenated shortenings (the solid kind)..."

Chapter 198 titled "Who pays for nutrition research?" (p. 741+) begins: "'Dr. Stare's Nutrition Department (at Harvard University, Massachusetts) received from Food Industries and Foundations representative of their interests between and including the fiscal year 1950 to 1956 gifts totaling approximately $378,000, half of which was from the Sugar Research Foundation, supported by the sugar interests, and the Nutrition Foundation, supported largely by commercial food processors. A large portion of the other half was from the chemical and drug interests.

"This challenging statement sets the tone for a series of open letters from the Boston Nutrition Society, Incorporated, to Dr. Nathan M. Pusey, President of Harvard University. We think readers will find in these letters the answer to their puzzled query Ä 'Why?' Why must we eat doctored up, chemicalized, refined, cheapened food and above all, why must some of our top food scientists, men like Dr. Stare of Harvard, call everyone a faddist and a crackpot who points out that the modern American food is not everything it should be?

"The open letters hit at the very heart of the problem. Much university research on nutrition is being financed by the very folks who profit from selling this worthless food."

Chapter 199, "A British nutritionist takes stock," summarizes an article titled "Food and Health," by Dr. H.M. Sinclair (*British Medical Journal*, 14 Dec. 1957) about the dangers of feeding too much cow's milk to infants and children. Another article on the same subject by Dr. Milton J.E. Senn, was published in *McCall's* (Jan. 1958). Chapter 272 is "Kelp for trace minerals" (p. 1005-09) and Chapter 273 is "The value of seaweed nutrition" (p. 1010-12).

Chapter 39, "Miscellany on milk" (p. 146-54), documents many problems with cow's milk. Its contents: Introduction, detergents in milk, antibiotics in milk, some infants can't take milk at all, is milk the universal antidote?, an all-milk diet is hazardous, ulcer patients beware!, cavities caused by milk, DDT contamination, misuse of calcium, radioactive substances in milk, milk as a cause of goiter, a famous nutritionist speaks (Dr. Norman Jolliffe), milk's value questioned (by McCance and Widdowson), allergies to milk sugar, dermatologist criticizes both bread and milk, and old (1926) court decision on raw milk. Chapter 41: "Yogurt" (p. 156+). "Yogurt is probably the most popular of all so-called health foods". In the 19th century, Metchnikoff was the first to investigate it scientifically. Chapter 96: "Sesame seed–An ancient and nutritious food" (p. 342-44; Tahini milk makes a good milk substitute). Address: Emmaus, Pennsylvania.

1890. Tiling, Wolfgang; Ehring, A.M.; Stewart, C.P. 1961. The use of soya-based foods in infant feeding. *Nutritio et Dieta* (*European Review of Nutrition and Dietetics*) 3(2):89-104. [2 ref. Eng; ger; fre]

• ***Summary:*** A note on the first page states: "Dr. Wolfgang Tiling died suddenly at the time when he was about to prepare a preliminary report of his observations on the use of soy-based foods in infant feeding." Though his results are incomplete, his colleagues feel they are sufficient to justify publication.

The section titled "Development of a soy-based infant-food" states that this material, which had been supplied by Dr. Ebermann to Dr. Tiling, and was one of the soya foods used by Dean, had been modified until the "formulation ultimately adopted and used in the later trials at the *Kinderkrankenhaus Rothenburgsort* gave excellent results in rat feeding tests, both short and long-term. This material is termed *Wanderlac* in Dr. Tiling's case records, but it will be referred to as *Velactin* in this paper since it is shortly to be marketed in the United Kingdom under this name by A. Wander Ltd. who kindly provided the considerable quantities used in these trials."

Clinical trials were conducted on over 40 children, most suffering from various allergies, with good results.

Note: This is the earliest document seen (April 2010) that mentions Velactin–though it is not yet on the market. Address: 2. Kinderkrankenhaus Rothenburgsort, Hamburg; (3) Dep. of Clinical Chemistry, Royal Infirmary, Univ. of Edinburgh, Scotland.

1891. Watanabe, Tokuji. 1961? Studies on tofu production from U.S. soybeans (2). Food Research Institute, Japan. 11 p.

Undated. Typed, without signature. [2 ref. Eng]
• ***Summary:*** Contents: 1. Experiments in the laboratory: Weight per 1,000 seeds, color of seed coats and color of hilum of U.S. and Japanese soybeans, speed of water absorption in U.S. and Japanese soybeans, protein and fat contents of U.S. and Japanese soybeans, water-solubility of protein in U.S. and Japanese soybeans, natures of soy milk obtained from U.S. and Japanese soybeans. 2. Production test of tofu: Production method of tofu, comparison between the tofu made from U.S. soybeans and that from the Japanese, choice of U.S. soybean variety suitable for tofu production. 3. Improvement of production methods.

Tables show: (1) Properties of U.S. and Japanese soybeans (Japanese: Nagano, Hokkaido, Miyagi, Aomori, Kumamoto. U.S.: Harosoy, Hawkeye, Adams, Chippewa, Clark, Lincoln, Blackhawk, Acme, Ottawa Mandarin, Norchief, Comet, Lee, Jackson, Dorman, Dortchsoy, Ogden, Wabash, Monroe, S-100, Capital, Flambeau, Shelby, Ford, Hardome, Renville, Lindarin, Perry, Grant; For each variety is given: Weight per 1,000 seeds, color of seed coat, color of hilum, remarks). (2) Nitrogen content and nitrogen outflow of U.S. and Japanese soybeans. (3-1) Influence of the quantity of water added on the nitrogen solubility of soybeans. (3-2) Influences of the length and temperature of heating on the nitrogen solubility of soybeans. (4) Comparison between U.S. and Japanese soybeans in tofu production (for each variety is given: Percentage of protein and fat in the soybeans. Protein in laboratory soy milk {%}. Protein in factory soy milk {%}. Weight of tofu {kg from 1.8 kg of soybeans}. Yield rate of tofu {% of solids in soybeans appearing in tofu, dry basis}. Yield rate of protein {% of protein in soybeans appearing in tofu}. Protein in tofu {%}. Height of tofu {cm}. Moisture of tofu {%}. Hardness of tofu {using penetrometer; large value = soft tofu}. Properties of tofu–Coagulation, texture, color {3 = excellent, 2 = good, 1 = fair}). (5) relationship of water-soluble protein + fat in soybeans to weight, protein, and fat contents of tofu. (6) Volume and composition of okara. (7-1) Properties of tofu at various doses of coagulant and various tempos [speeds] of coagulation.

Note: A Japanese version of all tables is given on unnumbered pages at the end. Address: Food Research Inst., Japan.

1892. Chen, Philip S.; Chen, Helen D. 1962. Soybeans for health, longevity, and economy. 2nd ed. South Lancaster, Massachusetts: The Chemical Elements. xii + 242 p. Jan. Illust. Index. 21 cm. 1st ed. 1956. [24 ref]
• ***Summary:*** This book is identical to the original 1956 edition, third printing (the dedication is to William J. Morse and Harry W. Miller), except that: (1) Table 1, titled "Soybean production in the United States" (p. 2) gives statistics to 1960, instead of 1958. (2) Appendix B (p. 224-36) has been updated based on the 1961 *Soybean Blue Book.* (3) The dust jacket has been updated. On the rear dust jacket is a portrait photo of Dr. Philip Chen and a biographical sketch. (4) The paper is slightly thicker.

Note: In 1962 Chen wrote *A New Look at God,* published by Chemical Elements (288 p.). Address: 1. Prof. of Chemistry, Atlantic Union College, South Lancaster, Massachusetts; 2. National Science Foundation Fellow, Cornell Univ.

1893. Collins-Williams, C. 1962. Cow's milk allergy in infants and children. *International Archives of Allergy and Applied Immunology* 20(1):38-59. [54* ref]
• ***Summary:*** "Allergy to a food denotes an antigen-antibody reaction where the food serves as antigen and causes the production of antibody in the person who ingests the food."

"There are a great many non-immunological reactions to foods which should be classified as intolerances [intolerance] rather than allergy since there is no antigen-antibody reaction.

Table 1 shows (listed alphabetically) the many signs and symptoms attributed to cow's milk allergy.

"Milk substitutes: One approach to the treatment of patients sensitive to cow's milk is the use of cow's milk substitutes, the most popular of which is one or other of the various soy bean preparations available on the market." Table 8 lists the various milk substitutes which have been tried in the past, most of them on a very restricted basis. Address: M.D., Director, Allergy Clinic. Hospital for Sick Children, Toronto, and Dep. of Pediatrics, Univ. of Toronto, Canada.

1894. **Product Name:** Beanectar or Beannectar (Soybean Milk).
Manufacturer's Name: Malayan Food Products Ltd.
Manufacturer's Address: 153 McNair Rd, 12, Singapore.
Date of Introduction: 1962. February.
New Product–Documentation: U.S. Foreign Agricultural Service. FAS-M126. Feb. p. 22. "Southeast Asia as a market for U.S. soybeans and vegetable oils." In Singapore 2 companies are engaged in the production of pasteurized soybean milk, which is sold as a soft drink. They use about 100 tons of soybeans a month for this purpose. One product is marketed as "Beanectar" soybean milk. On p. 37 the company name is given, and the product name is spelled Beannectar. The managing director is Tan Chong Ming. "The company uses about 3 tons of Mainland Chinese soybeans daily when operating."

1895. Spilsbury, Calvin C. 1962. Southeast Asia as a market for U.S. soybeans and vegetable oils. *USDA Foreign Agricultural Service.* FAS-M-126. 41 p. Feb. Summarized in Soybean Digest, March 1962, p. 26.
• ***Summary:*** Gives an excellent, detailed discussion, with many statistics, of the soybean markets in Hong Kong,

Singapore, Malaysia, Indonesia, British Borneo (Sarawak, Brunei, and North Borneo [Sabah]), and Burma.

"The 350,000 Chinese of British Borneo are large consumers of soybean food products and fats and oils, but this market is small. Domestic production of soybeans in North Borneo is more than sufficient to supply domestic demand for that country, and some exports are made each year. Imports of soybeans into Sarawak and Brunei, though small, have been growing each year. In 1960 Sarawak's imports were 608 long tons, compared with 526 tons in 1959 and 403 tons in 1958. Thailand, Mainland China, Vietnam, and Cambodia are the main suppliers, as U.S. soybeans have been scarce in this market."

Burma: "The domestic production of soybeans in Burma has been small, but output is large enough to provide demands of the Burmese people in the Shan State, population approximately 500,000, who use soybeans for food." The peanut is the main oilseed crushed in Burma. The majority of peanut crushing mills are located in Rangoon, Insein, Mandalay, and Myingyan.

Table 6 (p. 29) shows imports (in piculs; 1 picul = 133 lb) of soybeans to Sarawak, by country of origin, annually 1958-1960. The main source countries are Thailand, Mainland China, and Indochina. Imports increased from 6,853 piculs in 1958 to 10,343 piculs in 1960.

Appendix: Hong Kong: Importers of U.S. soybeans, manufacturers of wet and dried bean curd for export to U.S., soybean sauce manufacturers. Singapore: Importers of U.S. soybeans, importers agents providing services to soybean importers, manufacturers of soybean curd, largest soybean sauce manufacturers, soybean milk companies. Federation of Malaya: Importers of soybeans, soybean sauce factories (Penang, Province Wellesley, Kedah, Perak, Selangor, Malacca, Negri Sembilan). Sarawak: Soybean importers and dealers (all of Kuching). Burma: Fats and oils importers (Rangoon), vegetable oil mills (Rangoon).

Note 1. Sarawak became part of Malaysia in 1963. Note 2. This is the earliest document seen (May 2010) concerning soybeans in Brunei. This document contains the earliest date seen for soybeans in Brunei (Feb. 1962). Address: Fats and Oils Div.

1896. **Product Name:** Infa-Soy (Soymilk Infant Formula).
Manufacturer's Name: Madison Foods.
Manufacturer's Address: Madison College, Madison, Tennessee.
Date of Introduction: 1962. March.
New Product–Documentation: Letter from Sam Yoshimura. 1981. Feb. 20. "At the beginning of 1962, production of Infa-Soy, using Dr. Harry Miller's formula, was started under the direction of his son, Willis Miller." The key to the formula was the addition of a little cooked rice (or the water therefrom; a small amount of rice was cooked in excess water for 10-15 minutes), which was effective in preventing loose stools in infants. Soybean Blue Book. 1965. p. 115. The company is now called Nutrition International Corp. and Infa-Soy is described as a "hypoallergenic baby formula."

1897. Lahiri, Nripendra L.; Sastry, L.V.L.; Shurpalekar, S.R.; Chandrasekhara, M.R.; Swaminathan, M.; Subrahmanyan, V.I. Assignors to Council of Scientific and Industrial Research. 1962. Vegetable milk powder. *Indian Patent* 70,049. April 7. Application filed 15 Dec. 1959. (Chem. Abst. 57:14256a). *
• ***Summary:*** Two parts by weight of dehulled soybeans and 1 part by weight of peanuts are used as the main raw materials. Both are ground and sodium bicarbonate and water are added. The resulting milklike emulsion is adjusted to pH 8.0–8.2, stirred, then centrifuged to remove the crude fiber and starch. Sugar and buffer salts are added to the clarified emulsion, the pH is adjusted to 6.8–7.0, the milk is steamed to destroy tryptic inhibitor, then homogenized, spray dried, and fortified with vitamins A, B, C, and D, calcium, phosphorus, iron, and DL-methionine.

1898. *British Vegetarian.* 1962. Dr. Harry Willis Miller. March/April. p. 96.
• ***Summary:*** Discusses the excellent work of Dr. Harry W. Miller with plantmilks and infant nutrition. Dr. Miller, Emeritus Director of the International Nutrition Research Foundation in Arlington, California, has just been elected an honorary member of the Vegetarian Nutritional Research Council.

"Dr. Miller has recently been visiting different parts of the Far East setting up equipment for the production of liquid plantmilks in under-developed areas..." A large photo shows Dr. Miller.

1899. General Mills, Specialty Products Div. 1962. From soy products, General Mills formulates new protein-rich foods (Ad). *Soybean Digest.* May. p. 28. [11 ref]
• ***Summary:*** A full-page ad. "We are manufacturing and marketing SMP (Soy Milk Powder) which, when mixed with water, makes a delicious beverage for school lunches and for supplementing diets of children unable to get cow's milk; also, through an agreement with Meals for Millions Foundation, MPF (Multi-Purpose Food) which provides, in concentrated form, the essential nutrients usually lacking from high carbohydrate diets. Using soybeans as the key, we have developed TSP (Toasted Soy Protein)–an unusually low cost, high quality protein completely pre-cooked and ready to use. Other protein foods from soybeans are in the developmental stage. When perfected, these too will contribute to improved world nutrition."

The "Specialty products" logo resembles an infinity sign. A large photo shows a little girl, with a mud wall behind her, looking up at her mother, who is feeding her

with a spoon from a bowl. Address: 9200 Wyzata Blvd., Minneapolis 26, Minnesota.

1900. Marcello, Dominic. 1962. Italy: New soy pasta on market. *Soybean Digest.* May. p. 59.
• ***Summary:*** The Soybean Council of America is cooperating with soy-related industries in Italy. "As a result of this cooperation, the first macaroni supplemented with soy protein, manufactured by the Dieba Co., is now on sale everywhere in Italy. The name of the new product is 'Soiamin'–the first of a series of pasta products containing soy derivatives. Soiamin will be the trademark of all such products to follow.

"Our mutual problems include the production of two new types of pasta containing 5% and 10% soy protein to be called Soiamin 15 and Soiamin 20 respectively; a doughnut mix, bread and cookies, all containing soy flour; soy beverages; a salad and cooking oil bearing the name of 'soia'; plus a number of other dietetic products such as baby foods and food for people unable to digest gluten.

"Following the Dieba lead, two other major manufacturers are now working on the production of pasta with soy protein." Address: Soybean Council Director for Area 1.

1901. Shade, Lucille. 1962. How soybeans can help you. *Organic Gardening and Farming* 9(5):22-24. May.
• ***Summary:*** The subtitle reads: "A remarkable plant that yields a highly nutritious food, helps build soil, and does a dozen other jobs–the soybean belongs in your garden." A photo caption states: "The vegetable soybean draws heavily upon lime in the soil, but will return nitrogen if the residue of the vine is left in the field and turned under. Soybeans give the most complete vegetable protein."

"Soybeans can be eaten green in much the same way you'd eat lima beans... They can be roasted and eaten like peanuts, or used to make soy milk for babies allergic to other kinds of milk.

"For the home garden, be sure you get an edible or vegetable variety, not a farm legume or forage type. Edible strains differ as much in palatability from field varieties as does sweet corn from field corn... Two of the better edible varieties are Bansei and Pando. These mature fully in about 96 days... Green vegetable soys may be prepared the same way as other garden beans. They make a good addition to soups, chili con carne, salads, etc. Mixed with corn, they make a delicious succotash.

"Soybeans should be inoculated like any other legume. Not only will they do better but the inoculant will help the plant to utilize nitrogen from the air rather than from the soil. Soybeans can obtain as much as two-thirds of their nitrogen from the air.

"A package of inoculant can be purchased at almost any garden center very cheaply. Twenty-five cents will buy enough to inoculate 5 or 6 pounds of beans. To use, simply dump the seeds in a pan, cover with water and then drain immediately. Sprinkle the inoculant powder over the seeds, mix well, and plant.

"Soybeans have long been used as a green manure crop to improve both the condition of the soil and to add a goodly amount of nitrogen as well. For best results, inoculate the soybean seeds, plant at the rate of about 3 pounds for each 1000 square feet of ground and turn under when the plants reach the blossom stage. They will then be as large as they'll ever be and still be tender enough to decay rapidly in the soil. Most of the nitrogen has been gathered by this time also.

"Soybean meal is one of the finest organic fertilizers you can buy."

Note: This is the earliest article on soy seen (Aug. 2002) in *Organic Gardening and Farming* magazine.

1902. USDA Northern Regional Research Laboratory. ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, Illinois. iii + 242 p. Held 13-15 Sept. 1961 at Northern Regional Research Laboratory, Peoria, Illinois. No index. 26 cm.
• ***Summary:*** The earliest conference on this subject in the USA. A very important document, with many excellent articles by experts in their fields worldwide.

Contents: Introductory remarks. Session I: Nutritional deficiency problems in developing areas of the world. II: World marketing of soybeans and soybean products. III: Research and development on soybean foods. IV: Nutritional and biological studies. V: Processing and feeding value of fluid and dry soy milks. VI: Problems involved in increasing world-wide use of soybean products as foods–panel discussion. VII: Committee on quality and processing guide for edible soy flour and grits. VIII: Summary of conference. List of attendance. Address: NRRL, Peoria, Illinois.

1903. Herb-Mueller, Lene. 1962. Die Soja und Ernaehrungsfragen in Entwicklungslaendern [The soybean and nutrition problems in developing countries]. *Ernaehrungs-Umschau* 9(5):143-46. July. [Ger]
• ***Summary:*** Nutritive value of soybean products. Address: Bonn.

1904. *Soybean Digest.* 1962. Soybean Council of America, Inc.: Hold mass demonstration of soy foods in Pakistan. July. p. 20.
• ***Summary:*** R.S. Patel, Soybean Council of America director for Pakistan, "recently carried out a very successful mass demonstration on soy foods at Malir village, with over 500 children and 250 adults attending." He gave a lecture on soybeans and their uses. Mr. Sadiq, a government official, also gave a lecture.

They distributed snacks made from 10% soy flour

and 90% wheat flour, fried in soybean and cottonseed oil shortening. A soy beverage was also given to the children. "The program lasted about 2 hours and the enthusiasm was so great that a stream of people was still coming when it ended." A photo shows Mr. Patel with the soy foods and attendees.

1905. *Guardian* (*Manchester*). 1962. Milk made from vegetables may be on sale soon. Aug. 27. p. 2, col. 3.
• ***Summary:*** "Milk made from outer cabbage leaves, pea pods, and other greenstuffs may soon be on sale as a result of experiments by scientists working in the Vegetarian Nutritional Research Centre, Garston, Watford." Dr. Frank Wokes, director of the research center, believes that there will never be enough cow's milk to supply all the world's children or to meet all the protein deficiencies. Before the end of this year, the Centre hopes to open a pilot plant for the process; large scale production would start later.

Related experiments have been made since before World War I, and "a plantmilk, made from cereals and pulses, has been on sale for some years."

1906. *Times* (*London*). 1962. Milk made from plants: Research scientists' experiments. Aug. 27. p. 5, col. 2.
• ***Summary:*** "Milk made from outer cabbage leaves, pea pods and other greenstuffs may soon be on sale after experiments by scientists working in the Vegetarian Nutritional Research Centre at Garston, Herts. They hope to open a pilot plant for the process before the end of this year... Basically, the raw materials used are the same as the cow eats.

"The scientists have got rid of a greenish colour in the man-made milk and now they hope to get rid of its slight vegetable flavour. Then the product would go on the market as a powder or a liquid, and it is expected to compete in price with cows' milk."

"Dr. Frank Wokes, director of the research centre, said yesterday: 'There can never be enough cow's milk for all the world's children or to solve all the protein deficiencies. But there is always plenty of greenstuffs such as we are using... The vitally important vitamin B12 must be added.

"'A woman member of the research centre, now in her 80s, has offered to will her fortune for the production of plantmilk provided we are able to put on the market within a year of her death a plantmilk which is certified as satisfactory from a nutritional viewpoint. Another proviso is that its domestic value must be certified by Lady Dowding, wife of Air Chief Marshal Lord Dowding. Lady Dowding has been interested in the project for some years."

1907. Dowding, Muriel (Lady). 1962. Why I am interested in plantmilk. *British Vegetarian.* July/Aug. p. 188-89.
• ***Summary:*** This famous woman and vegetarian (head of the Beauty Without Cruelty campaign) is speaking at the [Vegetarian Nutritional Research] Centre located at the Stanborough School, Watford, Herts., England. The school is run by Seventh-day Adventists. She speaks of the cruelty involved when cows are made to give milk and dairy products, and looks forward to the alternate milk that this centre will provide, at the beginning of a new age–the Age of Aquarius.

1908. Miyasaka, Shiro. 1962. Analise comparativa do leite de vaca e de soja [Comparative analysis of cow's milk and soymilk]. *O Agronomico* (*Campinas, SP, Brazil*) 14(7-8):5. July/Aug. [2 ref. Por]
Address: Secao de Leguminosas, Instituto Agronomico, Campinas, Sao Paulo, Brazil.

1909. *Today's Food* (*Loma Linda Foods, Arlington, California*). 1962. [Commercial food products made by Loma Linda Foods]. 7(2):4-6. Summer.
• ***Summary:*** Loma Linda food products include: Loma Linda Boston Style Baked Soy Beans.

An article by nutritionist D. Van Gundy Jones (p. 4) notes that "Soy milk makes an excellent mayonnaise."
Address: 11503 Pierce Place, Arlington, California.

1910. Nagafuge, Emilio. 1962. Los productos alimenticios derivados de la soya [Food products derived from the soybean]. *Tierra* (*Mexico*) 17(9):678. Sept. [Spa]
• ***Summary:*** Contents: Preface. Soymilk. Soy cheese [tofu]. Soy flour. Soy oil. Soy lard and butter (*Manteca y mantequilla de soya*). Soy sprouts (*Los brotes de soya*). Soy sauce. Miso.

Note 1. This is the earliest Spanish-language document seen that uses the term *mantequilla de soya* to refer to margarine.

Note 2. This is the earliest Spanish-language document seen (Jan. 2013) that uses the term *Los brotes de soya* to refer to soy sprouts. Address: Mexico.

1911. Joshi, A.B.; Singh, H.B.; Mital, S.P. 1962. Why be indifferent to soybean? *Indian Farming* 12(7):15-18. Oct. Series 2.
• ***Summary:*** Contents: Introduction. Indian farmer's indifference. Soybean for food (as pulse or flour). Soybean dal. Soybean flour. Soybean milk. Soybean cake [for livestock feed]. Fodder and green manure. Industrial uses of soybean (Lecithin, derivatives).

Soybean acreage in India is almost negligible. "According to *ad hoc* estimates, only about 43,000 acres are planted to soybean in India, mainly in the hills of Uttar Pradesh, with an annual production of about 5,900 tons." Known there as *bhat, bharat,* or *botang,* it is commonly used as *muri* (roasted beans; just as roasted and salted gram and peas are eaten elsewhere in the country), or the beans are ground to make *sattu* for mixing with barley or wheat

sattu. Occasionally *chapatees* [chapatis] are also made from a mixture of soybean flour with maize flour. However, due to its high oil content, soybean flour can keep well only for short periods, especially so in warmer locations."

In China and Japan, soybeans are made into soya milk and tofu (which corresponds to *panir*), "a popular milk product prepared at home and cooked into vegetable curries in India."

Note: This is the earliest document seen (April 2013) that contains the word "panir" (or "paneer") used in connection with tofu or soy. Panir is a soft, fresh dairy cheese, widely consumed in India. It is more expensive than tofu. Address: Indian Agricultural Research Inst., New Delhi, India.

1912. Gladwyn & Co. 1962. Classified ad: On user's license–Plants for fruit juice powder, soya bean milk powder, instant tea. *Times of India* (*The*) (*Bombay*). Dec. 21. p. 14.
• ***Summary:*** By M/s. Chemap AG, Switzerland. Address: 251, D. Naoroji Rd., Bombay-1.

1913. Olson, Harvey Stuart. 1962. Olson's Orient guide [1st ed.]. Philadelphia, Pennsylvania and New York: J.B. Lippincott Co. 1008 p. Illust. (by Cy Ferring). Maps. Index. 20 cm. 1st ed., 1962 [1963].
• ***Summary:*** In Chapter 5, "On dining out in the Orient," we read (p. 229): In Japan, much loved and widely consumed items include "bean sprouts and pastes [miso] and sauces made from soy beans." The Japanese, like many "foreign visitors are fond of sukiyaki made of thin beef strips simmered in a tasty soy sauce garnished with fresh vegetables, served with a raw egg, and accompanied by rice. They enjoy tempura, too,..." The dip is made of finely grated radish [daikon] "and spicy soy sauce."

The section on "Chinese cuisine" states (p. 236): "Cantonese which is the blandest, most subtle, and least greasy of the varieties of Chinese cooking..." Features "bean curd and minced pork."

The section titled "Japanese specialties" (p. 245+) starts with Sukiyaki (One "bowl contains small pieces of lotus root, scallions, bamboo shoots, bean curds, mushrooms, and other greens," p. 246). Also (p. 249) "Batayaki is the first cousin to sukiyaki," but with the difference that "batayaki is prepared with a sauce less pungent than that used for sukiyaki." This sauce has "a soybean base, but mixed liberally with butter" [*bata*].

The entry for "Soy sauce" (p. 252) taken from the Random House *American College Dictionary* "defines soy sauce as 'a salty fermented sauce much used on fish and other dishes in the Orient, prepared from soy beans.' I cannot emphasize too strongly how important a part this sauce plays in the Japanese cuisine. It is not only used in connection with fish but as a sauce for sukiyaki. It is also used generously in preparing chicken and steak and is utilized as a garnish as well as an ingredient.

"As a matter of fact I can think of no place where this tasty bit is not likely to appear. I. for one, like soy sauce." However. if you wish, you can ask your waiter to omit it.

The section on Thailand (p. 278-79) notes: "*Haw Mok,* a flaming hot Thai specialty, is made by pounding dry chili peppers, shrimp paste, lemon grass, onions, garlic and salt, and blending them with steamed coconut milk and soy sauce decorated with egg and slices of raw fish. It is served in a large banana leaf."

The section on night clubs in Osaka, Japan says of Yen Kyo (p. 312). "Another quality Chinese restaurant... Taste the spring rolls, the chicken in papers, and the vegetable bean curd dishes."

In Chapter 12, "Japan," the section on Tokyo states (p. 692): "One can eat squid, lotus roots, roasted sparrows (head, claws and all), raw lobster, embryonic eggs on a stick, cuttlefish painted with soy sauce, blowfish, mud eel, mock turtle, fermented bean curd, bamboo shoots, and quail's eggs,..."

Note: The 1st, 2nd, and 3rd editions all contain 1008 p.

1914. Steinkraus, K.H.; Hand, D.B.; Hackler, L.R.; Van Buren, J.P. 1962. Research on soybean products of improved nutritional value. *Farm Research* (*New York Agricultural Experiment Station*) 28(4):4-5. Dec.
• ***Summary:*** Discusses soymilk and tempeh. As a result of studies at Geneva, the yield of soybean solids for soymilk production has increased from 65 to 90 percent." Photos show: (1) Two men pouring soymilk from a large metal vat into a cooker, in the Cornell "pilot plant process for producing soymilk. (2) Small packets of tempeh wrapped in banana leaves on a round woven bamboo tray in Indonesia. Address: Dep. of Food Science and Technology, Geneva, New York.

1915. Sutedjo, -; Poey, Seng Hin. 1962. Continuation of soya milk trials on premature infants. *Paediatrica Indonesiana* 2(4):129-39. Oct/Dec. [4 ref. Eng]
• ***Summary:*** "In the *Journal of the Indonesian Medical Association* of January 1961 the results of Indonesian made soya milk (Saridele of Jogjakarta) trials on infants and prematures have been published by the writers. Their conclusions are as follows: (a) Cow's milk remains superior to soya milk (saridele). (b) Soya milk, as a source of 'complete protein' in Indonesia–since cow's milk and other animal proteins are still difficult to get and highly expensive–can be used as a 'remedy' and preventive to protein deficiency in adults and children over six months of age. (c) Under pressing circumstances, it can probably be used also as a substitute for cow's and breast milk on infants over four months old. (d) On infants less than six months–to be more exact less than four months–soya milk is unfit for use as a substitute for cow's milk and breast milk." Address: Pediatric

Dep., Medical School, Univ. of Indonesia, Jakarta.

• ***Summary:*** A large chart (p. 18-19) lists the various ways of using the soybean plant and its seeds, including many foods and non-food industrial uses. From the cake or meal (*torta*) one can make adhesive materials, fertilizers, animal feeds, glue (*cola*), and plastics. Also food products: Flour, sauce (*môlho*), milk, etc. And industrial protein (*proteína industrial*).

From soy oil one can make various food products including margarine (*margarina*), salad oil (*óleo para salada*), cooking oil (*óleo para cozinha*). The green seeds can be used to make conserves or canned foods (*conservas*), salad (*salada*), or cooked dishes (*cozida*). The dry seeds can be cooked, sprouted, or used to make flour, milk, or animal feeds.

Note 1. This is the earliest Portuguese-language document seen (Aug. 2003) that uses the term *proteína industrial* to refer to isolated soy protein for industrial uses.

Note 2. This is the earliest Portuguese-language document seen that uses the term *margarina* to refer to margarine.

Note 3. This is the earliest Portuguese-language document seen (June 2009) that uses the term *graos verdes* to refer to green vegetable soybeans. Address: Prof. de Agricultura Geral–E.S.A. da U.R.E.M.G.–Vicosa, Brazil.

1918. **Product Name:** Jolly Joan Soymilk Powder.
Manufacturer's Name: Ener-G Cereal Co.
Manufacturer's Address: 1526 Utah South, Seattle, Washington.
Date of Introduction: 1962.
Ingredients: Soy flour, lecithin.
Wt/Vol., Packaging, Price: 15 oz bag in a box.
How Stored: Shelf stable.
New Product–Documentation: Talk with Sam M. Wylde, Chairman, Ener-G Foods, Inc. 1990. Oct. This company was founded in 1910 as Ener-G Cereal Co. in Seattle by Mr. L.J. McCarthy. The principal product originally was Jolly Joan Wheat Germ. This Jolly Joan Soymilk Powder was their first soy product, and an early product of its type in America. The FDA let them get away with using "milk" in the product name for about 5 years, then made them change it, since it did not contain milk (i.e. products that came from a mammary gland). So they changed the name to Jolly Joan Soyquick. Later (in about 1968-69) the Jolly Joan was replaced by Ener-G. Sam was with the company when the Soymilk Powder was launched. This was a powdered soy flour that had been treated (lecithinated) so that it could be mixed with water to make a milk. It was sold in a bag in box with recipes and a nutritional analysis on the sides. The main buyers were people with lactose intolerance. It was specifically marketed to those people, both adults and weaned infants.

The company's main business at this time was dietary foods.

1919. Genin, G. 1962. Le lait dans le monde [Milk in various countries of the world]. *Lait* (*Le*) 42(419-20):636-44. [Fre]
• ***Summary:*** The section titled "Japan: Manufacture of milk from soybeans" (p. 643) states: A former major in the Imperial army, Mr. Fujita, has found a way to furnish the Japanese population with an economical milk without increasing the importance of dairy animals. The milk which Fujita calls "Milkis" has a major advantage–its price is only one-third as much as that of cow's milk and the Department of Defense has created a pilot plant for the monthly production of 20,000 bottles (*flacons*) of this milk.

The milk is made from soybeans by a process which takes only 30 minutes. The national organizations which are working to develop the consumption of milk in this population are very interested in this new process. Address: Ingénieur E.P.C.I.

1920. **Product Name:** Vitasoy Soya Bean Drink (Sterilized in Narrow-Necked Soft Drink Bottles) [Malt].
Foreign Name: Wai-ta-nai.
Manufacturer's Name: Hong Kong Soya Bean Products Co. Ltd.
Manufacturer's Address: Aberdeen, Hong Kong.
Date of Introduction: 1962.
Wt/Vol., Packaging, Price: 6.25 oz soft drink bottle, sealed with a metal crown cap and sterilized.
How Stored: Shelf stable.
New Product–Documentation: Orr and Adair. 1967. Tropical Products Institute Report G-31. "The production of protein foods and concentrates from oilseeds." p. 70-71. Manufacturer: "The Hong Kong Soya Bean Products Co. Ltd., 29 Wong Chuk Hang Road, Aberdeen, Hong Kong. Date of Start of Production: 1940–discontinued 1942–recommenced 1945. Form of Product: Liquid 'milk': plain and malted. Ingredients: Soya, with added fat, calcium and vitamins. Composition: Plain 'milk': protein 3%; fat 2.5%; carbohydrate 5.7%; minerals 0.7%. Form of Packaging: Glass beverage bottles, sealed by metal crown."

"Volume of Sales: 2½ million cases, 60 million bottles annually. Channels of distribution: Retail trade essentially, but apparently some sales to schools and hospitals. Capacity of Plant: 240 8 oz bottles per minute. Cost Data:... manufacturing 15% of selling price; administration and overhead 5% of selling price; selling expenses 25% of selling price. Price Data: Plain 'Vitasoy': Ex-factory = H.K. $3.60 per case of 24 bottles or roughly 4/6d. per case or 2½d. per bottle. Assistance from Government/International Agencies: None. Quality Control Facilities: Internal laboratory, headed by graduate in bio-chemistry. Promotion: Extensive promotion over the years at dealer and consumer level. Still spend 5% of selling cost on advertising and promotion."

Vitasoy International Holdings Ltd. 1994. March 15. "New Issue..." Page 14 states: "The introduction in 1962 of a malt Vitasoy helped lead to further increases in sales."

1921. **Product Name:** [Soymilk].
Manufacturer's Name: Nihon Tanpaku Kogyo.
Manufacturer's Address: Japan.
Date of Introduction: 1962.
New Product–Documentation: Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 63-64. This was Japan's second commercial branded soymilk.

1922. Tsuchiya, Kanji. 1962. Dasshi daizu-ko no seisei hôhô [Method of refining defatted soybean powder]. *Japanese Patent* 16,658. Application filed 1961. [Jap]*

1923. Anderson, David W. 1962. Problems in formulation of soy milk. In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 166-74. [11 ref]
• ***Summary:*** Contents: Goitrogenicity of soy. Amino acid supplementation of soy milk. Summary. References. Address: Pharmaceutical Div., The Borden Co., 350 Madison Ave., New York 17, NY.

1924. Anson, M.L. 1962. Oilseed proteins in foods. *Archives of Biochemistry and Biophysics.* Supplement 1. p. 68-77. [23 ref]
• ***Summary:*** "A major occupation of man is to feed plant materials to animals and to use the animals as a source of animal protein foods. It is now possible, by applications of modern biochemistry and technology, to feed oilseed materials into a factory and to come out with protein foods similar to animal protein foods in nutritional value, taste and texture.

"Protein technologies were developed in the Orient thousands of years ago to produce products such as soybean curd and fermentation foods which still play a big role in the protein economies of hundreds of millions of people. The modern oilseed meals now produced at very low price give promise of being very useful in the fight against protein malnutrition in poor countries."

"During World War II, Henry Ford, who had the soybean religion, made large amounts of good 'ice cream' entirely from soy protein and fat, until he was stopped. The Chinese have a variety of cheese made from soybeans."

In the section titled "Ancient foods based on oilseeds," the author discusses soy milk and bean curd (tofu) in detail. He notes that traditional fermented foods serve primarily as a source of flavor, and perhaps of vitamins. "In Japan today scores of thousands of factories, big and little, make the traditional soy foods. These factories use up not only local soybeans but almost 10% of the huge American crop. The Japanese eat much more soy protein than meat protein." Address: 100 Eaton Square, London, S.W.1, England.

1925. Carroll, William R.; Muhrer, Merle E. 1962. The scientific contributions of George Washington Carver. Department of Interior, National Park Service. 60 p. See p. 20. Unpublished manuscript. [45* ref]
• ***Summary:*** The National Park Service commissioned this paper in connection with the Carver National Monument that it manages in Diamond Grove (also called Diamond) Missouri. The authors theorize that Carver may have been influenced in his peanut research by his knowledge of existing processes for making products from soybeans. "W.J. Morse, in an article on the soybean industry in the United States in 1917 reported that the Chinese had long used soybeans as a source of oil and food. Among the products they had developed were meal, flour, sauces, soybean milk, buttermilk, cheese, chocolate custards, etc. These products bear such a close resemblance to many of Carver's peanut products that it is quite possible he used these well established processes for his preparations and merely substituted peanuts for soybeans. Of course, scientific insight was necessary to see the possibilities of peanuts in terms of soybeans." Address: Dep. of Agricultural Chemistry, Univ. of Missouri, Columbia, Missouri.

1926. Cummins, J.S. ed. 1962. The travels and controversies of Friar Domingo Navarrete 1618-1686. *Works Issued by the Hakluyt Society* (*Cambridge, England*) No. 118. cxx + 475 p. Series 2. 2 vols. See Vol. 2, p. 195-96. Index. 28 cm. [273* ref]
• ***Summary:*** This work contains the "earliest accurate description by a European of food use of soybeans" (T. Hymowitz). The author, Domingo Fernández de Navarrete, is referred to as "Navarette" throughout this book. For details, see Navarrete's 1665 journal entry. Cummins states (p. cxix): "This edition is not a translation of the *Tratados,* for it is limited to the sixth book, namely the autobiographical section of the *Tratados.* Yet the section on tofu is almost identical (except in capitalization, italics, and punctuation) to the first English translation published in 1704 by

Churchill and Churchill. The title page notes that this work was "Edited from manuscript and printed sources by J.S. Cummins."

At the very end of Chapter XIII, titled "My journey to Che Kiang and stay there till the persecution," the author describes tofu in China. Note that Chekiang is today the name of a coastal province in eastern China, bounded on the north by Kiangsu province, on the south by Fukien [Fujian] province, and on the east by the East China Sea. Writing in the year 1665, Navarrete says (p. 195-96): "16. Before I proceed to the next Chapter, because I forgot it in the first Book, I will here briefly mention the most usual, common and cheap sort of Food all China abounds in, and which all Men in that Empire eat, from the Emperor to the meanest Chinese; the Emperor and great Men as a dainty, the common sort as necessary sustenance. It is call'd Teu Fu, that is, Paste of Kidney Beans.* I did not see how they made it. They drew the Milk out of the Kidney-Beans, and turning it, make great Cakes of it like Cheeses, as big as a large Sive [Sieve], and five or six fingers thick. All the Mass is as white as the very Snow, to look to nothing can be finer. It is eaten raw, but generally boil'd and dress'd with Herbs, Fish, and other things. Alone it is insipid, but very good dress'd as I say and excellent fry'd in Butter. They have it also dry'd and smok'd, and mix'd with Caraway-seeds, which is best of all. It is incredible what vast quantities of it are consum'd in China, and very hard to conceive there should be such abundance of Kidney-Beans. That Chinese who has Teu Fu, Herbs and Rice, needs no other Sustenance to work, and I think there is no body but has it, because they may have a Pound (which is above twenty Ounces) of it any where for a Half-penny. It is a great help in case of want, and is easy for carriage. It has one good Quality, which is, that it causes the different Airs and Seasons, which in that vast Region vary much, to make no alteration in the Body, and therefore they that travel from one Province to another make use of it. Teu Fu is one of the most remarkable things in China, there are many will leave pullets for it. If I am not deceiv'd, the Chinese of Manila [Philippines] make it, but no European eats it, which is perhaps because they have not tasted it, no more than they do Fritters fry'd in oil of *Ajonjoli* (a very small seed they have in Spain and India, which we have not**) which the Chinese make in that City, and is an extraordinary Dainty, of which Europeans do deprive themselves."

Footnotes: "*To fu, or beancurd, is made of the soya beans which were familiar to the servicemen in the East during the Second World War; few of them would 'leave Pullets for it (see Couling 46). **Ajonjoli, oil extracted from sesame (*Sesamum indicum*), used as an olive-oil substitute, a hair-dressing, and for medicinal purposes."

Near the end of Chapter 14, titled "My journey to the Imperial City, and residence there," Navarrete writes (p. 242-43, concerning the period 1666-1669): "19... My two Companions, three Servants and I continued in the Imperial City from the 28th of June till the 13th of September. During this time, bating Fish, Flesh and Wine, the Emperor allow'd all our Expence, as well as theirs; so that we had Rice, Wood, Herbs, Oil, and what they call Teu Fu [tofu] in abundance brought in to us; so that when we went away the Fathers of the Society that remain'd behind were stock'd for a great while with Rice, Wood, Oil and Vinegar." Note: The tofu, being a perishable food, would have been consumed within a day or two.

This first part of this book (p. xix–cxx) gives a detailed biography of Fernández Navarette. It begins: Few men have had more literate enemies and as many inventive biographers as Domingo Fernández de Navarrete (1618-86)..." The best of his life was spent working as a missionary in China, where he was a determined opponent of the evangelical methods of the 'Jesuit Mandarins.' On his return to Europe he wrote an account of China, the *Tratados... de la monarchia de China.* This is an enthusiastic compendium of contemporary knowledge of the Empire, which Navarrete constantly exalts as a Utopian state fit to be imitated by Europe... the author, wherever he went, had an observant eye, an open ear, and an ever ready pen... This edition of Navarette's travels is based on all of [his] writings, but principally upon the sixth book of the *Tratados"* an autobiographical account of his travels. Navarrete was born in 1618 in Castrogeriz, Spain (he was Castilian), and he died in 1686 on the island of Santo Domingo, where he was Archbishop and Primate of the Spanish Indies. In 1635 he became a Dominican friar in Peñafiel, Spain. In July 1645, at the age of 27, he volunteered for the Philippine mission. En route he spent 2 years in Mexico, from Aug. 1646. Landing in the Philippines on 23 June 1648, he did mission work among the Filipino Indians, then taught at the University, where his brilliant, curious mind was recognized. He then joined the Dominicans in China, arriving in Macao in 1658. "From the very beginning he seems to have fallen in love with China and its people," among who he now remained working until the outbreak of the persecution of 1664. He learned the Chinese language well–and loved it. He became very critical and accusing of the Jesuit missionaries in China–which later embroiled him in controversies with them. He reached Canton in March 1666, and spent the next 4 years under house arrest until Dec. 1669. Subsequently he travelled in many countries and underwent frightening adventures, finally arriving back in Spain in Dec. 1674. There, in Madrid, he wrote extensively–starting with his *Tradutos* [*sic, Tratados*] *historicos, politicos, ethicos y religiosos de la monarchia de China* (518 pages, divided into 7 Treatises) in the first half of 1675. In 1677 he was nominated Archbishop of Santo Domingo, where he arrived on 20 Sept. 1677. He died there of an illness in Feb. 1686. Address: King's College, Univ. of London.

1927. György, Paul; Omans, W.B.; Hau, E. W-S. 1962. Feeding value of soy milks for premature infants. In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 179-87. [9 ref]
• ***Summary:*** Discusses Sobee, Mull-Soy, Soyalac, and Saridele. The influence of processing on protein quality appears to be much greater in the case of soy than in the case of milk. For the soy-based formulas noted above, PER values from 1.39 to 2.20 (skim milk control is 2.63) are reported. Address: 1. Chairman of the Dep. of Pediatrics, Philadelphia General Hospital, Philadelphia, Pennsylvania.

1928. György, Paul (moderator); Anderson, D.W.; Fomon, S.J.; Hand, D.B.; Miller, H.W.; Sarett, H.P. 1962. Panel discussion on soy milk. In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 188-91.
• ***Summary:*** This discussion of the five papers in Section V ("Processing and feeding value of fluid and dry soy milks") focuses mainly on feeding soy milks to infants and children, rather than to adults.

"In introducing the panel discussion Dr. György said that FAO is writing a manual on milk and milk products. Several years ago FAO wrote a summary on milk. At the first two conferences 4 years ago there was considerable opposition to calling soy milk by that name. There is still opposition, but on the international level objections have subsided. Soy milk has taken its place along with human (or breast) milk, goat milk, and other milks which are normally designated to distinguish them from cow's milk.

"Dr. Fomon commented that it is important that a study be made on a number of babies (30 or more) from birth up to 8-9 months of age. They have some opportunity to do this with students' babies. Controls are breast fed or fed pooled human milk. Dr. György said that for premature babies breast milk is not satisfactory. In the Orient most mothers nurse their babies as long as they can, 1 to 2 years, and a higher protein diet is needed for the older babies to prevent the occurrence of kwashiorkor.

"Dr. Fomon expressed the opinion that for experimentation involving full-term babies the soy milk and human milk should be compared on an equal protein and fat basis." Address: 1. Chairman of the Dep. of Pediatrics, Philadelphia General Hospital, Philadelphia, Pennsylvania.

• ***Summary:*** Contents: Interrelation of soybean fractions. Procedure for pilot-plant production of full-fat soy milk fractions. Indices of quality in relation to processing conditions. Nutritional assessment. Conclusions. Pilot-plant equipment for soybean milk line: Lists 17 pieces of equipment. Address: Dep. of Food Science and Technology, New York State Agric. Exp. Station, Cornell Univ., Geneva, NY.

1930. Hayashi, Shizuka. 1962. Problems involved in increasing world-wide use of soybean products as foods in Japan. In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 200-06.
• ***Summary:*** Contents: Price. Quality. Margarine and shortening. Mayonnaise. Miso, shoyu, tofu. Soybean meal. Soy flour. Soy milk. Frozen tofu. Food sources of Japan.

The 400,000 tons of soybeans produced in Japan are used for foods. From approximately 1 million tons of imported soybeans, Japan produces 150,000 tons of oil and 700,000 tons of meal. "Japanese oil consumption is the poorest [i.e. lowest = best] among the world nations. We need to consume oil at more than 5 times the present quantity to reach the level of the western countries." In 1952 Japanese consumption of edible oils was 7.52 gm per person per day, increasing to 11.52 gm in 1960. Soybean oil supplies about 30% of Japan's total oil supply. The main obstacles to greater consumption are price and quality (due to flavor reversion). The leading oil is rapeseed oil. The main oils used in margarine and shortening are fish oil (35.8% of total), beef tallow (25.4%), whale oil (10.0%), and coconut oil (8.0%).

New developments with traditional Japanese soy foods include: Dried, powdered miso in instant form is now available. Soybean meal is now the main ingredient in shoyu, rather than whole soybeans. A few soy milk plants have been erected and bottled soy milk is now sold in the market in limited areas. A certain culture is used to eliminate the beany flavor. Today, soybeans and soybean products provide the average Japanese with 10.6 gm/day of protein (16% of total protein consumption of 67.7 gm), and 7.6 gm/day of fat (28% of total fat consumption of 26.7 gm). During the period 1934-38, average Japanese protein consumption was 54.9 gm per person per day and fat consumption was 13.2 gm (less than half what it is today). Address: Managing Director, Japanese American Soybean Inst., Nikkatsu International Building, Room 410, No. 1, 1-Chomo Yurakucho, Chiyoda-Ku, Tokyo, Japan.

1931. Hilbert, G.E. 1962. Foreign research program of U.S. Department of Agriculture on soybean protein products under Public Law 480. In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria,

IL: USDA NRRL. iii + 242 p. See p. 93-98.
• ***Summary:*** "For many years, the Department was financing with dollars a farm research program abroad."

"A considerable expansion of our foreign research program was effected a few years ago under Public Law 480. This program of research is financed with foreign currency accruing to the United States from the sale of surplus agricultural commodities, and, in a sense, trades surpluses for research results. Research in the field of economics, forestry, farm, marketing and utilization is carried out under this program. Projects are selected for financing which are of direct interest to the United States and also of interest to the foreign country.

"At the present time, 195 grants or research agreements have been executed in 20 countries in Europe, Asia, and Latin America. Funds are available to initiate programs in an additional 6 countries. Proposals from most of these countries are being processed at the present time. The annual cost of the grants already executed amounts to about the equivalent of $2-2½ million in foreign currency annually. Substantial funds are available for the expansion of this program.

"The Public Law 480 foreign research program is being administered by the Foreign Research and Technical Programs Division, Agricultural Research Service, U.S. Department of Agriculture, in Washington. A regional office has been established in Rome, Italy, to negotiate the costs of grants and administratively supervise the program in Europe and the Near East. A regional office has been established in New Delhi, India, also, to carry out the same functions in the Far East.

"The technical phases of the program–that is, the approval of projects on which grants are executed and the review of progress reports–are handled by the various research divisions in the Department. For example, all projects on the utilization of soybeans fall under our Northern Utilization Research and Development Division. All those dealing with the nutritional aspects of soybeans as a food are under the jurisdiction of the Institute of Home Economics.

"Ideas for new research projects may come from within the Department, from research organizations abroad, from our Research and Marketing Advisory Committees, from national commodity organizations, or from the processing industry. We are indebted to The Soybean Council of America for the interest it has taken in developing our research program on soybeans abroad. The Council has stimulated many foreign research groups to submit projects on improving uses for soybeans. It has brought to our attention, also, important problems on soybeans that need attention.

"In developing a program on soybeans we have been faced with the problem that most countries in which we have funds have had practically no knowledge or experience on the uses of soybeans, and have conducted very little research on their utilization. The opportunity has been very limited for financing research on the utilization of soybeans in laboratories with background experience on its products.

"Fortunately, the activities of UNICEF and FAO, on increasing the protein level of the diet in the developing areas of the world, and the powerful market development program of The Soybean Council of America, have stimulated great interest in many countries on the usage of soy products in the diet. These efforts have facilitated the development of our research program on soy products.

"As the primary emphasis of this conference is on soybean products for protein in human foods, the research work we are financing on soybean oil and fatty acids will not be discussed here. My talk will cover only those projects dealing with soybean proteinaceous foods, and with minor components in soy flour or soybean products which may affect their food value. A dozen or more projects of this kind, in half a dozen countries, are underway or will be shortly.

"At the National Institute of Nutrition in Rome, Italy, we have executed a grant with Professor Visco to finance research on the use of soybean protein products as supplements to wheat flour production of pasta, such as spaghetti and macaroni. The southern part of Italy depends to a large extent upon cereal grains as the main staple of the diet. Raising the protein level and quality of the diet in Italy could be done readily by increasing the protein content of pasta with soy protein products. Professor Visco has set as his objective an increase of 10 percent in the soy protein content of pasta. He believes this amount of soy protein in pasta would provide all the essential amino acids necessary for good nutrition. The Institute has produced pasta containing 10 percent by weight of soy protein. Pasta containing the type of commercial soy protein used was unaltered in cooking quality, but had a slight gray cast and slight change in flavor. The effect of lowering the content of soy protein on color and flavor of pasta is now being investigated. The effect of other sources of commercial soy protein on color and flavor will be studied, also. Professor Visco is interested in following up these studies by conducting nutritional investigations on groups of school children, using pasta fortified with soy protein.

"In Japan, we are negotiating a grant with the Food Research Institute, in Tokyo, for research on dried tofu. Fresh tofu is the most important soybean food in Japan. On a dry basis, its protein content ranges from 50 to 60 percent, and fat content from 21 to 50 percent. It has a bland flavor. It is eaten as such usually with soy sauce. Slabs are deep-fat fried [tofu], also, forming an envelope which is stuffed with hot rice. Fresh tofu is made in thousands of small plants, many of them family-run operations. Fresh tofu has a relatively short storage life comparable to that of fresh milk. Dried tofu, which is a spongelike product, has come into production in recent years. It has a shelf life of 6 months or

longer. However, the product is inferior to the fresh product in overall eating quality.

"Under the grant to be carried out at the Food Research Institute there will be studied the varietal effect of soybeans, and variation of processing conditions on the physical characteristics and flavor of dried tofu. Fresh and dried tofu have promise in supplementing the diet in the protein deficient areas of the world.

Miso is another important soybean food used in Japan. It is produced by the fermentation of soybeans with *Aspergillus oryzae*. The most popular use of miso in Japan is in soup. Miso soup plays an important part in the standard Japanese breakfast. Because of uneven uptake of water, not all varieties of soybeans can be used, or only with difficulty, in the traditional Japanese process for making miso. Most Japanese and Chinese varieties of soybeans are better than most American varieties. In preliminary experiments conducted at the Northern Utilization Research and Development Division, in cooperation with two Japanese miso experts, it was found that dehulled soybeans or soybean grits absorbed water uniformly and yielded excellent miso. Now we are interested in following up these studies on a pilot-plant scale using different varieties of soybeans, and carrying out the fermentation under various Japanese environmental conditions. A grant on this project is being negotiated with the Central Miso Institute.

"As it is produced at the present time, miso has a relatively high salt content. Salt is used in the process to control the microbiological population. Dr. Gyorgy informs me that miso with a greatly reduced salt content might make it more suitable for feeding infants and young children. The development of procedures for producing miso containing very little salt might broaden its usefulness." Continued. Address: Director, Foreign Research and Technical Programs Div., USDA, Agricultural Research Service, Washington 25, DC.

1932. Hilbert, G.E. 1962. Foreign research program of U.S. Department of Agriculture on soybean protein products under Public Law 480 (Continued–Document part II). In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 93-98.

• ***Summary:*** Continued: A related project on miso is under consideration in Israel. This is based upon producing a miso-type product from controlled amounts of oil ranging from none to that originally present in the bean. Japanese miso contains all the oil present in the bean.

"We are negotiating one other project with the Food Research Institute in Tokyo. This project deals with the development of procedures for producing a yogurt-type product from soy milk, and obtaining information on the changes that occur in the soybean components in the transformation. It is planned to have cooperative investigations on the nutritional value of the fermented soy milk conducted at the Institute of Nutrition Research under Dr. Arimoto. Although soy milk has been used for many years in the Orient as an infant food, the expansion of its use has been very slow, particularly in the underdeveloped areas of the world. At times, difficulties have been encountered in its large-scale production due either to lack of technical knowledge or to inadequate control methods. Soy milk may cause diarrhea or flatulence in some infants.

"It is possible that fermented soy milk may have advantages over soy milk. One potential advantage of fermented soy milk is that the acid may destroy undesirable microorganisms that too often occur under unsanitary conditions in underdeveloped areas of the world. The widespread use of yogurt in the original primitive areas of Northeastern Europe and Northern Asia may well have resulted from the comparatively greater safeness and stability of this product over milk. At the present time, 45 percent of all milk consumed in the USSR is in the form of yogurt, attesting its popularity and the fact that a taste for it can be acquired. Nutritional studies conducted in Europe have shown that yogurt is a highly nutritious product, and that digestibility is increased during the fermentation. Likewise, the fermentation of soy milk may lead to an improvement in its food value. At any rate, our hopes are high on this project.

"Fermented proteinaceous foods are produced and used in Indonesia. Three types are tempeh, ontjom, and ragi. Tempeh was just discussed by Dr. Steinkraus. Onjom is made by fermentation of peanut press cake with molds, probably the genus *Neurospora.* It is a popular food in West Java. Ragi is produced by a yeast-mold fermentation of rice flour and sugar. Little is known about the micro organisms effecting this fermentation. Ragi is not served as food. It is used in recipes for the preparation of other foods.

"More information on the microorganisms used in the fermentations to produce ontjom and ragi, and on the composition of these products, is needed. Similar types of products might be produced using other raw materials abundant in other underdeveloped countries. Knowledge on the quality of protein produced would be helpful in determining the usefulness of such products in upgrading the protein level of the diet.

"A grant is being negotiated with the Bandung Institute of Technology, Indonesia, on the isolation of pure cultures of microorganisms present in tempeh, ontjom, ragi, and other Indonesian fermented foods produced by different manufacturers in different parts of Java, as well as other islands of Indonesia. Variations of species used by different manufacturers and in different regions for the same type of food fermentation will be investigated under this grant also.

"Studies will be made of the chemical changes and physical transformations brought about by the pure cultures. This will involve an investigation of the products produced

in the fermentations including the proteins elaborated in all except the tempeh fermentation which already is receiving a great deal of attention. Pure cultures of the isolated microorganisms will be studied further and characterized at the Northern Utilization Research and Development Division.

"A number of grants on soybean protein have been executed or are being negotiated with research institutes in Israel.

"One of these deals with the effect of processing conditions on the yield and quality of isolated protein. This grant is being negotiated with Professor Zimmerman, of the Israel Institute of Technology. A great deal of work has been done in the United States and Japan on the commercialization of soy products. Large quantities are being produced, and some are being used for food purposes. However, there is need for more information on processing and drying of soy proteins, and the effect of processing conditions on flavor and nutritive value. This is the kind of research to be carried out in Dr. Zimmerman's laboratory. Also, he will study the flavor and acceptability of isolated soy protein when used in various Israeli-type foods. The effect of processing on the nutritive value of isolated soy protein will be determined by animal feeding tests.

"Although much information has been obtained by Dr. Allan K. Smith and others in the United States on the physical and chemical properties of soy protein, little is known about the complexes of protein in the bean or in the meal. There has been neglected the problem of protein complexes in the native state or formed in soybean oil meal processing operations. Whether protein-phytate complexes exist in the bean or result from interaction during processing operations is unknown. No information is available as to whether nucleoproteins, lipoproteins, and mucoproteins exist in soybeans. we have no knowledge, either, as to the interaction with protein of pigments, metal ions, and carbohydrates during processing of the beans.

"However, these changes affect the color, flavor, and (in view of the sensitivity of lysine) the nutritive value of the protein. This problem on the chemical, physical, and biochemical properties of protein complexes in soybeans will be studied under a grant which is being negotiated with Dr. Katchalski at the Weizmann Institute of Science. Dr. Katchalski's team has a worldwide reputation for the fine work they have done on the structure and modification of proteins. It is an ideal group to investigate this difficult and very important problem, the solution of which may lead to the enhancement of the food value of soy flour and soy protein.

"A grant is being negotiated with Dr. Guggenheim, at Hebrew University, on the development and biological evaluation of protein-rich foods from vegetable sources. Various mixtures of cereals with combinations of soya, sesame, sunflower, and chick peas will be studied. The nutritive value of different combinations of proteins will be assessed on growing rats. In vitro methods of measuring the essential amino acids will be made, also, and compared with levels of amino acids present in the blood of the portal veins of rats following a protein meal. Nutritional evaluation of the protein mixtures on humans will be carried out at a later stage.

"There has been a real need for the development of a rapid chemical method for measuring the biological value of proteins. Such a test would be very helpful in measuring change in nutritive value of proteins, including soy protein or flour, during processing and on storage. we are financing two studies on the development of such a method. One line of work is being carried out at the Israel Institute of Technology under Dr. Zimmerman, and the other at the University of Cambridge, England, under Dr. K.J. Carpenter.

"We are financing three basic investigations on certain minor components of soybeans which may affect the nutritive value of soy products. One of these is a comprehensive study of the simple sugar and oligosaccharides in soybeans. This work is being done at the University of Caen, France. Another investigation deals with a detailed study of the polysaccharides of soybeans, and is being carried out at the University of Edinburgh, Scotland, under Professor Hirst. The third deals with the isolation and characterization of saponins in soybeans and various processed soy products. This study also will include the exploration of methods for inactivating saponins in the processing of soybeans. This work is being done by Professor Bondi, Hebrew University, Israel.

"In this discussion I have summarized, briefly, the various lines of activity we are sponsoring abroad under Public Law 480 on soy protein and proteinaceous soy foods, and related investigations affecting the food value of soy products. It is hoped these investigations in countries where no work on soybeans has been done previously will stimulate additional research on soybeans, and lead to an increased recognition of the importance of soy products in the diet. It is believed these investigations will provide information that should be helpful in guiding efforts to upgrade the diet in protein deficient areas of the world." Address: Director, Foreign Research and Technical Programs Div., USDA, Agricultural Research Service, Washington 25, DC.

1933. Miller, Harry W. 1962. Traditional methods of processing and use of soy liquid and powdered milk. In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 149-56.

• ***Summary:*** "It is a new day when so many important sponsoring organizations join in evaluating the suitability of the protein of the humble soybean to meet the nutritional needs of the human subject, and to study practical ways of

extending its benefits in protein deficient diets.

"In August l940, I presented a paper entitled 'The Role of the Soybean in Human Nutrition' before the American Soybean Association at Dearborn, Michigan, and predicted that the day would come when we would find an awakened interest in this country in utilizing soy products as a part of the American menu. I believe we are rapidly approaching that goal, There is now an awakening in many lands to the needs of better nutrition, and it is timely that study and research be given to how we can utilize the values of the soy protein for universal race betterment.

"Soybeans have for centuries been the chief protein supplier in the heavily populated areas of Southeast Asia. It is well to examine methods of processing and utilization as practiced in the Orient. However, the per capita utilization of soybeans has been far below their needs, ranging from 15 to 50 pounds per annum in countries like China, Japan, and Korea, largely due to the inability of agriculture to keep pace with population.

"It was in these soy-producing and-utilizing countries that I had the opportunity over more than half a century to observe their methods of preparation, and to check the results in the feeding of soy products. Considerable leafy vegetables, stems and 'roots' have to a certain extent supplemented the diet with protein, so that adults of mature age probably get adequate protein. However, the appalling infant mortality and adolescent protein deficiency diseases have stressed the need for increased rations such as may be supplied by the soybean.

"Protein has its greatest contribution during the growing years of life. Three times the amount of protein per unit of body weight is needed the first year of life compared with the adult. During adolescence and the teenage years twice the amount of protein is required till they attain their normal body weight as in after life. If individuals are well grown with ample biologic protein their chances for long life expectancy are enhanced.

"With the infant's short intestinal tract and its immature digestive juices, foods have to be reduced to liquids to be usable. Consequently, a liquid food beverage, if supplied in sufficient quantity and quality, enables normal growth to proceed rapidly. Without it, growth is stunted; anemia, infection follows and many do not survive these years of inadequate food intake. Those that survive childhood often die early in life of degenerative diseases.

"The need of liquid nourishment following birth is evident from the fact that all mammals, including the human, have no provision for taking solid food, so as a starter food a lacteal secretion is by nature supplied, and to meet the need of the growing years of the human, various animal milks have been used. However, the supply is meager in the Afro-Asiatic countries.

"My attention was called to soybeans as a dietary food upon reaching China and living on Chinese cuisine. It was some 20 years later, in 1925, that I embarked on the development of a liquid beverage from the soybean. Considerable progress has since been made in improvement of such a food beverage and its use. However, it is only a few areas where nutritional use is made of soy milk, and much remains to be done in its improvement and distribution to combat malnutrition.

"The Oriental approach to processing the soybean is entirely opposite to that of the west. Western countries process the soybean by grinding it into fine flour after dehulling, and screening through very fine 200- or 500-mesh screens, or shall we call it, the milling operation. While in lands where soybeans have been used for centuries, they first hydrate the beans, or as we call it, use the wet-milling operation.

"In Eastern countries interest in soybeans has been primarily in its protein content, while the West has vied for its oil. It was my good fortune that I began my study of the soybean in the Orient where soybeans were used for human food, rather than for animal rations. Soaking the hard, dry bean was the first procedure, and it then is ground into a milklike slurry. The whole soybean is given a water soak for 8 hours, or after dehulling a water bath for 2 hours. In either case the bean doubles its original weight by water intake. It is then ready for the milling operations. This is accomplished with stone buhr mills, or disintegrators, that break up the continuity of the fiber, and expose its nutrient particles of protein, oil, carbohydrate, vitamins, and minerals to a water wash. The water-soluble nutrients are separated from the fiber portion by filtration. The amount of water used in the slurry mix, its temperature, whether hot or cold, and also the quality of beans, determines the ratio of soluble nutrients to those still clinging to the fiber.

"In fact, there are numerous techniques to be observed to get the dispersible protein and other nutrients in the highest soluble amounts. Beans differ, as also the aging of beans. The nutrient yield is greatest immediately after harvest time. Long heat exposure in warm climates, makes for less solubility. A proper soak is of great importance; then next the grinding of the beans. A small stream of water to give a tearing, rubbing action so as to thoroughly expose all soluble ingredients is preferred to a mill with a cutting action to mince into fine particles. Before filtration this slurry should be agitated and heated, which will yield an additional 10 percent to the soluble ingredients. Several methods of filtration, such as a shaking screen, a plate and frame pres, vacuum drum filters, or centrifuges of various types can be used. A re-grind of the fiber cake and a second extraction makes possible an extra 5 to 8 percent recovery of the solubles. A possible 92 percent of protein with other nutrients in proportion has been attained by grinding and filtration methods. In practical plant operations we expect 60 to 80 percent protein recovery of the original bean. This leaves considerable nutrients in the fiber or pulp, which is then used

for stock feed.

"The milky solution thus extracted is used either for cheese curds of various types, or is formulated and processed into a beverage milk–liquid or powdered. Soybeans are used in different countries in making a savory sauce, called Soy Sauce; a soup base as in Miso, or as a fermented bean as Japanese Natto. They are eaten as immature green beans in pod or shelled and are very delicious.

"Soy Milk: Trials have been made in the past to utilize soy milk by the Asiatics but for lack of proper processing methods such milk, as filtered and not formulated, was neither tasty nor nutritionally acceptable, giving rise to very unpleasant digestive responses. I have repeatedly asked in parts of China, Japan, and Korea why it was not used as a beverage, always with the same answer, that it gave rise to intestinal disturbances. So a cheese curd is used instead of milk. Curdling it into a cheese, through the use of calcium salts, vinegar or other coagulative agencies, has resulted in many savory food products. Heating this milk extract causes a scum film [yuba] to form, also very tasty, and the remaining portion is curdled and made into cheese cakes of varying dimensions and density. All such sheets and blocks of curd receive a second cook, or are fermented, which seems to render them more digestible.

"Soy cheese or curd is easy to market and very popular, being tastily flavored and combined in the Chinese cuisine as a meat, fowl, and fish replacer. The Japanese report 70 different forms or dishes utilizing soybeans, and the Chinese even more. Out of 1 pound of soybeans they make 4 pounds of curd called Tofu.

"While we have spent some time in Indonesia we have had little experience with Tempe–a fermented soybean food product.

"My contributions had to do with developing an easily digested and highly nutritious soy milk, and processing it sufficiently to render it acceptable to both infants and adults. The extract from the bean which is rich in protein can be formulated as desired with added fat, carbohydrate, minerals, and vitamins. These properties can be varied or formulated to that of human milk, or any other type of animal milk. The final product can be made in a single strength, or condensed to double strength and canned, or spray-dried as a powder.

"Our first work in developing a formulated soy milk dates back 56 years ago when we secured a Disper mill [Dispermill], or homogenizer, to constitute a formulated liquid. This soy milk was first used in the Shanghai Sanitarium and Hospital as a table beverage for nurses, helpers, staff, and patients of the institution, and later to the baby and children's ward of the Shanghai Clinic and Hospital. Here we had baby boarders, infants kept under observation on soy milk feeding for up to 2 years. The results of this feeding was reported in the China Medical Journal of 1957. Many other farmed out research studies were made, such as at the indigent hospital in the Philippines; at the Tokyo University, and the Ohio State University in America.

"Results on the Ohio State study are shown in Figure 1.

"The first commercial development was a soy milk dairy established in Shanghai in 1935, the process used was in-bottle sterilized milk, formulated to the standard of cow's milk; also a chocolate milk; and a soy-acidophilus milk, which was extensively marketed all over the city of Shanghai up until the plant was destroyed in 1937 by the bombing of Shanghai.

"A soy milk powder plant was also fabricated there, using a local made Grey Jensen spray dryer, which also came to an end in the same way at the same time.

"There are many technical problems involved in producing a satisfactory nutritional beverage from the soybean to simulate milk, which in the few moments we have would be impossible to enter into. These are gradually being solved, such as improved color, taste, stability, condensing as a double strength canned milk, and as an instant soluble powdered soy milk. On vacuum pan evaporation, due to the viscosity of soy milk, concentrating to more than 30 percent solids is the limit, as compared with animal milk at 45 percent solids. However, generally speaking, once a water extraction soy milk is obtained the same methods and equipment used by the dairy industry are applicable to produce it in various forms for marketing" (Continued). Address: M.D., Director Emeritus, International Nutrition Research Foundation, 11503 Pierce Blvd., Arlington, California.

1934. Miller, Harry W. 1962. Traditional methods of processing and use of soy liquid and powdered milk (Continued–Document part II). In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 149-56.

• ***Summary:*** Continued. "Once we have obtained a fiber-free milklike fluid from the soybean, containing the water dispersal nutrients of protein, oil, carbohydrate, minerals, and vitamins processed to make them nutritionally acceptable, it no becomes a question as to formulation. No standards have yet been set for the resulting formula. Composition of soy milk today has been a matter largely decided by the respective manufacturers.

"Dr. E. A. Ruddiman working in the early 4O's at Dearborn with the Ford Foundation, tackled this subject in a paper to the A.S.A. suggesting that cow's milk be the standard. Few pediatricians today accept that for infant feeding.

"We know fairly well what are obtained from the hydrated bean with 7 parts of water to 1 part of bean by weight; namely, 3.64 percent protein; 1.8 percent fat; and considering 40 percent of carbohydrate to be edible, a usable 1.5 percent dextrines, sucrose, and starch. In brief, the edible entities extracted from the soybean of fat and carbohydrates

are each half that of the protein.

"To this, additives can be added to formulate human milk, cow's milk, cream, and ice cream mixes of any variation desired. The types of beans used, methods of manufacture, causes variation in availability of nutrients and elements found in various preparations, so that chemical formulae do not always coincide with usability of nutrient.

"Thus far I have dealt with a nonfiber soy milk made either from the whole soybean, or dehulled, using only the cotyledons. This is the practice of the Orient and it is my belief that human nutrition is so important that we can afford to sacrifice to animal feed the fiber and small amount of ingredients that cling to it in order to obtain the rich ingredients in soluble form. It is still economical compared with other similar products on the market.

"However, some researchers have been making milk from the whole dehulled soybean used in entirety, giving us 3 percent fiber on a dry basis. For older children and adults this can do quite well when formulated. We have objected to the fiber on the grounds that animal milks are fiber free, and on coagulation we get a rough, tough curd as compared with a smooth, jellylike curd made from a fiber-free liquid. Isolated protein, either in entirety or combined with raw soy milk can be processed and formulated into a fiber-free milk. Here we need to be careful of having the proper additives. We have made fiber-free milk from the 70 percent soluble soy flakes or grits, and when fortified with vitamins and minerals, good growth records have resulted in animal feeding.

"We may say that protein is protein from the soybean, but too long processing at too high temperature, and too much exposure to chemical changes leaves a question in our minds as to whether we destroy its soy nutritive values. We do know that all soy milk needs a heat treatment above boiling to destroy the trypsin inhibitors.

"The one outstanding problem of soy milk, whether from the whole soybean, or its extracted solubles, is a characteristic soybean flavor. Since soy milk looks white like animal milk, those accustomed to animal milk think it should taste like cow's milk, especially since it is called a milk. The dairy people object to the word 'milk' used in reference to soy milk, claiming the term 'milk' designates an animal secretion.

"Trying to overcome this prejudice of the laity has led to much experimental work. We shall not be able to simulate the taste of cow's milk unless we use some derivative of animal milk, but we can mask the soy flavor by processing methods, also by additives of distinctive flavors.

"I wish to conclude this paper by referring to the widespread possibilities of the utilization of the soybean, and the economics involved. We assume that for adequate nutrition all nations of mankind need a milk beverage, especially in the very earliest years of life to promote adequate nutrition. The possibility of achieving this lies only with the soybean. The human, as well as all other mammals, require a milk for post-natal feedings. Soybeans can make this possible for the entire human race through improved and extended agricultural production and efficient processing methods, and within the reach of the meager economies of nations.

"Using the formula of animal milk, from l pound of soybeans we can obtain sufficient protein extracted to formulate a gallon of milk. This pound of soybeans yields all needed protein, half of the required oil, and some of the edible carbohydrate. The B vitamins, together with some minerals are present, and other vitamins can be added at low cost. At the market value of the sum total of constituents needed to constitute a gallon of formulated vitamized soy milk less than 15 cents is required, and these figures answer quite well for most parts of the world. While vitamins cost more in certain areas than they do here, added carbohydrates and the oil is cheaper in certain areas. The greatest expense, of course, is in processing equipment. Low-cost small pilot plants operated by cheap labor in countries of low economic resources seem very practical. These figures and statements are verified through the operation of several small pilot plants in Southeast Asia countries. The United States and China produce soybeans abundantly, and with the rising prices of soybeans, they are still the best buy of any agriculture product produced from the soil when their contained nutrients are used to sustain human life.

"It must be remembered that nearly all Afro-Asiatic people cannot afford containers, or the overhead cost of merchandising. They live largely on foods they produce and prepare at a consumer cost little above what the agriculture producer gets for his crops.

"The soybean is rightly called, because of its comparative wealth nutritionally, "gold from the soil." It ranks as the most outstanding product Americans can export if rightly processed for world nutritional relief. Great progress has been made in the adaptation of soy formulated foods for animal and pet diets. The soybean, in the light of what role it has had in preserving the millions of Southeast Asia people for centuries, deserves the combined efforts of scientists, nutritionists, and financiers to lift it into a human acceptable and economical available food.

"The soybean is variously called 'gold from the soil' or 'meat without bones.' With its multitudinous variety of ways to incorporate it in the human diet, I would like to give one more fitting title to it as a 'universal protective factor of diet.' Animal milk has served this role in Western lands, but is of limited availability. Soybeans incorporated in the national diets as a milk and cheese, and its many other recipes, if supplied in adequate quantities insures balanced nutrition. It is a body builder from infancy to the age limit. It is unique compared with other agriculture products in that it is available as a liquid, curd, or solid, as whole beans and flour.

"Yet, as a food supplier, the soybean has had little scientific research or the help of modern trained technicians.

We still hark back to the know-how of the Oriental people who have learned to relish the soybean and know of its building power, and enjoy its energy yield.

"We depend on flash pasteurization and a vacuum pull to de-bitter the beany odor and taste, but no one has come up with the answer, to what it is and from what it comes–the fat or carbohydrate component. We have had some success in a cheddar cheese, but so far have not been able to make a cheese that melts. It is to be hoped as a result of the study and interest that prompted this assembly that chemists, technicians, and dietitians, along with the agriculturists, can solve these interesting problems. It may be that an agronomist will come up with a new soybean with a delicious flavor." Address: M.D., Director Emeritus, International Nutrition Research Foundation, 11503 Pierce Blvd., Arlington, California.

• ***Summary:*** "Soybean milk is prepared in the laboratory under various conditions to discuss the effects of the amount of water added, heating temperature and heating time on its chemical composition and physical properties. When the amount of water is less than 5 times [the amount] of soybean, a part of its protein becomes insoluble and the viscosity of the milk is unusually high. The viscosity of the milk after dilution is higher than that of the milk which is diluted before heating. The chemical composition and physical properties of the milks prepared by heating before and after filtration are compared. Although the chemical composition of both milks are not so different, the viscosity of the latter milk is lower than that of the former.

"When 1.0% NaCl or 10% glucose or sucrose are added to the milk, they increase somewhat the viscosity. By adding 0.15% NaCl before heating, the viscosity of the milk becomes fairly higher than by adding after heating.

"The characteristic odor of soybean milk can be removed by soaking soybeans in 0.01-0.1% hydrogen peroxide solution and putting hot steam into the milk for 10 minutes." Address: National Food Research Inst., Tokyo.

1938. Wik, Reynold Millard. 1962. Henry Ford's science and technology for rural America. *Technology and Culture* 3(2):247-58. Summer. [37* endnotes]

• ***Summary:*** "Unquestionably Ford's greatest contribution to the application of technology to American agriculture lay in his insistence that mechanical power should supersede animal power on the farm... The story of how Ford's mechanical contraptions changed rural life in America is well known. Not so well known, however, are his attempts to introduce scientific technology into American agriculture."

One of Ford's early scientific efforts to improve agriculture consisted of experiments to produce alcohol as a motor fuel by distilling it from farm crops. When World War I threatened to create a gasoline famine, he announced in 1915 that alcohol could be extracted from grain and from garbage. The new Fordson tractor would be designed to burn alcohol as well as gasoline; thus the supply of fuel would be unlimited... Although the Ford Motor Company experimented with alcohol distillation in the Engineering Laboratory in Dearborn from 1915 to 1917, the efforts were feeble and inconsistent.

Note that Ford did not invent the idea of fuel alcohol. "As early as 1908, the British attempted to secure motor fuel for transport in Africa by distilling alcohol from sugar cane. In the same year, the Hart-Parr Company of Charles City, Iowa, equipped some of their tractors in Idaho, Colorado, and Cuba with alcohol-burning carburetors."

In the spring of 1921 Ford exploded one of his journalistic bombshells "when he exclaimed, 'The cow must go.' To replace the milk produced by cows he proposed artificial milk made synthetically. His dislike of dairy cows stemmed from unpleasant experiences on his father's farm where milking had been a most disagreeable and exasperating chore. Now he regarded cows as inefficient and unsanitary animals. [Their milk carried tuberculosis.] At times he refused to drink milk. "When asked why he owned 150 head of excellent Durham and Ayrshire dairy cows and one of the best dairy barns in the state, he replied that these

were kept just to prove they were all wrong."

Yet it was the soybean which gave Ford his best opportunity to apply science and technology to farming practice. The 'Ford and the Beanstalk' story originated as another panacea to fight the depression following the stock market crash of 1929." Rejecting other plans, "Ford came up with his own self-help solution which called for closer cooperation between industry and agriculture. If industry could use more agricultural products, this new demand would raise prices of farm crops...

"After some experimentation in the new Edison Institute of Technology in Dearborn in 1930, Ford chemists chose the soybean as the most promising raw material... The company spent $1,250,000 on soybean research in 1932 and 1933. Three hundred varieties of the bean were planted on 8,000 acres on the Ford farms."

Note 1. This is the earliest document seen (Jan. 1998) that uses the word "technology" in connection with soybean farming and production.

Note 2. The author is one of the country's leading authorities on the history of American technology. Address: May Treat Morrison Prof. of American History, Mills College, Oakland, California 94613.

1939. Madison Foods. 1962? The story of Madison Foods. Madison, Tennessee. 17 p. Undated. 22 x 10 cm.
• ***Summary:*** Contents: The early history of Madison and the story of Madison Foods. Early pioneers (with photo taken in about 1909 including W.C. White, Ellen G. White, Mr. and Mrs. Edson White, P.T. Magan, Mother Druillard, and E.A. Sutherland). Industries. Madison hospital offers you. Tasty, healthful Madison Foods: High in proteins (cans of the following are shown): Cheze-O-Soy, Com-Pro, Dinner Morsels, Kreme-O-Soy, Madison Burger, Madison Links, Not Meat, Soy Beans in Tomato Sauce, Nu-Steaks, Stakelets, Soyburger, Yum, Vigorost, Zoy-Koff.

The home of Madison Foods. Dr. Claxton (former U.S. Commissioner of Education) says. Dr. P.A. Webber. Madison College is vegetarian. Madison meat alternates for all. Kreme-O-Soy (a new double-strength milk-like canned beverage).

J.B. Craw (with photo), manager of Madison Foods, says: "New life has come to Madison Foods! The expansion program is moving forward. In fact, the entire food factory is being remodeled; new equipment is steadily and carefully being installed, and new products manufactured.

"Kreme-O-Soy, double strength liquid, is now on the market. It is an entirely New soy milk, an entirely New Formula... in a little while we will have a powdered soy milk.

"We are glad to have H. Willis Miller, Jr., the son of H.W. Miller (China Doctor) with us. Willis is doing a wonderful job of engineering in the placing and manufacturing of newly designed equipment to fit our special

need for the new products that will be coming out one by one. We will soon have a modern plant of which we can be very proud."

Other new products: Madison Links, Com-Pro. A message from the president: Ralph M. Davidson (with photo. Note: He was president of Madison College from 1961 to 1963).

President Davidson notes: "Madison Foods, an integral part of the college educational program accomplishes a three-fold mission. First, the food factory furnishes remunerative work for students to earn their way in school. Secondly, it provides a laboratory where the student may learn to do useful work with his hands, thus giving him a balance to his educational program. Thirdly, the successfully operated food factory will bring in means to subsidize the educational and instructional departments of the college."

(6) Dr. Perry Webber with many canned Madison Foods. (7) Four close-ups of a can of Kreme-O-Soy. (8) Group photo: Sam Yoshimura (production manager), P.A. Webber (PhD, consultant in chemistry and nutrition), J.B. Craw (manager), Dr. Harry W. Miller (the China Doctor), and Frank Miller (sales dept.). Address: Madison, Tennessee.

1940. Ohsawa, G. 1962? Zen macrobiotics: The art of longevity and rejuvenation. New York, NY: Ohsawa Foundation. Printed in Japan. 218 p. Undated. Index. 17 cm.
• ***Summary:*** This is the second printed edition of Zen Macrobiotics. The cover is gray. The author is George Ohsawa. The content is basically the same as the first printed edition, except that (1) Typographical errors on pages 3, 7, and 62 have been corrected; (2) A folded, undated insert, titled "Dictionary of Macrobiotic Terms" was found in this printing between pages 216 and 217 (for details, see below).

The insert is 17.0 cm / 6.69 inches high by 30.0 cm / 11.81 inches wide. Folded crosswise into thirds, it fits perfectly into these books; (3) The information on pages 217 and 218 is different and updated. The following appears on page 218: Brazil (Casa Longavida, Sao Paulo), Sweden (Miss Ilse Clausnitzer, Stockholm), U.S.A. (Ohsawa Foundation, 61, W. 56th St., New York; Ohsawa Foundation, P.O. Box 238, Chico, California; Chico-San, Inc., 64, 5th Ave., Chico, California; Musubi, 61, W. 56th St., New York–Macrobiotic Restaurant).

Concerning the date of publication: Although the date is not given in or on the book, Carl Ferré (who owns an original of this 2nd Japan printing) notes (8 May 2011): "Chico-San is listed. This means it was after Nov. 1961 at the earliest and most likely very early in 1962. I say this because the address given is not the Mangrove Ave. one." "There is no 'Printed in Japan' in this book either but it is so similar to the earlier one that it has to be printed in Japan. It is also undated. It is not 'revised'..."

In the 3-column "Dictionary of Macrobiotic Terms" (insert), for each entry there is the word or term, its definition, and one page number on which that word appears. Because the page numbers refer to pages in this edition, the dictionary was probably published at about the same time as this book–or at the time of the previous edition in 1960. The following is a selection from the Dictionary, with pages given for soy-related words: Aduki: Japanese red bean. Ae: Dressing (vegetables) with soy bean paste [miso], orange juice, etc. (p. 96). Aemono: Japanese salad (p. 88). Age: Fried bean curd. An: Red [aduki] bean jam. Ankake: Pouring [aduki] jam. Bancha: Coarse green roasted a few minutes. Bansho: Bancha with soy sauce (p. 152). Daikon: Long, white Japanese radish. Dango: A dumpling. Dentie: Head of eggplant salted, kept, dried and then burned into a powder. Egoma: A type of sesame seed–most yang. Gobo: Burdock. Gomashio: Sesame salt. Goma Tofu: Sesame curds (p. 87). Goziru [gôjiru, gojiru]: Soup made of grated soy beans and vegetables ("Ziru" means soup in Japanese) (p. 84). Gyoza: A Chinese food–vegetable mixture wrapped in pieces of thin dough. Hako: A mold or box in Japanese. Haru Tea: A very yang herb beverage. Hiziki [Hijiki]: Spindle-shaped, small, black seaweed. Jinenjo: A wild potato or a Japanese yam. Karinto: A kind of deep-fried cookie. Kasha: Russian buckwheat grain preparation. Kayu: Thin rice preparation [porridge]. Kinpira: Burdock and carrots preparation. Kitune [Kitsune]: Boiled rice or noodles cooked with thin fried bean curds [*agé*] (p. 68). Kobu (or Konbu): A (sea) tangle coming from deep ocean waters. Kobu Maki: Kobu stuffed with vegetables. Koi-Koku: A special carp and miso soup (p. 109). Kokkoh: A creamed blended cereal. Konnyaku: A paste made from flour of this Japanese tuberose [tuber]. Kuzu: Powdered plant-gelatine obtained from kuzu plant. M.U. tea: A tea made of 15 blended herb's roots. Matuba [Matsuba]: Pine leaves. Miso: Soy bean paste (p. 65). Miso Ae: Boiled vegetables served with miso cream (p. 96). Misoni: Carrots and onions cooked with miso (p. 129). Mochigome: Glutinous rice. Moti [Mochi]: Rice cake. Musubi: A knot. Nisime [Nishime]: Same as Nituke. Nituke [Nitsuke]: Vegetables sauteed. Nori: Laver or sloke–a kind of seaweed. Ogura: Aduki (red bean) preparation. Omedato: Dessert made of roasted rice and red beans. Originally Japanese word for congratulation. Oshitashi: Boiled vegetables, served with Tamari (p. 97). Ransho: Egg–Tamari preparation. Renkon: Lotus root. Sashimi: Sliced raw fish. Sarashina: A kind of buckwheat dish. Originally it means the name of a place famous for producing good buckwheat. Siitake [Shiitake]: A kind of Japanese mushroom. Sio [Shio]: Salt. Sio Kobu [Shio Kombu]: A kobu (seaweed) preparation. Soba: Buckwheat. Sukiyaki: Fish (or beef) and vegetables cooked a la japonaise. Sushi: A rice preparation. Syo-ban [Sho-ban]: Coarse green tea with soy sauce (p. 101). Tahini: Sesame butter. Tai: A red snapper [fish]. Tamari: Traditional soy sauce (p. 62). Tekka: A preparation of minced lotus root, burdock root, carrot, ginger, and miso (p. 96). Tempura: Japanese process of deep-frying in oil. Tofu: White soya bean cheese (p. 134). Tororo: Wild potato [wild yam]. Udon: Wheat vermicelli or noodle or macaroni. Umeboshi: Japanese plum salted and conserved for years. Ume-sho-ban: Medicinal beverage [containing umeboshi and shoyu] (p. 156). Yannoh (Ohsawa coffee): A cereal coffee made of roasted rice, wheat, aduki, chick peas and chicory. Yomogi: Mugwort (or wormwood). Yuba: Soybean protein prepared into transparent paper-like sheets (p. 77). Zosui: A rice preparation. Zaru: A bamboo basket. Address: Ohsawa Foundation: 331 Riverside Dr., New York City. Secretary Aihara, 44 W. 96th St., New York City, U.S.A.

1941. Ontario Soya-Bean Growers' Marketing Board. 1962? About soybeans: "A know your industry presentation." Chatham, Ontario, Canada. 12 p. Undated. 23 x 11 cm.
• ***Summary:*** Contents: A message from Dick Smith, Chairman, OSGMB. The big three: Soybeans, soybean oil, and soybean meal. Other soybean products: Soybean flour, milk, cheese (tofu), sauce, and sprouts. Where soybeans are grown worldwide. The position of soybeans in world fats and oils production. The import and export pictures in 1961. Production of soybeans by county in Ontario. Marketing the crop. Soybean grades. Activities of OSGMB.

In 1961 Canadian soybean production accounted for only 30.5% of Canada's need for soybean oil, and 31% of the country's needs for soybean meal; the rest had to be imported. In 1954, in order to establish a healthy market situation, OSGMB initiated a soybean export program. "The establishment of this 'second market' has proven its intended worth in helping to maintain price levels in Canada. In 1961, Canadian exports of soybeans and the bushel equivalent of meal and oil totalled 11.7 million bushels." Address: Box 668, 143 Wellington St. West, Chatham, Ontario, Canada.

1942. Omans, W.B.; Leuterer, W.; György, P. 1963. Feeding value of soy milks for premature infants. *J. of Pediatrics* 62(1):98-106. Jan. [10 ref]
• ***Summary:*** Recently soy products have been included in the "Protein-rich food Program of World Health Organization [WHO], Food and Agriculture Organization [FAO], and United Nations Children's Fund" [UNICEF]. This program's goal is to prevent protein malnutrition, which is widespread among infants and preschool children in most tropical countries. A toasted full-fat soybean preparation, Sobee, supported better growth in rats (PER 2.3 ± 0.15) and infants than soybean water extracts like Soyalac, Saridele, and Mull-Soy. The authors found considerably more variability in weight gain than with feedings of cow's milk formula. Formulas made from toasted low-fat soy flour gave the best results (PER 2.43), followed by those made from full-fat soy flour (PER 2.40).

Note: This is the earliest report seen on the results of feeding soy protein formula to premature infants. Address: Dep. of Pediatrics, Philadelphia General Hospital, Pennsylvania.

1943. Senti, F.R. 1963. Soybeans–Their future as a food and feed crop. *Soybean Digest.* Jan. p. 16-20.
• ***Summary:*** "A thorough survey of the present and potential markets for both the oil and meal fractions of the soybean." Discusses food uses of soybean oil, fats and oils used in margarine (1946-61; graph), sources of high-protein concentrates or livestock and poultry feeds (1937-61; graph), polyunsaturated fatty acids in the U.S. diet, feed and food uses of soybean meal, growth in oilseed meal consumption, tofu, miso, tempeh, UNICEF's clinical trial with soy beverage for infants in Taiwan, Public Law 480 and soya. To date 12 projects sponsored by the NRRL and funded by P.L. 480 on various food aspects of soybean utilization have been activated in Italy, Spain, Scotland, Finland, Israel, and Poland.

Figure 1, "Fats and oils used in shortening (1946-61)" is a graph showing that in 1945, soybean oil was the main oil used, followed by cottonseed oil, with animal fats a distant third. In 1961 soybean oil is still the leader (47.6% of total fats used), followed by animal fats (33.3%), then cottonseed oil (16.7%).

Figure 2 is a graph showing that per capita consumption of liquid edible oils increased from about 6.2 lb in 1945 to 11.2 lb in 1961.

Figure 3, "Fats and oils used in margarine (1946-1961)" is a graph showing the total increasing from about 450 million lb in 1946 to about 1,350 million lb in 1961. In 1946 soybean oil and cottonseed oil each accounted for about 50% of the total oil. In 1961 soy oil accounted for about 78% of the total, followed by cottonseed oil and corn oil. Address: Director, NRRL, Peoria, Illinois.

1944. American Academy of Pediatrics, Committee on Nutrition. 1963. Appraisal of nutritional adequacy of infant formulas used as cow milk substitutes. *Pediatrics* 31(2):329-38. Feb. [60 ref]
• ***Summary:*** Discusses: Soyalac, Mull-Soy, and Sobee. The influence of processing on protein quality appears to be much greater in the case of soy than in the case of milk. For the soy-based formulas noted above, PER values from 1.3 to 2.0 (casein control is 2.5) are reported. Address: 1801 Hinman Ave., Evanston, Illinois.

1945. *British Vegetarian.* 1963. Society reports: Fruitarian discussion group. Jan/Feb. p. 22-23.
• ***Summary:*** On 5 Nov. 1962 Dr. Franklin spoke on "Plant Milk and Protein." He first discussed the changes taking place in scientific views on the amount of protein required by a healthy body. Then he said that "the transition from the animal protein of dairy products to the less concentrated plant protein of leaves (plus about 10% soya milk) comprising plant milk, must be made slowly. Samples of the milk were tested and found very pleasantly sweet and smooth to the palate."

Dr. Franklin said that preparations for large-scale factory production were well in hand. Supplies for Health Food Stores and for export to undernourished peoples were expected in 3 to 4 months.

1946. Cross, Leslie. 1963. The Plantmilk Society: Progress report. *British Vegetarian.* Jan/Feb. p. 7-8.
• ***Summary:*** Recent samples of the Society's leaf protein plantmilk "have shown a marked improvement in appearance, flavour, and palatability." The Society is working to raise money to set up a commercial-scale pilot plant to produce this "Milk of Human Kindness." The first samples of plantmilk were extracted from an exclusively leaf-protein base, with the protein being coagulated by heat. In later experimental samples, small amounts of soya or other vegetable protein were added. Current work is on extracting some of the protein from the leaves by slow enzymic digestion. The fat content of Plantmilk presently consists of soy oil and maize oil, but in the future some of the fat in the leaf may be used.

1947. Diamond, Holton W. 1963. Vegetable fat replacements for dairy products. Paper presented at meeting of the Massachusetts Dairy Tech Society. 21 p. Held Feb. 4. [9 ref]
• ***Summary:*** "The manufacture of vegetable fat replacements for dairy products has increased tremendously in the last few decades." In all cases the butter fat has been replaced by vegetable fat, but in many cases the entire finished food may be described as "all vegetable." "We have soybean milk, margarine, and 'mellorine.' We have the vegetable alternate for cottage cheese, and in certain parts of the Orient rather

elaborately cultured and fermented soybean materials are manufactured and used as replacement for cheddar and other types of cheeses." Address: Vice President–Research, Rich Products Corp., 1145 Niagara St., Buffalo 13, New York.

1948. Fukamachi, Chiharu; Abe, Kazuyoshi; Watanabe, Tokuji. 1963. Fukuro-iri tôfu genryô toshite no funmu kansô tônyû ni tsuite [Qualification of spray-dried soybean milk as the material of bagged tofu]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 17. p. 129-31. March. Reprinted from Nippon Shokuhin Kogyo Gakkaishi 9:13 (1962). [4 ref. Jap; eng]
• ***Summary:*** Spray-dried whole soybean milk has recently appeared on the market in Japan. Tofu made with this milk was found to be excellent in firmness and its ability to hold water, compared to tofu made from fresh soymilk. For making bagged tofu, it is recommended that a mixture of dried and fresh soymilk be used, with 40% of the solids coming from the dried soymilk. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

1949. Fukamachi, Chiharu; Abe, Kazuyoshi; Watanabe, Tokuji. 1963. Tônyû no gyôko ni oyobosu tenkabutsu no eikyô ni tsuite [Effects of additives on the coagulation of soybean milk by calcium salt]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 17. p. 135-39. March. Reprinted from Nippon Shokuhin Kogyo Gakkaishi 9:19 (1962). [9 ref. Jap; eng]
• ***Summary:*** Tofu was coagulated with calcium sulfate calcium chloride, and sulfuric acid to compare their hardness and volume. The quality of the curd made with the acid was similar to that made with calcium chloride. Although the curd made with calcium sulfate was very soft and voluminous, it became smaller and harder and smaller in volume when a small amount of acid was added. Various kinds of agents were added to the soymilk before precipitation by calcium chloride to try to get a soft curd. Among these agents, sodium citrate and sodium polyphosphate seemed to be effective in making tofu softer and more voluminous, probably because of their high pH and their ability to increase the water-holding capacity of soy protein. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

1950. Nakayama, Osamu; Watanabe, Tokuji. 1963. Tônyû ni kansuru kenkyû. I. [Studies on soybean milk. I.]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 17. p. 144-47. March. [2 ref. Jap; eng]
• ***Summary:*** See summary at *Eiyo to Shokuryo* 15:191-95 (1962). Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

1951. Watanabe, Tokuji; Abe, Kazuyoshi. 1963. Kakushu san-rui oyobi en-rui ni yoru tônyû no gyôko ni tsuite [Studies on the coagulation of soybean milk by various kinds of acid and salt]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 17. p. 140-43. March. [5 ref. Jap; eng]
Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

1952. Watanabe, Tokuji; Nakayama, Osamu; Abe, Kazuyoshi. 1963. Tônyû no funmu kansô ni kansuru kenkyû [Study of spray-dried soya milk]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 17. p. 124-28. March. Reprinted from Nosankaku Gijutsu Kenkyo Kaishi 8:288 (1961). [5 ref. Jap; eng]
• ***Summary:*** The nitrogen content is much higher with spray drying than with lyophilization. Spray-dried soymilk powder, which gelatinizes into tofu through dispersing in water and heating, is obtained from samples which contain calcium sulfate and sodium phosphate. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

1953. *British Vegetarian.* 1963. Plant proteins and vegetable milks. March/April. p. 87-89. [1 ref]
• ***Summary:*** Discusses mostly leaf protein. Nutritionists agree that leaf protein should not form more than half of the total protein intake, and preferably much less. Amino acid deficiencies can be overcome by mixing the leaf protein with an equal amount of soya or groundnut protein and fortifying with vitamin B-12.

1954. *British Vegetarian.* 1963. "Plantmilk"–Progress report: The glowing year. March/April. p. 98. [1 ref]
• ***Summary:*** "Recently a good deal of serious and detailed work has been carried out with the object of making 1963 the year in which Plantmilk took its baby steps in the world of trade and commerce. This part of the work belongs to Plantmilk Ltd., the company formed by the Plantmilk Society in 1961 to carry the project forward as soon as the Society achieved its first main goal–to produce a satisfactory non-animal alternative to dairy or other animal milk."

Note. This is the earliest English-language document seen (Aug. 2013) that contains the term "Plantmilk Ltd."

1955. Honma, Osamu; Ono, H.; Nishihara, K. 1963. Daizu o tanpakushitsu gen toshita nyûji shoku no riyô ni tsuite [On the use of soybeans as a source of protein in infant diets]. *Chiryo* (*J. of Therapy, Tokyo*) 45(4):705-10. April. [28 ref. Jap]
• ***Summary:*** In Germany, soybeans are valued as a food with medicinal uses. There are some products on the market sold as Vollsojamehl (whole soy flour, made by Henselwerk in Magstadt) that are used in regular foods and medicinally by adults, but also by elderly people and young children. Soy-based infant formulas made in the USA include: Mull-Soy Liquid (made by Borden); Sobee Powder and Sobee Liquid (made by Mead Johnson); Soyalac Infant Powder,

Soyalac Infant Concentrated, and Soyagen Infant Powder (made by International Nutrition Lab. [Mt. Vernon, Ohio]). Those made in Germany include Soyakraft and Sojabasan (Henselwerk); Lactopriv; and Solactin. Address: Tokyo Keisatsu Byoin Shonika, Icho (Tokyo Police Hospital, Pediatric Div., Head).

1956. James, W.S. 1963. New sources of protein in a hungry world. *British Vegetarian.* March/April. p. 69-77.
• ***Summary:*** The world population is now doubling roughly every 40 years and by the end of this century it is expected to reach 6,000 million. A new source of protein has been found. Scientists have discovered ways of separating protein from the indigestible cellulose and fibre of waste vegetable matter, including leaves, grass, etc. One of the pioneers in this basic research is N.W. Pirie, F.R.S., head of the Biochemistry Department at Rothamsted Experimental Research Station, Herts. Pirie and his colleagues have developed a small "Village Unit" machine for extracting protein from vegetable matter. The leaf protein from these machines is a dark green cheeselike substance.

A chemical company has recently put up the necessary capital to form a subsidiary company named International Protein Products, Ltd., which has built a factory costing £300,000 at Plymouth, England, for extracting protein from various vegetable sources using I.H. Chayen's "Impulse Process." The protein concentrate now produced at Plymouth has been given the trade name Lypro; it consists of about 65% protein and 35% oil loosely combined. It looks very much like flour, has a very pale cream color, and a faint attractive nutty flavor.

The low biological value of some leaf proteins can be greatly improved by mixing them with equal weights of soya protein, in the form of commercial food products such as Soyalac (Loma Linda Foods) or Velactin (A. Wander Ltd.). Address: M.Sc.

1957. **Product Name:** [Lactopriv {Soy Based Infant Formula} (Powder)].
Foreign Name: Lactopriv.
Manufacturer's Name: Teopfer GmbH.
Manufacturer's Address: Heisingerstr. 6, Dietmannsried, West Germany.
Date of Introduction: 1963. April.
Ingredients: Incl. soy protein isolate.
New Product–Documentation: Honma and Nishihara. 1963. Chiryo (Journal of Therapy, Tokyo) 45(4):705. "On the use of soybeans as a protein source in infant diets." Lactopriv is mentioned as a soy-based infant formula but the manufacturer's name is not given.

Thomson. 1979. *Journal of the American Oil Chemists' Society.* March. p. 386-88. The product is now based on soy protein isolates. The manufacturer is Topfer GmbH, located at Heisingerstr. 6, Dietmannsried, West Germany. Phone: 083 74 80 41.

Soyfoods Center Computerized Mailing List. 1982. July 23. An alternative address is Ferdinandstr. 12, D-2000 Hamburg, West Germany. Phone: 04 03 01 31.

1958. **Product Name:** [Solactin (Soymilk)].
Foreign Name: Solactin.
Manufacturer's Name: Unknown.
Manufacturer's Address: West Germany.
Date of Introduction: 1963. April.
New Product–Documentation: Honma and Nishihara. 1963. Chiryo (Journal of Therapy, Tokyo) 45(4):705. "On the use of soybeans as a protein source in infant diets." Solactin is mentioned as a soy-based infant formula but the manufacturer's name is not given.

1959. General Mills, Inc., Specialty Products Div. 1963. From soy products, General Mills formulates new protein-rich foods (Ad). *Soybean Digest.* May. p. 5.
• ***Summary:*** "A management report from Mr. Sewall D. Andrews, Corporate Vice President and General Manager, General Mills Specialty Products Division."

"Here at the Specialty Products Division we are concentrating on new protein-rich food products for world feeding. We are manufacturing and marketing SMP (Soy Milk Powder) which, when mixed with water, makes a delicious beverage for school lunches and for supplementing diets of children unable to get cow's milk; also, through an agreement with Meals for Millions Foundation, MPF (Multi-Purpose Food) which provides, in concentrated form, the essential nutrients usually lacking from high carbohydrate diets. Using soybeans as the key, we have developed TSP (Toasted Soy Protein)–an unusually low cost, high quality protein completely pre-cooked, ready to use. Other protein foods from soybeans are in the developmental stage. When perfected, these too will contribute to improved world nutrition."

Photos show: (1) A small portrait photo of Mr. Sewall D. Andrews. (2) A half-page photo of a little girl, looking somewhat hungry, looking up at a woman holding a bowl of food in her left hand and a spoonful of that food in her right–food that she is about to feed to the little girl.

1960. Machida, Yoshiro. 1963. Seisei daizu tanpaku no yotô [Utilization of refined soy protein]. *Shokuhin to Kagaku* (*Food and Science*) No. 38. May. p. 42-47. [Jap]

1961. *Newsweek.* 1963. New foods and new hopes. 61:51. June 17.
• ***Summary:*** "It is a sad paradox that a child with a full stomach can die of malnutrition. The problem is not how much he eats, but rather what he eats. Without an adequate supply of protein, which enables a child's body and mind to grow, all the fats and carbohydrates he can eat will not help

him. One of the most promising ways out of this paradox is the development of new, high-protein foods, to supplement standard native fare of starchy foods such as cassava, manioc, yams, or plantains."

According to organizations like UNICEF and WHO, the world's two most promising sources of protein are considered to be fish flour and defatted oilseed meals, including those from soybeans, peanuts, cottonseeds, and coconuts. "UNICEF has helped start a project in Indonesia promoting Saridele, a soybean extract ideal for infant feeding. With such supplements, a child can be kept healthy from the time he is weaned, and loses his original source of protein, until he is 7 or 8, and the need for protein begins to diminish."

"UNICEF is cautiously optimistic. The agency's senior food technologist, Max Milner, said last week: 'We are beginning to see some glimmers of light.'"

1962. Hackler, L.R.; Hand, D.B.; Steinkraus, K.H.; Van Buren, J.P. 1963. A comparison of the nutritional value of protein from several soybean fractions. *J. of Nutrition* 80(2):205-10. June. [6 ref]
• ***Summary:*** In PER studies, several soybean fractions were fed to weanling rats. The results were somewhat surprising in that they indicated that the "residue from water extraction," or water-insoluble fraction, was the most nutritious.

Unextracted [full-fat] soybean flour was prepared by soaking dry soybeans overnight at room temperature in 3 times their weight of water. The beans were dehulled using a vegetable peeler and water flotation. The dehulled soybeans were drained, steamed for 1 hour at 100ºC, frozen at -40ºC then freeze-dried whole. The beans were then ground finely (through the 023 screen of a Rietz Disintegrator) with water. The soymilk and solids were separated in a plate filter while the milk was still cold. The soymilk was then cooked for 1 hour at 100ºC, concentrated, frozen, and freeze dried.

The PER for the different fractions and for casein were as follows: Casein 2.86, residue 2.71, dehulled soybean 2.51, curd [tofu] 2.20, soymilk 2.11, whey 1.93. Address: New York State Agric. Exp. Station, Geneva, New York.

1963. Sakata, Hajime; Enomoto, M.; Higuchi, Y. 1963. [Deodorization of soybean milk products]. *Japanese Patent* 11,939. July 12. 2 p. Application filed 30 Dec. 1961. (Chem. Abst. 60:6144a). [Jap]*
• ***Summary:*** Sodium sulfite was used to reduce the odor of soymilk, and the residual sodium sulfite was removed with an ion-exchange resin. Some hydrazine derivatives could also be used.

1964. Sakata, Hajime; Enomoto, M.; Higuchi, Y. 1963. [Deodorization of soybean milk products]. *Japanese Patent* 11,940. July 12. 2 p. Application filed 30 Dec. 1961. (Chem. Abst. 60:6144a). [Jap]*
• ***Summary:*** Deodorization was conducted by introducing hydrogen into the raw soymilk or mashed soybeans in the presence of Raney-Ni.

• ***Summary:*** This vegan cookbook contains no foods from animal sources except honey. It was developed primarily to help patients with food allergies and cardio-vascular problems. Soy milk, soy flour, soy grits, and [whole dry] soy beans are used extensively throughout the book.

Chapter 9, "Milk and Cream Substitutes," gives recipes for pecan milk, unsweetened walnut milk, almond cream, coconut milk, homemade soybean milk, Loma Linda Soyagen (powdered), cashew cream, cashew milk, and walnut milk.

Chapter 11, "Entrees," contains recipes for: Creamed soy beans. Green soy beans. Supreme loaf (with Vegeburger plus Yeastex or Savita). Walnut roast (with rich soy milk). Scrambled "eggs" with Smokene (and soy cheese/To-fu). Scrambled "eggs" with chives (with soy cheese [tofu] and soy milk). To-fu with mushrooms. Baked rice and cheese (with to-fu). Scrambled "eggs" plain (with soy cheese [To-fu] and rich soy milk). Soy beans (boiled). Soy bean croquette (with "2 c. soy bean puree"). Soy bean loaf (with "2 c. mashed cooked soy beans"). Soy bean patties (with "1

c. soy cheese" [tofu]). Baked soy beans.

Chapter 19, "Foreign Dishes," contains a recipe for "How to make to-fu" (using Loma Linda Soyagen powder, curded with lemon juice), plus two tofu recipes. The companion volume to this book is titled *Nutrition for Life.*

1979. **Product Name:** [Solein {Soymilk}].
Foreign Name: Solein.
Manufacturer's Name: Laticinios Mococa.
Manufacturer's Address: Mococa, Brazil.
Date of Introduction: 1963.
Ingredients: Incl. soyamilk and nonfat dried cow's milk.
Wt/Vol., Packaging, Price: Can.
New Product–Documentation: Dutra de Oliveira & Scatena. 1967. *J. of Food Science.* 32:592-94. This mixture of 30% soymilk and 70% cow's milk, developed by Dr. Barretto, was made by a cold-grind process, which gave a beany flavor. In 1981 it was sold mainly at pharmacies in powdered and canned form.

E. Orr. 1972. Tropical Products Inst. G73. The use of protein-rich foods for the relief of malnutrition in developing countries: an analysis of experience. p. 14. "As a result of work carried out at the Medical School of Ribeirao Preto, University of Sao Paulo, Brazil, a local dairy company, Laticinios Mococa, started producing around 1963 Solein, a combination of soya milk and skimmed cow's milk, spray-dried. Early in 1967 the ex-factory price of Solein, bulk packed, was equivalent to $0.60 per kg compared with $0.96 for dried skim milk, and $1.06 for dried whole milk. Sales were made to the Government Children's Bureau for the feeding of young children but it appears that these purchases have been modest in size and irregular. The company is now proposing to launch the 'dietetical' market, apparently through drugstores, at a price tentatively fixed at the equivalent of US$1.54 per kg." This scheme is now operating irregularly.

R.H. Moretti. 1981. *Journal of the American Oil Chemists' Society.* March. p. 521. "Soy milk developments in Latin America."

1980. **Product Name:** Loma Linda All Purpose Soyagen (Milk Free Soy Beverage Powder).
Manufacturer's Name: Loma Linda Food Co.
Manufacturer's Address: 11503 Pierce St., Riverside, CA 92505. Phone: 714-687-7800 (3/88).
Date of Introduction: 1963.
Ingredients: Soy solids, corn syrup, soy oil, sugar, soy lecithin, salt, di-calcium phosphate, tri-sodium citrate, calcium carbonate, di-potassium phosphate, artificial flavors, vitamins (ascorbic acid, DL-alpha tocopheryl acetate, vitamin A palmitate, cholecalciferol, riboflavin, phytonadione, cyanocobalamin), ferrous sulfate, tri-potassium citrate.
Wt/Vol., Packaging, Price: Canned.
How Stored: Shelf stable.
Nutrition: Per 1 oz. powder (approximately ¼ cup making

one cup of liquid): Calories 130, protein 6 gm, carbohydrate 14 gm, fat 6 gm, cholesterol 0 mg, sodium 150 mg, potassium 210 mg.
New Product–Documentation: Label and color photo sent by Loma Linda Foods. 1988. Oct. 5. This product was introduced in 1963; the label is dated "9/78"–Sept. 1978. A less sophisticated version of this product with the same name appeared in 1948.

1981. **Product Name:** Coffee Rich (Frozen Liquid Coffee Whitener).
Manufacturer's Name: Rich Products Corporation.
Manufacturer's Address: Buffalo, New York.
Date of Introduction: 1963.
Ingredients: 1986: Water, corn syrup, partially hydrogenated soybean oil, mono and diglycerides. soy protein, sodium stearoyl lactylate, polysorbate 60, dipotassium phosphate, disodium phosphate, sodium acid pyrophosphate, artificial flavor and color.
Wt/Vol., Packaging, Price: 1986: 16 oz (454 gm) Pure Pak gable top carton.
How Stored: Frozen.
New Product–Documentation: Ad (undated, about 1960s). "It takes just a little Coffee Rich to make a tremendous cup of coffee." A small bottle of Coffee Rich is held between the thumb and forefinger of someone's hand.

Leaflet (undated, about 1960s). "Technical information. New liquid Rich's Coffee Rich." A photo shows that Coffee Rich is sold in a quart Pure-Pak carton. It is "an all-vegetable fat emulsion designed primarily for use in coffee." It can also be used in cooking, is non-perishable, has a good, uniform taste and its stability resists "feathering," oiling off, and separation defects. "Economical: Coffee Rich is not a substitute product. It is a superior new product... Savings on present costs is but one important feature." Quantitative analysis: Fat 12%, corn syrup solids 14%, sodium caseinate 0.80% (used as a major emulsion stabilizer), sodium ion 0.1%, cholesterol free, beta carotene supplies about 300 I.U. of vitamin A activity per quart, calories–160 per 100 gm.

Shurtleff & Aoyagi. 1985. History of Rich Products' work with soy proteins. When this product was launched in about 1960, it was based on coconut oil and contained no protein. "The lack of protein gave the product a long shelf life when sold refrigerated in dairy cases, as was planned. But the product started settling out, so the company switched to using sodium caseinate as a protein source, then in about 1963 began using soy protein (typically 0.75% by weight) as the main protein source. In the mid-1970s, soy oil replaced half the coconut oil, then later in the 1970s all of it. The dairy industry spent a small fortune trying to keep Coffee Rich off the market." The first lawsuit was in Louisiana in 1961. "By 1974 the number of court cases and victories for Rich Products had grown to 40. That year the Kansas Supreme Court declared Coffee Rich 'a new and distinct food' and the milk lobby gave up. Rich Products' success in these suits led to the creation of a new product category: Coffee whitener."

Package with Label sent by Dr. Walter Wolf of Peoria, Illinois. 2000. Aug. 5. The package is copyrighted 1986. Blue and red on white. Front panel: Illustration of a coffee cup with steam rising in front of a red circle. Text: CoffeeRich. "Great fresh taste! No cholesterol. 100% milk free. Low in sodium and saturated fats. Keep frozen."

1982. **Product Name:** Whitehouse Whipped Topping, Whitehouse Whipped Topping Base, and Whitehouse Presto Whip.
Manufacturer's Name: Whitehouse Products, Inc.
Manufacturer's Address: Livonia Dairy, 2001 S. Telegraph Rd. at Harvard, Dearborn, Michigan.
Date of Introduction: 1963.
New Product–Documentation: Talk with David and Harvey Whitehouse of Delsoy Products and Whitehouse Products. 1992. Feb. 4. Harvey Whitehouse bought out Bob Smith in 1963, and a month or so thereafter David became president of the company. Shortly after the buyout, the company name was changed from Delsoy Products to Whitehouse Products. The brand and logo then became Whitehouse and product names were changed. Delwhip Topping became Whitehouse Whipped Topping, Delwhip Topping Base became Whitehouse Whipped Topping Base, and Presto Whip became Whitehouse Presto Whip. All continued to be made with soy protein. At about the same time, the company began to private label their products for

other companies under other brands. They continued to sell the products under their own brands as well.

1983. Chao, Buwei Yang. 1963. How to cook and eat in Chinese. 3rd ed. New York, NY: Random House. xxvi + 249 p. Foreword by Hu Shih. Preface by Pearl S. Buck. Illust. Index. 21 cm.
• ***Summary:*** This edition is quite similar to the original 1945 edition, except that it has some new front matter (such as introductions to the second [1949] and third revised editions), new pages added here and there plus 16 pages of recipes added between pages 228 and 229, and new cooking techniques. The page layout is basically unchanged, but when new pages were added, they were numbered 160a, etc; thus the contents of page 203 is identical in all editions.

A new table (p. 29) lists widely used Chinese foods and seasonings in four columns: Chinese characters, Mandarin, Cantonese, and English. Soy related ingredients (in English, Mandarin, and Cantonese) are: (4) Oyster sauce: hao-yu, hou-yau. (6) Soy sauce (1): chiang-yu (M). Soy sauce (2): shi-yau (C). Soy sauce (3): ch'au-yau (C). (7) First quality soy sauce: sheng-ch'ou (M), shang-ch'au (C). Note 1. The first character means "fresh" or "live."

Note 2. This is the earliest English-language document seen (April 2012) that uses the term "sheng-ch'ou" (Mandarin) or the term "shang-ch'au" (Cantonese) or the term "chü-yau" to refer to a type or grade of Chinese soy sauce."

(8) Flour jam: t'ienmien-chiang (M), t'inmin-cheung (C). (9) Bean sauce: Yuanshih chiang (M), yünshi-cheung (C). Note 3. The middle character (shih / shi) refers to fermented black soybeans. (10) Hoisin sauce: haihsien chiang (M), hoisin-cheung (C). Note 4. This is the earliest document seen (April 2012) that mentions Hoisin sauce.

However, among the new pages added, there is a nice new chapter 22 titled "Soybean Foods" (p. 228c-228h). Its contents: Introduction and Buddhist mock meats. Homemade tofu: Equipment needed (electric blender, form for setting), ingredients (curded with gypsum), grinding and straining, heating and setting, forming, bean curd recipes. Homemade soybean milk. Using soybean lees (okara; dregs are the leftovers you throw away and lees are those you keep). Frozen bean curd. Soy sauce beans [Soybeans baked in soy sauce]. Preserved soybeans: Homemade fermented black soybeans with salt, ginger, and optional hot chili powder or hot red pepper.

Note: This is the earliest English-language document seen (Nov. 2011) that uses the term "Preserved soybeans" to refer to fermented black soybeans.

The introduction (p. 228c) states: "Under various guises the soybean is used in vegetarian restaurants, often under Buddhist auspices, to produce sumptuous dinners, featuring "sliced chicken breast," "roast duck," "baked ham," that not only fool the eye, but also the tongue, almost, but as always, I want to concentrate on the important, everyday things and de-emphasize the fancy and elaborate. Dishes with bean curd are cheap and easy to prepare. Those who can afford fancy dishes can combine it with meat, etc., but just plain cabbage and bean curd connotes home sweet home."

Pages 158-59 contain 3 new soy-related recipes: Fried bean curd. Oyster sauce friend bean curd. Sweet-sour fried bean curd.

Recipe 14.27 (p. 155-56), titled "Red-in-snow stirs fava beans" begins: "Horse beans look like lima beans but are not. They are also called Fava beans and frequently sold by Italians. In China they are known as 'silkworm beans.'" Address: Berkeley, California.

1984. Chaves, Nelson. 1963. Proteínas vegetais e trópicos [Vegetarian and tropical proteins]. Recife, Brazil: Imprensa Universitária. 151 + 5 p. Illust. Series: Coleçao nordestina, 2. [75+* ref. Por]
• ***Summary:*** Soyfoods and their nutritional value are discussed on pages 65-67, incl. soymilk (*leite de soja*), tempeh, miso, tofu, shoyu, and natto.

Note: This is the earliest Portuguese-language document seen (Sept. 2011) that mentions tempeh, which it calls "tempeh." Address: Universidade do Recife, Instituto de Fisiologia e Nutricao.

1985. Lager, Mildred; Jones, Dorothea Van Gundy. 1963. The soybean cookbook: Adventures in zestful eating. New York, NY: Devin-Adair Co. xiv + 240 p. Foreword by Ruth Stout. Index. 22 cm.
• ***Summary:*** The copyright page states: "Note: This is a revised and updated version of a privately printed book, *How to Use the Soybean*, by Mildred Lager which was first printed in 1955 and reprinted in 1959." This lacto-ovo-vegetarian cookbook contains over 350 recipes, including 72 tofu recipes.

Contents: Preface to 1955 edition. Preface to 1963 edition. Part I: The versatile soybean. History of the soybean. Nutritional value. Abbreviations and special terms. Soup to nuts: Introduction, green soybeans [green vegetable soybeans], dry soybeans, roasted soybeans, sprouted soybeans, the cow of China–soy milk (kinds of soy milk), "the meat without a bone"–tofu or soy cheese, the little giant among protein foods–soy flour, soy grits and bits (puffed grits), soy oil and soy butter, meat replacement foods, sandwich spreads, malts, coffee substitutes, soy sauce, other soy products (soy albumen, Glidden's product that contains on a dry basis 96.6% protein [soy protein isolate]).

Part II: Soybean recipes. Green soybeans. Dry soybeans. Roasted or toasted soybeans. Sprouted soybeans. Meat replacement dishes. Soy noodles, macaroni, and spaghetti. Sauces and gravies. Soy soups. Salads. Soy spreads and soy butter ["a butter resembling peanut butter may be made from finely ground soybeans or soy flour... Roasted soy butter

is made from the roasted beans that have been ground into a fine flour."]. Soy milk. Tofu or soy cheese. Soy cereals and breakfast dishes. Soy desserts. Soy candies. Soy flour breads: Full-fat soy flour, low-fat or fat-free soy flour. Pastry. Cookies. Cakes. Extra tips. Appendix. Menus.

The chapter titled "History of the Soybean" (p. 3-7) discusses: W.J. Morse and the U.S. Department of Agriculture, Dr. J.A. LeClerc, the American Soybean Association (which has held a national convention every year since it was founded in 1920), its publication *Soybean Digest*, Henry Ford and his work with both industrial and edible soy products, T.A. Van Gundy, Harry W. Miller, M.D., Dr. Clive McCay of Cornell University (Ithaca, New York), and the Sept. 1961 Conference on Soybean Products for Protein in Human Foods (held at Peoria, Illinois).

Concerning T.A. Van Gundy we read (p. 5): "The father of one of the authors, T.A. Van Gundy, became interested in the nutritional value of soybeans while attending the World's Fair in San Francisco in 1915, where they were featured in the Oriental exhibits. Upon going home he purchased some soybeans and began experimenting in them. As far as we know he was the first person on the Pacific Coast to develop a line of commercial foods from this wonder bean. By 1927 he had developed a number of palatable products which he manufactured and sold through health food stores. Soybean foods were virtually unknown at this time, and it took courage and perseverance to put them across."

Recipes for "Soy Ice Cream" (p. 175-76) now include vanilla, maple nut, orange, and strawberry flavors. A recipe for "Granola" (p. 161) calls for 1 cup soy flour. The rest of the ingredients (such as wheat and barley flour) appear to be similar to those found in the earliest granola recipes of the mid-1800s. Address: Southern California.

1986. Rombauer, Irma S.; Becker, Marion Rombauer. 1963. Joy of cooking. Indianapolis/New York: Bobbs-Merrill Co. [x] + 849 p. Illust. by Ginnie Hofmann and Ikki Matsumoto. Index. 24 cm.

• ***Summary:*** One of the great American cookbooks. A classic and an all-purpose cookbook, this is the earliest known authorized edition prepared by Marion Rombauer Becker–who transformed the book. Irma, her mother, died in 1962.

Soy-related recipes: Chop suey or Chow mein (with soy sauce, p. 229-30). Soybeans, green (p. 260). Shrimp teriyaki (with "½ cup pineapple juice" and "2 to 4 tablespoons soy sauce"–but no recipe for teriyaki sauce, p. 377). Sukiyaki (with "½ cup 3/4-inch squares bean curd: Tofu" and "2 cups bean sprouts or cooked, drained Shirataki," p. 402).

Vegetable milks (incl. soy bean milk, almond milk, p. 487-88). About non-wheat flours (incl. soy flour, corn meal, rice flour, rye flour, potato flour, tapioca and sago flour, arrowroot flour or starch, barley flour, cotton seed flour, peanut flour, oat flour and oatmeal, bean flour, p. 498-501). About commercial sauces (incl. soy sauce and Worcestershire sauce, p. 542. Note: Soy sauce is not mentioned as an ingredient in Worcestershire sauce). Cornell Triple-Rich flour formula (with 1 tablespoon soya flour, p. 556).

Also discusses Whole-grain or Graham flour (p. 498). And how to make "coconut milk" and coconut cream. "Coconut milk and cream are very sensitive to high heat. For this reason they are added to hot sauces at the last minute or are cooked over hot water." They are prized in curries [and many Indonesian tempeh recipes].

Note: There is no entry for "Sprouts" (or "soy sprouts") in the Index. However there is an entry for "Bean sprout, salad, p. 80; cooked, p. 259." On page 80 the recipe titled "Oriental beans sprout salad" calls for "1 cup drained bean sprouts." On page 259 the recipe for "Cooked bean sprouts" calls for "4 cups sprouted beans, Mung or edible soybeans or lentils."

1987. Rose, Ian F. 1963. Faith, love and seaweed. Englewood Cliffs, New Jersey: Prentice-Hall, Inc. 221 p. Illust. Index. 24 cm. [30+ ref]

• ***Summary:*** This book is written by the father of Murray Rose, now age 23, one of the world's greatest swimmers, and the winner of many Olympic gold medals. It is the true story of how Murray was raised on a vegetarian diet, with emphasis on raw foods, natural foods, natural living, and whole-food principles. By the age of 13, Murray's prowess was already making news. In 1956, at age 17, he became the youngest triple Olympic gold medalist in the entire history of sport. In Rome, 4 years later, he made Olympic history again by winning the 400 meter freestyle and thus becoming the first person to win a distance swimming event in two successive Olympics. In college he swam for the University of Southern California (USC).

Mr. Rose advises 10 important dietary habits: 1. Wait until you are hungry before eating. 2. Eat simply, paying attention to food combinations. 3. Eat moderately. 4. Chew food thoroughly. 5. Eat raw foods whenever possible. 6. Never eat when overtired, worried, or emotionally upset. 7. Avoid sauces and condiments. 8. Don't drink with meals. 9. Avoid drinking alcohol and smoking tobacco. 10. Avoid eating meat.

Rose uses 3 main sources of protein: (1) Seeds (especially sesame and sunflower seeds); (2) nuts, and legumes (especially soybeans); cheese and fertile eggs (but not cow's milk). Rose has "four magic foods that guard you against vitamin and mineral deficiencies": seaweed, rose hips (for vitamin C), brewer's yeast (for B vitamins), and any good source of vitamin E (such as wheat germ and wheat germ oil).

In chapter 8, "Our protein pyramid: Seeds, nuts, and dairy products," the section titled "Soybeans give us better protein than steak" (p. 115-17) begins: "The other legume that deserves a permanent place in our store cupboard is

the soybean. This is a better source of protein than meat or eggs as is demonstrated by the following table. In every case, soybeans come out ahead." Three tables compare meat, eggs, and soybeans for their content of essential amino acids, minerals, and vitamins. "It is not hard to conclude that soybeans could well be part of everyone's diet, whether or not we include meat. The use of soybean flour is a good idea, too. Merely by substituting as little as five percent in any recipe containing wheat flour, you will be greatly increasing the protein value of the food."

In the section on dairy products, there are subsections titled "The fallacy of cow's milk as a human food" (p. 117) and "The alternatives to cow's milk" (p. 121). "As an alternative to cow's milk we introduced soy milk into Murray's diet with success. Ready prepared soy milk is obtainable today in many health stores but it can be made at home with a blender. One way is as follows:..." Also discusses tahini milk and almond milk.

Page 186 states that cow's milk, if consumed at all, should be consumed raw. It is wise to specify "certified raw milk." "If only pasteurized milk is available it may be best to substitute soy milk or to use a home-made nut milk... Soybeans are one of the few legumes which contain complete protein. They may be purchased ready-cooked or dry."

The section titled "The best kind of fat–and how to select it" suggests that unsaturated fatty acids are good for health and animal fats are best omitted from the diet. "Their place should be taken by soy oil, sunflower oil, sesame oil, safflower oil, and other vegetable oils." The ratio of polyunsaturates to saturates is given for each. "Soy oil, extracted from the soybean,... contains a high percentage of polyunsaturated fatty acids." Address: Sydney, Australia.

1988. Tobe, John H. 1963. Milk. St. Catharines, ONT, Canada: Modern Publications Reg'd. *
Address: Canada.

1989. Yang, Hao-jan. 1963. The development and rational utilization of soybean. *U.S. Joint Publications Research Service. Translations from Communist China's Agriculture, Animal Husbandry and Materials* 41:39-51. Translated from *Ta Kung Pao* (Peiping), 11 March 1963, p. 3. [Eng]
• ***Summary:*** A general article about the problems connected with the utilization of soybeans as food, feed and for industrial purposes. Contents: Introduction. The functions of soybeans on the development of agricultural production. Several problems of the development of soybeans. The rational utilization of soybean resources.

Note: This "is a translation of an article by Yang Hao-jan (2799 3185 3544) in *Ta Kung Pao*, Peiping, 11 March 1963, p. 3." Address: China.

1990. **Product Name:** [Soyakraft {Powdered Infant Formula}].
Foreign Name: Soyakraft.
Manufacturer's Name: Henselwerk GmbH.
Manufacturer's Address: Magstadt bei Stuttgart, West Germany.
Date of Introduction: 1963?
Ingredients: Incl. Whole soybeans, corn, malt, beet sugar, cane sugar [sucrose], soy oil, calcium salts, vitamins B-6, B-2, nicotinic acid, B-12.
Nutrition: 100 gm dry product contain 450 calories. 100 ml of ready to drink product with 5% sugar contain 80 calories.
New Product–Documentation: Honma and Nishihara. 1963. Chiryo (Journal of Therapy, Tokyo) 45(4):705. "On the use of soybeans as a protein source in infant diets." Interview with Harald Roquette by Anthony Marrese. 1990. March 15. The company still makes Soyakraft.

Nikolaus Ossenbach. 1986. "Hensel Information. Scientific communication. Milchfrei Kinder-Ernährung [Raising children on a milk-free diet]." Published by Henselwerk GmbH. Discusses Soyakraft. Note: This was the earliest known soymilk in Europe to be fortified with calcium.

1991. **Product Name:** [Whole soy flour (For use in Infant Formulas)].
Foreign Name: Vollsojamehl.
Manufacturer's Name: Henselwerk GmbH.
Manufacturer's Address: Magstadt bei Stuttgart, West Germany.
Date of Introduction: 1963?
New Product–Documentation: Honma and Nishihara. 1963. Chiryo (Journal of Therapy, Tokyo) 45(4):705. "On the use of soybeans as a protein source in infant diets."

1992. **Product Name:** [Sojabasan {Soymilk}].
Foreign Name: Sojabasan.
Manufacturer's Name: Henselwerk GmbH.
Manufacturer's Address: Magstadt bei Stuttgart, West Germany.
Date of Introduction: 1963?
New Product–Documentation: Honma and Nishihara. 1963. Chiryo (Journal of Therapy, Tokyo) 45(4):705. "On the use of soybeans as a protein source in infant diets." Interview with Harald Roquette by Anthony Marrese. 1990. March 15. Henselwerk no longer makes Sojabasan.

1993. Nagata, Aikichi; Yamamoto, H.; Terashima, S.; Matsumoto, T.; Onishi, S.; Konishi, S. Assignors to Ajinomoto Company, Inc. 1964. [Beverages from oil-free soybean flakes]. *German Patent* 1,160,717. Jan. 2. 4 p. Japanese application filed 12 Sept. 1959. (Chem. Abst. 61:6287h). [Ger]*
• ***Summary:*** The final beverage is an orange juice substitute.

1994. André, Émile. 1964. Sur l'utilisation des graines de soja dans l'alimentation humaine par les populations d'Extrême-Orient [On the dietary utilization of soya beans in the Far East]. *Oleagineux* 19(1):37-39. Jan. English-language summary p. XXVIII. [1 ref. Fre; eng]
• ***Summary:*** The author gives the results of his research on lipoxidase, initially inspired in early 1931 by a young Chinese student M. Kiawo Hou. He also discusses soymilk (lait de soja or téou-jou), tofu (fromage de soja or téou-fou), yuba (téou-fi), soy oil (huile de soja), soy sauce (tsing yeou [sic, tsiang yeou?]), miso (miso de soja), and soy sprouts (germes de soja). The residue from making tofu and soymilk (okara) is fed to poultry and pigs. Soya oil is made by an archaic process that is very inefficient. "The residue, not perfectly separated from the oil, is consumed by the poorer classes." Address: France.

1995. Dahlqvist, Arne. 1964. Method for assay of intestinal disaccharidases. *Analytical Biochemistry* 7(1):18-25. Jan. [14 ref]
• ***Summary:*** This early monograph reviews at least 26 cases of lactose intolerance; 13 of them had lactosuria. Address: Dep. of Physiological Chemistry, Univ. of Lund, Lund, Sweden.

1996. James, Isabel. 1964. Domestic science bureau. *British Vegetarian.* Jan/Feb. p. 37-39.
• ***Summary:*** The article begins with a question from a reader: "Can you please tell me something about the value and use of soya bean and soya flour?" The author gives a Bircher Benner recipe for Soya Pancakes (with soya flour), and notes that Soyolk and Hi-Soy soya flours are sold in Health Food Stores. The latter product is made by The British Arkady Co. Ltd. and is good for use in confectionery.

She then discusses soya milk and tofu. In the UK, Dr. Frank Wokes, of the Nutritional Research Centre, has done a great deal of work on the "preparation of a soya based vegetable "milk" that would be a suitable substitute for cow's milk and acceptable to children who could not take cow's milk. Largely as a result of this work *Velactin* is now available from Health Food Stores, made by Messrs. A. Wander Ltd." She then gives a recipe for home-made Soya Cheese (also known as Soybean Curd or Tofu), made from full-fat soya flour and coagulated with lemon juice.

She also mentions soya sauce and gives details on growing soya beans in England. "If the crop matures some of the green beans may be used in salads or as green vegetables." Address: B.A.

1997. André, Émile; Hou, Kia-Wo. 1964. La lipoxydase. Sa découverte dans le résidu de la préparation du lait de soja [Lipoxidase. Its discovery in the residue by-product of soybean milk production]. *Oleagineux* 19(3):187-93. March. English-language summary, p. XXVII. [Fre; eng]
• ***Summary:*** "The cheese called *Teou-fou* in China is somewhat consumed in Paris and the region surrounding it, where the number of Chinese restaurants is greater than one could believe." Of the total restaurants in this area, about 35 are Chinese restaurants, 10 at Vietnamese, and only 5 are Japanese. They are visited both by people of those countries and by western consumers who are curious to taste exotic foods. "There were, and still are, two or three shops in and around Paris, where tofu (fromage de soja) is prepared daily and delivered to the restaurateurs who have ordered it. Mr. Kia-Wo Hou had friendly relations with one of the two established at Colombes and was able to easily procure the materials he needed."

Note: In about 1910 Li Yu-ying, a Chinese soyfoods pioneer, established a soyfoods manufacturing company named Usine de la Caséo-Sojaïne, at Vallées, near Colombes, outside of Paris. It is not clear how the current companies at Colombes are related to the earlier company. Address: 1. Conseil scientifique a l'R.H.O.; 2. Docteur es-Sciences de l'Universite de Paris.

1998. National Food Research Institute (Shokuryo Kenkyujo). 1964. Daizu tanpakushitsu shokuhin no bussei [Physical characteristics of soy protein foods]. *Shokuryo: Sono Kagaku to Gijutsu* (*Food: Its Science and Technology*) No. 7. p. 55-65. March. [Jap]
• ***Summary:*** Discusses soymilk, tofu, aburage, soy protein gel and curd, Gelsoy, isolated soy protein (bunri tanpaku). Address: Tokyo.

1999. *Food Processing* (*Chicago*). 1964. The courts are raising the 'imitation barrier.' 25(4):25-27, 30-32, 34. April.
• ***Summary:*** "In an unbroken series of favorable decisions, nine different courts in seven states have recognized the legal right of Coffee-Rich, Inc. of Buffalo, New York, *not* to use the crepe-word 'imitation' on the company's new coffee-Rich coffee whitener–a replacement for traditional dairy cream.

"Because the issues involved in the Kansas decision are typical of all seven states in which Coffee-Rich has overcome the legal challenge of local dairy interests, Food Processing is reproducing *in toto* the Syllabus and opinion handed down by the Kansas Supreme Court."

The states in which Rich Products has won its legal battles against the dairy industry and the dates of the decision are as follows: Louisiana, 17 Nov. 1961; Indiana, 18 May 1962; Virginia, 29 Oct. 1962; Kansas, 4 Sept. 1962; Washington state, 28 Jan. 1963; Wisconsin, 1 Nov. 1963; Michigan, 23 Dec. 1963. In each case it was decided that Coffee-Rich was not an imitation cream, milk, or half-and-half and therefore did not need to have the word "imitation" printed on its label. "General Counsel for Rich Products Corporation and its wholly owned subsidiary, Coffee Rich Inc., is Arnall, Golden & Gregory of Atlanta, Georgia. All

of the successful litigation has been handled by Ellis Arnall, Senior Partner, and Elliott H. Levitas, Junior Partner. Mr. Arnall is former Attorney General and Governor of Georgia."

Within the article is a 2-page sidebar titled "How a man's vision furthers new forms of food." It shows portraits of Robert E. Rich and Holton W. Diamond (holding a carton of Coffee-Rich), and states: "Weaning the world from the cow by means of tailor-made vegetable-fat and vegetable-and-protein products that do specific jobs better than their cow-born counterparts–and usually at much lower cost–has been almost a personal crusade for Robert E. Rich, President of Rich Products Corporation and Coffee-Rich, Inc., its wholly owned subsidiary.

"Like all crusades, this one is costly; Rich has spent upwards of a half-million dollars and continues to spend large sums of money for legal fees, court costs, etc., as he 'blazes the trail' for technological advance in state after state (see box score at left).

"Interestingly, considering the consternation he produces among entrenched dairy interests, Rich has a dairy-plant background, and even today continues to head up the largest solely-owned dairy in the U.S.

"Rich's pioneering in non-dairy whip toppings and whippable emulsions began immediately after World War II. As milk order administrator for the state of Michigan during the war, he had learned about the Ford Motor Company's George Washington Carver Laboratories' successful development of a continuous method of producing soy milk and cream by extracting soy protein from the bean

"In April, 1945, using a new batch-extraction process that surpassed the original Carver extraction method in efficiency, Rich produced his original soy-cream Whip Topping. By freezing it, he was able to market it throughout the U.S., over extended periods of time.

"The new synthetic product had several advantages over cream. It could be re-whipped, even several days after initial whipping. It produced almost twice the whipped yield of regular cream–more than tripling its liquid bulk when it was whipped. Stiffness and overrun were retained longer, and the product possessed markedly better keeping qualities. And, it cost less.

"In addition, when kept frozen, it can be stored for more than two years–then thawed and used. This is utterly beyond the capabilities of whipping cream.

"In 1956, Rich acquired the research "jewel" who since has boosted the company into the position of largest U.S. specialist manufacturer of whippable emulsions. Holton W. Diamond, who had been chief chemist of The George Washington Carver Laboratory of The Ford Motor Company, came to direct Rich Products' research.

"Diamond's 'Diamond Process' patents for producing vegetable-fat whippable emulsions enabled Rich to market a line of bases and toppings with remarkable shelf-life, resistance to mechanical breakdown, compatibility with fruit acids and other qualities that could not be approached by conventional cream-derived products.

"Newest all-vegetable-fat emulsion product–liquid 'Coffee-Rich' is a coffee 'whitener' which, although shipped frozen, exhibits great stability after thawing, remaining fresh up to two-to-three weeks under normal refrigeration. This unusually protracted shelf-life results principally from absence of protein–except for .8 per cent of sodium caseinate, used as stabilizer.

"Since Coffee-Rich is slow to sour or spoil or curdle, it eliminates a major problem encountered with coffee-vending machines. Restaurants, hospitals, cafeterias and other large-volume feeding outlets also are prime prospects."

Concerning Chil-Zert soy ice cream: In United States v. 651 Cases, Etc. the court held that Chil-Zert was an imitation of chocolate ice cream since it "contained the identical ingredients of Chocolate-flavored ice cream in approximately the same proportions, 'except that soy fat and soy protein are used therein in place of milk fat and milk protein'; that it was manufactured in substantially the same manner as Chocolate ice cream, and with the use of similar machinery; that it was similar in taste, appearance, color, texture, body and melting qualities; that it had identical use and that 'its composition differs only from ice cream in the substitution of a cheaper ingredient; namely vegetable oil in place of milk products.'"

2000. **Product Name:** Granogen (Powdered Soymilk for Adults).
Manufacturer's Name: Granose Foods Ltd. (Importer-Marketer). Made in the USA by Loma Linda Foods.
Manufacturer's Address: Stanborough Park, Watford, Herts., WD2 6JR, England. Phone: 0923-672281/2.
Date of Introduction: 1964. April.
Ingredients: Soya bean solids, corn syrup, soya oil, sugar, salt, lecithin, vitamins.
Wt/Vol., Packaging, Price: 1 lb can. Retails for 9 shillings 6 pence (4/64, England).
How Stored: Shelf stable.
Nutrition: Protein 22.5%, carbohydrate 46.8%, fat 22.6%, ash 4.2%, moisture 3.9%.
New Product–Documentation: *The British Vegetarian.* 1961. March/April. p. 93. "Soya milk for household use." Granose Foods will soon be in a position to supply two varieties of spray-dried soya milk, Soyalac and Soyagen, made by one of their associated companies, Loma Linda Food Company in Arlington, California. Soyalac is specially prepared for infants, whereas Soyagen is for general use. A table compares the nutritional composition of the two products.

The British Vegetarian. 1964. March/April. "Granogen: Soya Bean Milk Now Available." "Readers will be glad to know that a really delicious general purpose soya bean milk is now available in Britain and will shortly be on sale in Health Food Stores." Made in America, Granose is

imported and distributed to the trade by Granose Foods Ltd., Stanborough Park, Watford, Herts. Fortified with vitamin B-12, this fine white powder is sold in a 1-lb can for 9 shillings 6 pence.

Orr and Adair. 1967. Tropical Products Institute Report G-31. "The production of protein foods and concentrates from oilseeds." p. 72. Soyalac is made in both liquid and powder form by Loma Linda Foods. The powder is imported into the U.K. by Granose Foods Ltd. and sold under their brand name of Granogen. A nutritional analysis is given.

Leah Leneman. 1971. *The British Vegetarian.* Jan/Feb. p. 6. "Plantmilk and sex!" The author (and many other people she knows) prefers the taste of Granogen to that of Plamil as an alternative to cow's milk. Granogen, however is not made in Britain.

Listing in The Vegetarian Health Food Handbook (UK). 1974. p. 155. "Granogen Soya Milk by Granose Health Foods Ltd." Note the new company name.

Manufacturer's catalog. 1980. April. "Soya milk for adults with added vitamins and minerals. Of great value to those with milk allergies." Purves. 1981. Nutrition and Food Science. Jan/Feb. p. 5-6.

Letter from Adrian Peck, production manager at Granose Foods. 1990. July 11. This product has always been imported as a powder. Granose has never sold a liquid Granogen. Before 1988 it was named Granogen and made in the USA by Loma Linda Foods. From 1988 on it was renamed Soyagen and made in West Germany by DE-VAU-GE.

2001. **Product Name:** [Naga-di Powdered Soy Beverage].
Foreign Name: Naga-di {Pulver}.
Manufacturer's Name: Nago Naehrmittel AG. Then Lindt & Spruengli from 1971. Then Galactina Ltd. from 1980.
Manufacturer's Address: CH-4600 Olten, Switzerland. It was partly made at a plant in Sursee. Then Kilchberg near Zurich, Switzerland. Then Belp, Switzerland. Phone: 1-716-22-33.
Date of Introduction: 1964. April.
Ingredients: Made from whole soybeans (not isolates).
Wt/Vol., Packaging, Price: 500 mg heavy paperboard tube, lined inside with aluminum foil, and having aluminum and plastic lids.
How Stored: Shelf stable below 20ºC.
Nutrition: Per 100 gm.: Protein 20 gm, fat 15 gm, carbohydrates 61 gm (incl. 35 gm lactose, 15 gm glucose, 9 gm saccharose, 2.5 gm starches and oligosaccharides), calories 460, d-l-methionine 0.4 gm, sodium 110 mg.
New Product–Documentation: This was the world's earliest known enteral feeding product. Hartmann and Kapp. 1964. Schweizerische Medizinische Wochenschrift 94(34):1173-76. Aug. 22. "Experiences with dietary preparations: Influencing the serum lipids with the help of a dietary preparation based on soya." This is about Naga-di, a soy protein drink and commercial dietary formula made and marketed by Firma Nago AG (Nago Nährmittel AG) of Olten, Switzerland.

Note: *Webster's Dictionary* defines "enteral" (a term first used in 1903) as being the same as enteric (first used in 1869). The latter it defines as "1: of or relating to the intestines; broadly, alimentary. 2: of, relating to, or being a medicinal preparation treated to pass through the stomach unaltered and disintegrate in the intestines." The term "parenteral" (first used in about 1910) is defined as "situated or occurring outside the intestine; esp: introduced otherwise than by way of the intestines." Thus, intravenous feeding is a type of parenteral feeding.

Brochure published by Nago Nährmittel AG, Olten, in about 1966. "Naga-di. Biologisch vollwertige Diätnahrung zur Regulierung des Fett- und Cholesterinstoffwechels" (A biologically high-quality diet food for the regulation of fat and cholesterol metabolism). 4 p. 14 cm. square. Gives the nutritional composition, preparation, concentration, dosage, and indications in German, French, and Italian.

Talk with Conrad Seewer of Galactina. 1990. May 17 and 21. The first product in the Nago line was Naga-di. It was developed by Nago Olten for oral and enteral feeding, not for tube feeding. Afterwards they developed Naga Sonda for tube feeding. The company also made products like Ovomaltine (Ovaltine). He thinks the whole company merged in about 1971 with Lindt & Spruengli, which completed development of the line. Lindt & Spruengli is a large and famous chocolate company located near Zurich. Naga-di was made from whole soybeans; it contained no isolates. Trypsin inhibitors caused a problem in the beginning but it was later solved. One could make drinks from Naga-di, which could be fed either from a cup (mixed with other beverages such as coffee or chocolate, or with fruit) or it could be fed enterally, with a tube into the stomach. The product is no longer on the market. Being a chocolate manufacturer, Lindt & Spruengli was not able to distribute their product, considered a food for sick people, to hospitals. Galactina was able to distribute to this market. Galactina bought the Naga product line from L&S in 1979, and sales began in 1980. Galactina as a company did not work with soy products before that date. The main reason for buying this product line was the company's interest in soya, their existing distribution system to clinics, and their goal of diversifying into the field of clinical nutrition. One of Galactina's main businesses is the manufacturing and marketing of dietetic foodstuffs.

Talk with Peter Speck of Galactina. 1990. May 23. Nago Olten had a plant at Sursee. They wanted to produce a product for enteral tube feeding that contained no lactose or animal protein. Mr. Heinz Knell at Nago Olten (who is still alive, on pension) was responsible for the development of Naga-di and Naga-Sonda, both spray dried products. Nago Olten belongs to the Lindt & Spruengli group but he is not sure when Nago was purchased by Lindt & Spruengli. In 1979 this plant was sold to Galactina. When Peter arrived

at Galactina, the company made these two products only in dried form. Then in 1981 they started to produce them in a liquid form in Tetra Pak. Speck's first job at Galactina was to develop the liquid form of Naga Sonda in Tetra Pak. Speck would define "enteral" as relating to a tube that is put through the nose into the stomach. Enteral must involve a tube. There are two types of stomach feeding: oral feeding and enteral feeding. Enteral feeding is used for patients who are unconscious, or cannot eat with their mouth because of an operation or broken jaw or problems with their teeth. The other way of feeding such patients is by parenteral or intravenous feeding, by using a needle to run the solution into the veins. Enteral feeding makes much more sense if the patient's digestive system is okay. Of Galactina's clinical stomach feeding soy products, about 70% are fed enterally with a tube and 30% are fed orally without a tube. As soon as you can take food orally, you have more choices.

Letter (fax) from Mr. Heinz Knell of Lindt & Spruengli, Olten. 1990. July 12. This product was launched in April 1964 by Nago, Nährmittel, CH-4600 Olten. It was partly made in Sursee/Sprueken? It came in a 500 gm cardboard carton which was aluminum coated. It was a powder for the preparation of a diet drink for the regulation of fat and cholesterol metabolism. This was the first of the three pioneering soy products that he developed. Each was the first of its type, as far as he knows, based on soya. He learned how to make these products based on his own research. Each product was made starting with whole soybeans (not soy flour or isolates). The method used to prevent flatulence (intestinal gas) in infants is a company secret. Lindt & Spruengli was not involved in the development of the products. On 1 April 1971 Nago merged with Lindt & Spruengli. Galactina got involved in the development and marketing of these products in 1979.

Letter (fax) from Conrad Seewer of Galactina. 1990. July 13. A leaflet dated Aug. 1979 shows a canister of "naga-di" is cylindrical, with the silhouette bust of two hairless humans and horizontal lines. A dose of 900 gm contains 4,140 calories, and 1 carton contains 6 doses. A bag of 109 gm contains 500 calories, and 1 carton contains 50 bags (only for hospital use). Seewer adds: "This 900 gm cardboard tin, aluminum coated on the inside, as used for Naga Di and Naga Sonda. Bebe Nago was packed in a similar tin but smaller (500 gm)."

Note: This is the earliest known commercial soy product made by Nago Naehrmittel AG, which became Galactina Ltd. from 1980.

2002. Lo, K.S. 1964. Pioneering soy milk in Southeast Asia. *Soybean Digest.* May. p. 18, 20.

• ***Summary:*** "In 1962 we sold 2,500,000 cases of Vitasoy... Vitasoy has become the largest single seller in the local soft drink market. And this is no small achievement, when we are competing with such internationally known brands as Coca Cola, Pepsi Cola and Seven Up. We have certainly come a long way since we first got started in 1940 with a small setup to make 'milk' out of the soybean. How I came about it was quite an accident. I happened to be in Shanghai in 1937 and attended a talk given by the late Julian Arnold who was then commercial attache to the American Embassy in Nanking. He called soybean the 'Cow of China' and practically attributed to it the preservation of the Chinese race... I was very impressed by his talk and came away with soybean stuck in my mind. I soon returned to Hong Kong and decided to do some experiments in making a formulated soybean milk which could serve as a milk substitute. A few friends took an interest in my work, and a private limited company with a paidup capital of HK$15,000 was formed to put the product on the market. The small factory with its crude equipment was formally opened in March 1940 by the then director of medical services, Dr. Selwyn-Clarke. In my opening speech, I said that the aim and object of this new venture was to bring better nutrition to the masses of people at the price they could afford to pay. This has ever since remained the policy of our company. To this day the retail price of our Vitasoy is less than one-third the price of cow's milk.

"The first couple of years were extremely difficult. We soon found that, even among us Chinese to whom the soybean was by no means new, there was a strong prejudice against soy milk. They not only did not believe its nutritional values, but thought it could cause diarrhea, indigestion and stomach ache. At that stage the taste of our product, too, left much to be desired. Many consumers found it hard to take, because of the strong beany flavor and the slightly bitter taste. Another problem we had to face was the keeping quality of the soy milk. We followed the dairy industry by packing it in standard half-pint milk bottles and sealed them with paper cap and hood. They spoiled even quicker than milk unless they were kept under refrigeration all the time."

"Hurt by public prejudice and lack of marketing know-how, the business soon became a failure. When the Pacific War broke out in December 1942, the company had not only lost all its money, but also owed a large sum to me personally because I had to put up the money in order to keep it going. After the Japanese took over Hong Kong, they also took over our small factory and everything inside it. I left the Colony for Free China and remained there until the war was over.

"I returned to Hong Kong after the war was over, and my first task was to get Vitasoy back on the market. I was happy to find most of the equipment was left intact in the factory and by November 1945 Vitasoy [which was named Sunspot Soya Milk at the time] was on sale again. This time I decided to push my product to the small people in the street and to market it as a beverage rather than a milk substitute."

In 1953 the original milk bottle with a paper cap and hood was changed to a soft drink bottle with a metal crown cap. After sterilization by heat, it could be kept for months

without refrigeration. “This technical breakthrough gave the biggest impetus to the increase in sales volume.”

“Soft drink sales in Hong Kong are very seasonal, with 80% of the volume during the 6 summer months and the remaining 20% spread out from November to April. So we set to work on a heater which will keep Vitasoy hot during the cold weather. Its function will be just the opposite of an electric beverage cooler. After some initial failures we finally came out with a heater which has a capacity of heating up to 4 cases of Vitasoy at a time and always maintains a temperature of 145ºF. So at any time during the winter a customer can walk up to a store and ask for a bottle of hot Vitasoy which will take away the chill, and yet not hot enough to burn his lips... With the help of the heaters, we are able to maintain 50% of our peak summer sales through the winter months. Hot Vitasoy stands out uniquely among the soft drinks, because there is no other soft drink which one can drink hot!”

In 1963 the company built a new plant in Kowloon with twice the production capacity of the old original plant in Hong Kong. Today, Vitasoy is consumed by 250,000 people daily.

“The influence of our work does not stop within the bounds of this little island. We helped UNICEF train technicians to operate a soybean milk powder plant in Indonesia. In Singapore, Malaya and Thailand, private enterprise started soybean milk plants after having seen our success in Hong Kong.”

Photos show: (1) K.S. Lo. (2) Part of the crowd standing in line at the Vitasoy plant in Kowloon. Address: Hong Kong Soya Bean Products Co., Ltd.

2003. Madison Foods. Div. of Worthington Foods, Inc. 1964. Wholesale price list–order blank. Worthington, Ohio 43085. 1 p. July 1.

• ***Summary:*** Products in Madison Foods line (now owned by Worthington Foods) include: Cheze-O-Soy [canned tofu]. Com-Pro. Dinner Morsels. Madison Burger. Not Meat (plain or tomato). Nu-Steaks. Stake-Lets. Vigorost. Yum. Zoyburger. Kreme-O-Soy [canned soymilk]. Soy Beans (Boston). Zoy-Koff (regular, or fine grind).

Worthington now has warehouses in Portland, Oregon; Oakland, California (actually San Leandro); Washington, DC; and Madison, Tennessee. Address: Worthington, Ohio. Phone: 614-885-9511.

2004. Asahi Kasei Kogyo Company. 1964. [Soybean protein beverage]. *Japanese Patent* 16,324. Aug. 11. English-language summary in Soybean Digest, Feb. 1966, p. 52. [Jap]*

• ***Summary:*** Uses defatted soybean meal. Address: Osaka, Japan.

2005. Heiner, Douglas C.; Wilson, J.F.; Lahey, M.E. 1964. Sensitivity to cow’s milk. *J. of the American Medical Association* 189(7):563-67. Aug. 17. Council on Foods and Nutrition. [18 ref]

• ***Summary:*** Clinical sensitivity to cow’s milk has been estimated to occur in 0.3% to 7% of all children. Discusses the multiplicity of antigens in cow’s milk and variability of antibody responses, hypochromic microcytic anemia, and celiac disease.

Summary” Sensitivity to cow’s milk is difficult to recognize, to document, or to ascribe to any one constituent of the food... Recent evidence indicates that the ingestion of cow’s milk may cause the occult loss of significant quantities of blood into the gastrointestinal tracts of some children with hypochromic microcytic anemia.” Address: Dep. of Pediatrics, Univ. of Utah College of Medicine.

2006. Hartmann, G.; Kapp, H. 1964. Erfahrungen mit Praeparaten: Beeinflussung der Serumlipide mit Hilfe eines Diaetpraeparates auf Sojabasis (Naga-di) [Experiments with dietary preparations: Influencing the serum lipids with the help of a dietary preparation based on soya]. *Schweizerische Medizinische Wochenschrift* 94(34):1173-76. Aug. 22. [10 ref. Ger]

• ***Summary:*** This is about Naga-di, a soy protein drink and commercial dietary formula made or marketed by Firma Nago AG of Olten, Switzerland. “A commercial dietary formula prepared from soybeans was examined for a possible lipid-depressing effect in a total of 34 individuals with normal and elevated serum lipids. Addition of the preparation to the normal diet had no effect on serum lipids.

However, when about ¼ of the daily calorie intake was summarily replaced with the soybean preparation for 4 weeks, comparison with controls showed a slight decrease of serum lipids in normo-lipemic subjects and a marked decrease in the hyper-lipemic group. All lipid fractions are affected, the triglyceride fraction to a marked degree. Six subjects with slight to pronounced hyperlipemia showed a marked decrease in all lipid fractions after at least 12 days on pure formula diet. No undesirable side effects were observed.”

Note: This is the earliest document seen (Jan. 2010) showing reduction of cholesterol levels in response to soy protein in a scientific human study.

Also issued as an offprint pamphlet, promoting “naga-di” by Nago Nährmittel AG, Olten. Address: Medizinischen Universitaetsklinik Basel.

2007. Smith, A.K. 1964. The Mount Fuji meeting. An international symposium on oilseed protein foods. *Soybean Digest.* Aug. p. 18-20.

• ***Summary:*** The symposium, sponsored by the International Institute of Food Technology, was held on May 11-15 at the Mt. Fuji Hotel, Lake Yamanaka, Japan. “The 85 technologists participating in the program represented 20

countries and included 30 from Japan and 20 from the United States. An additional 26 technical observers represented the Japanese food industry." "The Mount Fuji symposium was a historic occasion for the advancement of oilseed protein foods, being the first time an international conference was devoted solely to this subject."

"Dr. Y. Sakurai of Tokyo University and George F. Stewart of the University of California, Davis, were co-chairman for the meeting. Dr. T.M. Anson, assisted by others, developed the program. Dr. Masahiro Nakano was chairman of a committee to collect and display oilseed protein foods."

"Soybeans, peanuts, cottonseed, sesame, and coconut were the five oilseeds included in the program as sources of food proteins. Because of their long history and extensive use for food, soybeans were the topics of a major part of the papers and discussion."

"Among the newer developments in the Orient, K.S. Lo of Hong Kong reported on his successful commercial operation in the daily production of 24,000 cases of soybean milk in his two plants. His milk is made from well-washed and dehulled soybeans. It contains about 3% protein, 2-3% fat, and 5-7% carbohydrates, with added vitamins and calcium. Mr. Lo's methods for marketing soymilk are unique; he is also a large dealer in bottled soft drinks, and he markets soy milk as a soft drink. His milk competes with soft drinks rather than with other forms of milk or other health foods. Regardless of his method of marketing, he feels that the product is serving an important nutritional function in the Hong Kong area." Note: Vitasoy is once again being fortified with vitamins and calcium.

Dr. Tokuji Watanabe of the Food Research Institute reported on new ways of making tofu, such as "packed or bagged tofu" which is increasing in popularity. The soymilk is coagulated with calcium sulfate inside a polyethylene or vinylidene chloride plastic bag followed by heating in a water bath. This new process saves time and labor. Several plants are now producing 20,000 bags per day. Tofu is now also being freshly prepared in the home from spray-dried soy milk, coagulated with calcium. "More than 285,000 metric tons of soybeans and 65,000 metric tons of soybean meal are consumed annually for making fresh tofu in Japan, and because of low cost and high food quality, its consumption is said to be increasing.

Concerning miso, koji is now being made by a continuous method in 20-inch deep metal trays. Miso soup is now sold in a dried form. Shoyu production consumes 250,000 metric tons of soybeans of the equivalent as meal.

"The use of soy flour and grits in the United States for edible purposes was estimated at 200 million pounds and in England at 40 million pounds. The largest use of soy flour in the United States was estimated at 50 million pounds for bread and other baked products. In England, most soy flour is the full fat, enzymatic active type and is used at about 0.75% for improving color and flavor of baked goods."

"While isolated soybean protein for industrial uses has been produced since 1937, the production for food protein dates only from 1959. The production of industrial protein is carried on by two U.S. producers and annual production was estimated to be in the range of 40-50 million pounds. Four U.S. companies were reported to be producing or engaged in extensive research on isolated protein for food uses. The newest to be manufactured is referred to as a protein concentrate. It is prepared by washing soy flakes either with 80% alcohol or with water at the isoelectric point of the protein (pH 4.5). The concentrates must contain 70% protein whereas the isolate is 95% or more. The largest use of the isolate and concentrate is in comminuted or ground meat products, also referred to as sausage-type meats. Soy protein concentrate can be legally used in sausage-type meats up to 3.5% of the finished product." Address: NRRL, Peoria, Illinois.

2008. Mustakas, G.C.; Griffin, E.L., Jr.; Allen, L.E.; Smith, O.B. 1964. Production and nutritional evaluation of extrusion-cooked full-fat soybean flour. *J. of the American Oil Chemists' Society* 41(9):607-14. Sept. [14 ref]

• ***Summary:*** The abstract begins: "A processing method for preparing full-fat soybean flours for human consumption by a new extrusion cooking method was developed." The paper continues: "The extrusion equipment described in this paper was used in 1961 to convert soybeans directly to full-fat meals for feed mixing. Swine feeding tests carried out on these meals at Purdue University [Indiana] were reported [Jimenez et al. 1961, in *Feedstuffs* 33(44):42] to give comparable weight gains and feed conversion efficiencies of regular defatted soybean meal with added fat.

"On the basis of the Purdue experiment, it was conceived that it might be possible to apply the cooker-extruder process to dehulled soybeans to produce an edible-grade full-fat soybean product which could be ground to a highly nutritious flour for human foods."

"A collaborative project was therefore sponsored by UNICEF, and undertaken by the Northern Utilization Res. & Dev. Div., ARS, USDA [NRRL], and the Wenger Mixer Manufacturing [Sabetha, Kansas] to develop and evaluate and evaluate a simplified extrusion cooking process for the production of full-fat soybean flour for edible uses." Contains an analysis of 12 soybean flours processed under different conditions. "The United Nations Children's Fund (UNICEF) has been improving local diets in the developing countries, especially of children and of pregnant and nursing mothers. Since [cow's] milk is a logical food for this group, UNICEF has assisted in building and equipping over 200 milk-processing plants in the developing countries to provide safe milk or milk powder."

"Asians have traditionally used soybean foods, generally in a moist form. Some of these are: soy milk (a water extract of the ground whole bean); tofu (a precipitated curd similar

to cottage cheese); and tempeh (a fermented product of the decorticated bean). Because of their relatively short shelf life they are usually made locally each day as a cottage or small village industry."

The product flavor was evaluated. "The prevention of off-flavors and odors which result from fat deterioration is of major importance." Only one lot was stabilized with an antioxidant. Accelerated stability tests were conducted on two lots at 100ºF and 113ºF for 1-39 weeks. The higher-temperature lot began to show evidence of rancidity by its elevated peroxide value of 6.4 at the end of 15 weeks, and this rancidity was strong at the end of 26 weeks when the peroxide value reached 54. The fresh products had a desired nutty flavor, and the strong beany-bitter flavor had been removed.

"Proposed Clinical Testing. A 1,000-lb lot of the milled soy flour has been forwarded to the P.N. Sarihusada Co., Jogjakarta, Indonesia, where it will be formulated and packaged for acceptability testing in the areas now supplied by the plant with the dried water-extracted soya milk formulation. Clinical and acceptability testing is being done by the College of Medicine of the National Taiwan University, Taipei, Taiwan. It is part of a large-scale clinical test with infants up to 12 months of age to compare the extruded soy flour formulated as a milk, with various other soybean products." Two illustrations show the extrusion equipment, which was operated by LaVon Wenger.

Note 1. This is the earliest document seen (Dec. 1997) that discusses extrusion cooking in connection with soybeans for food uses. This appears to be the first production of full-fat soy flour (FFSF) by an extrusion cooker.

Note 2. This is the earliest document seen (Sept. 2000) that describes the equipment used to make soy flour. Address: 1-2. NRRL, Peoria, Illinois; 3. Food Conservation Div., UNICEF, United Nations, New York; 4. Wenger Mixer Manufacturing, Kansas City, Missouri.

2009. **Product Name:** [Naga-Sonda {Powdered Soy Beverage for Enteral Tube Feeding}].
Foreign Name: Naga-Sonda {Pulver}.
Manufacturer's Name: Nago Naehrmittel AG. Then Lindt & Spruengli from 1971. Then Galactina Ltd. from 1980.
Manufacturer's Address: CH-4600 Olten, Switzerland. It was partly made at a plant in Sursee. Then Kilchberg near Zurich, Switzerland. Then Belp, Switzerland.
Date of Introduction: 1964. October.
Wt/Vol., Packaging, Price: 108 gm or 500 gm heavy paperboard tube, lined inside with aluminum foil, and having aluminum and plastic lids.
How Stored: Shelf stable.
Nutrition: Per 100 gm powder: Protein 19.4 gm, fat 15.7 gm, carbohydrate 57.9 gm, minerals 3.2 gm, water 3.8 gm, calories 463 kcal, sodium 296 mg, potassium 579 mg, chloride 528 mg, calcium 324 mg, phosphorus 347 mg, magnesium 111 mg, iron 5.9 mg, copper 0.7 mg, manganese 0.8 mg, zinc 4.6 mg...plus 13 vitamins.
New Product–Documentation: In French, sonde means "probe." This product is typically administered to a patient through a tube that goes in through the nose and down into the stomach. This is called enteral tube feeding or simply tube feeding. Products so fed may be called "tube feeding formulas."

Brochure published by Nago Nährmittel AG, Olten, in about 1966. "Naga-sonda. Biologisch vollwertige Sondennahrung." 4 p. 14 cm. square. Gives the nutritional composition, preparation, concentration, dosage, and indications in German, French, and Italian.

Talk with Peter Speck. 1983. This product, introduced in 1969, is sold to the dietetic and pharmaceutical markets for enteral tube feeding. Shurtleff & Aoyagi. 1984. Soymilk Industry and Market, Update. The company is presently making 40,000 liters/week of various types of soymilk from whole soybeans. Soya Bluebook. 1985. p. 85; 1986. p. 104, 111. Soya Bluebook. 1986. p. 111; 1989. p. 131. Talk with Peter Speck. 1990. June 2. Soya Bluebook contains a misprint. Naja Sonda (Dry product for enteral tube feeding) is actually Naga Sonda.

Galactina Diätetica. 1986. Naga-Sonda: Vollbilanzierte Trink- und Sondennahrung auf natuerlicher Basis [Naga-Sonda: A natural, fully-balanced drink and special food]. 18 page booklet with 15 references. This easily digestible product is a nutritionally balanced, low-bulk, natural drink and enteral food made with soy protein. It contains the required essential amino acids, essential fatty acids, minerals and vitamins, and trace elements. It contains no lactose, gluten, purines, or cholesterol. It is used mostly by doctors. Letter from Peter Speck. 1988. March 11. "Naga Sonda was launched in 1969 in dry form."

Letter (fax) from Mr. Heinz Knell of Lindt & Spruengli, Olten. 1990. July 12. This product was launched in Oct. 1964 by Nago, Nährmittel, CH-4600 Olten. It was partly made in Sursee/Sprueken? It came in 500 gm doses, in aluminum foil packets in a carton. It was a powder, which was dissolved in water for complete nutrition via a navel tube. This was one of the three pioneering soy products he developed. Each was the first of its type, as far as he knows, based on soya.

Letter (fax) from Conrad Seewer of Galactina. 1990. July 13. The soybeans for this product, even at the time it was launched, were purchased from the USA. From the soybeans a soymilk was made and vitamins and minerals were added.

2010. *Foreign Agriculture.* 1964. USDA promotes soy beverage, defatted grits in test project. 2(48):10. Nov. 30.
• ***Summary:*** A pilot project to test the consumer acceptance of U.S. defatted soy grits and soy beverage products will get underway within the next 3 months with the distribution of 7,500 tons to consumers in six foreign countries. Main

participants will be Brazil, Hong Kong, India, Korea, the Philippines, and Taiwan.

2011. Fomon, Samuel J.; Owen, G.M.; Thomas, L.N. 1964. Methionine, valine and isoleucine: Requirements during infancy: Growth and nitrogen balance studies with normal fullterm infants receiving soybean protein. *American J. of Diseases of Children* 108(5):487-93. Nov. [12 ref] Address: Dep. of Pediatrics, State Univ. of Iowa, Iowa City, IA 52241.

2012. Nichols, Teal. ed. 1964. Zen cookery. Chico, California: The Ohsawa Foundation. 83 p. Index. 22 cm. A second edition appeared in 1965.

• ***Summary:*** This is the earliest known macrobiotic cookbook written by an American, and its influence was profound.

Note 1. The Nov. 1964 edition of *Yin Yang* magazine, published in Chico, California, announced that the book had been published that month (Nov.).

"Acknowledgements: Our heartfelt gratitude goes to Lima Ohsawa, the foremost authority on Macrobiotic Cookery, without whose patient assistance and teaching this book would not have been possible. Many of the recipes appearing in Zen Cookery are from her collection in an earlier edition of Zen Macrobiotics. The Editor wishes further to thank the following people for recipes, suggestions, and invaluable comments: Joanne Hirsh, Dorothy Salant, Nina Bauman, Cornellia Aihara, Penny Smith, Shayne Oles, Betty Kennedy, and Jane Andrews."

"Zen Cookery is a collection of recipes gleaned from the files of many people, all of whom have adjusted their salt intake to suit their own needs. Their recipes reflect this."

Contents: 1. Grains. 2. Noodles. 3. Vegetables. 4. Soups. 5. Sauces. 6. Salads. 7. Inspirations from around the world. 8. Special dishes. 9. Miso soy bean paste. 10. Tamari soy sauce. 11. Breads. 12. Pancakes and crepes. 13. Pie doughs. 14. Desserts. 15. Beverages.

Note 2. This is the earliest English-language document seen (March 2012) that contains the term "tamari soy sauce." It is also the earliest English-language cook book seen that contains the word "tamari" or the term "tamari soy sauce."

Each recipe is numbered. Recipes mentioning soy in recipe name (and a few other recipes introducing foods new to the USA): 2. Rice with tamari soy sauce. 3. Rice with aduki beans. 4. Rice & aduki pudding. 7. Sesame rice. 9. Rice with chick peas (garbanzo). 21-28. Buckwheat recipes. 34. Bulghur. 48. Buckwheat noodles in soup (Soba with kombu). 50. Buckwheat noodles with fried bean curds [tofu]. 54. Buckwheat noodles with miso sauce. 55-56. Buckwheat noodles in kuzu sauce. 61. Udon with aduki. 62. Carrot sesame nituke [nitsuke]. 75. Scallion nituke with miso (soybean paste). 76. Carrot and onion nituke with miso. 77. Onion nituke with miso. 78. Vegetable miso stew. 79. Boiled pumpkin with miso. 80. Vegetable sauces with kuzu arrowroot (and tamari soy sauce).

81. Vegetables with tamari soy sauce and tahini. 98. Jinenjo (5 recipes). 101. Miso-vegetable relish. 102. Aduki beans, black [soy] beans, chick peas. 105. Baked chick peas. 106. Buckwheat-aduki pancakes. 107. Udon with aduki beans. 108. Chestnut-aduki gelatine. 109. Chick pea party dip (with tahini and tamari). 110-118. Sea vegetables (kombu, nori, hiziki, wakame, most with tamari). 119. Clear broth (with tamari). 122. Tamari-vegetable broth. or stock. 123. Miso soup (2 types). 124. Creamed miso soup. 125. Root vegetable soup with miso. 131. Soybean soup. 134. Wakame soup (with miso). 149. Sesame sauce. 150. Miso sauce. 151. Miso salad dressing. 152. Thick tamari soy sauce. 153. Tahini tamari soy sauce. 154. Onion tahini sauce (with tamari). 172. Wakame salad.

189. Clam miso. 190. Scallop miso-lemon. 203 Miso spread [with tahini]. 204. Miso sauce [with tahini and orange rind]. 205. Sauce for vegetables [with black sesame and miso]. 206. Scallion miso. 207. Miso salad dressing. 208. Miso-vegetable relish. 209. Miso soup. 210. Udon with miso sauce. 211. Rice porridge with miso. 212. Deep fried miso balls. 213. Carrots and onions miso. 214. Vegetables miso. 215. Tekka (2 types). 216. Tea with tamari soy sauce. 217. Tamari broth. 218. Stringbeans. 219. Dried radish (daikon). 220. Shredded sea vegetables (hiziki). 221. Thick tamari soy sauce. 222. Tahini-tamari sauce. 223. Vegetables with tahini-tamari soy sauce. 234. Aduki muffins. 238. Miso spread (for sandwiches). 239. Tahini-tamari spread. 246. Buckwheat aduki pancakes. 272. Aduki pudding. 273. Chestnut-aduki gelatine. 274. Kanten jello (with agar).

291. Grain Milk (Kokkoh [Kokoh]; a finely ground combination of roasted rice, glutinous rice, oatmeal, soybeans, and sesame seeds). 294. Tea with tamari soy sauce (syo-ban).

Note 3. This is the earliest document seen (Feb. 2005) that mentions Kokkoh (or Kokoh), a grain milk introduced by macrobiotics.

Note 4. Tofu, amazake, and seitan are not mentioned in this book. 287 is Ohsawa Coffee (Yannoh) and 288 is Dandelion Coffee.

Note 5. This is the earliest document seen (June 2000) that mentions the use of miso in a salad dressing (Nos. 151 and 207).

Note 6. In 1985, when writing a revised edition of this book titled *The First Macrobiotic Cookbook*, Herman Aihara wrote (p. v) that this 1964 edition, published by the Ohsawa Foundation of Chico, California, was first the edition of the various subsequent and very influential books with this title.

Note 7. This is the earliest document seen (March 2011) concerning Herman or Cornellia Aihara and macrobiotics (or soyfoods).

Note 8. Along with soyfoods, this cookbook (and its many successors) also introduced numerous other basic

Japanese foods such as aduki [azuki] beans (3-4, 102, 106-08, 234, 272-73), sea vegetables of all types, and soba. Address: Chico, California.

2013. Hand, D.B.; Steinkraus, K.H.; VanBuren, J.P.; Hackler, L.R.; Rawi, I. el; Pallesen, H.R. 1964. Pilot-plant studies on soymilk. *Food Technology* 18(12):139-42. Dec. [7 ref]
• ***Summary:*** Contents: Summary. Introduction. Experimental methods [cold-water grind]: Spray-dried water-extracted soymilk, soymilk from [unsoaked] dehulled soybeans, soymilk from soaked dehulled soybeans, spray-dried acid curd, soymilk residue [okara]. Results and discussion: Interrelation of soybean fractions, indices of quality in relation to processing conditions, nutritional assessment, studies on flavor.

Note 1. This is the earliest English-language document seen (June 2013) that uses the term "soymilk residue" (or "soy milk residue") to refer to okara.

This investigation was made to develop improvements in the process for making dried soymilk from whole soybeans for use in developing countries, and especially in the process used at the soymilk plant in Indonesia equipped by UNICEF. The authors made a dry soymilk of excellent quality directly from whole soybeans without including the typical water-extraction step. The yield is higher and labor costs are reduced. A homogenizer is added to the processing line, but an evaporator and filter press are eliminated.

Figures show: (1) Flow sheet for water-extracted soymilk. (2) Flow sheet for soymilk from dehulled whole soybeans. (3) "Distribution of solids and protein as percentages in fractions from soaked soybeans." When whole soybeans are soaked, 98.5% of the solids and 99.5% of the protein remain in the soaked beans; the rest goes into the soak water. When the soaked soybeans are ground and filtered, 65% of the solids from the original dry soybeans and 83% of the protein remains in the soymilk; 33.5% of the solids and 16.5% of the protein goes into the residue [okara]. When the soymilk is made into tofu by cooking, precipitation with 4% acetic acid, and pressing the curd, 49% of the solids from the original soybeans and 74% of the protein remain in the tofu; 16% of the solids and 9% of the protein go into the whey.

(4) "Distribution of solids and protein as percentages in fractions from dehulled soybeans." When whole dry soybeans were steamed lightly, then dehulled, 10% of the solids and 4% of the protein were lost in the hulls. When the dehulled whole soybeans were soaked in 3 times their weight of water, 10% of the solids in the original dry soybeans and 4.5% of the protein was lost in the soak water. This 80% of the solids and 89.5% of the protein remained in the soaked dehulled soybeans.

Tables show: (1) Composition of soymilk samples (% of total). (2) Taste panel comparison of soymilk samples: The water-extracted soymilk received the highest (i.e., best) score for flavor (6.7) and consistency (8.1), followed by the soymilk made from dehulled whole soybeans (6.1 and 6.8), then the soymilk made from dehulled soaked whole soybeans (5.2 and 5.8). The acid-precipitated curd received a very low flavor score (1.8) and low consistency score (1.8) because of its grittiness.

(3) Pilot plant equipment list: Names and sources of 17 pieces of equipment,

Note 2. This is the earliest document seen (Oct. 2003) with the word "soymilk" in the title from Cornell University's Department of Food Science and Technology, Geneva, New York. This was the first group to consistently spell "soymilk" as one word–the modern spelling. Address: New York State Agric. Exp. Station, Cornell Univ., Dep. of Food Science and Technology, Geneva, New York.

2014. Van Buren, J.P.; Steinkraus, K.H.; Hackler, L.R.; Rawi, I. el; Hand, D.B. 1964. Indices of protein quality in dried soymilks: Heat effects on soymilk. *J. of Agricultural and Food Chemistry* 12(6):524-28. Nov/Dec. [19 ref]
• ***Summary:*** "Soymilk powders were prepared by various heating and drying procedures." A study of protein damage during the process was conducted. For example, overheating increased the darkness of the product and decreased the available lysine. Table 1, "Indices of adequacy of heat treatment," shows the percentages of soluble nitrogen and residual trypsin inhibitor. Address: Cornell Univ., New York State Agric. Exp. Station, Dep. of Food Science and Technology, Geneva, New York.

2015. Chu, Dawson. 1964. The production of protein-rich foods in Republic of China. *Industry of Free China* 21(1):21-34. *
• ***Summary:*** As part of its program to promote the production of protein-rich foods, the Government of Taiwan is organizing rural co-operatives for the manufacture of soya milk.

2016. DeMaeyer, E.M. 1964. Clinical trials with full-fat soy formulation in Taiwan. FAO, WHO, and UNICEF Report. 10 p. *

2017. Poey, S.H. 1964. Trial of soy bean milk on children older than five months. In: Proceedings of the A-A Congress on Pediatrics. I. See p. 595. *

2018. **Product Name:** Soylack (Soy Beverage).
Manufacturer's Name: Soy Products Co.
Manufacturer's Address: 3054 East Court Ave., Des Moines 9, Iowa.
Date of Introduction: 1964.
New Product–Documentation: Soybean Blue Book. 1964. p. 107.

2019. **Product Name:** [TFA Soymilk].
Manufacturer's Name: Taiwan Farmer's Association.
Manufacturer's Address: Taiwan.
Date of Introduction: 1964.
Wt/Vol., Packaging, Price: Glass bottle.
New Product–Documentation: Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 95, 98. This is a cooperative of many small soymilk producers was established in 1946 and began to make soymilk in 1964, using a process introduced by Dr. Harry Miller. By 1980 the TFA had 6 soymilk plants in operation, producing 11.18 million bottles (each 260 ml) or 2.91 million liters. The largest, Lo-Tung produced 5,820,000 bottles, the smallest 350,000.

2020. **Product Name:** Poluk Milk.
Manufacturer's Name: [Medium-sized Soft Drink Manufacturer].
Manufacturer's Address: Bangkok, Thailand.
Date of Introduction: 1964.
Wt/Vol., Packaging, Price: Bottle.
New Product–Documentation: E. Orr. 1972. Tropical Products Inst. G73. The use of protein-rich foods for the relief of malnutrition in developing countries: an analysis of experience. p. 15-16. "Poluk Milk has been produced in Thailand by a medium-sized soft drink manufacturer since 1964. It differs from the soya beverages mentioned above in that the soya milk is combined with powdered milk and butter. It could therefore be described as a milk extender but appears in fact to be marketed as a soft drink. Sales are in the region of 400,000 bottles per year, about half the capacity of the plant, and appear to be static. The main reason given for the failure of sales to expand is competition–as mentioned above the soft drink market in Thailand is highly competitive."

2021. Aykroyd, Wallace R.; Doughty, Joyce. 1964. Legumes in human nutrition. *FAO Nutritional Studies* No. 19. xi + 138 p. Reissued by FAO in 1982 (152 p.). [119 ref]
• ***Summary:*** Contents: Preface. Introduction. History of legumes. Production and consumption. Composition and nutritive value. Methods of processing and cooking: Soybean preparations in East Asia (p. 48-52)–Germination (sprouted soybeans), soybean curd (tofu, incl. *chou tofu* or "stinking soybean curd"), soy sauce (shoyu), soybean paste (miso), tempeh, natto, hamanatto, soybean "milk," fermented preparations from groundnuts. Groundnut flour.

Effects of processing on nutritive value: Soaking, decortication, heating, germination, fermentation (mentions tempeh), effects of storage.

Toxic substances. Legume proteins. Observations on the value of legumes in human feeding. The place of legumes in human diets. Appendixes: (1) Legumes eaten by man. (2) Nutritive value of important legumes. (3) Amino acid content of legumes. (4) Account of lathyrism in central India by General Sleeman. (5) Bibliography of soybean (11 references). Some legume recipes. References.

Soybeans are also mentioned on pages 15 (Table 1, "Important legumes"), 23 (Indonesia, soybean curd, soy sauce, tempeh), 23-24 (Japan, miso, shoyu, natto, tofu, Korea, Taiwan), 39-40 (carbohydrates in soybeans include "galactans, pentoses, and hemicelluloses which are poorly utilized." Fats: only the groundnut and soybean are important sources of it), 55 (heating and trypsin inhibitor, methionine and cystine, raw unheated soybean meal, saridele), 58 (fermentation, tempeh, PER), 75-76 (protein values), 81 (Dean used soybeans to treat a protein deficiency), 84 (soybeans in India), 97 (soybean curd).

Appendix 1, titled "Legumes eaten by man" (p. 101-14), lists the various legumes by their Latin names. The entry for *Psophocarpus tetragonolobus* gives its vernacular names as "Goa bean, asparagus pea, winged pea, winged bean, sesquidillas."

Note: This is the earliest English-language document seen (Aug. 2007) that uses the word "sesguidillas" to refer to the winged bean. Address: 1. Dep. of Human Nutrition, London School of Hygiene and Tropical Medicine; Former Director, Nutrition Div., FAO, Rome, Italy.

2022. Belden, Gail Chester; Congleton, W.L.; DeVoto, W.R.; et al. 1964. The protein paradox: Malnutrition, protein-rich foods, and the role of business. Management Reports, 38 Cummington St., Boston, MA 02215. ix + 145 p. No index. Also published by Nimrod Press, Boston, in 1965. 28 cm. [101 ref]
• ***Summary:*** Contents: Foreword by Nevin S. Scrimshaw, Massachusetts Inst. of Technology (MIT). Preface (by the 10 authors, May 1964). I. The problem and the challenge: Population and food supply, protein and nutrition, protein quality, getting the protein into the diet, the need for action. II. Pioneering commercial efforts–Approaches to product development and marketing: 1. ProNutro in South Africa: Incumbe–the initial product, development and testing of ProNutro, commercial test marketing, first national campaign, second national campaign, results of the national campaigns. 2. Incaparina in Latin America: Development of Incaparina, field trials, commercial policies on INCAP, advertising policies. 3. Incaparina in El Salvador and Nicaragua. 4. Incaparina in Guatemala. 5. Incaparina in Mexico. 6. Incaparina: Early development, test marketing, results of the first three months. 7. A protein-rich concentrate for Africa: Product development, commercial introduction. 8. Other approaches: Nestle corn-soy weaning food in Brazil, India [no soy], Senegal [no soy], Saridele [which means "essence of the bean"; a soymilk] in Indonesia, started in mid-1957. 9. Lessons from the case histories: Product development, price, packaging, distribution, promotion, grass roots facilities versus incremental expansion, results, government and medical support.

III. A look at quality problems and processing soybeans: Solvent extraction, water-extracted soy protein, full-fat soy flour. Cottonseed: Expeller process, pre-press solvent extraction. Peanuts. Fish: VioBin process (p. 78), Chile process, Bureau of Commercial Fisheries. Other protein sources: Protein isolates, protein from petroleum, other oilseeds, other plants. Conclusion. Note: The VioBin Corporation produces commercially a fish protein concentrate or fish flour at plants in New Bedford, Massachusetts; Monticello, Illinois; and Greenport, New York. "Ezra Levin, president of VioBin, states that his process can solve the malnutrition problem and that a one-time $300 million investment could finance enough permanent, self-sustaining facilities to overcome the world's animal protein deficit indefinitely." He has written a paper titled "The VioBin process for solvent extraction and dehydration of wet-fat products" (Monticello, Illinois, Sept. 1963) (p. 78).

IV. Are potential protein resources available?: Animal vs. vegetable protein. Oilseed resources. Marine resources. Protein resources and individual countries. V. The role of governments: United States government: Cooley loans, guarantees, information, research, Food for Peace, competition. Local governments.

VI. Commercial feasibility–attitudes and opinions: How well is industry informed? What approaches are being considered?: Commercial ventures, individual projects, incremental basis, licensing arrangements, cooperative efforts, government involvement. What are the bottlenecks?: Finding the commercial market, distribution, changing food habits, product development, motivation and personnel, technical problems, risk and economic return. What are the opportunities?: Profitability, future markets, public relations value, local government relations, social responsibility. Lack of consensus.

VII. Conclusions, reflections, and advice: Product development, production, promotion, distribution, getting started, words of caution. VIII. Bibliography. IX. Appendix.

Concerning Food for Peace (p. 102-04). "The Food for Peace program was an outgrowth of Public Law 480, passed in 1954. The original purpose of the law was to provide the United States with a means of disposing of surplus commodities by selling them for local currencies of needy countries. Total exports under this law accounted for 28% of total U.S. agricultural exports for the first nine years the law has been in operation." These exports were composed of the following: wheat and wheat flour (56%), fats and oils (16%), cotton (13%), feed grains (5%), rice (4%), dairy products (2%), and other commodities (4%). "In 1963 these exports amounted to 34% (in dollars) of the total United States economic assistance effort abroad.

"In administering Public Law 480 the various agencies involved are governed by the provisions of the four sections: Title I–sales for foreign currencies (63% of total shipments); Title II–emergency relief and economic development (11%); Title III–donations through voluntary agencies (25%); Title IV–credit sales for dollars (1%).

"The Department of Agriculture administered the program from 1954 until 1960, when President Kennedy created the office of the Director of Food for Peace program. This person reports directly to the President and coordinates the efforts of the many governmental agencies that are involved in the administration of Public Law 480." A diagram (p. 103) shows the Food for Peace operational [organization] chart. Immediately below the Director of Food for Peace are USDA, AID (Agency for International Development), State Department, Treasury Department, BOB [Bureau of the Budget, later Office of Management and Budget], Defense USIA & OEP Commerce [OEP is Office of Economic Programs within the Business and Defense Services Administration].
